Peter Masucci. Hematophorphyria in the treatment of melancholia. Alfredo Santamaria, Julio N. Quaranta, Oscar F. Gabisso and Rodolfo Nelli. *Semana med.* (Buenos Aires) 1935, II, 1747-50. A. E. Meyer. The use of helium in the treatment of asthma and obstructive lesions in the larynx and trachea. Alvin L. Barach. *Ann. Internal Med.* 9, 739-65(1935).—A mixt. of 80% He and 20% O has $\frac{1}{2}$ the wt. of a comparable vol. of air. The inhalation of such a mixt. caused a decrease in pulmonary ventilation and pressure, a relative and absolute diminution in the length of expiration, and an increased rest period between respiratory cycles. It may thus relieve dyspnea.

John T. Myers. Protective action of certain chemicals against infection with poliomyelitis virus by the nasal route. A. B. Sabin, P. K. Olitsky and H. R. Cox. *J. Bact.* 31, 35-6(1936).—Treatment with 4% alum or 4% tannic acid increased the resistance of monkeys.

John T. Myers. The action of mustard oil on cells in tissue cultures. H. Wollmar. *Zentr. Bakt. Parasitenk.* 1 Abt., 135, 161-4(1935).—Films of mustard oil not in contact with growing cells may hinder growth or change the type of mitosis.

John T. Myers. Effect of various anesthetics on salivary secretion. Benjamin H. Robbins. *J. Pharmacol.* 54, 426-32(1935).— Ft_2O stimulates salivary secretion during induction and recovery if the vapors pass over the upper respiratory mucosa. Et_2O , $CHCl_3$, cyclopropane, C_2H_6 , NO_2 , barbital and epival all cause a cessation of salivary secretion during anesthesia by depressing the secretory center. In so far as change in rate of salivary secretion is an index of irritant action, the order of irritation is Et_2O and $CHCl_3$, cyclopropane, C_2H_6 and NO_2 , the latter being nonirritating.

T. H. Rider. The reduction of pitressin and pitocin with cysteine. Robt. R. Sealock and Vincent du Vigneaud. *J. Pharmacol.* 54, 433-47(1935).—Neither reduction with cysteine nor subsequent reoxidation affected the pressor and oxytocic principles of the posterior pituitary gland. Benzoylation or methylation destroyed the activity of the reduced material but did not affect the activity of the nonreduced compds. Conclusion: Pitocin and pitressin contain S

in the disulfide form, and the sulfhydryl or potential sulfhydryl group is essential to their activity T H R

The toxicity of methyl mercaptan for fresh-water fish Arch E Cole *J Pharmacol* 54, 448-53 (1935)—Methyl mercaptan affects fish in the same manner as mammals, acting on the central nervous system and producing death by a paralysis of the respiratory muscles T H R

Metabolic response of white rats to continued administration of dimethoxyphenol B Terada and M L Tainter *J Pharmacol* 54, 454-62 (1935)—The metabolism of young rats was unaffected by dimethoxyphenol (I) even in quantities of several fatal doses Continued administration of I did not produce tolerance I was without effect when fed to rats with the diet, apparently because of relative tissue-insensitivity in the young and slow gastrointestinal absorption and rapid renal secretion in both young and adult rats When excretion was interfered with by removal of the kidneys, 1 mol I caused the use of over 4000 mols O₂ T H R

The pharmacology of nicotine Harry Gold and Frederick Brown *J Pharmacol* 54, 463-76 (1935)—Barbital (I) antagonizes the action of nicotine (II), although it does not prevent death from 2 fatal doses Such death is without convulsions The emetic action of II is not abolished by I The disappearance of the convulsive, emetic and respiratory stimulating effects of II after repeated doses may be due to partial peripheral motor paralysis Respiratory stimulation by II appears to be central, while respiratory depression and paralysis are peripheral T H R

The relative efficiencies of a series of analeptics as antidotes to sublethal and lethal dosages of pentobarbital, chloral hydrate and tribromoethanol (avertin) O W Barlow *J Pharmacol* 55, 1-23 (1935)—Picrotoxin, metrazole, ephedrine, artificial respiration, coramine, icoral, strychnine and caffeine sodio-benzoate were found to be of more or less symptomatic value (in the order mentioned) in antidoting temporarily the depressant effect of the hypnotics T H R

Ether dosage after preanesthetic medication with narcotics (barbiturates, magnesium sulfate and morphine) Frank A Calderone *J Pharmacol* 55, 24-39 (1935)—After morphine and subanesthetic doses of Na amyltal there was no difference from normal in blood Et₂O concn causing surgical anesthesia or respiratory stoppage MgSO₄ had little effect on blood Et₂O concn for anesthesia, but did lower it for respiratory stoppage The margin of safety of Et₂O anesthesia was unaltered by preliminary medication with sedative doses of morphine or several different barbiturates, and was lessened with MgSO₄ T H R

The pharmacological action of alkaloids of fumaraceous plants II Corydine R A Wand *J Pharmacol* 55, 40-5 (1935)—Corydine (C₂₀H₂₀O₄N₂), prisms, m 148.5°, produces in intact animals an initial stage of drowsiness later mixed with fibrillary twitches in isolated muscles, and in large doses produces strychnine like convulsions with death due to asphyxia Corydine given intravenously in rabbits produces an initial fall in blood pressure followed by a rise to normal or above and increased tone and slows the perfused frog heart The tone and height of contraction of the excised uterus were increased T H R

Barbiturates XII Factors governing the distribution of barbiturates James M Dille, Charles R Linegar and Theodore Koppanyi *J Pharmacol* 55, 40-61 (1935), cf C A 30, 128—Barbiturates can be detected in the blood as long as they are present in the tissues, and no organ tissue has any specific affinity for them, although barbital is less concd in the brain and pentobarbital sodium more concd in the brain than in other organs XIII The duration of action of barbiturates Theodore Koppanyi, Charles R Linegar and James M Dille *Ibid* 62-71.—Long-acting barbiturates are destroyed slowly, hence they are present in the brain for long periods Pentobarbital is quickly destroyed and rapidly disappears from

the central nervous system; hence it is short-acting T H R

Narcoses and the chronaxie P K Knoefel *J Pharmacol* 55, 72-81 (1935)—Cocaine, chloral hydrate and urethan influence excitability rather than cond of nerve The chronaxie is not an index of the excitability of nerve during narcosis T H R

Alcohol injected intravenously Effect of habituation on rate of metabolism Henry W Newman and Windsor C Cutting *J Pharmacol* 55, 82-9 (1935), cf C A 30, 163—Tolerance to alc, if it exists in the dog, is due to tissue tolerance, not to an increased rate of alc metabolism T H R

Sex variation in the ketonuria of ether anesthesia in rats Geo A Emerson *J Pharmacol* 55, 90-6 (1935)—Ketonuria is greater in females Ketosis was not produced by adrenalin in doses of 0.2 mg per kg at 4-hr intervals T H R

Choline and certain of its analogs I The pharmacological activity of acetylphosphocholine and acetyl arsenocholine relative to acetylcholine Arnold DeM Welch and Martin H Roepke *J Pharmacol* 55, 118-26 (1935)—The qual actions are identical, but the P analog has only 5 to 15% and the As analog only 1 to 2.7% the activity of acetylcholine by various tests T H R

Homogluceic or hypogluceic curves for injection of glucose José A Pángaro *Dia méd* 6, 731 (1934), *Anales asoc quim Argentina* 23, 24B—Homogluceic or hypogluceic curves, in which "hyperglucosemic waves" are lacking, observed in cases with or without preprior to the test, are found to be related to latent hyperinsulinism E M Symmes

Emetine in the treatment of enterocolitis and nonamebic diarrhea Jaime Damianovich *Dia méd* 6, 969 (1934), *Anales asoc quim Argentina* 23, 24B—Emetine HCl, injected subcutaneously in initial doses of 0.01-0.015, is a valuable remedy and has no contra-effects E M S

Coagulation Bleeding and calcemia Its modification by ingestion of a mixture of calcium lactate and ammonium chloride Roque A Poletti *Dia méd* 6, 1091 (1934), *Anales asoc quim Argentina* 23, 24B—Oral administration of Ca lactate with NH₄Cl causes a 5.04 times diminution of coagulation time and a 2.86 times diminution of bleeding time, as compared with the use of Ca lactate alone Calcemia is not modified E M Symmes

Utilization and tolerance of the monoglucosides J Garcia-Blanco *Dia méd* 6, 1090 (1934); *Anales asoc quim Argentina* 23, 24B—Fructose, galactose and mannose appear to be converted into glucose before utilization It appears in the urine soon after its circulation in the blood is started Xylose is absorbed slowly, and its hepatic retention is also slow, its utilization small, and elimination by the liver easy E M Symmes

The effect of adrenaline on arterial and venous plasma sugar and blood flow in dogs and cats C F Cori, R E Fisher and G T Cori *Am J Physiol* 114, 53-68 (1935), cf C A 28, 846—Adrenaline solns were protected against destruction *in vitro* by the addn of antioxidants Intravenous injection of 0.015 and 0.003 mg per kg per hr produced hyperglucemia in amygdalized dogs and cats, resp By the use of a blood-flow recorder, rates of injection of adrenaline were found which increased plasma sugar and lactic acid without changing significantly the blood flow through muscle or through the whole leg The significance of the arterio-venous difference as a measure of sugar utilization in the tissues and the errors involved in such detns are discussed E D Walter

Influence of certain polycyclic hydrocarbons on the growth of the Jensen rat sarcoma Alexander Haddow *Nature* 136, 868-9 (1935), cf C A 28, 4129, 29, 5187—Daily intraperitoneal injections of ac colloidal suspensions of 1,2,5,6-dibenzanthracene, 1,2-benzopyrene, 5,6-cyclopenteno-1,2-benzanthracene and 1,2-benzanthracene in 0.5% gelatin caused a marked inhibition of the growth of the Jensen sarcoma On the other hand, anthracene and phenanthrene proved completely devoid of inhibitory power under the same conditions L D W

Effect on tumors of intravenous injections of new soluble complex salts of ferriacorbene. Fernand Arlong, Albert Morel and André Jossierand. *Compt. rend.* 201, 745-7(1935); cf. C. A. 29, 7471¹—The Ca, Mg and Pb salts of ferriacorbene were prepd. and tested as previously described. Julius White

Concomitant variations of the chronaxie and the nervous excitability under a pharmacodynamic effect. Action of cocaine and its substitutes on the motor nerve of *Rana esculenta*. Jean Régner and André Quevauviller. *Compt. rend.* 201, 912-14(1935)—The sciatic nerve of *Rana esculenta* was isolated and chronaxie measurements were made. After the administration of cocaine or procaine,

there was a marked decrease in excitability but no change in chronaxie. Julius White
Antagonistic effect of potassium iodide in baldness due to thallium acetate. O. V. Hyleš and F. A. Diakov. *Nature* 136, 685(1935)—Rats given 3, 4 and 6 mg. of TI-OAc (I), resp. per os per kg body wt. caused a loss of hair after 12 days. At the end of 35 days most of the rats were bald. Rats on a similar diet but supplemented with 0.75 cc 2% KI subcutaneously completely retained their hair coating. The mortality caused by the toxicity of I was also markedly reduced. J. W.

Malaria medicaments (Fel'dman, Kopplovich) 10.
Halogen derivs of procaine (Frejka, Vymetal) 10

12—FOODS

F. C. BLANCE AND H. A. LEPPER

Protein and moisture content of wheat grown in New Mexico. C. W. Botkin. *New Mex. Agr. Expt. Sta., Bull. No. 230*, 16 pp (1935)—New Mexico wheats contain approx. 4.6% less moisture than the 13.5% av. for moister climates and, therefore, contain more solid per bu. than other wheats. The av. protein content of wheats grown under dry farming conditions over a 7-yr period is 13.7%, the max. yearly av. being 15.6, based on a 13.5% moisture content. The protein content increased when the yield was low and decreased when the yield was high. The hard red spring wheats were high in protein and reached a max. of 17.1%. In the soft spring-wheat varieties, the protein content was low. C. R. Fellers

Biochemical changes in wheat grain under the action of high temperatures. V. L. Kretovich and F. N. Ruzantzeva. *Compt. rend. acad. sci. U. R. S. S. (N. S.)*, 3, 409-12(1935), cf. C. A. 29, 490⁴—Samples of various grains were heated in a chamber and the soly of gliadin in FIOH, hydration of gluten and the activities of catalase and diastase measured. Denaturation of gliadin was increased on heating to 90-130°. The hydration of gluten was markedly decreased. Catalase activity is sharply cut on heating to 90° even with quite dry grain. The diastase activity increased markedly at 60-90°, and is relatively high temp., 105°, caused a decrease in H₂O, but in phosphate-citrate buffer it is resistant to even these temps. Control of grain drying and hot-conditioning could be based upon detn. of catalase activity. C. E. P. J.

Carotenoid pigments in wheat with special reference to varieties and strains. W. W. Worzella and G. H. Cutler. *Cereal Chem.* 12, 708-13(1935)—The amt. of carotenoid pigments was studied on line-ground whole-wheat meal of 29 wheat varieties and 72 hybrid strains. The finer the wheat meal the greater the extn. of the carotenoid pigments. Significant pos., interannual correlation coeffs. for carotenoid pigments were obtained between the results of different seasons when wheats of diverse nature were grown under similar environmental conditions, this indicates that carotenoid pigmentation is an inherited varietal characteristic. Hybrid families which appear to be homozygous and others heterozygous for this character are presented. The range of the wheats studied in carotenoid pigmentation, expressed as carotene in parts per million, varied from 1.66 to 3.80 for 1932-33 to 1.80 to 3.80 for 1933-34. L. H. Bailey

Wheat embryo the inorganic and phosphoric constituents. Ennio Zunini. *Chim. ind. agr. biol.* 11, 379-42(1935)—The embryos, which are mechanically cut to produce flours of good keeping qualities, contain Fe 0.20% (on dry basis), nuclein P 0.26%, rhytin P 0.34, lecithin P 0.10, ash 4.25, K 1.09, S 0.24, Mg 0.16, Ca 0.043, Na 0.01 and Si 0.004%. Zn, Mn, Fe, Ni, Al, Cu, Co and B were detected. It is suggested to add these powd. residues to ordinary flours every time bread is prepd., to improve its quality. G. A. Bravo

Soft winter-wheat studies. IV. Some factors producing variations in wholemeal "time" data. E. G. Bayfield. *Cereal Chem.* 12, 559-68(1935); cf. C. A. 29, 3407²—The Pelshenke and Cutler-Worzella procedures give dif-

ferent results. With a 150-cc beaker B believes a 4-g doughball will have definite advantages over larger-sized doughs. The time test is empirical in nature, and relative results are the best which may be hoped for. For truly comparable data great care must be taken to see that all tests are made under comparable conditions. Of the factors studied, variation in vessel diam. proved very important as a cause of variability in the results. The doughball should be of such a size that it receives no support from the vessel used in carrying out the test. Provided a proper size of vessel is used, the time increases with decreasing size of doughball and increasing moisture in the meal (within the limits studied). Uniformity in grinding is essential. Samples which have been heated to eliminate insects give time data which are erratic and higher than those from the same samples which have not been heated. Increases in time due to aging of the meal were found to be within the exptl. error of the detn., provided the tests were made within a few days after grinding. L. H. B.

An experimental flour mill for 100-grm wheat samples. W. F. Geddes and B. Fessell. *Cereal Chem.* 12, 691-5(1935). L. H. Bailey

An experimental milling and baking technic requiring 100 grams wheat. W. F. Geddes and T. R. Aitken. *Cereal Chem.* 12, 696-707(1935)—No major changes in the flow sheet used for the regular 3-stand Allis-Chalmers exptl. mill were necessary when the 100-g. sample mill was used. Fifty g. of flour was taken to make a dough which was divided into 2 equal parts immediately after mixing. Special baking tins were obtained to accommodate the doughs from 25 g. of flour. These tins were similar to the standard "low form" tins scaled down to suitable proportions. The only baking data recorded were loaf vol. and external appearance. L. H. Bailey

Report of the 1934-35 committee on standardization of laboratory baking. W. F. Geddes, et al. *Cereal Chem.* 12, 652-3(1935)—The comm. recommends that (1) a comprehensive study be made of baking tins, (2) a further study be made of the method of reporting the results of the Standard Baking Test. L. H. Bailey

Correlation of experimental and commercial baking tests. J. Frelich, S. McHugh and C. N. Frey. *Cereal Chem.* 12, 668-91(1935)—It was found, in comparative tests using bakery and lab. methods with the same straight dough formula and ingredients, that lab. conditions in mixing or fermentation could be so adjusted as to produce results equal to those obtained in the bakery, as indicated by the characteristics of the finished bread. L. H. B.

What the baker wants in flour. Mary M. Brooke. *Northwestern Miller* 184, 493, 516(1935)—Chemical factors, such as protein and ash, are only indicators of strength, grade and uniformity of milling. We must rely on the baking test for baking characteristics. L. H. B.

The baking strength of flour. M. J. Blush. *Northwestern Miller* 184, 817, 831-5(1935)—In this country "strength" is usually regarded as an expression of a flour's capacity to make a large well-risen loaf. For all practical considerations a flour is fundamentally as "strong" as its protein suggests. "Weakness" is a term that should be

reserved for flours of low gluten content, and possibly also for those flours whose inferiority may be traced to unsoundness or to ingredients or treatments that have been excessively superimposed upon the flour. L. H. B.

Definition and measurement of "flour strength" as an inherent property of wheat. M. J. Blish and R. M. Sandstedt. *Cereal Chem.* 12, 653-64 (1935).—Wheats of equal protein content have essentially the same baking potentialities, in terms of loaf vol., even though they do not all respond equally to a single baking formula and procedure. Therefore, for all practical purposes, protein content and inherent "flour strength" are one and the same thing. "Strength" as an inherent property is to be determined by the baking test but by the protein test. The essential purpose of the baking test is to measure the response of a flour to single and combined treatments and environments that are likely to be accorded to it under modern industrial conditions. All possible combinations should be tried if necessary. L. H. Bailey

A simple method for determining the "yellowness" and "grade" of wheat flours. A. G. Simpson. *Cereal Chem.* 12, 569-74 (1935).—No more elaborate apparatus than a standard type of colorimeter is required, the rest of the equipment being ordinary lab glassware. The method depends on the extn. of flour with acetone, by which the yellow color due to carotenes can be determined, and again with 80% acetone, from which, after making alk., measurements of the "flavone yellow" color, gives a measure of the "grade" of flour. As regards the determination of the "grade" of flour, the flavone-color determination gives a more sensitive method than ash-content determination and is applicable where the latter cannot be used. L. H. Bailey

Contingent glucidic and alcoholic fermentation of wheat flours. R. Geoffroy. *Compt. rend. acad. agr. France* 21, 847-9 (1935), cf. *C. A.* 27, 1679.—The formation of maltose during bread making is optimum at 63° and is influenced by the sanitary condition and nature of the wheat, the amt. of extn. and the method of grinding. The vols. of fermented doughs before baking are related to the ranking of the flours as classified by "diastatic powers." Factors governing the speed of fermentation are: temp. of the medium, amt. of yeast, origin of the yeast, quantity of salt and consistency of the dough. The effect of the pH on the flours is felt at the beginning of the fermentation. K_2BrO_4 , $(NH_4)_2S_2O_8$ in traces and toluene in large amts. slightly retard the speed of fermentation. Cu sulfate and NH_4 phosphate activated the alc. fermentation. Dough reaches its max. vol. at the end of 4 hrs. of normal fermentation. The speed of fermentation was studied by measuring the CO_2 formed. J. R. Adams

Paprika flours from Sieged. István Horváth. *Készletügyi Közlemények* 38, 161-7 (1935).—The flours are mixtures of the pericarps and washed kernels of paprika fruits. Those which contain much kernels are dark-reddish, contain much oil and less ash and sugar. They contain 0.085-0.116% etheral oil according to Griebel, 5.32-6.06% extractable ash, 2.37-2.45% N and 14.84-12.51% sugar as invert sugar. S. S. de Finitis

Test dough mixer calibration. Quick Landis and D. Freulich. *Cereal Chem.* 12, 665-7 (1935).—Two methods of calibration are described: (1) use of the Farnograph as a direct calibration instrument, (2) indirect comparison with a mixer of known calibration or a previously calibrated flour of known development energy value. L. H. B.

Sugars of flour and dough. H. Colin and H. Belval. *Bull. soc. chim.* [5], 2, 1907-12 (1935).—White flour contains, at the most, 1% of sol. saccharides, of which at least 50% is levulose (I) (cf. Tanret, *Bull. soc. chim.* 5, 724 (1891)). Maltose occurs in the dough as a result of the amylolysis of the more fragile starch grains. In the presence of yeast, sucrose and reducing sugars are quickly eliminated from the dough by fermentation. The consequent rising of the dough is maintained by the maltose present. It persists partially in the raised dough. Flour which has been deprived of its amylolytic power by sterilization with boiling alc. gives only 0.15% of alc. on fermentation, a yield which demonstrates the unimportance of preformed fermentable sugars. C. R. Addinall

The yield and the composition of the milk of the ewe. Wm. Godden and Claude A. Puddy. *J. Dairy Research* 6, 307-12 (1935).—Averages of the compn. of all the samples taken from 8 ewes during a two-yr. period expressed in g. per 100 cc. are: total solids 19.30, total protein (N \times 6.38) 6.09, casein 4.61, albumin and globulin 0.88, sugar 4.81, fat 7.43, total ash 0.97, CaO 0.292, P_2O_5 0.380 and ClO 0.78, and sp. gr. 1.0317. The compn. of milk taken from grazing ewes in various parts of Scotland is also given. The milk did not show any marked differences in compn. as a result of wide differences in the Ca content of the rations. A. H. Johnson

The influence of high environmental temperature on the secretion and composition of milk. S. Barlett. *J. Dairy Research* 6, 283-9 (1935).—When cows were subjected to high temp. produced artificially, only slight reduction occurred in milk yield and in the butter fat and solids not-fat contents of the milk. Since summer conditions are known to effect considerably larger changes in these characteristics it is suggested that high temp. is not the only factor responsible for the low milk yield and the lower fat and solids not-fat contents of summer milk. A. H. Johnson

Application of the Schiff-Sørensen reaction in the determination of proteins in milk. Carlo Nuti. *Ann. chim. applicata* 25, 482-8 (1935).—The Schiff-Sørensen test was applied to the determination of total N and casein in a no. of milks. The N determinations are in very good agreement, but casein determinations are practically valueless. A. W. C.

Nonprotein nitrogen of cow milk. A. E. Perkins. *Ohio Agr. Expt. Sta., Bull. No. 548 (53rd Ann. Rept.)*, 62 (1935); cf. *C. A.* 28, 1110.—The nonprotein N of milk comprises about 5% of the total N and is readily obtained in the filtrate after the pptn. of the casein and albumin. Methods are being developed for the determination of urea, NH_4 , amino acids, creatine and creatinine in milk. Urea makes up about 50% of the total nonprotein N of milk and is the most variable constituent. Uric acid also shows much variation in amt. The latter is higher in milk from cows fed low-protein rations. C. R. Fellers

The milk of a typical herd of Shorthorn cows. III. Nitrogen distribution, chloride, lactose, copper and iron content over a period of two years. Wm. Lewis Davies. *J. Dairy Research* 6, 363-8 (1935).—Analyses are reported over a 2-yr. period on weekly samples of milk from Shorthorn cows covering fractional distn. of N, together with lactose, chlorides, Cu and Fe. The data are tabulated and discussed and serve as a comprehensive standard of typical Shorthorn milk on which criteria of the normality of individual samples may be based. A. H. J.

Methylene blue reduction test and the number of bacteria in milk. J. D. Filappo. *Chem. Weekblad* 32, 601-2 (1935).—Four hundred and twenty-six samples of com. milk were examined for bacteria by the time required for reduction of methylene blue and by bacterial count. The time required for milk to decolorize the dye is only roughly related to the no. of bacteria in the milk. Milk showing a reduction period shorter than 2 hrs. is not suitable for human consumption. W. Gordon Rose

Chemical analysis of milk and its application to cheese factories. Juan Minut. *Ind. lechera* 15, 595 (1933). *Anales asoc. quim. Argentina* 23, 26B.—Methods, standards and proof of watering of milk. E. M. Symmes. Comparison of thermal processes (for milk). Juan Minut. *Ind. lechera* 15, 762-3 (1933); *Anales asoc. quim. Argentina* 23, 26B.—A review of methods of investigation of heating milk. E. M. Symmes

Various methods of grading milk. M. M. Miller. *Proc. 8th Ann. State Coll. Wash. Inst. Dairying* 1935, 32-5.

Grading milk at the factory. The value of the methylene blue reductase test and the fermentation test. S. B. Thomas and D. E. Ralph. *Welsh J. Agr.* 11, 209-24 (1935).—There appeared to be some general correlation between the results obtained by the reductase and color-form tests. A high percentage of the samples placed in reductase grades III and IV contained large nos. of coli-

form organisms Coliform organisms were not detected (in 0.1-ml samples) in 67% of 1088 samples of milk that were placed in grade I by the reductase test. There was no marked correlation between the presence of coliform organisms and the results obtained by the fermentation test.

K. D. Jacob
Vitamin D developments F. B. McKenzie *Proc 8th Ann. State Coll Wash Inst Dairyng* 1935, 22-5—The several methods of producing vitamin D milks are discussed, viz., by feeding irradiated yeast to the cows, by adding vitamin D concentrate to the milk and by irradiating the milk.

A. H. Johnson
The daily fluctuation of the fat content of milk Zoltán Csulák *Mezőgazdasági Kutatóisk* 8, 270-8 (1935)—Milk of cows in the 3rd 5th month of lactation averaged 2.5-5.5% fat. Evening milk contained most, morning milk the least fat. In case of 3 milkings daily the 12 night hours supplied 49.02% of the whole milk and 41.62% of the whole amt. of fat. In case of only 2 milkings daily the night 12 hrs gave 56.4% of the amount of milk and 49.83% of the amt. of fat.

S. S. de Finály
An unusual variation in the butter-fat content of milk K. Hartley and D. W. H. Baker *J Dairy Research* 6, 353-63 (1935)—The butter-fat content of milk is consistently higher in the morning than in the evening during the wet season and the reverse is true during the dry season. The relative quantities of milk produced in the evening during the dry season are slightly less than those produced during the wet season but this difference is inadequate in explaining the change in percentage of butter fat. Some evidence is offered that the change in butter-fat content of the milk is directly due to the marked climatic differences between the 2 seasons and that it cannot be controlled by altering the diet of the cattle.

A. H. Johnson
Comparative study of the vitamin A content of butter fat from four breeds of dairy cattle T. S. Sutton and W. E. Krauss. *Ohio Agr. Expt. Sta., Bull* No. 548 (53rd Ann. Rept.) 59 (1935)—Composite samples of butter fat obtained over a 2-yr. period showed that definite breed differences in the vitamin A activity occur. Holstein and Guernsey fats gave similar biol. responses. Ayrshire and Jersey were likewise similar but lower in vitamin A content. The biol. values of these fats were not correlated with their carotene content. This suggests that breeds differ with respect to the relative amts. of pro-vitamin A secreted in their milk. Ayrshire, Holstein, Jersey and Guernsey in winter yielded, resp., 1.45, 1.95, 2.03 and 3.45 mg. of carotene per kg.; summer values were 4.70, 8.00, 12.10 and 20.50 mg. per kg.

C. R. Fellers
A monohydroxypalmitic acid in butter fat A. W. Bosworth and G. E. Helz *J Biol Chem* 112, 459-92 (1936)—Butter fat contains an optically active monohydroxypalmitic acid which differs from any of these acids previously described. The Pb soap is sol. in Et₂O and the Ba soap in CCl₄. The m. p. of different preps varied from 16.5° to 17.5° and [α] from 2.40° to 2.47°. All samples contained traces of unsatd. acids. On reduction with H₂, palmitic acid is obtained.

A. P. Lohrhop
Are flavor and coloring sources of bacteria in ice cream? P. H. Tracy and M. J. Prucha. *Ice Cream Trade J.* 32, 17-18 (1936).

A. H. Johnson
High-solids ice cream Paul Young *Proc 8th Ann. State Coll Wash Inst Dairyng* 1935, 35-45—The fact that lactose crystallizes when the solids-not-fat content of ice cream is increased operates to prevent the production of ice cream of as high milk-solids content as desired. Most methods of increasing the solids-not-fat in ice cream involve a reduction of the lactose content. The following methods of reducing the lactose content in ice cream are discussed: treatment of the milk with lactase, use of edible caseinates and centrifugation of lactose crystals from the condensed product contg. added sucrose. High solids ice creams are said to have characteristics of usual ice creams of higher fat contents.

A. H. J.
Cultural identification of peptonizing bacteria. Juan Minut. *Ind. Lechera* 15, 36-8, 57 (1933); *Arales asoc. quim. Argentina* 23, 26B—Technic of identification in milk, by the Gassner methods, using neutral red. E. M. S.

Application of the catalase test to butter. Geo. Cruess-Callaghan. *Sci. Proc. Roy. Dublin Soc.* 21, 253-5 (1935)—The value of the catalase test for the detn. of the quality and keeping property of butter was investigated. Reasons are given for the conflicting coeffs. of correlation in results of other workers varying from +0.191 to -0.06. A coeff. of correlation between the catalase figure and the quality of butter of about -0.4, and one between the catalase figure and the keeping quality of butter of the same order have been put forward as the most reliable index of the value of the catalase test. These coeffs. have been worked out from figures, probably for ripened cream butter, previously published.

J. C. J.
Biacyetyl in cold-stored butters C. R. Barnicoat. *J. Dairy Research* 6, 397-406 (1935), cf. C. A. 30, 174—Acetylmethylcarbinol and biacyetyl are present in New Zealand butters made from slightly ripened cream. Most of the acetylmethylcarbinol plus biacyetyl found in such butters appears to have been added to the cream with the starter rather than to have developed during the customary mild ripening process. Little change in the acetylmethylcarbinol plus biacyetyl content of butter occurred during cold storage at 14° to 17° F. for more than 6 months. Larger quantities of biacyetyl (4 p. p. m.) added to butters made from cream with and without the use of starter showed considerable losses after cold storage for several months. The losses were of the same order for both types of butter but in the case of the butters made with starter, part of the biacyetyl has been reduced to its precursor (acetylmethylcarbinol).

A. H. Johnson
Identification of acetic acid esters added to butter to mask adulterants Silvio Bezzi and Silvio Sacconi. *Ann. chim. applicata* 25, 407-17 (1935)—In the detn. of volatile acids in butter, their proportion is constant if the butter is genuine. Therefore, if fractions are collected, each will have a certain percentage of the total volatile acids. It has been found that if the distn. is carried out as in the Reichert-Meissl test, i. e., collecting 4 fractions of 55 cc. each, and detg. the acid in each, the proportions will be for I 0.373, II 0.285, III 0.205 and IV 0.138. These are called the coeffs. of fractionation. If tracetin has been added, the values of I and II will be low, and III and IV high. The values for acidity are in cc. of 0.1 N NaOH.

A. W. Contier
Carotene for coloring butter T. S. Sutton and R. B. Stoltz. *Ohio Agr. Expt. Sta., Bull.* No. 548 (53rd Ann. Rept.), 59-60 (1935)—An attempt was made to use a soln. of carotene to enhance the color and increase the nutritive value of winter butter. Approx. 60 mg. of the uncolored, 45 mg. of the colored, and 30 mg. of the June butter were about equal in vitamin A content as detd. by rat assays. Fifteen drops of "caritol" were used per lb. in 1 sample and 2 cc. of "Prumaten" were used in the second sample. Carotene increases the color and vitamin A content of the butter, and its use is less misleading to the consumer than other coloring compds. which have little or no nutritive value.

C. R. Fellers
Vitamin A content of sour-cream butter, sweet-cream butter and margarine I. L. Hathaway and H. P. Davis. *Neb. Agr. Expt. Sta., Research Bull.* No. 79, 3-8 (1935)—Nineteen samples of margarine obtained from Ill., Ohio and Neb. were analyzed chemically and the vitamin A content of each one was compared with that of either sour-cream or sweet-cream butter. The fat content of the butter samples varied from 80.2 to 81.5% while the fat content of the margarine samples varied from 78.3 to 80.2%. The samples of margarine were very poor sources of vitamin A when compared with butter. One of the margarine samples caused an av. gain of 10 g. per rat and another caused an av. gain of 25 g. per rat when fed at the rate of 1 cc. daily for 8 weeks. In every other case the rats fed margarine showed a final loss of wt. and most of them did not survive the expt. Butter was fed at a daily rate equal to 1/10-1/20 of the quantity of margarine fed in all cases but 1, and the rats survived and gained, the smallest gain averaging 45 g. and the largest 111 g. during the 8-week period.

Biology in the cheese factory Colorimetric acidimetry. Juan Mmut *Ind lechera* 15, 351-2, 366(1933), *Anales asoc quim Argentina* 23, 26B—The Dormic method is recommended E M Symmes

A review of recent Cheddar-cheese making experiments N S Golding *Proc 8th Ann State Coll. Wash Inst Dairying* 1935, 3-10—A review of exptl work done on Cheddar cheese within the last 5 years is given The phases of the subject considered are milk quality, effects of pasteurization, conditions of use of rennet, types of starter, loss of vitality of starters, acidity, salting, ripening and cheese defects Forty-two references

A H Johnson
The electrical resistance of pork and bacon I Method of measurement F H Banfield *J Soc. Chem Ind.* 54, 411 13T(1935)—In order to det the concn of NaCl in various parts of cured meat, the elec resistance was measured by means of a 2 pronged probe, insulated to the tips A thermionic valve oscillator, generating current at 1000 cycles, was used This high frequency was obtained by close coupling of 3 coils of No 40 enameled wire, 2 of 5000 and 1 of 3000 turns Following this oscillating circuit was a second amplifying valve with potentiometer-controlled output This allowed output control without affecting the frequency. With this high frequency generator and thermionic-valve rectifying circuit of Callan and Horrobin (*C A* 23, 789), it was necessary to use storage batteries to supply high-tension current to the rectifying valve The Kohlrausch modification of the Wheatstone bridge was used to det. the resistance Platinization of the probe tips facilitated the manipulation Readings were standardized with small cubes of meat left in NaCl solns of various concns. until equil was reached The resistance was detd. in various parts of the piece and NaCl content checked by chem analysis A curve was constructed for a certain temp The resistance falls rapidly up to 3% NaCl, then slowly. Saltpeper had the same effect as salt Since most pickle brines contain $\frac{1}{10}$ NaCl, the NaCl content would be 90% of the amt. indicated As a test, samples of cured meat were analyzed and the probe method was checked to 0.5% of the NaCl content A Salinity Tester is now manu. by Evershed Vignoles, calibrated for 5°, 10°, and 15° and having a scale for depth penetration II The electrical resistance of salt in solutions, gels, minced pork and bacon F. H Banfield and E H Callow *Ibid.* 413-17T—The elec probe described above was used in the detns of elec resistance (E R) In the measurement of E R of various concns of NaCl in H₂O, agar-agar gels, gelatin gels and minced pork, an increase of NaCl caused a decrease in the E R The addn of H₂O to a definite mixt of minced pork and bacon decreased the E R of the mixt, probably since there was less poorly conducting material in the same vol fat (3.3% fat) minced pork had a greater E R than lean (0.9% fat) pork, at the same NaCl concn. Although the addn of NaCl decreased the E R of minced pork, it also led to an increase in the internal E R of the tissue, since, as the amt of NaCl was increased, it required a larger proportionate amt to decrease the E R The addn of KNO₃ to minced pork decreased the E R to exactly the same extent as a chem. equiv of NaCl The E R. of various mixts of minced pork and NaCl decreased as the temp. increased. Minced pork had less E R. than an intact piece of salted pork, at the same NaCl concn, probably because of less connective tissue and less fat in the minced product Intact pieces of unsalted pork and bacon showed greater E R across the fibers than with the fibers, when measured between parallel plates, but with the elec probe there is no difference from which direction the E R is measured III The penetration of salt into muscular tissue during the curing of bacon F H Banfield and E H Callow *Ibid.* 418-21T—By the elec probe method (I), the elec resistance (E R) of muscular tissue, before and after curing, was measured The E R of fresh pork was considerably greater in a very fat side than in a very lean one. The E R of muscular

tissue in all 8 sides measured was the greatest near the shoulder and least in the hind leg, therefore the muscular tissue of the hind leg must contain less fat than near the shoulder The E R. was greater near the cut surface of the side than in the deep-seated parts, probably because of loss of H₂O in the former. The effect of extra fat or loss of H₂O in increasing the E R. of muscular tissue was still evident to some extent, even after curing, yet the authors were able to observe by changes in E R. the progressive penetration of salt During both dry salting and tank curing, there was a decided fall in the E R during the first 24 hrs, indicating a penetration of salt into the innermost parts of the sides Tank curing gave more rapid penetration of salt than dry salting, even when the sides had been previously injected with pump-pickle Chem. analysis showed there was practically no difference between the concn of salt in a very fat and a very lean side, both having been treated the same Chem analysis also showed there was a definite gradient in the concn of both salt and H₂O in the sides The outer layer, in contact with the air, had the most salt and least H₂O, even if the sides had been previously injected with pump-pickle.

R L Horst
The effect of the feeding of kitchen-refuse upon the quality of bacon S Schmidt-Nielsen and C F. Pettersen *Norg Tek Høskole, Aethandl.* 25, 787-805(1935)—Bacon produced in certain localities has been found to be of a very soft consistency, yellow in color and becomes rancid when salted It was the purpose of the authors to ascertain if highly unsatd acids in the food can be detected in the bacon and if C₁₈ and C₂₀ unsatd acids are present in the fat Samples of bacon were obtained from 9 swine, which are divided into 2 general groups Group I consisted of 3 animals fed a standardized mixt. of kitchen-refuse, corn and barley, and Group II, of 6, which had been fed the usual corn-milk diet The bacon fats were rendered at the temp. of boiling H₂O in a CO₂ atm The analytical constns of the fats and their acids and the properties of the benzene-sol and -insol polybromides and Me esters of these fat acids were detd., as well as the constns of the fat of the kitchen-refuse food mixt No detns were made on the fat of the food given the animals of Group II The m. p. of the fat from the softer bacons of Group I was 1.4° m. p. lower than that of Group II Groups I and II showed an av. Hübl I no (cor according to Schmidt-Nielsen and Owe, *C A* 18, 2818) of 69.8 and 61.2, resp., a difference of 8.6 The av. thiocyanate I nos (according to Kaufmann, *C A* 20, 2256), indicative of the amt. of fat acids with 1 or 2 double bonds, were 54.4 and 52.3, resp., a difference of 2.1 The difference between the av. I no and the av. thiocyanate I no of Group I was 15.3 and of Group II, 8.9, the amt of unsatd acids in Group I being about double that in Group II The solid and liquid acids were sepd according to the soly of the Pb salts in EtOH The av I nos of the acids of the 2 groups were 72.1 and 64.0, the av. solid fat acids, 32.3 and 38.9%, the av I no of the solid acids, 4.16 and 2.54 and of the liquid acids, 105.9 and 99.1, and most characteristic, the av. EtOAc-insol bromides, 2.36 and 0.29%, resp In the 2 groups, 72.8 and 57.8% of the fat acid bromides were insol in benzene and the Br content of the total bromides was 68.45 and 67.40%, resp The av. Kottstorfer no of the benzene-insol bromides in Group I was 174.7 and av. Br content 69.79% From this it is concluded that the greater part of the fat acids in Group I is C₁₈H₃₃O₂ The Me ester of the fat acids subjected to fractional distn gave, in the residue for Group I, an av. I no of 109.8, compared to 73.1 for the total acids, and for Group II, 78.8 compared to 64.2, indicating more highly mol and more unsatd acids than in the distillate, confirmed by 1 of the Group I yielding 1.04% insol bromides in the distillate and 14.15% in the residue The Kottstorfer no of the first fraction in Group I was 213.7 and in Group II, 212.0, indicating that Group I was also richer in lower fat acids The authors conclude that the unsatd acids in Group I were of marine origin, that these acids were more highly unsatd, that 90% of the unsatd acids of the food were recovered in the

including seeds and juice. The latter makes up about 29% of the wt. of the fruit and has the following percentage compn.: water 79.8, protein 0.6, fat and crude fiber 0, ash 0.48, carbohydrates (by difference) 19.1, acidity as citric acid 2.3, Ca 0.005, P 0.018 and Fe 0.018. The seeds contain 12.7% protein and 8.3% fat with an ash content of 1.92%. The juice is very palatable and possesses com. possibilities. The juice may be readily utilized in cocktails, candy, syrups, jelly and cordials.

C. R. Fellers
Vitamin C content of paprika fruit. Istvan Szanyi. *Természettudományi Közlemények* 67, 527 (1935).—Veins, stem and seeds of Hungarian paprika contain only traces of vitamin C. Green paprika fruit contained 400, brown 800–2000, fully ripe, red paprika 1048 to 2100 mg. vitamin C per kg. Flesh or juice of paprika is much higher (3160 mg./kg.). S. S. de Fina

Influence of pectin on the velocity of inversion of sucrose. Sergio Berlingozzi and Mario Testoni. *Ann. chim. applicata* 25, 483–96 (1935).—Pectin was found by B. and Liquori (C. A. 25, 1235) to retard the velocity of inversion of sucrose. The action has now been measured quantitatively. The rate of inversion of sugar soln. by citric acid in the presence of 1% pectin was detd. at 10°, 35°, 45°, 65° and 80°. The retarding action of pectin increases with the concn. Thus, in a 13% sugar soln. the value of K at the above temps was reduced 20.4, 30.5, 22.0, 22.3 and 9.7%, resp. due to the presence of pectin. In a 5% sugar soln. the reduction in K was 20.3, 32.8, 24.7, 24.8 and 17.1%, resp. It is seen that the retarding action decreases with increasing temp. and practically disappears at 107°.

A. W. Conners
Chemical composition of certain fodder plants from Cameron Highlands. C. D. V. George. *Malayan Agr. J.* 23, 483–5 (1935).—When cut at weekly intervals at Serdang the crude protein, fat and fiber contents of guinea grass (*Panicum maximum*) were about the same as those of grass cut every 3 weeks at Cameron Highlands. Buffalo grass (*Paspalum conjugatum*) cut in flower at Cameron Highlands was of about the same compn. as that cut every 3 weeks at Serdang. Analyses are given for Dallis grass (*Paspalum dilatatum*) and for kikuyu grass (*Pennisetum clandestinum*). The clovers were of about the same compn. as like varieties grown in Europe. J. R. N.

Digestibility of artificially dried roughages. J. A. Newlander. Vt. Agr. Expt. Sta., *Bull.* No. 400, 3–12 (1935); cf. C. A. 29, 55361.—The digestibility for cows of each of the following artificially dried roughages was detd.: corn silage, both wet and dried, oat hay, sudan grass, soybean hay and Japanese millet. The amts. of digestible crude protein and total digestible nutrients were: corn silage, dried, 3.73 and 67.71; corn silage, wet, 4.57 and 68.24; oat hay, 10.50 and 70.57; sudan grass, 12.44 and 65.25; soybean hay, 9.00 and 71.43; and millet, 8.05 and 67.96%. C. R. Fellers

New methods for preserving legume forage. A. E. Perkins. Ohio Agr. Expt. Sta., *Bimonthly Bull.* No. 177, 200–5 (1935); cf. Vitanen, C. A. 29, 24171.—New methods of ensiling leguminous crops by stack, acid-treated (A. I. V.) and artificial drying are discussed. Results of the 1st year's expts with the A. I. V. acid-treated silage show that fermentation is prevented in the ensiled hay and losses of drainage water are reduced. The product is palatable to dairy cows and, in spite of the mineral acids present, appears to be harmless physiologically. A mixt. of CaO and NaHCO₃ is normally fed in moderate amts. along with the silage to neutralize the acids. The method is not recommended for general adoption at the present time. C. R. Fellers

Effect of season and maturity on the composition of blue grass. C. H. Hunt and W. L. Robison. Ohio Agr. Expt. Sta., *Bull.* No. 548 (53rd Ann. Rept.), 68–9 (1935); cf. C. A. 28, 13955.—Frequent clipping decrease the total yield of dry matter but increase the protein content of the dry matter. In general, the 1st cutting in May was highest in protein and fiber content and lowest in fat content. The N-free ext. increased as the season advanced. The ash content remained fairly const. C. R. Fellers

1 Composition of hays from Somogy county. László Urbányi. *Mesgazdasági Kutatók* 8, 320–7 (1935).—Natural meadow hays, calcd. to 85% dry matter content, contained crude protein 87%, CaO 9.88, MgO 4.17 and P₂O₅ 4.91%. Alfalfa hay, calcd. to 84% dry matter, contained crude protein 19.05, CaO 24.14, MgO 4.84 and P₂O₅ 5.92%. Red clover hay, calcd. to 84% dry matter, contained crude protein 15.38, CaO 19.25, MgO 5.23 and P₂O₅ 4.96%. The detailed analyses show that the compn. of various meadow hays is much influenced both by the botanical types of component plants and the different factors of vegetation. S. S. de Fina

Experiments on grass silage. C. Boyle and J. J. Ryan. *Journal (Saorstát Éireann Dept. Agr.)* 33, 143–39 (1935).—Grass silage made by the A. I. V. method contained H₂O 79.90, protein 3.08, oil 0.64, fiber 5.45, carbohydrate 9.29 and ash 1.64%; the compn. of the silage closely approximated that of the original grass. The effluent that escaped from the silo contained total dry matter 5.2 and protein 1.6%. The total loss in wt. was 7.3%, as compared with 10.6–11.9% when the grass was ensiled by the ordinary method. The pH of the silage was 4.0–4.2 in the top portion and 3.7–3.8 in the bottom portion. Both types of silage were excellent feeds for dairy cows and calves. K. D. Jacob

Vitamin A content of corn silage. W. E. Krass. Ohio Agr. Expt. Sta., *Bull.* No. 548 (53rd Ann. Rept.), 62 (1935).—Corn silage contained 2.5 Sherman units of vitamin A per g. Assay of the silage showed approx. twice as much vitamin A activity (rat bioassay) as the green corn from which the silage was made. C. R. Fellers

The food value of oat hulls. E. J. Sheehy. *Journal (Saorstát Éireann Dept. Agr.)* 33, 167–72 (1935).—Hulls from white oats contained H₂O 10.5, crude protein 3.94, EtO ext. 1.48, sol. carbohydrate 53.17, fiber 28.26 and ash 3.63%. In expts. with cattle, the hulls gave satisfactory results when they were substituted for good quality meadow hay in the ration at the rate of 11 lbs. to 8 lbs. K. D. Jacob

Detn. of true dry substance in solid and liquid products [flours] (Monzot) 28. Analysis for fluoride—application to detn. of spray residue on food products (Hoskins, Ferris) 7. Automatic recording balance [for use in drying macaroni products] (Bunnington, Geddes) 1. Effects of arsenical sprays on grapefruit, oranges, tangerines, Temple oranges, limes and lemons (Longfield-Smith) 15. Proteins of the cowpea (Adolph, Chiang) 11A. Jars for preservation of food (Shtern) 19. Coconut fat treatment in the confection industry (Hölscher) 27. Cellulose "bulking agent" for use in foods (U. S. pat. 2,026,865) 7. 23. Addn. compds. of bacetyl and glycerol [used in the margarine industry] (Ger. pat. 619,628) 10.

Vitaminizing food. F. Hoffmann-La Roche & Co. (Soc. anon.). Fr. 788,014, Oct. 2, 1935. The vitamin C content of food is increased by adding esters, e. g., Me or Et, of 2 keto-L-gulonic acid.

Preserving food. International Sugar & Alcohol Co. "Isaco" Fr. 788,098, Oct. 3, 1935. Pure dextrose or xylose is used for preserving foods contg. much water. This avoids excessive sweetness and sepn. of "crusts" of sugar.

Preserving milk for human consumption. Georg A. Kranse (to Katadyn, Inc.) U. S. 2,028,072, Jan. 14. Milk is partially sterilized by treatment with oligodynamically active bodies such as silvered clay pellets while in a previously heated condition (suitably at a temp. of about 63°), the heating being for a time shorter than the conventional pasteurization time and insufficient to cause complete sterilization or to impart a boiled taste to the milk, and the oligodynamic treatment is interrupted within 4 min. to avoid color or taste changes in the milk, substantially the full vitamin value of the milk is retained.

Header and tube heat-exchange apparatus suitable for treating milk. Fritz G. Cornell, Jr. U. S. 2,027,809 Jan. 14. Structural details.

Filters suitable for milk, etc. Maurice A. Goldman (to Commercial Filters Corp.). U. S. 2,028,061-2, Jan. 14. Various structural details.

Canning crab meat. Carl R. Tellers. U. S. 2,027,270, Jan. 7. Meat from the "blue crab," "rock crab" or "sand crab," before initial discoloration, is treated with an aq. soln. of an Al, Zn or Sn salt such as sulfate, nitrate or chloride contg. about 50-500 p. p. m. of Al, Zn or Sn, and the treated meat is sealed in containers and sterilized.

Confection compositions such as chocolate coatings. Benjamin R. Harris. U. S. 2,027,167, Jan. 7. A fat together with dispersed comminuted material such as cocoa and sugar is used with an ester of sulfuric acid having a terminal lipophile group with at least 8 C atoms and a hydrophilic sulfate group, such as sulfonated cacao butter or the like.

Apparatus for concentrating fruit juices. Marcel Mallet. Fr. 787,016, Oct. 1, 1935.

Food flavorings. Arthur Alt (to Monsanto Chemical Co.) U. S. 2,027,261, Jan. 14. A flavoring for various foods such as ice cream, confectionery, bakery products, preserves, etc., comprises an alkyl ether of protocatechuic aldehyde, such as the *m* benzyl ether, dissolved in alc. Other ingredients such as coumarin, vanillin, sugar and water may be added.

Food flavorings. Lucas P. Kyrides and Henry H. Retalliau (to Monsanto Chemical Co.) U. S. 2,027,287, Jan. 14. A vanilla-like taste and odor are given to foods such as confectionery, bakery goods, preserves, syrups, etc., by use of alkyl ethers of protocatechuic aldehyde such as the Pr, Bu, Am, hexyl, heptyl or octyl ethers,

which may be used in admixt. with various other flavoring ingredients if desired.

Caffeine-free tea. Theodor Grethe. Ger. 621,557, Nov. 9, 1935 (Cl. 53k. 3). Addn. to 608,215 (C. A. 29, 2620P). The process of Ger. 608,215 is modified by treating the tea with steam for a short time, e. g., 5-8 mins., after the extn. with an org. solvent. The conditions must be such that the temp. of the tea does not exceed 65°. The steam treatment may precede or follow the treatment with air or an inert gas.

Use of solid carbon dioxide for supplying inert gas in packages of coffee, etc. Carl H. Hansen (to John Hansen) U. S. 2,027,429, Jan. 14. Various operative details are described. U. S. 2,027,430 relates to a container adapted for use in packaging operations of this character.

Preventing oxidation and rancidity of coffee, shelled nuts, cheese, powdered-milk products, milk chocolate, etc. Sidney Musher (to Musher Foundation Inc.). U. S. 2,026,697, Jan. 7. Various solid food materials have their particles mixed or coated with finely divided antioxidative vegetable material such as oat flour or finely divided barley, hominy, soybean flour, crushed sesame seed, crushed peanuts, crushed linseed cake, soybean press cake, castor-bean pomace, corn-germ cake or corn gluten, or, in the case of roasted coffee, a small proportion of finely ground unroasted coffee. Alc. exts. or the like from similar materials also may be employed as inhibitors of oxidation or rancidity. Rubber, greases, soaps, resins and various drugs, chemicals and pharmaceutical products, etc., may be similarly preserved from rancidity, oxidation or aging changes. Numerous details and examples are given.

The surface tension of fat acid condensation products and fatty alcohol sulfuric acid esters. W. Weltzien and H. Ottensmeyer. *Monatsh. Chem. Phys.* 66, 504-7 (1935).—Expts. were conducted (1) to purify commercially available powders so as to remove admixed electrolytes without any sepn. of the various homologs, as a mixt. of the latter is at times necessary for technical purposes, (2) to det. how surface tension depends on concn. and temp. and (3) to find out whether the addn. of electrolytes produces further changes in the surface tension. Igepon T powder (A) and Gardinol WA coned. powder (B) were purified by double recrystn. from AcOEt; Igepon A powder (C) was purified by double recrystn. from 96% LiOH. Dynamic surface-tension measurements were made with Traube's stalagmometer. A shows the greater dependence of surface-tension on the concn. at 20° and 80°. Nearly identical values were obtained with B and C at 20°. At 80° the concn. factor was less pronounced in the lower concns. than it was in the cold. At a concn. of 1 g./l. the surface tensions of all 3 products are practically identical at 20° and 80°. The difference of about 10 dynes/cm. between 20° and 80° corresponds to

the change in the surface tension of pure water. The greatest decrease of the surface tension is brought about at relatively low concns. and further addns. produce no great changes. Equally coned. solns. of the com. products contained considerably smaller amts. of the surface-tension-active ingredients than did the purified products. The addn. of electrolytes to the surface-tension-active substances tested yields, particularly at higher temp., an extraordinary, unexpected addnl. decrease of the surface tension. Leopold Scheffan.

Rock wool in relation to health. Lawrence T. Fairhall, Stewart H. Webster and Granville A. Bennett. *J. Ind. Hyg.* 17, 263-75 (1935).—Cats were subjected to cold vapor, hot vapor and dust expts. with varying concns. of rock wool. The chem. data indicate no hygienic hazard. Histological examn. of the lungs, the liver and kidneys reveal no const. or significant pathol. changes.

Accidents during the removal of acids (in cleaning solutions) from well pipes. Kremer. *Geundh.-Ing.* 59, 26-7 (1936).—The "Fierin" used for cleaning consists essentially of 20% HCl and a protective collod. Its action may produce sufficient CO₂ to replace most or all of the O present. Poisonous S-contg. gases may also be produced. Either of these factors could account for the deaths of workers reported. M. G. Moore.

Red squill investigations—effectiveness of red squill extracts as raticides. Robert E. Buck and C. R. Fellers. *Ind. Eng. Chem.* 27, 1497-9 (1935); cf. O'Connor, et al., C. A. 30, 1881.—Toxic exts. prepd. from red squill powder are efficient raticides. The best solvents are MeOH and EtOH and exts. made with a Soxhlet app. were more toxic than those prepd. by shaking or stirring. Wheat bran is a suitable carrier for the dried ext. Exts. can be prepd. on a large scale by percolation. Extd. baits are more palatable and more readily standardized than red squill powder. Field tests were made. C. W. Whittaker.

Determination of phosgene in gases from experimental

fires extinguished with carbon tetrachloride fire-extinguisher liquid W. P. Yant, J. C. Olsen, H. H. Storch, J. B. Littlefield and Leopold Scheffan *Ind Eng Chem, Anal Ed* 8, 20-5 (1936).—The results previously reported by the Bur. of Mines (cf. *C. A.* 15, 294) on COCl_2 in the gases from excelsior fires extinguished by CCl_4 -type fire-extinguishing liquids have been questioned (cf. Olsen, *et al.*, *C. A.* 25, 2075) on the basis that the analytical method gave erroneously high results. The Bureau, with the cooperation of the manufacturers of the CCl_4 -type fire extinguisher, repeated some of the earlier work under a reproduction of the former conditions except that a different analytical method was used. In the first report the COCl_2 was absorbed in alc. NaOH and the NaCl formed was detd. by titration, while in this new investigation the same constituent was detd. by passing the gas sample first through a suitable purifying tower to remove interfering substances and then through a soln. of aniline water which had been said with sym. diphenylurea. Any COCl_2 in the gas sample reacts with this reagent, pptg. diphenylurea which can be filtered off and weighed, this serves as a measure of the COCl_2 present. The purity of the diphenylurea formed was checked by its m. p. and also microscopically by detns. of the cryst. structure and n . The report gives a detailed description of the exptl. procedure and methods and a tabulation of results obtained. The COCl_2 found in 16 expts. in which excelsior fires were extinguished in 2 sealed chambers (capacity 28 and 32 cu. m., resp.) ranged from 4 p. p. m. by vol. to 92 p. p. m., with an av. of 23.6 p. p. m. When the CCl_4 -type fire-extinguishing liquid was dropped on an I-beam previously heated to red heat and without fire present the amt. of COCl_2 found was 119 p. p. m. The exptl. results are in substantial agreement with those formerly reported by the Bureau. The article calls attention to the importance of using materials for test chambers which absorb minute amts. of COCl_2 as this is a highly reactive gas. It is suggested that neglect of this precaution may have given rise to conflicts in results reported by previous investigators. The authors state that it is not the intention of the Bureau to discourage the use of CCl_4 -type fire extinguishers, which are excellent for stopping incipient fires, but rather to det. the decompn. products which may result and which should be recognized and properly evaluated. L. S.

Gas mask disinfection with a formaldehyde water vapor mixture Bau Kein-Hun, E. Heide and Wang Kan. *Die Gasmaske* 7, 115-23 (1935).—Expts. were carried out in a gastight chamber with a capacity of about $\frac{1}{2}$ cu. m. The HCHO water vapor mixt. was generated in place by adding 8.3 g. cryst. KMnO_4 to 3.3 g. paraformosol in 10-33 cc. H_2O . The organisms used were *Es. coli*, *Staphylococcus aureus* and anthrax spores. These were applied in known nos. on cover glasses which were exposed for different times at different temps. and humidities. It was concluded that the important factors in this method of disinfection are the HCHO content of the condensed water and the duration of the exposure. HCHO in vapor form was ineffective. The following 2 formulas for disinfecting gas masks are recommended. For general use for each cu. m. of storage space use 30 g. paraformosol (1.8), 75 g. KMnO_4 , and 9 cc. H_2O . The HCHO content of condensed water is about 2%. For known contamination with contagious diseases, for each cu. m. of storage space use 45 g. paraformosol (1.8), 112.5 g. KMnO_4 , 135 cc. H_2O . The HCHO content of condensed water is about 4%. Exposures of 1 hr. are sufficient for general use but when known contamination with dangerous diseases has occurred it is advisable to expose for 8-12 hrs. Gas masks should be hung up in the disinfecting chamber dry since water on the gas masks will dil. the concn. of HCHO . A. L. Kibler

Use of higher sulfonated fatty acids in the laundry (Brever) 25. Stürer for the manuf. of glues and adhesives (Wollenberg) 1. Dicarboxylic acid esters of tetrahydrofurans) alc. [plasticizers] (Borglum) 10. Halogenated products of phenyl phenylphenyl ether [used in plastics] (U. S. pat. 2,028,081) 10. Guanyl and biguanyl compds

[having wetting, frothing and dispersing properties] (Fr. pat. 788,423) 17. Dissolving rubber to form a product used in insulation (U. S. 2,028,068) 26. Esters of etherified glycolic acids [used as softening agents] (U. S. pat. 2,027,901) 10. Unsatd. aldehydes and ketones [products used as resin components] (Brit. pat. 435,494) 10.

Extracting products by solvents Unes de Melle (Soc. anon.) Brit. 435,725, Sept. 26, 1935. See Fr. 778,689 (C. A. 29, 4833). For "extd." read "extd."

Plastic compositions. Ernest Belmans. Fr. 787,980, Oct. 2, 1935. Fillers such as sawdust, cork, asbestos or vulcanized rubber are incorporated homogeneously in plastic material by passing the latter between rollers to form a layer about 0.5 mm. thick and spreading the filler evenly on to this layer.

Plastic compositions. Jean de Granville and Léopold Davion. Fr. 788,407, Oct. 10, 1935. The use of catalysts and heat in making resins from CHO and carbamide, phenols, cresols, etc., with or without casein, is replaced by the use of high frequency currents. High-frequency currents are also used for insolubilizing casein, alone or mixed with other substances.

Plastic materials. I. G. Farberman A-G. Fr. 788,645, Oct. 14, 1935. Products of high mol. wt. contg. S and resembling rubber are made by causing alkali, alk. earth or NH_4 polysulfides to react with 2-chloroethyl-2'-chloroethyl ether in the presence of a diluent such as water and substances having surface activity such as BaSO_4 , preferably freshly pptd. Cf. C. A. 30, 536.

Plastic compositions containing cellulose acetate Joseph R. Mares (to Monsanto Chemical Co.) U. S. 2,028,403, Jan. 21. A neutral ester of a carboxylic acid and an acetal of glycerol and AlCl_3 , such as formal glycerol benzoate, is used for plasticizing cellulose acetate.

Plastic compositions suitable for coating, molding, etc. Carleton Ellis and Wm. F. ter Horst (to Ellis-Foster Co.) U. S. 2,028,575, Jan. 7. A reaction product sol in a restricted no. of org. solvents such as hexahydrophenol, phenols and diethylene glycol, diethylene dioxide, etc., is formed from glycerol dichlorohydrin and an alkali polysulfide by heating together. Numerous examples are given.

Cellulose nitrate plastic compositions Harold J. Titterton and Imperial Chemical Industries Ltd. Brit. 436,161, Oct. 7, 1935. Plastic compns. are obtained by dissolving cellulose nitrate in monomeric Me methacrylate contg. methyl- α , β -dichloroisobutyrate and subjecting the mixt. to a treatment that effects polymerization of the Me methacrylate. Polymerization may be in presence of catalysts, e. g., Br_2O , succinyl peroxide.

Decoratively colored plastic magnesia articles Albert E. Cleghorn (to Travatex Products Corp.). U. S. 2,027,021, Jan. 7. In the manuf. of cast articles, there is added to a plastic mixt. of magnesia, MgCl_2 , etc., a metal salt (such as $\text{Fe}(\text{SO}_4)_3$ or a Cu salt) which reacts to give a hydroxide or oxide of the desired color.

Plasticizers for nitrocellulose compositions. Compagnie française pour l'exploitation des procédés Thomson-Houston. Fr. 788,674, Oct. 14, 1935. Mixed phthalates of glycerol or glycol with an aliphatic monohydric alc. such as MeOH , EtOH , PrOH , BuOH , AmOH and hexyl alc. are used.

Apparatus for extruding plastic material such as in making molded rubber articles Geo. F. Brouseau and Harvey D. Ferns (to Hood Rubber Co.) U. S. 2,024,044, Jan. 14. Structural, mech. and operative details.

Synthetic resins N. V. Industriële Maatschappij Vootheen Noury & van der Lande. Fr. 788,584, Oct. 12, 1935. Drying or semi-drying oils or their esters are polymerized and the fats of the polymerization products are split, or the fats of the oils are split and the mixed fat acids are polymerized. The unpolymerized fat acids are eliminated by distn. and the polymerized products are transformed to resins by reaction with compds. used for the production of resins, e. g., glycerol, phthalic anhydride and vinyl acetate or chloride.

Synthetic resins, varnishes, etc. E. I. du Pont de Nemours & Co. Brit. 435,762, Sept. 23, 1935. Resinous materials sol. in varnish oils are prep'd by causing CH_3O or a deriv. thereof to react in an alk. medium with a binuclear phenol contg. at least 1 but not more than 2 reactive positions and contg. at least 4 nonaromatic C atoms, 1 of which is a secondary or tertiary C atom that is directly joined to a C_6H_5 ring in 1 of the *o*- or *p*-positions to the phenolic OH. Among examples, (1) di-(4-hydroxy-3-methylphenyl)dimethylmethane is condensed with CH_3O in presence of NaOH and the product, sol. in Me_2CO , alc. and ethoxyethanol, is blended with raw China wood oil or laseed oil, or mixts thereof, and thinned with a mineral thinner and an aromatic hydrocarbon, with or without a Co drier to yield a varnish, and (2) the resin prep'd in example (1) is blended with a polyhydric alc.-polybasic alc. condensation product contg. a drying oil or a fatty acid derived therefrom and thinned, with or without the addn. of an oil, to yield a varnish. The products may be blended with cellulose derivs., natural resins and ester gums, synthetic resins and synthetic resin-forming material, bitumens, natural or synthetic waxes, pigments, plasticizers, fillers, lakes, etc., for use in the manuf. of coating compns., molding plastics, impregnating agents for paper, wood, etc., adhesives for safety glass, linoleum, cements, sealing waxes, insulating materials, etc. In 435,796, Sept. 23, 1935, divided on 435,762, oil-sol. resinous materials are prep'd by condensing CH_3O with a chlorinated di- or tri-nuclear phenol having at least 1 but not more than 2 substitutable reactive positions and at least 3 non-aromatic C atoms, 1 of which is directly joined to at least 3 C atoms and is directly joined to a C_6H_5 ring as described in 435,762. In an example, di-(4-hydroxy-3-chlorophenyl)diphenylmethane is condensed with CH_3O in presence of NaOH and the product is blended with China wood oil and thinned with mineral thinner and aromatic hydrocarbons to yield a varnish. In 435,797, Sept. 23, 1935, divided on 435,762, CH_3O or a polymer thereof is condensed with a mononuclear phenol having at least 1 but not more than 2 substitutable reactive positions and at least 7 non-benzenoid C atoms, 1 of which is directly joined to at least 3 C atoms and is directly joined to the C_6H_5 ring as described in 435,762. In an example, *p*-terphenyl phenol is condensed with CH_3O in presence of NaOH to yield a resin.

Synthetic resinous condensation products. Walther Schrauth (to Deutsche Hydrierwerke A-G). U. S. 2,027,351, Jan. 7. By heating together initial materials such as phthalic anhydride, succinic acid, ricinoleyl alc. and glycerol, resins of especially good elasticity are obtained, and generally similar products may be derived from phthalic acid, phthalic anhydride, hexahydrophthalic acid, succinic acid, adipic acid, fumaric acid, maleic acid, citric acid, tartaric acid, oxalic acid, etc. The said acids may be used alone or conjointly as a mixt.; it is advantageous to co-employ besides polybasic aromatic dicarboxylic acids simultaneously aliphatic, polybasic carbon acids, such as succinic acid, adipic acid or tartaric acid. Several examples with details of procedure are given.

Synthetic resinous products free from phenolic odor. Gustave E. Landt (to Continental-Diamond Fibre Co.). U. S. 2,027,988, Jan. 14. An initial phenolic-aldehyde condensation product is treated with a small proportion of a halogen such as Br, an inorg. halogen oxy-acid or a salt of such an acid such as a hypochlorite or chlorate to render the product free from phenolic odor in the final, infusible state, and the reaction product is subsequently heated to convert it into the final state.

Resinous composition. Daniel E. Strain (to Canadian Industries Ltd.). Can. 353,925, Nov. 5, 1935. Ten parts by wt. of methyl methacrylate dissolved in 90 parts by wt. acetone is partially polymerized and then treated with a mixt. of 20% H_2O and 80% MeOH , which ppt. the polymer but not the unpolymerized substance. The new compn. softens above 100° .

Moldable resinous product. Gerald H. Mains (to Canadian Westinghouse Co. Ltd.). Can. 354,092, Nov. 12, 1935. A first fabric is impregnated with a phenolic

resin. A second fabric is treated with a phenolic resin on one surface and a urea resin on the other surface. The second fabric is placed over the first fabric with the urea-resin surface outward. A third fabric is impregnated with urea resin and placed over the second fabric. The fabrics are treated with heat and pressure to unite them.

Mixed resins. Adrien A. Champetier and Albert Laporte. Fr. 787,967, Oct. 2, 1935. Mixed resins sol. in oils are obtained by esterifying resinic acids of natural resins by the phenolic functions of synthetic resins, the heating necessary being carried out in an autoclave under pressure in an atm. constituted by a phenolic product, and the heating is followed by a treatment under vacuum. The reaction mass is heated to above 260° as rapidly as possible.

Polyvinyl resins. Shawinigan Chemicals Ltd. Brit. 436,072, Sept. 30, 1935. Resins are made by causing a polyvinyl ester, other than a formate, a substance, other than AcH , contg. an active carbonyl group that combines with free OH groups of a hydrolysis product of the polyvinyl ester and H_2O to react in the presence of a hydrolyzing and acetalizing catalyst and an org. solvent, other than an alc., and, if desired, in the presence of an alc., the amt. of H_2O or H_2O and alc. being sufficiently small to give homogeneous reaction conditions such that the acetal reaction may attain or exceed 87% of completion. In a modification, a partial or complete hydrolysis product of a polyvinyl ester, other than formate, formed in absence of a carbonyl compd., is caused to react with a carbonyl compd., other than AcH , in the presence of an acetalizing catalyst and an org. solvent, other than an alc., and, if desired, in the presence of H_2O or an alc., or both, in amt. sufficiently small to permit of obtaining homogeneous reaction conditions such that the acetal reaction may attain or exceed 87% of completion. Films or threads are manuf'd by extruding the reaction mixt. into air or into a pptn. bath, with or without previous neutralization of the catalyst. The products are also suitable for the production of sheets, rods or tubes, safety glass, coating compns. and moldings. Among examples, (1) polyvinyl acetate (I) having a viscosity of 15 centipoises is heated to 70° with H_2O and paraformaldehyde in the presence of H_2SO_4 , AcOEt and BuOH , and (2) a hydrolysis product of I (prep'd by 50% hydrolysis of I of 2.5 centipoises viscosity in EtOH contg. H_2SO_4) is isolated and heated to 70° with aq. CH_3O and H_2SO_4 in the presence of AcOEt and EtOH .

Polyvinyl resin. Howard W. Matheson and George O. Morrison (to Shawinigan Chemicals Ltd.). Can. 353,601, Oct. 15. A polyvinyl ester is hydrolyzed with an inorg. acid and water, in any extent up to 100% hydrolysis. The product is condensed with an aliphatic aldehyde and with an aromatic aldehyde.

Phenol-aldehyde resins. Adolf Heck (to Cook Paint & Varnish Co.). U. S. 2,027,337, Jan. 7. A phenol, about 2 mols., is condensed with 1 mol. of an anhydride of an aromatic dicarboxylic acid such as phthalic anhydride in the presence of a chloride of Al, Fe or Zn, and the resulting condensation product is caused to react with about 5-25% its wt. of an aldehyde such as "paraform" and the material is partially resimified by heating to about 170° until a resinous product sol. in alcs., esters and ketones is obtained.

Use of vinyl resin compositions for tubes, toys, electrical parts, etc. Lauchlin M. Currie (to National Carbon Co.). U. S. 2,027,961, Jan. 14. Various operative details and final heat treatment are described. U. S. 2,027,962 relates to operative details such as covering pipes, hand grips, etc., with preformed vinyl resin compn. and then heating the material to convert it into final stable form.

Synthetic horn. Internationale Galalith-Gesellschaft Hoff & Co. (Henri Dumont and Werner Lück, inventors). Ger. 619,532, Oct. 4, 1935 (Cl. 39b. 18). Glass-clear horn stable to light is made by adding a mixt. of alkylaryl-alkylated aniline and dichlorohydrin to moistened casein and working up the casein by usual methods. Thus, ethylbenzylamine and dichlorohydrin are added to moistened casein. Coloring matter and filling materials are added.

The casein is then molded, pressed, etc., hardened by CH_3O and, if desired, polished

Insulating material Electric & Musical Industries Ltd. Fr. 788,531, Oct. 11, 1935. Mica, for use as insulator in elec. discharge app., is heated to about 1000° for 1-5 min., whereby its thickness is increased to about 5 times. The mica may then be subjected to pressure

Thermal insulator Edward A. Toohy and Earle R. Williams (to Johns-Manville Corp.) Can. 353,583, Oct. 15. A sheet of felted asbestos fibers with a starch binder contains water-repellant material of the type of wax distributed throughout the sheet in amt. not in excess of 10% of the wt. of the sheet.

Thermal insulator John D. Cochran, Jr. (to Formica Insulation Co.) Can. 354,110, Nov. 12, 1935. A foundation body is impregnated with a heat-resistant resin. Al sheet 0.005 in. thick is placed over the body and provided with rough surfaces. Over the Al sheet is placed a fibrous sheet impregnated with a heat-reactive resin, and a thin pigmented adhesive sheet is interposed between the Al sheet and the surface sheet. The whole is heated and pressed

Nonconducting coverings for heat Friedrich Buchwald (to N. V. Internationale Alfol Maatschappij) Brit. 434,682, Sept. 6, 1935. Vessels for transporting solid CO_2 have insulation comprising 2 or more layers of corrugated millboard and bright metal foil sep. by spaces through which the gaseous CO_2 evolved passes outwardly to the atm.

Dielectrics for Kerr cells Sueddeutsche Telefon-Apparate-, Kabel- und Draht-Werke A.-G. Ger. 622,368, Nov. 26, 1935 (Cl. 21a¹ 32 50). A benzene deriv. which contains 2 or 3 nuclear substituents, is solid at atm. temp., and has elec. insulating properties and a high dipole moment, is dissolved in PhNO_2 or another liquid having about the same Kerr const. Specified benzene derivs. include *o*-dimethylbenzene, *p*-nitraniline, and 1,2,3-dichlorotolubenzene

Rubber-asbestos products Dewey & Almy Chem. Co. Ger. 622,320, Nov. 25, 1935 (Cl. 39b⁵). See Brit. 399,870 (C. A. 28, 1824¹)

Rubber-asbestos products Dewey & Almy Chem. Co. Ger. 622,416, Nov. 28, 1935 (Cl. 39b⁵). See U. S. 1,907,017 (C. A. 27, 3571¹)

Adhesives I. G. Farben und A.-G. Ger. 621,138, Nov. 2, 1935 (Cl. 22¹ 2). For uniting surfaces of artificial horn prep. from casein, use is made of adhesives comprising casein 100, urea, thiourea or a deriv. thereof 50-100, and water 100-200 parts, with or without appropriate addns., e. g., a pigment, a filler, a softening or a wetting agent, or a small proportion of a hardening agent

Adhesives Fritz Masold Ger. 622,212, Nov. 22, 1935 (Cl. 22¹ 2) Addn. to 615,594 (C. A. 29, 8179¹) The compds. described in Ger. 615,509 are improved by addn. of a small proportion of wood meal or rye bran

Adhesive polymerized vinyl-ester-resin coatings. Ernest L. Kallander and Gardner R. Alden (to Dennison Mfg. Co.) U. S. 2,027,435, Jan. 14. For giving a vinyl ester-resin coating on material such as adhesive tape, a desired degree of tackiness, it is treated with a volatile moistening liquid contg. a true solvent for the resin such as alc. and an aliphatic hydrocarbon such as naphtha serving to restrain the solvent action. U. S. 2,027,436 relates to adhesive tape coated on one face with a vinyl ester resin and on the other face with another material such as cellulose acetate capable of adhesive activation by an org. liquid, both coatings being capable of adhesive activation by a common org. liquid and capable of adhering firmly to each other when so activated but without tackiness prior to such activation. Various examples are given

Dispersing rubber in alkali silicate solutions. Max H. Kheloth (to C. F. Burgess Laboratories, Inc.) U. S. 2,028,397, Jan. 21. An alkali silicate soln. such as a soln. of Na silicate has thoroughly mixed with it rubber in the form of a rubber soln. or suspension, and a fluosilicate such as that of Na which is slightly water-sol. The resulting soln. is suitable for use as an adhesive.

Cement for abrasive articles. Albert Lloyd Ball (to Carborundum Co.) Can. 353,933, Nov. 8, 1935. A cement is composed of 16-18 parts of a liquid condensation resin in the A stage sold under the trade mark of Liquid Redmanol BR-1373, 8-10 parts H_2O , about 73 parts of particles of fused SiO_2 . The SiO_2 consists of approx. equal parts of particles which pass a 40-mesh screen and are retained on a 200 mesh screen, and particles which pass a 200-mesh screen

Apparatus for preparing adhesive sheets such as those used in belt manufacture Charles A. Ball (to Chicago Belting Co.) U. S. 2,026,726, Jan. 7. Various structural, mech. and operative details

Adhesive tape Donald R. Anderson. U. S. 2,027,461, Jan. 14. Various details of app. and operation

Wetting agents, etc. I. G. Farbenindustrie A.-G. Brit. 435,481, Sept. 23, 1935. Products suitable as wetting, washing, leveling, dispersing and emulsifying agents are obtained by condensing fatty acids contg. at least 8 C atoms, or reactive derivs. thereof, with polypeptides contg. 1-5 peptide groups. In examples, (1) glycylglycine is condensed with lauric acid chloride in the presence of NaOH, and (2) the mixt. of polypeptides obtained by hydrolyzing leather waste with $\text{Ca}(\text{OH})_2$, NaOH or H_2O is condensed with oleic or lauric acid chloride or the chlorides of coconut acids or the acids obtained by oxidizing paraffin with air. The products obtained with the last-named acids may be used in mercerizing baths. The products are useful for making dye pastes, making dyed textiles fast to rubbing and stabilizing peroxide solns.

Wetting agents, etc. N. V. Chemische Fabriek Servo and Meindert D. Rozenbroek. Brit. 436,075, Sept. 30, 1935. As assistants in processes for cleansing, wetting, bleaching, dyeing, finishing or oiling fibrous materials, leather included, use is made of compds. with a straight chain of at least 8 C atoms contg. (a) a terminal COOH esterified or amidated with an alc. or amine contg. a group derived from an oxygenated acid of S, or (b) a terminal SO_3H , or (c) a terminal persulfonic group, the straight chain carrying also a side chain that contains at least 2 C atoms and is free from acidic salt forming groups. The side chain is linked to the main chain directly or through an atom of O or N, and the C atom in the main chain to which the side chain is attached must not be in the α - or β -position. The side chain may be built up by (1) introducing an alkyl group into the straight chain, (2) esterifying with a mono- or poly-hydric alc. a COOH linked to the main chain, or converting the COOH into a substituted amide group, the COOH may be introduced into the straight-chain compd. by way of the CN group, (3) reaction of a straight-chain compd. contg. halogen with a compd. such as a malonic, tricarballic or acetoacetic ester, i. e., a compd. in which a H linked to C can be substituted by an alkali metal, (4) esterifying or etherifying a OH linked to the straight chain, e. g., by etherifying the OH group or groups of hydroxy fatty acids, e. g., ricinoleic acid, (5) substituting a carbonaceous group, e. g., by acylation, into an amino group linked to the straight chain, or (6) causing a straight-chain compd. contg. halogen to react with an amine, diamine or hydroxy- or oxo-amine; the side chain may contain substituents, e. g., OH, oxo or nitrogenous groups, or esterified or etherified OH groups. Among 13 examples, (1) the dichlorinated acid of coconut oil is converted into a dibutyl ether by reaction with BuONa and then amidated by condensation with taurine, (2) dichlorooctylsulfonic acid is heated with NaOH soln. to yield dihydroxyoctylsulfonic acid which is treated with butyric acid chloride, (3) the product of (2) is converted into a persulfonic compd. by treatment with Na_2O_2 , (4) Na dichlorooctylsulfonate (1) is heated with Bu_3NH , whereby Cl is replaced by the dibutylamino group, and (5) 1 is heated with the Na compd. of di-Et malonate

Wetting and dispersing agents Henkel & Cie G. m. b. H. Fr. 788,663, Oct. 14, 1935. Unsapoifiable org. compds. which, besides 2 free OH groups, contain at least 1 aliphatic or cycloaliphatic radical of high mol. wt. joined to the radical contg. the OH groups by a chain of

O or S, are used. Examples are mono-octyl ethers of glycerol and diglycerol, monododecyl ethers of polyglycerols or glycerol and also the tetradecyl-, hexadecyl- and octodecyl-compds.

Bleaching, washing and other compositions. Henkel & Cie. G in b. II Brit 475,801, Sept. 23, 1935. Comps. consisting of alkyl-reacting mixts. conig. a prep. compd. and a salt of pyro- or meta-phosphoric acid are stabilized by an addn. of Mg silicate added in the ready-formed state Cf C A 29, 8183¹.

Detergent, wetting, antispattering, emulsifying and frothing agents. Benjamin R. Harris U S 2,023,347, Dec. 3. Numerous examples are given of the prepn of ester derivs. of at least relatively high mol. fatty acids or relatively high-mol. alcs. with at least one semi-esterified sulfuric acid group, such as a substance of the general formula $\text{ROX}[\text{OS}(\text{O})_2\text{O}]_n\text{V}$, where R is an acyl radical with at least 4 C atoms, X represents the residue of an aliphatic polyhydroxy substance of a class consisting of glycerol, polyglycerols, glycyls, polyglycyls, hydroxy carboxylic acids, sugars, sugar alcs., and acid derivs. of sugars which link together the acyl radical with the sulfate group, Y is a cation, and w and v are small whole numbers, at least one. Among the compds. formed are monododecyl bisulfate, monododecyl diethylene glycol sulfate, and sulfonated mixed coconut fatty acid mono esters of diethylene glycol, sulfonated monoethyl glucose (many other compds. also being mentioned). In prep. these compds., there can be used as sources of the lipophile group such materials as melissic acid, stearic acid, oleic acid, ricinoleic acid, lauric acid, palmitic acid, cetyl alc., lauryl alc., cholesterol, mixed coconut fatty acids, mixed tallow fatty acids and other materials with marked affinity for oils and fats. For linking the lipophile groups with the sulfate groups, there can be used glycerol, diglycerol, polyglycerols, glycyls, polyglycyls, hydroxy-carboxylic acids, sugars, alcohol derivs. of sugars, acid derivs. of sugars, and other di- and poly-hydroxy org. substances. For introducing the sulfate groups there may be used sulfuric acid, concentrated or fuming, chlorosulfonic acid, sulfuric chloride, SO_2 and other sulfonating agents. The treatment with these agents may take place in the presence or absence of solvents and condensing agents such as pyridine and the like.

Alkyl sulfates of high molecular weight (wetting, dispersing, foaming and smoothing agents for the textile and leather industries, etc.) Heinrich Bertsch (to H. Th. Böhm A.-G.) U S 2,027,906, Jan. 14. Unsated hydrocarbons contg. not less than 10 C atoms, such as centene, etc., are converted into sulfuric esters of the corresponding hydroxy compds. by treating them with a mildly acting sulfating reagent such as H_2SO_4 and H_2O at a temp. not exceeding 0° (suitably -10-0°).

Phosphoric acid esters of fatty acid monoglycerides (frothing, wetting, detergent and emulsifying agents). Benjamin R. Harris U S 2,026,785, Jan. 7. Products suitable for use in various textile treatments, etc., have the general formula $[\text{ROXOP}(\text{O})(\text{O})_2\text{O}]_n\text{Z}$, where "R" is a lipophile group, "X" is the residue of a polyhydroxy substance, "Y" and "Z" are cations, and "w" is a small whole no. and are nonnitrogenous esters of a phosphoric acid and a polyhydroxy substance where at least one hydroxy group of the polyhydroxy substance has its H substituted by a lipophile group. The term "non-nitrogenous" indicates substances devoid of N linked directly to C. The lipophile group may include any fatty acid group such as the fatty acid radicals of, caproic acid, capric, caprylic, valeric, butyric, abietic, palmitic, myristic, lauric, benzoylbenzoic, naphthoic, toluic, palmitic acid, stearic, lauric, melissic, oleic, myristic, ricinoleic, linoleic acid or mixed fatty acids derived from animal or vegetable fats and fish oils such as lard, coconut oil, corn oil, cottonseed oil, partially or completely hydrogenated vegetable oils such as cottonseed oil, corn oil, sesame oil and fatty acids of various waxes such as beeswax and carnauba wax; or the lipophile group may be an alkyl radical derived from an alc. corresponding to any of the preceding acids,

such as cetyl alc. or lauryl alc. Examples of polyhydroxy substances, the residues of which may serve as linkages between the lipophile groups and the hydrophilic phosphate groups, are as follows: mucic acid, tartaric acid, saccharic acid, gluconic acid, glucuronic acid, gulonic acid, mannonic acid, trihydroxyglutaric acid, glyceric acid, and the like, as well as carboxylic oxidation products of polyglycerols and sugars such as: xylitol, galactose, fructose, maltose, sorbitol, glucose, dulcitol, arabitol and other sugar alcohols such as hexahydric alcohols derived from sugars, and other substances having free hydroxy groups. Various examples with details are given.

Nitrogen-containing esters (frothing, wetting, detergent, emulsifying and penetrating agents for treating textiles, leather, ores, etc.) Benjamin R. Harris U S 2,023,075, Dec. 3. Numerous examples are given of the production of compds. of the general formula $\text{L-O-COCH}_2\text{N(X)Z}$, where "L" is a lipophile group of the class consisting of alkyls, ethers and esters, and having at least 4 C atoms, "X" is an amine, and "N" represents a quinequivalent N with the three indicated valence bonds satisfied by the radical of the class consisting of alkyls, aryls, and the radical of a heterocyclic ring of which the N is a member. In this general formula, "X" may represent Cl, Br, I, NO, OH, SO_3 , or an acetate or other org. or inorg. amine, and N is a quinequivalent N three valence bonds of which are satisfied by alkyl, aryl or cyclic radicals. Among the compds. production of which is involved are the cholesteryl ester of betaine chloride (I), the melissyl ester of betaine bromide (II), and of I, the cetyl ester of I, the octyl ester of II, the dodecyl ester of I, the cholesteryl ester of II. Among the acids which may be employed as a source of the fatty acid lipophile radical forming a part of the lipophile ester group are: caproic, capric, caprylic, valeric, butyric, abietic, hydroxystearic, benzoic, benzoylbenzoic, naphthoic, toluic, palmitic, stearic, lauric, melissic, oleic, myristic, ricinoleic, linoleic acid or any fatty acid with at least 4 C atoms, mixed fatty acids derived from natural fats, oils, hydrogenated oils, waxes. Tertiary amines which may be used as a source of and for the purpose of forming the quaternary nitrogen in the betaine radical are: pyridine, various picolines, quinoline, isoquinoline, quinaldine, PhNMe₂, PhNMe, Et₃N, EtNMe₂, MeN and other tertiary amines which are sufficiently reactive to form quaternary ammonium compds. In general, the preferred method of making these substances is to cause a tertiary amine, either aliphatic, cyclic or mixed aliphatic-aromatic to react with a lipophile ester of monohydroxy- or monochloro-acetic acid. The "L" of the formula may also be satisfied by an ester or ether group, such as a fatty acid ester or alkyl ether of a polyhydroxy substance. The polyhydroxy substances employed may be hydroxy carboxylic acids, sugars, alcs., sugar alcs., glycyls, polyglycyls, glycerols, polyglycerols, in fact, substantially any substance having at least two esterifiable hydroxy groups. Examples of other polyhydroxy substances are: mucic acid, tartaric acid, saccharic acid, gluconic acid, glucuronic acid, gulonic acid, mannonic acid, trihydroxyglutaric acid and glyceric acid, as well as carboxylic oxidation products of polyglycerols such as represented by the formula $\text{HOOCCH}(\text{OH})\text{CH}_2\text{OCH}_2\text{CH}(\text{OH})\text{CH}_2\text{OCH}_2\text{COOH}$, xylitol, sucrose, glucose, lactose, galactose, fructose, maltose, shamose, sorbitol, dulcitol, arabitol and other substances having free hydroxy groups.

Esters of sulfodicarboxylic acids. Alphonse O. Jaeger (to American Cyanamid & Chemical Corp.) U S 2,028,091, Jan. 14. Numerous details and examples are given of esters having wetting, detergent and emulsifying properties such as the di-Me, di-Am, dioctyl, didodecyl, didodecyl, difenyl, dibenzyl, di-Ph, bi(tetrahydrofurfuryl), Me iso-Bu, di-Bu, di-Ph, di-Ph, 1,1-stearyl or similar esters of sulfo-Bu, and unsatd. aliphatic dicarboxylic acids such as mono and disulfosuccinic, sulfodichlorosuccinic, sulfodipic, sulfopropylsuccinic, sulfoglutaric, sulfomaleic, sulfocrotonic, sulfomaleic, sulfomaleic, sulfomethylsuccinic, sulfomethylglutaric, sulfomaleic, sulfopropyl-

succinic, sulfoacetylglutaric and other sulfonated dicarboxylic acids of the aliphatic series

Sulfonic and phosphonic esters Oranienburger chem. Fab A -G (Kurt Lindner and Johannes Zickermann, inventors). Ger 622,268, Nov 23, 1935 (Cl 12a. 23 02). Unsaid monohydric aliphatic alics contg at least 10 C atoms are partly esterified with H_2SO_4 or other sulfonating agent, and esterification is then completed with H_3PO_4 or a deriv thereof, e. g., P_2O_5 . The products are finally neutralized. Modified products are obtainable by adding other substances, e. g., hydrocarbons, other alics, ketones or carboxylic acids or their anhydrides or chlorides, to the reaction mixt. The products are useful as *washing and emulsifying agents*.

Aliphatic sulfonation products I. G. Farbenind A -G (Karl Keller and Eduard Coffey, inventors). Ger. 622,296, Nov 25, 1935 (Cl 12a 23 01). The known products obtained by treating polychlorinated higher paraffin hydrocarbons with alkalis are treated with sulfonating agents. Products contg both SO_3H and OSO_3H groups are obtained. Examples are given. The products are useful as *wetting and emulsifying agents*.

Glycerol ethers Imperial Chemical Industries Ltd., Alfred W Baldwin, Isidor M. Heilbron and Wm E. Jones. Brit 436,143, Oct 7, 1935. For the production of β -ethers of glycerol (I), the alkali metal compd. of an alkylidene or aralkylidene ether of I is caused to react with an inorg ester of an aliphatic alc having at least 8 C atoms and the compd. thus produced is hydrolyzed. The products are oily or waxy and, when emulsified, as by the salts of cetyl sulfuric ester, yield useful softening agents. They may be converted into detergents as described in Brit. 436,209 (following abstr.). In examples, benzylidene glycerol is treated with Na or K and condensed with cetyl iodide, cetyl Na sulfate or octadecyl iodide, the products being hydrolyzed with HCl.

Wetting agents, etc Imperial Chemical Industries Ltd., Alfred William Baldwin, Hugh Mills Bunbury and Isidor Morris Heilbron. Brit 436,209, Oct. 7, 1935. Addn to 398,818 (C A 28, 1487). Wetting, cleansing and dispersing agents are obtained by sulfonating β -glyceryl alkyl ethers in which the alkyl group contains 13-20 C atoms. In examples, (1) cetyl- β -glyceryl ether is treated with Na pyrosulfate and pyridine, the product foams strongly in soln and cleanses greasy woolsens, and (2) cetyl- or octadecyl- β -glycerylether is treated with CH_3SO_3Na in CCl_4 .

Molded product Royal F Strickland (to Canadian General Electric Co Ltd.). Can 353,565, Oct. 15. In manuf. an article having a fragile portion, there is placed in the mold surrounding that portion a material composed of a synthetic resin, such as Durite, a hardening agent, such as hexamethylenetetramine, and a noncompressible filler, such as marble flour. This produces a base for elec. lamps composed chiefly of synthetic resin.

Molded articles of thermoplastic material such as battery cases of bituminous composition. Charles L. Keller (to Richardson Co.). U S 2,027,483, Jan 14. Various mfg. details are described.

Molding hollow bodies Brevets & Procédés Industriels (B F P. I.) and Eugen Katz. Brit 432,321, July 24, 1935. A seamless hollow body, e. g., a container, box, article of clothing, hat, toy, etc., consists of 2 shells connected by surface adhesion, 1 of the shells is molded as a seamless uncalendered hollow body with a porous surface from paper pulp in molds with pervious walls and the other is formed on the inside and (or) outside of the 1st shell and consists of latex or a latex compn. The pulp is deposited on the pervious molds by compressed air or suction and saponin, "Igepon," etc., may be added to assist the penetration of the latex into the porous surface. The pulp is of vegetable or animal origin and strong or foaming substances other than latex may be added. Vulcanizing mixts may be added to the latex and also dyes or perfumes. The latex shell may be provided with a fat, oil or volatile hydrocarbon-proof coating of Ac cellulose, gelatin or chlorinated rubber.

Apparatus for molding blanks from powdered ma-

terials such as bakelite. Leo C. Shippey (to General Motors Corp.). U S 2,025,021, Jan. 14. Various structural, mech. and operative details.

Coloring benzylcellulose molding-compositions Imperial Chemical Industries Ltd. and Archibald A. Harrison. Brit. 435,539, Sept. 16, 1935. The blue dyes contg Cu obtainable according to Brit 322,169 (C. A. 24, 2890), 389,842 (C. A. 27, 4941) or 410,814 (C. A. 28, 6374) are incorporated in benzylcellulose extrusion molding compns. The free dyes or lakes formed therefrom may be used.

Coloring nitrocellulose coating-compositions Imperial Chemical Industries Ltd. and Archibald A. Harrison. Brit 435,614, Sept. 16, 1935. Divided on 435,539 (preceding abstr.). The dyes and lakes mentioned in 435,539 are incorporated in nitrocellulose coating-compns. The compns so obtained give blue weather-resistant coatings, fast to light, on metal, fabric or leather.

Condensation products from acetylene and phenols, etc Walter Keppe and Ernst Keyssner (to I. G. Farbenind A.-G.). U S 2,027,199, Jan 7. Products which are of resinous character are obtained by reaction of C_2H_2 at temps of 100-300° on cyclic org. compds. hydrolyzed in the nucleus such as $PhOH$ or p -phenols in the presence of a catalytic org. base such as pyridine or cyclohexylamine which is resistant to the reaction temp and inert, at such temp, to the hydroxylated reacting compd.

Vinyl polymerization products Otto Röhrl. Brit 436,084, Sept. 30, 1935. Materials useful as substitutes for glass, wood or metal are made by supporting or suspending 1 or more pieces of absorbent material, e. g., fabric, paper, fine wire mesh or plywood, in a chamber, introducing 1 or more unpolymerized or partially polymerized unsatd org. compds capable of forming hard polymerization products, if necessary with the addn of hardening agents, and polymerizing or completing the polymerization of said compds. The products may be used in the manuf. of motor bodies, parts of aeroplanes and railway carriages, film spools, toys, dishes, casings for wireless sets, floor coverings, etc.

Polymerization of methyl methacrylate. Emil D. Ries (to Canadian Industries Ltd.). Can 354,096, Nov 12, 1935. A mixt of 37 parts by vol of methanol, 53 parts H_2O , and 10 parts Me methacrylate is heated for 96 hrs at 65°. The polymer is obtained in the form of a soft sponge, which is readily broken up. The whole mass is removed from the polymerizing vessel, filtered, washed with methanol, and dried for 3 hrs at 20° and 3 hrs at 120-140°.

Cleansing agents, etc Henkel & Cie G m. b. H. Brit. 435,465, Sept. 23, 1935. Cleansing, bleaching, dyeing, penetrating and like compns contain H_2O -sol hypophosphates, e. g., $Na_2P_2O_5$, or hypophosphates of triethanolamine, cyclohexylamine or aminopropandiol. For example, $NaBO_2$, 12, $Na_2P_2O_5$, 15, soda 10 and Mg silicate 1, with or without soap 50 lb., are mixed. In 435,475, Sept. 23, 1935, H_2O -sol trimeric alkali metaphosphates are added to cleansing, bleaching and wetting agents and to liquids used in the prepn and dyeing of textiles, leather, hair, etc. For example, 35 lb. of the metaphosphate mixed with 65 of the Na salts of the sulfuric esters of higher fatty alics is used for washing delicate fabrics, e. g., wool or silk. In 435,562, Sept. 24, 1935, phosphates, pyrophosphates, e. g., $Na_2H_2P_2O_7$, or hypophosphates, e. g., $NH_4P_2O_5$, are added to cleansing and washing agents, the mixts. may be used to bleach or to assist wetting and dispersion in dyeing or other treatment of textiles, leather, etc. For example, a mixt. of $Na_2H_2P_2O_7$ 10 with the Na salts of the H_2SO_4 esters of higher fatty alics 60 lb. is used for washing silk or wool. In 435,710, Sept. 26, 1935, H_2O -sol. polyphosphates are used as addns to known cleansing, wetting, bleaching and superfatting agents. For example, a mixt. of $Na_2P_2O_5$ 15, soda 10, perborate 10, stabilized by Mg silicate 1, and soap 50 lb. is used for washing clothes.

Detergents Henkel & Cie G m. b. H. Brit 435,217, Sept. 19, 1935. In cleansing-agents that contain alkali carbonate and neutral alkali pyrophosphate, the phosphate is at least half the carbonate. Soap, per salts,

waterglass, metasilicate and borax may be present. Thus, a mixt of soap 45, NaBO_3 10, $\text{Na}_2\text{P}_2\text{O}_7$ 30 and Na_2CO_3 15 lb is used for washing textiles

Stenizing liquids Katadyn A-G Brit 422,101, July 15, 1915 H_2O and other liquids are sterilized by adding liquid H_2O_2 or other nongaseous O-yielding substances other than halo compds together with 1 or more oligodynamically active metals or 1 or more compds of such metals in oligodynamically minute quantities, in such manner that the actions of the 2 different agents can be separately controlled Cf C A 29, 392²

Wax emulsions I G Farbenindustrie A-G Brit 475,618, Sept 19, 1935 See Fr 784,614 (C A 30, 1935)

Polishes Gayet, Beriot & Fils Fr 787,910, Oct 1, 1915 Colloidal suspensions of fats, waxes, paraffins, etc., in water contg glue, e.g., bone glue, are used. The fat is dissolved in kerosene or like solvent and mixed with a soln of glue and a soln of starch and soap

Absorption material, apparatus for removing moisture from the air Edmund Altmeyer Brit 434,666, Sept 6, 1935 See Fr 772,706 (C A 29, 1542²) and Ger 610,939 (C A 29, 5703³)

Porous bodies Maxwell L. Whitacre and Peter DeLeeuw (to Carbundum Co.) Can 353,932, Nov 5, 1935 One of several examples of making porous articles is: Mix 4000 g of fused Al, 2000 g of a clay bond, 1600 cc of H_2O contg 4 g of acetanilide and 20 cc of EtOH for 15 min, add 300 cc of a 2.5% glue soln and mix 10 min, add 300 cc of a 1.5% soln of H_2O_2 and mix for 2 min, place in a mold and dry at room temp for 48 hrs

Dispersion of carbon black Charles W. Tucker (to Dewey and Almy Chemical Co.) Can 354,103, Nov 12, 1935 Carbon black is mixed with H_2O in the presence of a sol salt of a compd having the structure of the product obtained by condensing substantially 1 mol of formaldehyde with substantially 2 mols of 8-naphthalenesulfonic acid. The aq dispersing agent comprises 2-6% of the quantity of carbon black

Wood-filling composition Earl D. Flood and John A. Hannum (to Flood Co.) U. S. 2,027,095, Jan 7, 1935 An aq. vehicle is used with a predominant proportion of finely divided mineral filler and with small proportions of cellulose acetate, rubber latex, a drying oil and Na salicylate

Compositions for coating metal, stone, wood, paper, textile materials, etc Paul Friedrich (to Trustkantoor Amstelland N.-V.) U. S. 2,027,686, Jan 14 Bituminous hydrocarbon materials such as tar, pitch and asphalt are mixed with smaller amts. of aliphatic chlorohydrocarbons such as C_2HCl and fluid homologs and derivs of benzene and the mixt. is heated to above 130° under superatm. pressure with rapid stirring to form a reaction product

Gum-lac coatings Rheinische Schellackbleiche Ernst Kalkhof A-G. Fr. 788,703, Oct 15, 1935 A coating which hardens without heating comprises a soln of gum-lac of known type to which AlCl_3 or urea is added as hardening agent. Resins, cellulose derivs, fillers and dyes may also be added

Modified castor oil, coating composition Harold J. Barrett (to Canadian Industries Ltd.) Can 354,089, Nov. 12, 1935 This relates to improved softening agents and more particularly to nitrocellulose compns contg. these agents. E.g., a mixt. of 81.3% of castor oil and 18.7% of phthalic anhydride is heated without stirring with CO_2 at 220° for about 12 hrs. until the acid no. of the mixt. reaches approx 15. The product obtained is a light-brown oil of a viscosity of 471 poises

Tar varnish Soc. du gaz de Paris Fr. 788,249, Oct. 7, 1935 A tar varnish contains coal-tar pitch, crude phenol and benzene, to which a pigment or insulating filler is added

Removing halogens from fluids Kodak Ltd Brit. 435,735, Sept 26, 1935. Halogens, except F, are removed from fluids by contact with polyvinyl aldehyde condensation products, which may be used in any suitable phys. form, e.g., powder, grains, porous masses, fibers,

threads, films, etc. The absorbed halogen is readily removed by treatment by heat, vacuum, solvents or suitable reagents. Iodine may be extd from the mother liquors obtained from the refining of seaweed ashes or NaNO_3 . Halogens may be similarly removed from air or other gases. The products comprising the condensation products with halogens, particularly I, may be used as bandages, etc., for medical purposes. I solns may be prepd. by immersion thereof in a solvent, e.g., alc. The products may also be used for inhalation purposes or to remove impurities that react with halogens, e.g., H_2S , SO_2 , from gases. A suitable filtering mass is prepd. by causing polymerized vinyl alc, dissolved in H_2O 100, to react with HCl (sp gr 1.19) 24 and 40% CH_3O 9 parts, stirring, molding when coagulation starts and allowing to stand

Removing water from vaporous mixtures with anhydrides such as acetic anhydride Henry Dreyfus U. S. 2,027,420, Jan 14 Water vapor such as that in admixt with Ac_2O is caused to react with a gaseous hydrocarbon such as CH_4 (suitably at a temp of about 600-850° in the presence of Ni, Co or Cu)

Fluid for hydraulic brakes, etc Wagner Electric Corp. Fr 783,534, Oct 11, 1935 A preferred compn is glyceryl diricinolate 50 and diacetone alc 50 parts, but the monoester of glycerol and glycol and polyglycol esters may also be used, and other ales such as EtOH, PrOH and tetrahydrofurfuryl alc may be used. If an alc. other than diacetone alc is used it is desirable to add a small amt of a neutralizing agent such as K arsenate to avoid all acidity

Friction material suitable for brakes and clutches John D. Alley (to American Brakeblok Corp.) U. S. 2,026,767, Jan 7 A flexible friction material is prepd by mixing 18 parts of a drying vegetable oil such as linseed oil with S 2.7, finely divided pyrobituminous material such as bituminous coal 25, and short-fibered asbestos 65 parts, shaping as desired, and curing without pressure in a baking oven at a temp of about 50° for 4-5 hrs and then at about 150° for 5-6 hrs Cf C A 29, 2631¹

Bushings for use in steering columns, etc. Newton Skillman (to O & S Bearing Co.) U. S. 2,027,559, Jan 14 An inner liner of lubricant-impregnated fibrous material is backed and held in place by a hardened asphaltic material of such consistency as readily to shear when forced into an undersize housing unit

Material for seals such as pump packings resistant to chemicals. Wilbur A. Lazier (to E. I. du Pont de Nemours & Co.) U. S. 2,027,389, Jan 14 A packing for seals such as those of pumps for acids comprises a fibrous base such as asbestos impregnated with a mist comprising a hydrogenated castor oil (hydrogenated to produce a waxy material m 70° or higher) and a solid lubricant such as graphite

Paste of comminuted metal Henry H. Mandie Can 354,050, Nov 12, 1935. Metal, e.g., Al, in flake form is mixed with a purified hydrocarbon of suitable volatility and boiling range. Dissolved in the mixt in a quantity less than 5% of the Al present is an alkali metal salt of a volatile aliphatic acid and an Al salt of a nonvolatile aliphatic acid. The latter is present in greater amt than the former

Strip for sealing cartons Old Colony Trust Co (executor of the estate of William W. McLaurin) Can 354,144, Nov 12, 1935 A strip is coated on one side with a water-resistant adhesive, such as asphalt. Over this coating is placed a coating of water-sol adhesive, such as fresh glue. The intermediate coating prevents the strip from loosening in warm climates

Casting transparent films Edouard M. Kratz (to Marbo Products Corp.) U. S. 2,027,829, Jan 14 In the casting of films such as those of casein or gelatin the surface of a carrier web used is protected by a coating of petroleum jelly deposited from a soln in a volatile solvent

Lignin derivative. Guy C. Howard. Can 353,886, Nov 5, 1935. Lignin substance is sepd from assoc nonlignaceous org matter to obtain an aq dispersion of free ligninsulfonic acid contg. some organically com-

bined base in the form of a salt of ligninsulfonic acid. This is heated and evapd under conditions of sufficiently low partial pressure of SO_2 in the gas phase to induce the escape of nearly all the SO_2 gas. The evapd product is dried with H_2O to produce a lignin deriv. in gel form, which is then sep'd from the mother liquor. It is useful as a bonding agent.

Apparatus for use in making synthetic carbonado diamonds. Jean H. L. DeBats. U. S. 2,027,963, Jan. 14. Various structural, mech. and operative details.

Rock wool. John Buss. Brit. 435,064, Sept. 13, 1935. The wool is made from siliceous material, e. g., rock, metal or ore slag, by pouring the molten material in a thin stream onto the marginal surface of a thin metal disk rotating at high speed and utilizing the rotation of the disk to discharge air or other fluid, e. g., paraffin oil, from beneath the disk onto the mineral fibers. App. is described.

Magnetic powders. Heraeus-Vacuumschmelze A.-G. and Wilhelm Rohn. Ger. 619,749, Oct. 5, 1935 (Cl. 21g, 31 03). Metal powders with predetermined magnetic properties are obtained by reduction of crystals of mixed salts formed to give the desired end-product mixt. Mixed salts of Fe or Ni with Co, Cr, Mo, Cu, Mn, Si or Ag are used. The products are used for making magnetic cores, etc.

Proofing agents. Wingfoot Corp. Ir. 788,057, Oct. 3, 1935. A waterproofing compn. for paper, etc., comprises a mixt. of a waxy substance and a condensation deriv. of rubber. The latter may be made by boiling a soln. of rubber in C_2H_4 for 1 or 2 hrs., adding 10% of a transformation reagent such as SnCl_4 , and continuing the heating for several hrs.

Containers of treated paper or the like suitable for holding lubricating oils, etc. Wilbur A. Lazier and James H. Wertz. (to E. I. du Pont de Nemours & Co.). U. S. 2,027,390, Jan. 14. Material for containers such as paper bottles is coated with a compn. comprising a substantially H-sat'd ester of a fatty acid having a m. p. of 50° or higher such as substantially H-sat'd castor oil, hydrogenated blown drying oils or waxy esters of hydroxy stearic acids with high-mol.-wt. alcs.

Panels of wood veneer with a core such as wood. Charles B. Norris. (to Haskelite Mfg. Corp.). U. S. 2,028,076, Jan. 14. Various mfg. details are described.

Buffing wheels. Elisha W. Hall. U. S. 2,027,425, Jan. 14. Layers of fibrous buffing material such as cloth are united at spaced intervals by a tenacious adhesive such as a latex compn.

Playing courts, etc. Caleb Archbidge. Brit. 435,324, Sept. 19, 1935. A tennis-court, path, etc., are provided with a layer comprising an aggregate of ground wood, ground cork, ground rubber and sand, held together by a binder of oil, e. g., linseed, with either resin or a resinous substance. The ground wood may be pretreated with linseed oil.

Dry preparations dispersible in water. Soc. pour l'ind. chim. à Bâle. Brit. 435,412, Sept. 20, 1935. See Ir. 709,930 (C. A. 29, 530*).

Imitation straw hats. Caradine Hat Co. Brit. 435,207, Sept. 17, 1935. An imitation straw hat is made from fabricated or woven paper by applying a waterproof stiffening of transparent cellulose gum lacquer, consisting preferably of pyroxilin (I), dammar (II) and AcOEt (III), to the partly shaped hat body and, after giving the body its final shape, coating the surface with an opaque cellulose gum lacquer consisting of I, II and III, to which a filler comprising TiO_2 , ZnO and lithopone together with a stabilizing agent, e. g., picric acid.

Shoe polish. Hugh P. Griffin and Robert P. Richardson. U. S. 2,028,324, Jan. 21. A dry compn. for white shoe polish contains lithopone, BaSO_4 or ZnS in mixt. with talc and Na_2PO_4 .

Softening bleached and dyed ruscus. John M. Dux. U. S. 2,028,873, Jan. 7. The material is submerged in an emulsified soln. of a water-sol sulfonated vegetable oil, glycerol and a vegetable gum, and Na benzoate also may be added, as may also MgSO_4 .

Printer's blanket. Harold D. Rice. (to U. S. Rubber Co.). U. S. 2,027,322, Jan. 7. A base such as a sheet of felt carries a coating of the solids deposit of an aq. dispersion of rubber vulcanized to the base.

Attaching linings to furs. Josephus A. Kleine. Brit. 433,587, Aug. 10, 1935. Reinforcing linings are attached by adhesive rubber dispersions sprayed on as small droplets.

Catalytic material suitable for igniting cigarettes. Richard E. Berthold. (to Cardinal Products, Inc.). U. S. 2,021,475, Nov. 19. A calcined residue of cotton is sat'd with a soln. of Th nitrate, Zn nitrate, Al nitrate, Pt chloride and Ba Pt cyanide, with the total amounts of nitrates, chloride and cyanide in the ratio of about 14:2:1, and the sat'd calcined material is formed into igniting pellets which may be used as described in U. S. 1,899,008.

Floor covering. Milton O. Schur and Walter L. Hearn. (to Brown Co.). Can. 353,556, Oct. 15. A felt base is composed of compacted, waterlaid, substantially unhydrated but refined wood pulp and up to about 25% by wt. of added cementitious material such as well-hydrated cellulose and starch substantially uniformly distributed therethrough. The felt is sufficiently absorbent to be readily penetrable by molten bitumen.

Laminated phonograph records. Richard F. Warren. (to Carbide and Carbon Chemicals Corp.). U. S. 2,028,120, Jan. 14. A core of fibrous material such as paper is used, at least the surface of which is impregnated with a hardened artificial resin to render the core moisture-resistant, a playing groove receiving surface being provided contg. as the sole resinous constituent a polymerization product from a vinyl lower aliphatic acid ester such as vinyl acetate, a vinyl halide or styrene or mixts. of such products. Durable records with a "minimum" of surface noise are thus produced.

Stiffening fabric suitable for use in shoe manufacture. Joseph Fausse. (to Celastic Corp.). U. S. 2,027,968, Jan. 14. A fabric has a cellulose deriv. such as cellulose nitrate or acetate or ethyl cellulose pptd. in the interstices on one side, with the cellulose deriv. in a colloided solvent resistant form on the other side, and is adapted for use by treating with a solvent followed by shaping and drying in the desired final form.

Stiffening fabric suitable for use in shoe manufacture. Russell Hamilton. (to Celastic Corp.). U. S. 2,027,973, Jan. 14. A fabric is impregnated throughout with a cellulose-deriv. soln. such as one of cellulose nitrate or acetate or ethyl cellulose and without drying is passed into a pptg. bath, the solvent-liquid content of the soln. and pptg. bath being at least "partially immiscible" and the fabric being subjected to the pptg. bath for a time only sufficient to ppt. part of the cellulose deriv.; the impregnated fabric is dried, treated with a cellulose-deriv. solvent to soften it, shaped and dried in the final desired form.

Impregnated fabric suitable for stiffening shoe materials. Earle H. Cameron. (to Celastic Corp.). U. S. 2,027,957, Jan. 14. A material adapted to be softened by treatment with a solvent comprises a fabric carrying a pptd. cellulose deriv. such as cellulose acetate or ethyl cellulose in its interstices and also carrying, distributed throughout the pptd. cellulose deriv., a cellulose deriv. in a relatively harder, firmer, colloided and more solvent-resistant form.

Fumigation such as that with moist air in contact with calcium cyanide. Wm. W. Hinds. (to Calcyanide Products Corp.). U. S. 2,027,042, Jan. 7. App. and various operative details are described.

Repellent or fumigant. Evan Clifford Williams. (to Shell Development Co.). Can. 353,986, Nov. 5, 1935. As a fly repellent a compn. contains an unsat'd org. sulfide or polysulfide.

Fire extinguishers. Pierre J. Marchant. Brit. 433,757, Sept. 23, 1935.

Fire extinguishers. Soc. pour l'achat, la vente et l'exploitation de brevets, S. A. V. E. B., S. A. Ir. 788,401, Oct. 10, 1935. An alk. soln., an acid soln. and a stabilizer are used, the stabilizer being incorporated in the acid soln. and being stable in acid. Thus, a soln. of NaHCO_3 and a soln. of $\text{Al}_2(\text{SO}_4)_3$, with or without acids,

contg. Na laurosulfonate or "Igepon" are used. A thin layer of oil may be poured on to each of the solns
Extinguishing fires Otto Wille. Ger. 622,219, Nov

22, 1935 (Cl 61b 2). For extinguishing fire from incendiary bombs having a thermite charge, use is made of mixts. of dry sand with anhyd. KHSO_4 .

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Industrial utility of public water supplies in the United States, 1932. W D Collins, W L Lamar and E W Lohr. U. S. Geol Survey, *Water Supply Paper No 658*, 140 pp (1934). U S Pub Health Eng Abstracts 15, W, 101 (Oct 5, 1935), cf C A 27, 791—Brief descriptions and chem analyses are given of public water supplies of 670 cities of the U S Treatment of different waters for boiler-feed purposes is also considered for different classes of waters C R Fellers

Water works of Madisonville, Ky, celebrates its 21st birthday Hall Arnold *Water Works Eng* 88, 1480-1 (1935), cf C A 30, 550⁵ W A Moore

Lewiston's water system W P Hughes. *J Am Water Works Assoc* 27, 1708-11 (1935)—The supply is Clear Water River $\text{Ca}(\text{OH})_2$ and $\text{Al}_2(\text{SO}_4)_3$ are used, followed by sedimentation and rapid sand filtration After filtration and before the water goes to the reservoir 2 lb. Cl per million gal is added D K French

Water supply in England A C L Chorlton *Munic Eng. Sanit Record* 94, 684 (1934). U S Pub Health Eng Abstracts 15, W, 123 (Nov 9, 1935) C R F

London's water supply Sir Wm Prescott *J Roy Sanit Inst.* 55, 643-58 (1935). U. S. Pub Health Eng Abstracts 15, W, 113 (Nov 2, 1935)—An area of 573 sq miles is furnished 300,000,000 gal of water a year Great economy in operation is being effected through the adoption of a system of double filtration and the installation of Diesel engines There are 139 acres of slow sand filters and $\frac{1}{2}$ acre of rapid sand filters C R Fellers

The Swinford waterworks of the Oxford corporation H H. Crawley. *Water and Water Eng* 37, 651-8 (1935)—Structural and operating features are given W A Moore

The municipal water supply of Paris. John B Hawley *J. Am. Water Works Assoc.* 27, 1699-1703 (1935).—Most spring waters from which the Paris supply is taken are soft, agreeable to the taste, and nearly sterile as to pathogenic bacteria Two slow sand filtration plants existed which have been improved, and chlorination app is part of the plant equipment. There is also a non-potable supply carried through sep pipe lines for other uses D K French

New water supply of Athens, Piraeus and district T. A. Liefnrcel. *Water* 18, 21 (1934). U S Pub Health Eng. Abstracts 15, W, 146 (Dec. 14, 1935)—The supply comes from an impounding reservoir near Marathon and is brought to Athens and Piraeus 25 km by a pipe line Until 1920, the Aqueduct of Hadrian, dating from the 2nd century, formed the only supply of water for the cities Sea water is used for street cleaning. C R Fellers

The nature of the waters at Oulmès, Morocco R Frey. *Ann. franç. Avanc. Sci., Congrès de Rabat* 1934, 73-7; *Rer. Geol.* 15, 245—Two warm springs at Ain Karouba and Lala Afa show, resp., 2.9 and 32.1 g per l of alkali chlorides, 4.1 and 14 alkali sulfates, 6.1 and 14.5 alkali carbonates and 87 and 52 alk. earth carbonates J F Schauer

Additions to the water supply of Melfort, Sask J E Underwood *Can. Eng.* 68, No 8, 3-4 (1935). U S Pub Health Eng Abstracts 15, W, 52 (May 11, 1935)—The normal treatment of the water taken from Melfort Dam consists of Cl and alum treatment and pressure filtration. Odor and taste troubles, especially serious after freezing, were controlled by aeration, sedimentation and treatment with activated C at the rate of 2.5 oz per 66,000 gal. The alum and activated C are fed into the supply main leading to the aeration basin. Thorough mixing occurs in passage through the nozzles. The activated C is suspended in the feed water with the aid of an

ordinary elec washing machine The water is chlorinated before delivery to the pressure filters. C R Fellers

Irrigation and water supply in Victoria, Australia. L R East *J Inst Engrs Australia* 6, 389 (1934). U. S. Pub Health Eng Abstracts 15, W, 153 (Dec 28, 1935).—Descriptive C R Fellers

Water supplies from underground sources J D Restler *Surveyor* 87, 283 (1935); U S Pub Health Eng Abstracts 15, W, 147 (Dec 14, 1935)—The advantages of ground over surface sources are stressed C R Fellers

Presence of lithium in several waters in the Turn Hills Marcella Jarach *Ann chim applicata* 25, 385-8 (1935)—Amts of Li-O up to 0.01 g/l have been found in waters from the Turn Hills This is probably derived by seepage of water through the granite formations, which often contain large amts of alkalies A W C

The sparkling spring of Oberschützen in the Burgenland E Dittler and R Dworzak *Chem Erde* 9, 209-85 (1935)—The mineral spring at Oberschützen near Tatzmendorf (40 m S of Vienna) is marked by its large content of Na^+ (0.8789), Mg^{++} (0.2312), SO_4^{--} (0.8465) and HCO_3^- (0.00665 g/l) Total solids are 5.3717, with 2.051 g/l CO_2 The Mg is probably derived from an underground extension of serpentine from the N E A boring in the neighborhood shows streaks of coal at about 70 and 140 m C A Silberrad

A selenium spring John T Miller and Horace G Ryers *Ind Eng Chem, News Ed* 13, 456 (1935).—Samples of water from, and soil and vegetation in the neighborhood of, a "poison spring" in Custer Co., S Dak were analyzed for Se and As The water was found to contain only 0.4 p. p m Se and 0.5 p. p m As, quantities insufficient to account for the death of cattle Soil contained 1.5-4.0 p. p m Se, while the vegetation contained as high as 1600 p. p m Se This latter is soil and was regarded as the primary cause of death of cattle. M G Moore

Water Charles R Hazen *Can Eng* 67, No 11, 14-17 (1934). U. S. Pub Health Eng Abstracts 15, W, 20 (Mar 23, 1935)—The properties and impurities of water in its many ind applications are discussed C R Fellers

New methods for the examination of ground-water regions L Munder. *Verh intern theort argew. Limnol* 6, 238 (1934). U S Pub Health Eng Abstracts 15, W, 116 (Nov. 2, 1935)—Carbonate hardness differs widely in different types of water, and is comparatively const for each source of water This characteristic was used in prepg a carbonate-hardness chart for a large ground-water region, in which points of equal carbonate hardness were joined by lines From the lines of hardness can be detd the direction and comparative amt of river-water infiltration and the direction of ground-water flow. The method should prove valuable in preliminary investigations of ground-water utilization and for hydrological calns. and investigations C R Fellers

Removal of lead and copper from drinking water K. Holl *Arch Hyg Bakt* 113, 296-304 (1935); U S. Pub Health Eng Abstracts 15, W, 99 (Oct 5, 1935)—Filtration of water through cotton wool may be efficacious, but the adsorbent action of the cotton is inadequate for waters contg more than 1 mg per l of Pb If present in smaller amts, a cotton wad about the size of a man's fist will remove Pb almost completely from 10-15 l of water Filter paper shreds when made into a suitable filter bed on a funnel will remove Pb up to a concn of 2.5 mg per l. Activated C gives best results in Pb removal Small-scale expts. showed that the addn. of 10 g. of the

C to 5 l of water, followed by filtration through filter paper contg. another 5-g layer of C, removed completely the Pb in water contg. 8 mg per l. Filtration through a Berkefeld candle filter will also remove Pb up to a concn. of 2.5 mg per l from many waters, but the presence of chlorides lessens the efficiency of removal. Filtration of water through a bed consisting of MgO in granular form will also remove both Pb and Cu from water. The adsorbent materials must be changed regularly for best results.

Iron and hard water problems solved at Waupun, Wis. H T Rudgal. *Water Works Eng* 88, 1404-7(1935).—The lime treatment followed by recarbonation to reduce the alkali is used. The Fe is deposited in the clarifier basin.

A modification of the Sanchis method for determination of fluorine in water. C Herrero Ducloux. *Analges aquim Argentina* 23 (3-6(1935)), cf. Sanchis, C A 28, 28134.—Prep a 0.17% soln. of Na alizarinsulfonate (I) and an 0.87% soln. of $Zr(NO_3)_4$ (II), to 10 cc of II add 10 cc of I, let stand several hrs., shake, dil with 80 cc of distd. H_2O , protecting from the light, this forms the indicator soln. (III). Prep a soln. 1.5 N as to HCl and 1.5 N as to H_2SO_4 (IV) and a 0.1105% NaF soln., from which take 5 cc and add to 250 cc soln., so that 1 cc = 0.01 mg F (V). Instead of using 100 cc., and heating in flasks, use 50 cc. in test tubes. From a buret, drop into 8 test tubes 1, 2, 3, 4, 5, 6, 7, 8 cc of V, make up to 50 cc with distd. H_2O , add 2 cc of IV, then 1 cc of III, shake, place the tubes in a support in a NaCl brine heating bath and heat 3 min., withdraw the tubes, let stand 5 hrs. or until the next day, and compare colors with tubes in which the sample to be analyzed has been treated similarly. E M S.

Alterations in a lime soda water treatment plant. F L Hana. *Warne* 57, 105-7(1934), *U S Pub Health Eng Abstracts* 15, W, 156(Dec 29, 1935).—After 10 yrs' operation of a lime soda treatment plant, the appearance of turbidity in the raw water caused difficulties. These were removed by altering the method of adding reagents and the insertion of perforated bottom plates in the reaction tanks, and colloidal turbidity was removed by the addn. of 150 g. of solid $Al_2(SO_4)_3$ per hr. at a flow of 20 cu m an hr. After the alterations the filter runs were 3 times as long as previously. C R Fellers.

Use of powdered activated carbon in Florida. F E Stuart. *Proc 9th Ann Meeting, Fla Sec Am Water Works Assoc* 60-2, *U S Pub Health Eng Abstracts* 15, W, 46(Apr 20, 1935), cf. C A 28, 17677, 29, 55541.—For elimination of taste and odor the filters should be first seeded with 2 lb. of C per million gal of filter capacity. The sludge should be blanketed with 25 lb. of C per million gals of water treated per day. This step is followed by adding 8 lb. of C along with the alum. After these initial steps the dosage may be varied according to needs.

Apparatus with a metal casing for sampling deep water and determining the corresponding water temperature. L Schioppa. *Zentr. Bakt. Parasitenk., Abt. I* 130, 301(1933), *U S Pub Health Eng Abstracts* 15, W, 24(Mar 23, 1935).—Three l. samples can be readily obtained at depths of over 400 m in 2-3 min. The samples are suitable for bacteriol. examn. C R Fellers.

A filtration plant in southern Michigan. D E Bicknell. *Am City* 49, 67-8(1934), *U S Pub Health Eng Abstracts* 15, W, 54(May 11, 1935).—The supply of St. Joseph is from Lake Michigan. The completely electrified plant has a capacity of 6 million gal per day. The 2 mixing tanks and coagulation basins are so arranged that they can be operated in series or parallel. Filters can be washed by scp pump or from high service discharge. Cl is added to raw water suction. Alum, $(NH_4)_2SO_4$, and powd. activated C are added at the inlet to the mixing tank. The final dose of Cl is added in the filter effluent flume ahead of the clear well. C R Fellers.

Design, construction and operation of 40,000,000 gallon filtration plant for the city of Hamilton, Ontario. W L McFaul. *Can Engr* 68, No 14, 62-5(1935), *U S Pub Health Eng Abstracts* 15, W, 151(Dec 21,

1935), cf. C A 27, 2508; 29, 55541.—The water from Lake Ontario is filtered by 12 filters of a capacity of 3.3 million gal daily. The filter underdrainage system which is of the perforated-pipe type, is covered with 20 in. of graded gravel with an effective size of 0.5 mm and uniformity coeff. of 50%. Filter runs are limited to 48 hrs. or a loss of head of 8 ft. During the summer the runs may be reduced to 20-30 hrs. by microorganisms. The coagulation basins provide 3 hrs. detention. Pretreatment by NH_3 and Cl is used and alum is applied only intermittently for turbidity removal. Residual Cl is maintained throughout the plant and post-chlorination is not required. The cost of the plant was \$1,220,000. C R F.

Problems in water filtration plant operation. Brantford, Ont. I P Adams. *J. Am. Water Works Assoc.* 27, 1725-7(1935). Hamilton, Ont. D H Matheson. *Ibid.* 1727-8. Peterborough, Ont. W. G. Hunt. *Ibid.* 1728-31.—The various experiences involve largely taste, odor or color in the water. Novel methods of filtration and application of chemicals were of great assistance.

Effect of filtration through rapid filters on the operation of slow filters according to observations at the filtration plant of Warsaw. I Piotrowski. *Gas & Woda* 14, 183(1934); *U S Pub Health Eng Abstracts* 15, W, 148(Dec 14, 1935).—Rapid sand filtration without coagulation prior to slow sand filtration at Warsaw removes suspended matter and 90-95% of the microorganisms. This increases the operation period and efficiency of the slow sand filters and renders filtration more regular.

Controlled coagulation maintains filters in good condition. Frank W. Bouison. *J. Penna. Water Works Operators Assoc.* 6, 15-16(1934); *U S Pub Health Eng Abstracts* 15, W, 10(Feb 16, 1935).—A gummy mat on the rapid sand filters of the S. Pittsburgh Water Co. caused much trouble but was finally corrected by lowering the pH of the coagulated water to 6.9, thereby bringing down the excess Al and Fe from the acid raw water.

Emergency work during the New York State flood. Anselmo F. Dappert. *J. Am. Water Works Assoc.* 27, 1647-69(1935).—As a result of the flood many filter plants and an enormous no. of private wells were seriously damaged. Portable emergency chlorinators and emergency hypochlorite treatment plants were installed in 16 communities, most of them by department engineers. In addn. the general emergency work covered nearly a score of individual related matters. Also in *J. New Engl. Water Works Assoc.* 49, 376-94(1935).

Aeration of water by air diffusion. Frank C. Roe. *J. Am. Water Works Assoc.* 27, 897-904(1935).—In the abstr. in C A 29, 6338, the expression "perforated pipe or plates" should read "porous diffuser plates and tubes".

The municipal water-softening plant at Glendive, Mont. C W Eyer. *J. Am. Water Works Assoc.* 27, 1704-7(1935).—The lime-soda process is used, but for the soda-ash supply water is available from a deep well carrying 7.2 grains free Na_2CO_3 per gal and 35.2 grains $NaHCO_3$, $Ca(OH)_2$, and Na aluminate are first added and then enough well water. A baffle mixing chamber and flocculator brings about quick settling in the clarifier. A portion of the sludge is recirculated, this saves an estd. 10 lb. lime per hr.

Future problems of water works operators with regard to taste, odor and palatability. Lewis O. Bernhagen. *Proc. 17th Texas Water Works Short School* 1935, 135-7, *U S Pub Health Eng Abstracts* 15, W, 111(Oct. 26, 1935).—General methods of preventing offensive tastes and odors are detailed. Microscopic exams made at frequent intervals will serve to detect undesirable algae.

Possible value of hydrogen ion in the forecasting of taste and odor periods by algae and decomposition of organic matter. Wm. Veyan. *N. Dak. Water and Sewage Works Conference* 1, No 6, 3-4(June, 1935), *U S Pub Health Eng Abstracts* 15, W, 110(Oct. 26, 1935).—Succ

algae consume the free and even half-bound CO_2 , thereby raising the pH of the water, and since bacterial action on org. matter releases CO_2 , lowering the pH , it is suggested that changes in the pH may forecast taste from either of the 2 causes

C. R. Fellers
Interference of algae with tests for residual chlorine

Ammonia-chlorine in the tropics *J. S. Boissier Water and Water Eng.* 38, 24 5 (1936)

W. A. Moore
Maintenance of chlorine equipment *Raymond J. Faust Mich. Eng. Expt. Sta. Bull.* No. 64, 27 30 (1935)—Phys. characteristics of Cl_2 types of chlorinators, common troubles with chlorinators, need for maintaining chlorinator, lines and tanks at uniform temp., and solns for cleaning chlorinator parts are discussed. G. H. Y.

Bacteriological examination of water supplies
Committee Rept. Ministry of Health (Engl.), *Rept. on Pub. Health and Med. Subjects* No. 71, 38 pp (1934), *U. S. Pub. Health Eng. Abstracts* 15, W, 16 (Mar. 9, 1935)—The plate count on agar incubated 3 days at $20-2^\circ$ and 2 days at 37° is recommended. Results are interpreted as most probable nos. of coliform bacteria per 100 ml. This is det'd by a series of diln. tubes in MacConkey's liquid bile salt-lactose-neutral red medium incubated at 37° for 2 days. Differentiation into *Es. coli*, intermediates and *Aerobacter aerogenes* is recommended if the water contains 2-10 bacteria per 100 ml. The Committee regards the presence of *Aerobacter aerogenes* with far greater suspicion than is done in the U. S.

C. R. Fellers
Comparative studies of media for the determination of the coli-aerogenes group in water analysis. C. C. Ruchholtz *J. Am. Water Works Assoc.* 27, 1732-45 (1935), cf. C. A. 30, 1301—In order of productivity the following media are listed from highest to lowest: buffered lactose broth, fuchsin lactose broth, methylene blue-bromocresol purple broth, brilliant green-blue broth, crystal violet broth, and formate-nicotinate broth. For inhibitivity to spore-bearing lactose fermenters, formate-nicotinate broth was the best. Addnl. work is being done with this media as well as brilliant green-blue broth, and MacConkey's broth in confirmation procedure, in comparison with standard procedure, on finished chlorinated water where coli-aerogenes det'n is difficult. D. K. F.

Weed growths in reservoirs and open canals. G. E. Arnold *J. Am. Water Works Assoc.* 27, 1684-93 (1935)—Weeds are defined as aquatic growths having a root system whereby they are attached and not free floating. Weed growth increases with the temp., there being very little at temp. of $40-50^\circ\text{F}$. Silty, loam soil or sand is preferable. CO_2 is consumed and O liberated by growing weeds. Covering a reservoir to eliminate direct light will prevent practically all weed growths. CuSO_4 in various quantities is the best agent to prevent as well as to kill weed growth. Mature growing weeds are not always killed with CuSO_4 , and cutting and pulling is probably the most effective means of growth control. Cl and NH_3 and Cl_2 are not successful. Varying the water level is frequently helpful. D. K. French.

Disinfection of water mains. W. A. Gentner and M. S. Wellington *J. New England Water Works Assoc.* 1933, No. 2, 165; *U. S. Pub. Health Eng. Abstracts* 15, W, 13 (Feb. 23, 1935)—In Hartford, Conn., the practice of placing 225-g doses of solid NaOCl in the newly laid mains at 30-m. intervals is followed. The method is inexpensive and effective. At New Haven, brushing out the pipes and washing them with strong NaOCl soln before laying did not give satisfactory bacteriol. results. Sufficient Cl to give 1 mg. per l. of water in the pipe was allowed to remain in the pipe line for 5 days. The residual Cl concn. at that time was 0.3 mg. per l. The results were fully satisfactory. C. R. Fellers.

Chemical behavior of Eternit pipes. L. Kaatz and H. E. Richter. *Gas- u. Wasserfach* 77, 119 (1934); *U. S. Pub. Health Eng. Abstracts* 15, W, 11 (Feb. 23, 1935), cf. C. A. 28, 5155³—On contact with Eternit, the pH

of Leipzig water increases, while the hardness decreases at first, then remains constant. A protective coating of CaCO_3 forms on the pipe but this is sometimes destroyed by fresh aggressive water. Very aggressive water may cause asbestos fibers to become detached from the pipe. The changes are greater in the new pipe. Ca(OH)_2 is washed out from the cement in the Eternit and reacts with, and removes, any free CO_2 present in the water. There is no objection from a chem. viewpoint to the disinfection use of Eternit pipes for water. C. R. Fellers.

Chemistry of corrosion [in water pipes]. George M. Crook. *Proc. 17th Texas Water Works School* 1935, 44-8, *U. S. Pub. Health Eng. Abstracts* 15, W, 122 (Nov. 9, 1935)—A review. C. R. Fellers.

The use of bitumen in the construction of water and sewage mains, plants, etc. Fr. Joedicke. *Tech. Gemeindeblatt* 38, 269-72 (1935). M. G. Moore.

Recent tendencies in the field of sewage disposal. H. Bach. *Chem.-Ztg.* 59, 861-3 (1935). E. H.

Sewage treatment at Muskegon Heights (Mich.). R. A. Anderson. *Mich. Eng. Expt. Sta. Bull.* No. 64, 34-43 (1935)—Suggestions for design changes are based on operating experience with the new plant. Operating and cost data are tabulated for ready comparison.

G. H. Young
Pretoria sewage-disposal works extensions. G. F. Newby. *Surveyor* 86, 251 (1934), *U. S. Pub. Health Eng. Abstracts* 15, S, 70-1 (Aug. 31, 1935)—The dry-weather flow of sewage is 330,000 gal. per day. The works comprise a screening chamber and 4 units, each consisting of a grit channel, settling tank, 4 trickling filters and 2 sludge-digestion tanks. The new settling tanks have hopper bottoms and provide 2 hrs. retention with an upward velocity of 4.73-7.6 ft. per hr. The new digestion tanks will provide a capacity of 0.78 cu. ft. per head for a population of 100,000. Utilization of sludge gas for heating is not economical in Pretoria because of the very low elec. rates. The final effluent is discharged into the Apes River. C. R. Fellers.

Sewage disposal by subsoil irrigation. E. Z. Weber. *Gesundh. Tech. Stadtechy.* 25, 145 (1933), *U. S. Pub. Health Eng. Abstracts* 15, S, 48 (Aug. 3, 1935)—Porous subsoil is an excellent medium for the disposal of sewage in settlements not connected with a sewerage system. The sewage should undergo treatment in a septic tank before irrigation in the subsoil. Russian regulations require that not more than 10-20 l. of sewage should be received by 1 sq. m. of surface per day. C. R. Fellers.

Sewerage and sewage disposal of Sittingbourne and Milton. G. T. Cotterell. *J. Inst. Munic. Co. Eng.* 61, 290 (1934); *U. S. Pub. Health Eng. Abstracts* 15, S, 68-9 (Aug. 31, 1935)—This article describes in detail the 3 sewerage systems of the recently amalgamated districts of Milton Regis, Sittingbourne and Murston. Sewage flows through an inlet channel, screens, grit channel and a baffled aerated grease and oil interceptor to 3 two-story settling tanks; sludge from the double hopper-bottomed lower stories of the settling tanks is discharged into 2 digestion tanks which are equipped with heating coils and gas collectors. The sludge gas has a calorific value of 700 B. t. u. per cu. ft. Supernatant liquor from the sludge-digestion tanks is returned to the raw sewage. Digested sludge is dried on clinker drying beds without causing odor, fly trouble or ponding. Settling-tank effluent is treated in an activated-sludge plant which comprises a mixing channel, 6 aeration and re-aeration channels for diffused-air aeration, and 6 hopper-bottomed final settling tanks. Excess activated sludge is returned to the raw sewage. The final effluent is discharged into Milton Creek. C. R. Fellers.

Operation of the York Township sewage-disposal plant. C. Chamberlain. *Can. Engr.* 69, No. 10, 25-7 (1935)—Weekly operating records are given for the 2.5 million gal. per day of sewage which is treated with FeCl_3 and dewatered in vacuum filters. Also in *Eng. Contr. Record* 49, 936 (1935). Ann Nicholson Hurd.
Operation of the Byholmen sewage-disposal plant at Helsingfors. R. Granqvist. *Gesundh.-Ing.* 58, 683-8

(1935), cf. C. A. 30, 552⁶—Details of construction and extensive tubular operation data are given. The plant, built to serve a population of 20,000, is overlaid to serve 55,000. Treatment is by simple settling (with partial sludge digestion at the bottom of these basins), activated-sludge treatment, subsequent settling and addnl sep sludge digestion. The plant is so planned as to facilitate expul work, e. g., there are 4 sep activated-sludge units, each built on distinctly different plan. M. G. M.

Operating experiences with sewage-treatment plants and the design and construction of new plants. Z. Weidlich *Gesundheitsfach* 26, 185(1934); *U. S. Pub. Health Eng. Abstracts* 15, S, 71(Aug 31, 1935).—Sep rather than combined sewerage systems are recommended for towns whose sewage undergoes treatment. Flow in sand traps should be at the rate of 0.3–0.5 m. per sec. For variable sewage flows, a double channel is recommended. Sep sludge digestion is preferable to treatment in 2-story tanks. Hopper bottoms should be at least 6 m. deep and not more than 1.2 m. in diam. Digestion tanks should be heated in winter for best results. Fishponds or deep final settling tanks are most suitable for secondary treatment. C. R. Fellers

Sewerage works at Tunbridge Wells. H. P. Bishop. *J. Inst. Munic. Co. Eng.* 61, 169(1934); *U. S. Pub. Health Eng. Abstracts* 15, S, 69(Aug 31, 1935).—The av. compn. of the sewage in parts per 100,000 is: free NH_3 , 1.4; O_2 absorption in 4 hrs at 26.7°, 5.2; nitrite and nitrate N, 0.0; Cl 10.3; dissolved solids 53; suspended solids 36; and dissolved O_2 absorbed in 5 days, 41. C. R. Fellers

A biozeolitic theory of sewage purification. Emery J. Thierault. *Ind. Eng. Chem.* 28, 85–6(1936); cf. C. A. 29, 5560⁶—Previous studies and theories of the action of activated sludge are critically reviewed. The new theory offered holds that clarification by activated sludge (which is complete in 30 min) is due to a base-exchange process with the aluminosilicate complex or sludge zeolite which surrounds the bacteria. Oxidation is explained partly as the result of primary decomposition by bacteria and partly by enzymic or purely chem. action. Applications to sewage treatment and comparison with corresponding methods of water treatment are considered. M. G. Moore

Adsorption by activated sludge. Emery J. Thierault and Paul D. McNamee. *Ind. Eng. Chem.* 28, 79–82(1936).—Addnl evidence is offered in support of the biozeolitic theory of sewage purification (cf. preceding abstract). Measurements on the adsorption and desorption (washing out) of various cations from their salt solns by both ordinary activated sludge and that which had been previously dried at 100° (to destroy humus and eliminate any effect due to its presence) yielded data which followed the Freundlich formula satisfactorily even over a 20-fold range of soln concns. The approx. analysis of activated sludge gives: zeolite 30%, bacterial cells 35%, adsorbed matter 20%, water 5% and carbon from humus 10%. M. G. Moore

Mechanical chemical methods of sewage treatment. H. C. H. Sinton. *Surveyor* 85, 375–7(1934); *U. S. Pub. Health Eng. Abstracts* 15, S, 40(July 20, 1935).—The use of vacuum filters enables the sludge to be de-watered to such an extent that it can be incinerated. In the Guggenheim process which has been on trial in New York and Chicago, the settled effluent after chem. pptn. is passed through a zeolite filter which acts partly as a straining filter and partly as an appliance for the removal of NH_4 compds. There is an increasing tendency to regenerate and reuse the chemicals employed in water purification or sewage treatment. C. R. Fellers

Removal of hydrogen sulfide in sewage by aeration. W. S. Mahle. *Sewage Works J.* 7, 91–6(1935); *U. S. Pub. Health Eng. Abstracts* 15, S, 52(Aug 3, 1935); cf. C. A. 28, 5157⁶—Expts showed a marked increase in the H_2S in the Imhoff tanks at the Fort Worth, Tex., sewage plant, a decrease in the aeration tanks, and practically complete elimination on passage through the sprinkling filters. The most economical time for H_2S removal is approx. 150 min., using 0.25 cu. ft. of air per gal. Max.

H_2S removal in raw sewage was obtained in 15 min. aeration with 0.4 cu. ft. of air per gal. C. R. Fellers

Susceptibility of certain sewage bacteria to the action of bacteriophages. Olof Sievers. *Z. Hyg. Infektionskrankh.* 116, 15(1934); *U. S. Pub. Health Eng. Abstracts* 15, S, 72–3(Aug 31, 1935).—Filtrates from untreated water had a bactericidal action on 82 out of 150 strains of typhoid-colon bacteria from sewage while the filtrate of treated water affected only 47 strains. That is, treatment reduced the lytic action of the water. Bacteriophages play an important part in sewage treatment. Treated water contains more lysin-resistant bacteria than untreated water. The no. of lysin-sensitive bacterial strains is reduced during sewage treatment though they do not entirely disappear; this reduction is believed to be due to bacteriophages, especially in the activated-sludge treatment. C. R. Fellers

Disinfection of sewage with minimum amounts of chlorine. W. L. Mallmann and W. F. Shephard. *Misch. Eng. Exptl. Sta. Bull.* No. 64, 21–6(1935).—Results are given of a plant-scale check on the work of Rudolph and Ziernba (cf. C. A. 28, 5561⁶). Samples were collected in thio-sulfate-treated bottles, chlorinated samples were collected after exposure for 7, 14 and 21 min.; control samples were collected at a point just before the effluent entered the chlorination tank. Cl demand and residual tests were made each time samples were collected. Av. bacterial count on the influent was 1,000,000 bacteria per ml., Cl demand on the influent averaged 5 p.p.m. Tentative conclusions drawn are: (1) With an excess of Cl, all exposed bacteria are killed and the excess Cl oxidizes org. particles surrounding other bacteria, so that the overall effect is to destroy all bacteria. The need of long detention to effect decided reduction in bacterial counts bears out this theory. (2) The higher the initial count the greater the percentage reduction in bacteria, even though the no. of surviving bacteria is const., accordingly, this method of presenting results gives an inaccurate picture. The safety of an effluent must be based upon the actual no. of bacteria escaping chlorination, not upon percentage reduction. (3) The data indicate that partial satisfaction of Cl demand is unsatisfactory for sewage sterilization. G. H. Young

Stabilization of settling-basin sludge by activated carbon at Sacramento. R. E. Mittelstaedt. *Taste and Odor Control* 1, No. 5, 1–2(1935); *U. S. Pub. Health Eng. Abstracts* 15, W, 98(Oct. 5, 1935).—Sludge decompos. in the settling basins imparted a slight taste and odor to the sewage effluent. Washing and scouring gave only temporary relief. Approx. 300 lb. of sludge, mostly alum and mud, is present in 1,000,000 gal. of water entering the basins. Lab. beaker tests translated into terms of plant practice showed that 2 lb. of activated C per 1,000,000 gal. of water was the min. effective dose. This amt. of added C effectively removed all odor from the sludge. C. R. Fellers

Septic tanks for hotels. E. A. Hepburn. *Dept. Pub. Health, State of Victoria, Health Bull.* 13, 1120–4(1934); *U. S. Pub. Health Eng. Abstracts* 15, S, 77(Sept. 7, 1935).—The capacity of a septic tank in gal. should equal 700 + 30 N, N being the total no. of persons served. Imhoff tanks are preferred to septic tanks where supervision can be ensured. C. R. Fellers

Annual report of the Ruhrverband, 1933. K. Imhoff. *Ruhrverband, Essen* 8 pp(1934); *U. S. Pub. Health Eng. Abstracts* 15, S, 65–6(Aug 24, 1935).—Ind. pollution in the Ruhr is decreasing. Various new purification plants and treatment plants for sewage are described. C. R. Fellers

Stream pollution with special reference to some South African conditions. M. Lundie. *Surveyor* 86, 205(1934); *U. S. Pub. Health Eng. Abstracts* 15, S, 52(Aug 3, 1935).—The change in the O_2 content of waters which run normally 0.7 parts per 100,000 is the best measure of the self-purification of polluted waters. At the crit. point increasing pollution will result in more rapid consumption than production of dissolved O_2 . The degree of O_2 ab-

sorption constituting safety has been given values varying between 0.25 and 0.5 part per 100,000. C. R. Fellers
River pollution control and its organization in Poland.
Z. Rudolf. 4th Hydrol Conf. Baltic States, Leningrad
1933, Sed. Underground Waters.—State Hydrol. Inst.
and United Sci. Tech. State Editorial Office of People's
Commissary for Heavy Ind., U. S. S. R. U. S. Pub.
Health Eng. Abstracts 15, S, 22(Mar. 2, 1935)

C. R. Fellers
Pollution and purification of liquids. M. Y. Khwaja
J. Inst. Sanit. Eng. 39, 43(1935). U. S. Pub. Health
Eng. Abstracts 15, W, 149(Dec. 14, 1935)—In nature,
self-purification of water is effected by bacteria, sedimentation, dilution, the action of sunlight and the chemical interaction of inorganic substances. Methods of water treatment are described in general terms. $KMnO_4$ is useful in water disinfection especially during epidemics. C. R. F.

Summary of the recent investigation of swimming pools and bathing places in New Jersey. D. M. Dittmar, et al. Pub. Health News, N. J. Dept. Health 18, 53-8 (1934). U. S. Pub. Health Eng. Abstracts 15, Sw, 3 (May 11, 1935)—Of the 378 places from which samples were collected, fewer than 4% contained water showing *B. coli* present in less than 10 cc. Methods of pool treatment and management are discussed. C. R. F.

Operation of a small swimming bath in the tropics. M. G. Ionescu. Engineering 139, 207(1935). U. S. Pub. Health Eng. Abstracts 15, Sw, 7(Dec. 7, 1935)—The water after treatment with coagulant and alkali is filtered at a rate of 3000-4000 gal. per hr. in a pressure filter. Sufficient $NaOCl$ solution is added to give a concentration of 1.2 p.p.m. A concentration of 0.8 p.p.m. of Cl_2 did not adequately disinfect the water. Algal growths were controlled by the use of $CuSO_4$ at a concentration of 1.3 p.p.m. and 0.2 p.p.m. each week afterward. The tank is refilled every 3 weeks. C. R. Fellers

Purification of bath water. A. A. Turner. J. Roy. Sanit. Inst. 55, 441-5(1935). U. S. Pub. Health Eng. Abstracts 15, Sw, 4(May 11, 1935)—At the Finchley pools the water is coagulated, filtered, ammoniated, aerated and sterilized. At the children's pool sterilization is accomplished by the Rayzone ultraviolet-ray system. Bacteriological exams show approx. 1 bacteria per colony on agar plates at 37° and the absence of *E. coli*, *Coli. dysenteriae* and streptococci in 100 cc. C. R. Fellers

Artificial alteration of the reaction of water reservoirs for the control of the larvae of the malaria mosquito. P. I. Pavlova. Med. Parasitology & Parasitic Diseases (Moscow) 1, 265(1934); U. S. Pub. Health Eng. Abstracts 15, W, 114(Nov. 2, 1935)—In the region near Moscow, larvae of the mosquito, *Anopheles maculipennis*, were destroyed when the bog waters were reduced to a pH value of 1.9 by the addition of H_2SO_4 . In acid peat bogs and in pits lined with clay beds, the pH of the water remained fairly constant for several months, but in alkali peat bogs the acidity was soon lost. C. R. Fellers

Relation of bacteria and bacterial filtrates to the development of mosquito larvae. Lloyd E. Rozeboom. Am. J. Hyg. 21, 167-79(1935); U. S. Pub. Health Eng. Abstracts 15, Ma, 26(Oct. 20, 1935)—Autoclave sterilization of a medium for larvae renders it unsatisfactory for their development. The presence of bacteria seems necessary for larval growth. The bacteria furnish either an intra- or extra-cellular substance that acts as a stimulus to larval development. Bacterial suspensions in distilled water are not entirely satisfactory as larval food. Colloids or solutes were not used as larval nutrients. C. R. F.

Anthracene, a new mosquito larvicide. S. Kutcher. Med. Parasit & Parasitic Diseases (Moscow) 3, 141-8 (1934); U. S. Pub. Health Eng. Abstracts 15, Ma, 18 (May 25, 1935) (in Russian).—Best results were obtained by the use of refuse from coke-benzene plants (containing 12-15% anthracene) plus dust so that the resultant mix contains 10% anthracene. The mix is spread over the surface of the water by means of a pulverizer. The kill is practically 100% of all larvae. The effect on fish and water vegetation was not detrimental. C. R. Fellers

Use of chloropicrin as a mosquito larvicide. F. Yat-

senko. Med. Parasit. & Parasitic Diseases (Moscow) 3, 91-3(1934); U. S. Pub. Health Eng. Abstracts 15, Ma, 17(May 25, 1935) (in Russian).—Chloropicrin may be used both as a fumigant and as a stomach poison. For the 1st, the chloropicrin is mixed with fine road dust and paraffin oil in the proportion of 11 to 1 kg. of dust and 2 l. of paraffin oil and the mix is stored in a closed receptacle for 4 hrs. Just before use, the mix is again mixed with additional road dust (amt. not stated), placed in a pulverizer and sprayed over the surface of the water, this amt. is sufficient for 1 hectare. In 24 hrs. all eggs, larvae, pupae and almost all other aquatic organisms are destroyed completely. Fish are affected only when the depth of the water does not exceed 12-15 cm. Men and animals should not visit the dusted areas for 2 hrs. following treatment. When used as an intestinal poison, 100-150 g. of chloropicrin is mixed with 1 kg. of flour, 1 kg. of fine road dust and 100-150 g. of paraffin oil. This amt. is sufficient for 1 hectare. The mix is kept in a closed container for 24 hrs., after which it is spread by means of a pulverizer or by hand. All larvae are destroyed in 10-12 hrs., though all eggs and pupae are not killed. Both methods are very suitable for mosquito control. C. R. Fellers

Sanitary significance of the succession of coliform organisms in fresh and in stored feces. Leland W. Parr. Am. J. Pub. Health 26, 39-45(1936). J. A. K.

Regenerating fatty substances from waste waters of the wool industry (Sokolov) 27. Gutter and water supplies in Holland (Reith) 11G. Minimal threshold of the dental sign of fluorosis (mottled enamel) (Dean, Elvove) 11G. Sterilizing liquids (Brit. pat. 432,101) 13

Apparatus for purifying water by heating and centrifugal action. John S. Wallace. U. S. 2,027,501, Jan. 14. Various structural and operative details.

Apparatus (with superposed filtering beds) for purifying water. Pierre R. Gaudet (to Soc. d'étude pour l'épuration des eaux, "procédés G. et B."). U. S. 2,027,475, Jan. 14. Structural, mech. and operative details.

Reclaiming pure water by vacuum distillation from impure waters. Vincen P. McVoy. U. S. 2,027,395, Jan. 14. Various details of app. and operation are described.

Transformation products of carbonaceous materials. Établissements Phillips et Pain. Fr. 788,692, Oct. 14, 1935. Products obtained by treating wood, lignite, peat, cork, wood charcoal, coal, coke, etc., with concd. H_2SO_4 , CH_3SO_3H or SO_3 or mixtures of these, are used as base-exchange substances for purifying water and treating salt solutions.

Reagent for purifying and softening water. Chem. Werke vorm. H. & E. Albert (Hans Huber and Hans Mengede, inventors). Ger. 622,294, Nov. 25, 1935 (Cl. 85b 101). Addn. to 595,072 (C. A. 28, 4146). The prepn. of a water-purifying reagent from Fe-Al phosphate by the method of Ger. 595,072 is effected at a raised temp. and pressure.

Apparatus for softening water. Établissements Phillips et Pain. Fr. 784,567, July 22, 1935.

Removing boiler scale. Ewald Franz. Ger. 619,570, Oct. 3, 1935 (Cl. 13e 7). The scale and also other non-metallic deposits such as soot or rust, is removed from metal surfaces by heating the metal with a fine-pointed flame of at least 2000°. The flame may be fed by vaporized lower alcohols or ketones and O.

Treating waste waters. Pierre L. Boucherie. Fr. 788,343, Oct. 8, 1935. Apparatus for aerating is described.

Apparatus for purifying sewage by blowing in air. O. F. T. A. (Office française de travaux d'assainissement). Fr. 788,360, Oct. 9, 1935.

Apparatus for aerating and clarifying sewage. Frank S. Currie. U. S. 2,027,370, Jan. 14. Various structural and operative details.

Sewage-sludge treatment. Edward D. Flynn (to Oliver United Filters Inc.). U. S. 2,026,969, Jan. 7, 1935. Solids and liquids of sewage are sepd. and the sepd. solids

are continuously rolled and tumbled in the presence of a sufficient quantity of hot gases and a comminuted combustible material such as coal dust to form pellets substantially capable of supporting their own combustion; these pellets are then burned, and the resulting gaseous products of combustion are used in the pelletizing App is described

Apparatus (with steam-heated tubes) for drying sludge such as sewage sludge. Laurence M. Keoughan U. S. 2,028,395, Jan. 21. Various structural and operative details

Apparatus for removing sludge from sewage settling tanks, etc Samuel Shafter, Jr (to Chain Belt Co) U. S. 2,028,094, Jan. 14. Mech. and operative details

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M S ANDERSON AND E D JACOB

Soil survey of Wales. Progress report, 1931-34 D O Hughes and W G D Walters *Welsh J Agr.* 11, 188-208(1935), cf C A 26, 4897 —Data are given on the percentages of org matter and available Ca, P and K in typical soils from Anglesey and Northwest Denbighshire. In general, the soils of North Wales have no natural reserves of CaCO₃. P deficiency is widespread and many of the soils are deficient in K K D Jacob

The soil of Tagaytay Ridge, Cavite D Z Rosell and A S Argüelles *Philippine J Sci* 57, 409-20(1935) —Morphological and phys characteristics, the pH value and the N, P, K, Ca and Mg contents are given J O H

Study of soils XVI Study of two soils of Indochina. Displaceable acid radicals and pH Creation of clay improperly called "colloidal" J Clarens and J Lacroix *Bull soc chim* [5], 2, 1884-92(1935), cf C A 29, 7544 —Analyses, particularly in respect to the buffer power to both acids and bases, are given for 2 dissimilar soils of Indochina with suggestions for their phys and chem improvement. In both cases the soil could be improved by increasing its buffer action through the addn of CaO or CaCO₃. These soils constitute examples of equal phenomena in which both the anions and cations take part, an equal which can be simply expressed by the pH of the supernatant soln of the soil sample

J R Adams
Influence of parent material on soil character in humid, temperate climate R S Stauffer *J Am. Soc Agron* 27, 885-94(1935) —Where other factors concerned in soil formation, such as age of material, rainfall, temp, topography and vegetative cover, are very similar, soils may still vary widely in their properties because of differences in materials from which they are being formed. Glacial drift varies greatly even within short distances, and these differences are reflected in the soils formed from it. Parent materials will be responsible to some extent for the characteristics of all except the most highly weathered soils, and a knowledge of this parent material is important in any system of soil mapping J R Adams

Influence of the nature of the soil on the composition and baking value of wheat Em Midge *Compt rend acad agr. France* 21, 832-6(1935) —The gluten content and the quality of the gluten in the wheat increase as the percentage of fine material in the soil increases. An optimum soil constitution is indicated. These wheat values are also in proportion to the humus/clay ratio of the soil. The use of fertilizer caused considerable improvement in the quality and amt. of gluten in the wheat J R Adams

Solonetz soils of the state farm Delve (Uzbekistan) S A Kudrin and A N Rozanov *Pedology* (U S S R) 30, 371 91(1935) —Analyses—mech., chem (total), and exchangeable bases—of a series of gray semi-desert soils in various stages of solonchicity are given

J S Joffe
The nature of the chemistry of the solonchak and solonetz of the Araxdyan steppe and methods of chemical amelioration R Kh Aldinyan *Pedology* (U S S R) 30, 392-404(1935). —A series of analyses of solonchak and solonetz soils and the influence of irrigation and gypsum addns on the base exchange complex are given

J S Joffe
The solonetz and its cultivation in the Transbaikal region I I Gantimurov *Pedology* (U S S R) 30, 149-66(1935) —Chem analyses of a no. of solonetz, solonchetic and solonchak-solonetzic soils are presented

showing that on the true solonetz addns of gypsum were very effective in increasing permeability and decreasing dispersion and moisture-holding capacity. CaO + S and S alone were also effective in the same direction as gypsum J S Joffe

Fertility of marsh soils M. Popp. *Das Superphosphat* 11, 103-5(1935) —Acid-sol Ca in marsh soils varied from 0.85 to 2.00%, K varied from 0.40 to 0.60%, and P₂O₅ from 0.15 to 0.25%. From 0.15 to 0.45% of N was found. In general the nutrient content of the soils varied with the clay content. The P₂O₅ content of the marsh soil is dependent upon the age of the soil. With increasing age the P₂O₅ content decreases. The phys nature of the soil also affects the P₂O₅ content, the light marsh soils contg less P₂O₅ than the heavy ones K. C. B

Minerals in soils C D Jeffries Pa Agr Expt Sta, Bull No. 308, 11-12(1934) —Preliminary studies of 4 typical soils showed outstanding mineral differences. Feldspars are notably lacking in Dekalb and Lackawanna soils, and the small amt present is plagioclase and not K-bearing. In Hagerstown and Volusia soils, large quantities of feldspars were present, notably microcline and a trace of plagioclase. Microcline is very insol and does not add materially to the K content of the soil. Mineral analyses of the soils are given and the application of the results to soil fertility and fertilizer studies is pointed out. C R Fellers

A procedure for the estimation of sand in soil samples Eduard v. Boguslawski *Z Pflanzenernähr., Düngung u Bodenkd* 41, 1-8(1935). —Boil a 10-g sample for 30 min with 75 ml 2% H₂O₂, to samples high in humus, add 25 ml 6% H₂O₂ and continue the boiling, keeping the soil well stirred. Transfer the residue substantially freed of humus to a 300-ml Erlenmeyer flask with 0.01 N NaOH, almost filling the flask with the soln, and allow to stand overnight to ensure decompn of all excess H₂O₂. Stopper the flask and shake 2 hrs by machine or by hand, and then transfer the contents to a special cylinder bearing 2 marks exactly 15 cm apart, the upper at 300 ml vol, the lower 3-4 cm. from the bottom. Fasten a glass siphon with the lower end reversed, 7-8 mm internal diam, in the cylinder with a stopper, to draw off the suspension of particles smaller than 0.02 mm. to the lower mark, after settling for exactly 7 min. Refill the cylinder to 300 ml with 0.01 N NaOH, stir well, settle and siphon as before, repeating until material is entirely removed. Transfer the residue to a dish, evaporate and weigh as total sand, and further fractionate by suitable sieves C J S

Decomposition of organic matter in Norfolk sand. the effect upon soil and drainage water Charles E Bell *J Am Soc Agron* 27, 934-46(1935); cf C A 29, 6343* —The addn of freshly ground, dried org matter to Norfolk sand reduced the pH of the soils at the beginning of the expt below that of the virgin soil. The application of (NH₄)₂SO₄ further reduced the pH and the addn of complete fertilizer reduced the pH to a greater extent than did (NH₄)₂SO₄. There was a gradual increase of the pH from the beginning to the end of the expt. The addn of org materials caused a slight increase in the residual N in the soils after 1 yr. The addn of inorg nitrogenous fertilizer with these org materials in cropped soils caused a slight loss of N as compared with soils to which only org matter had been applied. When only inorg. nitrogenous fertilizers were added to cropped soils, there was an increase in the N over that found in the untreated check

The application of org. matter caused an increased residual org. matter content at the end of the expt. The addn. of org. matter to the soil apparently had little effect upon the amt. of drainage water lost over a period of a yr. More drainage water, total N and total bases were lost from fallow than from cropped soils, and the quantity of N lost depended upon the amt. added to the soil. The loss of total bases was increased by the addn. of org. matter, and applications of inorg. fertilizers increased their loss. The loss of bases was greatest from soils to which the greater quantity of N was added. The addn. of org. matter failed to show any favorable influence on the retentive power of Norfolk sand for bases. The addn. of org. matter increased the exchangeable Ca and Mg content in both the fallow and cropped soils. Soils to which $(\text{NH}_4)_2\text{SO}_4$ was added contained less exchangeable Ca than those soils not treated with this material, and addn. of complete fertilizer to fallow soils increased the exchangeable Ca. Apparently, the presence of N reduced the amt. of exchangeable Ca in the soil. Fallow soils contained more exchangeable Na and K than did the cropped soils. The univalent ions were of greater quantity in the drainage water from the fallow soils than in the water from the cropped soils, but the quantity of bivalent Ca was about the same in both. As the proportion of Ca in the total bases in the drainage waters increased, the proportion of K decreased. J R Adams

The importance of soil type and mechanical composition for sensitivity of plants to chlorine. A V Sokolov. *Repts. Sci. Inst. Fertilizers and Insectofungicides, Leningrad, 3rd Intern. Congr. Soil Sci., Oxford 1935, 23-32* (in French).—From pot expts with cereals, flax, hemp and buckwheat on soil and soil-sand mixts., in which complete fertilizers are compared with sulfate and Cl, it is concluded that Cl in fertilizers is more harmful on podzols than on chernozems, on the former more Cl is absorbed by the plants. The cause is not lower pH developed by chlorides, nor is liming always an effective remedy. In general, potatoes and fiber plants growing on light soils are more adversely affected by Cl than when growing on compact soils. Nineteen references. C J S

[Soil] acidity studies. G H Poesch. *Ohio Agr. Expt. Sta., Bull. No. 548 (53rd Ann. Rept.), 56 (1935)*.—Alk. soils are undesirable for snapdragons, clarkia, pine, daisies, lilies, tulips and daffodils. Optimum growth for green color in these plants was at pH 6-6.5. At pH 7 and 8, distinct stunting and yellowing of foliage resulted. This was probably due to the unavailability of P, Fe and Mn. C R Fellers

Exchange cations in the soils of the U S S R. N P Remezov. *Repts. Sci. Inst. Fertilizers and Insectofungicides, Leningrad, 3rd Intern. Congr. Soil Sci., Oxford 1935, 7-22* (in English).—The importance of exchange cations in pedological processes is discussed, with special reference to the principal soil types of the U S S R. Analytical data from the examn., by methods outlined, of profile samples from 10 of these types, taken at agricultural expt. stations, are presented and discussed. C J S

The physical-chemical rules for the cation exchange in mineral soil. F. Alten and B. Kurnies. *Ernähr. Pflanze 31, 401-7 (1935)*.—See C. A. 29, 8197. J O H

The chemical character and importance of the colloidal fraction of the soil. J. V. Csiky. *Z. Pflanzenernähr., Düngung u. Bodenb., 41, 185-203 (1935)*; cf. C. A. 27, 547.—C. agrees with Mattson and Gustafsson (C. A. 29, 2272) in considering soil particles neither uniform, definite compds nor simple mixts of such, but gigantic amphotolytic ions which can combine mutually as well as with simple ions, and he explains exchange and hydrolytic reactions and the behavior of the soil's colloidal complex under acid or alk. conditions on this basis. Exptl. work with artificial "Al silicates," "protein-lignates" and natural soil colloids is discussed in support of these ideas. He believes that it is possible to develop a simple procedure, based on equil. between soil and salt soln. at definite pH values, and requiring detn. of ionic balance, which will completely characterize a soil's colloidal complex and enable comparisons to be made between soils of widely

varying nature. This, with special studies of the soil's content of nutrients and its H-O economy during the growing season, should be of great practical value. Twenty-six references. C J Schollenberger

Chemical nature of organic matter or humus in soils, peat bogs and composts. Selman A. Waksman. *J. Chem. Education 12, 511-19 (1935)*.—In the abstract in C. A. 30, 202, the statement "The lignins contain hemicelluloses, notably polyuronides and resins" should read "The lignins, certain hemicelluloses notably polyuronides and resins are resistant and tend to accumulate."

Irvin C. Feustel
Characterization of humic acids from the standpoint of carboxyl and hydroxyl groups and nitrogenous compounds. S S Dragunov. *Repts. Sci. Inst. Fertilizers and Insectofungicides, Leningrad, 3rd Intern. Congr. Soil Sci., Oxford 1935, 83-95* (in German).—The chemistry of humus from soil, peat and lignite is reviewed, and expts. are described from which it is concluded that the estn. of COOH and OH groups by methods outlined is of value in soil studies. The humus from soil contained less of both than that from peat, and the transition from lignite to coal showed progressive decreases. Hydrolysis expts. with humic acid indicate that the N compds are in part proteins and their decomposition products, easily made sol. by heating with acid or alkali, but another part of the N is firmly combined with humic acid and is not attacked by acid hydrolysis. Humic acid from various peats fixed 3-5-4% N on ammoniation. No exact relation between the degree of decompn. of a peat and its N content was discovered, but the higher the content of humic acids, the greater was the quantity of non acid-hydrolyzable N. In many cases, drying peat promoted hydrolysis of the N compds. Eighteen references. C J Schollenberger

Practical soil analysis. L. Schmitt. *Ernähr. Pflanze 31, 421-30 (1935)*.—The detn. of the fertilizer requirements of soils is discussed. With regard to lime requirement, the advisability of detg. values for exchange and hydrolytic acidity in addn. to pH values is discussed. When interpreting the results of the Neubauer method for available K_2O and P_2O_5 in the soil, it is necessary to take into account the individual soil characteristics. John O. Hardesty

The determination of organic carbon in soils. László G. Kotzmán. *Mészgazdasági Kutatók 8, 333-7 (1935)*.—The dry combustion method of Dennstedt, and methods of oxidation in soln. by sulfuric and chromic acids and by $KMnO_4$ were compared on nine soil samples. Two series of expts. were made, one without any previous treatment and another with samples treated previously with a strong soln. of H_2SO_4 . Chromic acid oxidation gave an av. of 91.1%, $KMnO_4$ oxidation 100.0% of the values obtained by the Dennstedt dry-combustion method. The $KMnO_4$ method seems to be the best for quick serial work. The values obtained ranged from 90.6 to 113.2% of those obtained by the Dennstedt method. It is proposed to det. factors for the $KMnO_4$ method on the basis of a set of many soil samples in order to eliminate the errors. S. S. de Finály

The carbide method of determining soil moisture. V. Sibirskii. *Pedology (U S S R) 30, 187-97 (1935)*.—See C. A. 29, 7545. J. S. Joffe

The influence of irrigation on solonetz soils. N. V. Orlovskii. *Pedology (U S S R) 30, 360-70 (1935)*.—Analyses—total and exchangeable bases—on the profiles of some solonetz soils are given. J. S. Joffe

The influence of absorbed magnesium on the physical properties of the soil. P. I. Shavruigin. *Pedology (U S S R) 30, 167-73 (1935)*.—Samples of chestnut brown soils, solonetz and chernozem were satd. with Ca, Mg and Na and subjected to a series of tests. The Mg soil did not filter as well as the Ca soil; its swelling, max. hygroscopicity and moisture capacity were higher than the Ca and lower than the Na soil. J. S. Joffe

Relations between surface, hygroscopicity and heat of wetting of soil. W. U. Behrens. *Z. Pflanzenernähr.,*

Düngung u. Boden 40, 257-310(1935) —A critical review is given of theories and exptl work of others with description of procedures and calens. B's investigations on the heats of wetting (H_w) of Na permute, kaolin and soils with H_2O , aniline, olive oil, toluene and paraffin oil indicate fairly regular decreases in the above order, i.e., H_w decreases as the interfacial tension with H_2O increases (cf. Patrick and Grimm, *C. A.* 16, 518). Wheat starch showed practically no H_w except with H_2O , but the other substances investigated had considerable H_w with all the liquids. With soils, H_w in cal/g multiplied by 3.6×10^4 approximates surface in sq cm/g, the hygroscopicity over 10% H_2SO_4 in g H_2O /100 g soil multiplied by 2.7×10^4 gives a similar value for surface, calens indicate that the av. thickness of the H_2O layer as above is 0.33 μ or 1.2 mol diams. Ninety-seven references.

C. J. Schollenberger

Granulometric (mechanical) composition as an index of the physicochemical properties of soils and subsoils V. Bezruk *Pedology (U. S. S. R.)* 30, 202-18(1935) — Quartz sand was ground in a colloid mill, the fractions were sepd., and their properties with respect to swelling, hygroscopic moisture, max. hygroscopicity and plasticity were detd. It is shown that the fractions less than 0.001 mm attain colloidal properties. The various quartz fractions were added to a morain loam (horizon B₁), podzol loam (horizon B₂), chernozem (horizon A), and solonetz (horizon B) in quantities sufficient to make them all of the same mech. compn. On the mixts the detns. made on the quartz fractions and resistance to compression and rate of wetting were also made. It was found that beside the mech. compn. the difference in the cation satn. (Na for solonetz, Ca for chernozem and H for the podzol) has a marked effect on the properties examd. and in road making these should be considered. J. S. Joffe

The influence of soil temperature upon development of plants J. O. Musso *Z. Pflanzenernähr., Düngung u. Boden* 40, 311-22(1935) —High soil temp. relative to that of the air is favorable to the development of above-ground parts and hastens ripening, underground parts develop better when the relation is reversed, with delay in maturity. The adaptability of soils to particular crops is influenced by factors affecting soil-air temp. differences, and artificial means of modifying the same, e.g., mulches, may be useful.

C. J. Schollenberger

Factors affecting the value of soil as a source of inoculation for leguminous crops H. W. Batchelor *Ohio Agr. Expt. Sta., Bull. No. 548 (53rd Ann. Rept.)*, 20(1935) —Four years' work shows that soils of pH 8.0, 7.0 and 6.0 are of value in the order given as carriers of N-fixing bacteria. Soils contg. added P were better carriers of the bacteria than unphosphated soils. Probably any soil contg. 1 million symbiotic N-fixing bacteria per g is satisfactory to use as an inoculant. C. R. Fellers

Comparative investigations on ashed and unashed materials by electrometric titration G. Demes *Z. Pflanzenernähr., Düngung u. Boden* 41, 74-82(1935) —The electrometric titration previously described (*C. A.* 29, 1561) has been applied to the detn. of "alkalinity" or potential base content of leaves, etc., in forestry soil studies. Two series of detns. were made on the same samples, one set merely suspended in H_2O , the others previously ashed, but the procedures are not clearly described. The detns. on unashed materials were not in good agreement with those previously ashed, the latter procedure is evidently necessary as a preliminary treatment. C. J. Schollenberger

The relationship between the reaction of a soil and its phosphate content E. G. Doerell *Das Superphosphat* 11, 107-12(1935) —With an increase in the av. yearly temp. from 4° to 10° over a period of 6 years there was a tendency for most of the soils examd. to become more alk. As the rainfall increased from 500 to 1300 mm, the no. of soils poor in phosphate increased from 85 to 100% of the total studied. When the soils were classified as to pH and amt. of phosphate, it was found that the majority of those that were very poor in phosphate were in the range 5.3-6.5. Those soils that were deficient in phosphate were in

the range 6.5-7.5. Those soils classed as good were in the range 7.5-8.5. K. C. Beeson

Efficiency of soil and fertilizer phosphorus as affected by soil reaction Robert M. Salter and E. E. Barnes *Ohio Agr. Expt. Sta., Bull. No. 553, 3-40(1935)* —A description is given of the effects of liming the naturally acid Wooster and Canfield silt loams upon the availability of soil P and upon the comparative efficiencies of different P fertilizers. Data from 6 field and 1 greenhouse study show there is a notable tendency for P response to decline as the soil reaction is changed from pH 5.0 to 7.5 by repeated lime applications. Lime makes available the stores of soil P with a rise in pH value. With most crops nearly max. yields were produced at the most alk. reaction without any added P. Soil P sol. in dil. org. acids at const. pH also was lowest at pH 5.0, increased markedly to pH 7.5, and was higher at pH 4.5 than at 5.0. Sudan grass in the greenhouse removed considerably more P from unphosphated soil at pH 7.0 than at 6.0. Conclusion: By maintaining the reaction of these soils at pH 7.5 satisfactory yields of crops may be produced with a min. investment in P fertilizers. Probably greater fixation of P took place at the higher pH values. Steamed bone meal showed an efficiency compared to superphosphate of approx. 80% for the cereals and timothy and equalled the superphosphate for clover on unlimed land, at pH 5.0. As the soil reaction was increased to pH 7.5 by repeated liming, the efficiency of the steamed bone decreased to 0 for corn, to about 20% for oats and wheat and to 30% for clover. Basic slag showed an efficiency compared to that of superphosphate of about 85% for the cereals on unlimed land and was about 40% superior to superphosphate for clover under the same conditions. With repeated liming the efficiency of the basic slag dropped to 0 for corn, to 70% for the cereals and to 85% for the clover. The P of rock phosphate had an efficiency of about 40% for both grain crops and clover on unlimed land. With repeated liming to a pH of 7.5 its efficiency dropped to 10% or less for the same crops. Its efficiency for sweet clover at pH 7.0 was about 50%. $NH_4H_2PO_4$, with wheat at pH 5.5 showed an efficiency, as compared to superphosphate, of 68%. This increased to 73% at pH 6.0 and to 112% at pH 7.0. The efficiency of all P fertilizers on these soils decreased as the soil reaction approached neutrality. C. R. Fellers

Availability and fixation of phosphorus in Hawaiian soils A. Floyd Heck *J. Am. Soc. Agron.* 27, 874-84(1935), cf. *C. A.* 30, 206¹ —The quickly available P content of Hawaiian lateritic soils is more variable than that for most groups of soils. As many as 75% of these laterites have a P availability low enough that they should respond to P fertilization. Laterites with a pH value below 6.5 are usually low in available P. Of the 70 soils with a pH value below 6.5, 54% have a P availability of 25 p. p. m. or less, and only 9% are above 100 p. p. m. In the 24 soils with pH values of 6.5 or higher, 54.2% have an availability above 100 p. p. m. Native P in these laterites of low P availability is largely in the form of basic Fe phosphate with a soly. of P similar to that of dufrenite. When soil P is applied to these laterites, the majority of them fix over 80% of the applied P in slowly available form. Most of this P is fixed in the soil as basic Fe phosphates, with perhaps some Al phosphates, but there is seldom much of it as Ca phosphate. J. R. A.

Further experiments on the influence of soil reaction and phosphonic acid on the growth of vines Karl Möhringer *Z. Pflanzenernähr., Düngung u. Boden* 41, 28-36(1935) —In a continuation of the work previously reported (*C. A.* 29, 1558⁹), the effectiveness of Rhenania phosphate in promoting general vigor and root growth was confirmed, a small dose of CaO , raising the pH value from 3.9-4.1 to 4.3-4.5, caused a temporary improvement almost as great, although the final effect was less favorable. This indicated a need for P_2O_5 as well as reduction of soil acidity. Observations on leaf color, etc., indicated some correlation with factors known to affect the vines, but it is concluded that the practical value of such foliar diagnosis is slight. Detns. of P_2O_5 and K_2O in wood and roots at the end of the expt. indicated nothing significant.

Differences in soil pH at the end were so slight that they were probably not decisive, unless indirectly through changes in availability of P_2O_5 ; the substantial correctness of the acidity limit, pH 5, for good growth of the vine still stands. Nine references. C. J. Schollenberger

The role of phosphates and lime on podzol soils of variable concentrations of hydrogen and iron. A. T. Kurnakov. *Podology* (U. S. S. R.) 30, 493-500 (1935). — Pot expts with barley on podzol show that P in the form of acid phosphate immobilizes the soil iron, an addition of lime accomplishes this result and increases the pH , the addition of Na_2HPO_4 immobilizes the Fe and increases the pH . Mobile Fe decreases the P intake by plants. Thomas slag is very effective on podzols because of its activity similar to Na_2HPO_4 . J. S. Joffe

The determination of the forms of inorganic phosphorus in soils. R. Anderson Fisher and R. P. Thomas. *J. Am. Soc. Agron.* 27, 863-73 (1935). — A method is proposed for distinguishing the different forms of inorg. P. An extractant of pH 2 consists of a 0.02 N H_2SO_4 and 0.3% of $KHSO_4$ and another of pH 5 consists of a buffered soln. of $AcOH$ contg. 3.6 cc of concd. $AcOH$ per l. and 19.04 g. of Na acetate. To two 750-cc. Erlenmeyer flasks contg. 2-g. samples of soil is added 400 cc. of the pH 5 extractant and, similarly, to a third flask is added an equal vol. of the pH 2 extractant. These soils were sufficiently buffered to maintain unchanged pH values during extn. of calcareous as well as acid soils. After 30 min. of shaking, the soln. of 1 of the pH -5 extn. flasks is filtered. The other pH -5 extn. soln. is filtered after 2 hrs. of shaking and the soln. with the pH 2 extractant is filtered after 2 1/2 hrs. of shaking. In each case only the filtrate which has run through in 15 min. is used for analysis and of this the first 25-30 cc. is discarded. Regular colorimetric detns. are made on these filtrates. From data on the solvent action of these 2 extractants, equations are set up for estg. the P present in the following 3 groups of materials: (A) amorphous and finely divided cryst. phosphates of Ca, Mg and Mn; (B) amorphous phosphates of Al and Fe; and (C) P absorbed upon hydrous oxides and that present in the form of apatite. This method of analysis placed 22 representative Maryland soils in practically the same order of P needs as did pot tests for response to P_2O_5 fertilization. J. R. Adams

The study of the mutual reactions of phosphates and soils. II. Action of lime on monocalcium phosphate in the presence of anhydrous calcium sulfate. J. Clurens and H. Marrius. *Bull. sv. chem.* [5], 2, 1930-5 (1935); cf. C. A. 23, 3325. — The presence of $CaSO_4$ modifies the pptn. of $CaH_2(PO_4)_2$ by CaO . At first $CaHPO_4$ is pptd. alone but the pptn. of $Ca_3(PO_4)_2$ soon follows and the proportions of this salt rapidly increase. With sufficient CaO the P_2O_5 is completely pptd. as tricalcium phosphate. The P_2O_5 is first pptd. as the monocalcium salt and addnl. CaO merely changes this to the $Ca_3(PO_4)_2$. The application of these data to the use of superphosphate as fertilizer is shown. J. R. Adams

The relative feeding power of oaks and maples for soil phosphorus. H. L. Mitchell and R. F. Finn. *Black River Forest Papers* 1, 6-9 (1935). — Over the range of P applied to the soil in the form of finely ground Florida phosphate rock, red maple leaves contained (wt. for wt.) approx. twice as much P as did the leaves of red oak growing on the same site and receiving identical fertilizer treatments. The ratio between the P absorption of the 2 species was approx. the same with the P supplied as "soil phosphate" (unfertilized soil of control plot) or as soil P plus various supplements of rock phosphate. Likewise, the leaves of sugar maples contained approx. twice as much P as did those of chestnut and white oaks growing on the same sites. P absorption tended to vary between genera but not with species. K. D. Jacob

A method for determining the nutrient needs of shade trees with special reference to phosphorus. Harold L. Mitchell. *Black River Forest Papers* 1, 1-4 (1935). — Comparable 0.25-acre plots of an even-aged (about 40 years) stand of mixed hardwoods, principally red oak (*Quercus borealis* Michx.), chestnut oak (*Q. montana*

Willd.) and red maple (*Acer rubrum* L.), were fertilized uniformly with varying amts. of finely ground rock phosphate on May 23, 1934. On Oct. 1 of the same year, 5-6 leaves of the various species were taken from approx. the same location on each tree (from the ends of the branches near the top of the crown on the south side); after they were dried, the petioles were removed and the finely ground leaf material was analyzed for P. The results indicated a close relationship between the amt. of P applied to the soil and the quantity of this element in red oak, chestnut oak and red maple leaves. Preliminary results indicated that there is also a correlation between the N and K contents of the leaves of various deciduous trees and the quantities of these nutrients supplied by soils. Ground phosphate rock seems to be a good source of P for both coniferous and deciduous trees. K. D. Jacob

The assimilation of phosphorus by *Aspergillus niger* and *Cunninghamella* sp. F. B. Smith, P. E. Brown and H. C. Muller. *J. Am. Soc. Agron.* 27, 988-1000 (1935). — The wt. of *Aspergillus niger* mycelium in Nihilas medium (cf. H. Nihilas, *et al.*, *Ernährung Pflanze* 26, 97-103 (1930)) to which sol. was added was roughly proportional to the concn. of P in the medium over the range from 0 to about 60 p. p. m. of P. This growth of *Aspergillus niger* may be used to indicate roughly the amt. of P available to *Aspergillus niger*, but the application of such results to show quantitatively the amt. of available P in the soil is likely to lead to erroneous conclusions. It may serve as a qual. test if the technique employed is carefully standardized. The most satisfactory procedure for the soil used was 4 g. of soil in 90 cc. of medium in a 250-cc. extn. flask with a 1-cc. suspension of spores 6-10 days old for incubation and an incubation period of 6 days. J. R. Adams

The role of potassium and of phosphorus in the utilization of nitrate and ammoniacal nitrogen by plants. F. V. Turchin. *Repts. Sci. Inst. Fertilizers and Insect-Fungicides, Leningrad, 3rd Internat. Congr. Soil Sci., Oxford 1935, 33-49* (in German). — From yields and compn. of barley grown in pots of sand, variously fertilized and with N supplied in several forms, and other crops in field expts., it is concluded that with deficiency in K, NH_4 is not efficiently utilized, but its accumulation in the leaves is toxic. Glucose also accumulates. When N is supplied as nitrate, lack of K is less serious, but the importance of P is greater. P_2O_5 is essential for the normal utilization of nitrate, with an insufficient supply, nitrate accumulates in the leaves. The relatively greater importance of K and P therefore depends upon the form of N available. In the soils of southern U. S. S. R., this is mainly nitrate; hence K is not needed so much as for the acid northern soils in which NH_4 is the source of N. These characteristics of the action of K and P also exert an influence upon the reduction-oxidation power of plant tissues, as shown by expts. P supplied in fertilizers increased the reducing power; this effect is explained as due to utilization of nitrate which requires a reduction. On the other hand, K increases oxidation power, required for the synthesis of amides from NH_4 . Depending upon the source of N, there is probably an optimum reduction-oxidation potential in plant tissues, and a proper balance between K and P supply is favorable to its maintenance. Fourteen references. C. J. Schollenberger

Phosphorus content and buffer capacity of plant sap as related to the physiological effect of phosphorus fertilizers in fibrous low-moor peat. J. R. Neller. *J. Agr. Research* 51, 287-300 (1935). — Fresh-sap studies were made of the leaves, and in some cases of the stems, of 5 different plants growing under field conditions on the brown fibrous peat of the Everglades. The total sol. P of the saps of these 5 plants was much increased by soil dressings with sol. phosphates. Lime acted to reduce and S to increase the assimilation of P in all plants studied. Total acidity and the total amt. of inorg. P tended to vary directly with the concn. of sol. P in the sap. Active acidity of the plant sap, expressed as pH values, changed appreciably as a result of different phosphate treatments, whereas the buffer capacities were much greater in the saps of high P content. Neither the sp. concn. nor the total sol. solids

of the saps appeared to have any definite relation either to P concn or to physiol injury. The crops that responded unfavorably, if at all, to P were those of which the saps were relatively high in P in the absence of soil treatment with a phosphate carrier. Those that responded favorably contained sap relatively low in P. W. H. Ross

Migration of phosphoric acid during the course of the process of podzolization. Joret and Malterre. *Compt rend acad Agr France* 21, 943-6 (1935).—The infertility of podzolized soils is due not only to a removal of the bases but also to the removal of P_2O_5 during podzolization. The removal of P_2O_5 to the lower horizons is paralleled by the removal of Fe_2O_3 . The removal of P_2O_5 from the surface soil does not prohibit setting up a supply of P_2O_5 in this soil but it puts a time limit on its availability.

J. R. Adams
The influence of special cultivation and liming on forest soils. Hugo Lendle. *Forstwiss Centr* 57, 477-94 (1935).—A preliminary report is given on the sep and combined effects of liming and cultivation with a special implement. Expts were made over a 3-yr period on forest soils of low lime content. Humus was detd by loss on ignition, and pH colorimetrically and by the quinhydrone electrode. Methods for mech analysis, percolation and pore vol also are described. *Ibid* 513-29.—The cultivation markedly reduced the time of infiltration of H_2O into the soils while liming caused a slight increase in the time on the cultivated plots. The penetration resistance to a sounding instrument was increased by lime on plots low in humus but decreased on those higher in humus. The loosening effect of cultivation was most lasting on soils low in clay and humus content. *Ibid* 550-72.—Liming and cultivation caused a decrease in humus content. H_2O content in general was parallel to the humus content. The limed and cultivated soil of one plot showed a higher relative H_2O humus ratio than the plots cultivated or limed separately. The reverse was true on another plot, however. *Ibid* 695-608.—The pH of fresh soil was from 0.1 to 1.4 units higher than of air-dry soil from one plot but in others small differences were found. Liming was effective to a depth of 10 or 15 cm, and raised the surface pH from 5.5 to nearly neutral. Cultivation raised the pH of sandy soil but not of loam soil. *Ibid*, 627-39.—A summary of preceding articles is given with a list of 62 references.

Irvin C. Feustel
Lime and calcium sulfate plants, a contribution to the subject of soils and plants. O. H. Volk. *Ber. deut. botan. Ges* 53, 796-806 (1935).—Soils high in $CaSO_4$ did not differ essentially from soils high in $CaCO_3$ in the properties investigated. The plants found on $CaSO_4$ soils are similar to those found on other soils that have an alk pH and are well aerated, provided other conditions are favorable.

Lawrence P. Miller
Atmospheric additions of combined sulfur to arable soils. Gabriel Bertrand. *Compt rend acad. agr. France* 21, 1015-19 (1935). *cf* C. A. 29, 8998¹.—Careful detas of the combined S in rain water near Grignon showed that there was about 2.5 mg of the metalloid per l of water. If this was completely absorbed by the soil, it would be sufficient to cover the S requirements of the principal cultivated crops of that locality.

J. R. Adams
Soil and fertilizer studies by means of the Neubauer method. S. F. Thornton. *Ind. (Purdue) Agr. Expt. Sta., Bull. No. 399*, 3-38 (1935).—Soils of pH 5.6-8.0 were exam'd by the Neubauer technic to det mineral nutrient deficiencies. Very acid soils are slightly more deficient in available P and K than those of neutral reaction, but soil reaction cannot be used as an indication of fertilizer needs. Subsoils are much lower in available P than surface soils. Nearly all subsoils are deficient in P. Values for available K are only slightly lower for subsoils than for corresponding surface soils. For 20 soils of pH values 4.5-8, P recovery varies from 4.4 to 56.8% with $CaH_2(PO_4)_2$ and from 4.4 to 42.4% with $Ca_3(PO_4)_2$. The efficiency of sol $CaH_2(PO_4)_2$ is detd largely by the fixation capacity of the soil, while that of the $Ca_3(PO_4)_2$ is influenced by both fixation power and solvent power. K recoveries are much higher than those of P, varying from 29.2 to 100%.

On very acid Newton fine sandy loam, the addn of lime doubles the P recovery from $CaH_2(PO_4)_2$ but has little effect on K recovery. With separates from 8 types of domestic rock phosphates, neither the Neubauer method nor pot tests show any significant influence of particle size on P availability. P recovery from 22 different P carriers is increased by addn of KCl, the av increase being 4% from both quartz sand and acid silt loam soil. For 21 different soils of pH 4.5-8.0, the addn of KCl results in a consistent increase in the available P supply. The addn of Ca phosphates does not increase the available soil supply of K. NH_4NO_3 gives a marked increase in recovery of P from $Ca_3(PO_4)_2$. Results of the analysis of soils from 6 continuous fertilizer expts running 10-20 years show no significant residual accumulation of available P or K as a result of the different treatments. Seventy-seven references.

C. R. Fellers
Movement of fertilizer salts in soils by capillarity. G. M. McClure. *Ohio Agr. Expt. Sta., Bull. No. 548 (3rd Ann. Rept.)*, 18-19 (1935).—P supplied by rock phosphate did not move upward to any extent. That supplied by either $(NH_4)_2HPO_4$ or $NH_4H_2PO_4$ showed the greatest movement, followed by Na and K phosphates. The movement from treble superphosphate was appreciably greater than that from 20% superphosphate but less than that from the NH_4 , K or Na phosphates. The presence of $(NH_4)_2SO_4$, $NaNO_3$, or $NaCl$ did not affect the extent of the movement of P from 20% superphosphate. N supplied by the NH_4 phosphates did not move upward to so great an extent as did that supplied by $(NH_4)_2SO_4$ or $NaNO_3$. The soils used were Chenango loam of pH 4.6 and after liming 7.2, Wooster silt loam, Miami silty clay loam and a Brookston clay. The fertilizer was applied in a narrow zone about 1/4 in. above the bottoms of soil columns which were 6 in. deep and 3/4 in. diam.

C. R. Fellers
Irrigation water and cultivation of citrus. A. Reilenberg. *Hadar* 8, 231-3 (1935).—Irrigation waters from various sources in Palestine contained bicarbonate (expressed as HCO_3) 96-304, Cl 47-1784, sulfate (expressed as SO_4) 6-189, nitrate (expressed as NO_3) 6-57, Na 5-917, K trace to 57, Ca 39-265, Mg 7-102 and Fe trace to 14 p.p.m. The pH values were 7.3-8.6. Damage to citrus trees occurs when the Cl content of the water is 300 mg/l. or more, but complete infertility or death of the trees occurs only at much higher concn.

K. D. J.
The requirements in water and fertilizers for the accumulation of nicotine in some types of *Nicotiana rustica* cultivated in the irrigated fields in the lower Volga region. A. Ya. Tolstoplek. *Tobachnaya Prom* 1935, No. 3, 20-2.—The yield of nicotine does not show any regularity when irrigation and fertilizing conditions are changed; the changes affect various types of *Nicotiana rustica* differently.

A. A. Boechting
Further experiments on the fertilizing action of magnesium. M. Popp, J. Contzen and F. Nieschlag. *Z. Pflanzenenergie, Düngung u. Bodenk* 40, 323-57 (1935).—Pot tests with grass and field expts with potatoes on peat and sandy soils, comparing CaH_2PO_4 and $MgHPO_4$, K_2SO_4 and sulfate of potash magnesia and other fertilizers, as to effect upon yields and compn. of crops and analyses of the soils are reported. Conclusion. Although Mg salts are in many cases beneficial, their effect cannot be predicted from data obtained by HCl or NH_4Cl extn. of the soil.

C. J. Schollenberger
Ammoniated peat—mechanism of formation of water-soluble nitrogenous constituents. L. B. Howard, L. A. Pinck and G. E. Hilbert. *Ind. Eng. Chem.* 27, 1508-9 (1935). *cf* C. A. 29, 3447¹.—Ammonia, urea, other amide, unclassified and total N were detd. on the cold water exts of a peat ammoniated 4 hrs at 180° at 35 kg per sq cm and of the same peat after drying and reammoniation for an addl 24 hrs. The formation of 75-90% of the water-sol constituents of ammoniated peat involves the production of NH_4 salts of carboxylic acid which are transformed on continued heating (1) by decarboxylation to evolve CO_2 which in the presence of excess NH_3 is converted to urea and (2) by dehydration to

form other amides. This transformation of the NH_4^+ salts prevents loss of NH_3 by disson upon storage. Max. potential carboxylic acid content of the peat is desirable.

Colin W. Whittaker

Color of apples as affected by weather and cultural conditions. C. O. Rawlings. New Hampshire Hort. Soc., 24th Ann. Rept. 1934, 29-34.—Defoliation of apple trees was accomplished by spraying the trees with 5% solns of either $\text{Ca}(\text{NO}_3)_2$ or NaNO_3 2 weeks prior to harvest, the treatment materially improved the color of the apples without injuring them, although the Williams variety showed some fruit drop. Injection of H_2BO_3 , HCl , sugar or NaNO_3 into the branches caused defoliation in some instances, but none of the treatments was successful, for one reason or another, although H_2BO_3 markedly improved the color of the fruit. NaNO_3 reduced the color and caused leaf injury. The color of the fruit was improved somewhat by ringing the trees to increase the sugar content of the apples. The color of the apples was increased markedly in some instances by applying sugar to the soil beneath the trees 3 weeks before harvest, and the fruit ripened 2 weeks earlier, direct injection of sugar into the branches had no significant effect. Application to the soil of S, lime, citric acid, $\text{Fe}_2(\text{SO}_4)_3$, MnO , KCl or superphosphate had no effect on the color. In general, late summer applications of NaNO_3 did not affect adversely the color of the apples.

K. D. Jacob

Examination of vine leaves to determine deficiency of nutrients. László Salacz. Magyar Ampel. Értékn. 9, 218-53(1935).—Analyses are given of vine leaves during the period of vegetation on plots untreated and fertilized with various combinations of plant nutrients. The N content decreased from 3.29-4.14% in May to 0.85-1.85% in October. K_2O content of dry matter was 1.64-1.96% in May and diminished to 0.73-1.23% in Oct. P_2O_5 decreased from 0.66-0.79% in May to 0.08-0.20% in Oct. The results correspond to those of Lagatu (C. A. 22, 837) with the exception that in Hungary the K content of the leaves is not higher than that of nitrogen in a good harvest.

S. S. de Finály

Experiments to formulate practical rules of fertilization. László Salacz and István Kúhn. Magyar Ampel. Értékn. 9, 254-7(1935).—Expts. made on different types of vine soils in Hungary from 1921 to 1934 are summarized. Yield produced by various mixes of fertilizers is noted. Best results seem to be obtained by using chiefly N fertilizers only. P and K salts are of less importance.

S. S. de Finály

Choosing the proper types of fertilizers on the basis of characteristics of vine soils. Desző Dicity. Magyar Ampel. Értékn. 9, 257-66(1935).—A table based on theoretical investigations is given, by which fertilizers can be selected for vine soils according to their appearance, color, lime content and density.

S. S. de Finály

Hardness [of apple trees] in relation to fertilizer application. Fred. S. Browne. Pomological & Fruit Growing Soc. Quebec, 41st Ann. Rept. 1934, 22-4.—The av. hardness rating (resistance to winter injury) of Wealthy apples was 80.56 for trees receiving fertilizers contg. N, P and K. The av. rating was 26.25 for trees receiving only N and P, 26.46 for those receiving only N (applied as NaNO_3) and 29.37 for unfertilized trees. Similar results were obtained with the Golden Russet variety, but fertilizers had comparatively little effect on the hardness of the more resistant Fameuse variety.

K. D. Jacob

Fertilizer experiments on lucerne grass. Felix Frank. Erdk. Pflanze 31, 410-15(1935).—It is only when the crit. H_2O content of the soil has been detd. (Sekera's method) that allowance can be made for the mobility of the soil nutrients, and the Neubauer values corrected accordingly. This explains why good response of K_2O fertilizers is found on soils with high Neubauer values. Neubauer values are of themselves not a reliable criterion of the fertilizer requirements of the soil.

J. O. H.

The technology of humic phosphate fertilizers. K. K. Apushkin and E. A. Kurochkina. Mineral'nue Udo-

breniya Insektosungusdus 1, No. 4, 96(1935).—Humic phosphates contg. up to 40% H_3PO_4 were obtained by repeatedly treating peat with technical H_3PO_4 . In this process peat is partially hydrolyzed to sugars which can reduce Fe, forming with it complex compds., which in their turn inhibit the pptn. of Fe phosphates. The humic phosphates on being treated with liquid NH_3 and $\text{KNH}_4(\text{NO}_3)$ become ammonized, this permits the prepn. of humic ammonium nitrate phosphates with a ratio of N P of 1:1, with a humic ammonium nitrate phosphate content of up to 20% in the fertilizer (over 40% of N + P). The humic ammonium nitrate phosphates were obtained not only from peat but also from long-flame coals. Good results were obtained with these compds. in the field.

A. A. Boethlingk

The agricultural chemical characteristic of potash-ammonium nitrate. F. V. Turchin. Mineral'nue Udobreniya Insektosungusdus 1, No. 4, 68-72(1935).

The best fertilizer for areas requiring N and K is an equimol mixt. of NH_4NO_3 and KCl . The presence of Cl (22-23% of the weight of the fertilizer) in the potash-ammonium nitrate fertilizer does not have a detrimental effect on the plants.

A. A. Boethlingk

The antagonistic action between potash and alkaline earths for plant growth. Kisaburo Shibuya and Takashi Toru. J. Sci. Soil and Manure (Japan) 9, 411-24 (1935).

Expts. were conducted with rice plants, sown and grown for 18 days in quartz sand according to the Neubauer method. Mixed salts in soln. together with lime and magnesia were added in several quantities to 0.05 N K_2SO_4 , 0.1 N KCl or 0.01-0.05 N KNO_3 . Results were: (1) K-Ca and K-Mg antagonisms were noticeable during the growth of rice plants. (2) Degree of the antagonistic action depended upon the kinds of cations and anions in the following order: K-Ca greater than K-Mg, and SO_4 greater than Cl greater than NO_3 . (3) The greatest effect of antagonistic action was observed in the soln. of salts of the same disson degree. (4) The antagonistic action caused an unfavorable effect upon plant growth in cases where the nutritive potash was present in less than adequate amt. The effect was not so unfavorable in the cases where potash was in excess. (5) The nitrates were observed to display only slight antagonism between cations owing to the fact that they changed the disson degree to no appreciable extent on being added to the soln.

Y. Kamoshita

Determination of fertilizer needs from root-soluble, citric acid- and water-soluble phosphoric acid. II. E. Knickmann. Z. Pflanzenernähr., Düngung u. Bodenk. 41, 208-24(1935).—A continuation of the study previously reported (C. A. 28, 1451), now including data on 4126 samples, indicates that a prediction as to the profitable use of a P_2O_5 fertilizer based on a lab. examn. of a soil sample by any single test is of questionable value, and in any event requires careful consideration of local conditions rather than a rigid adherence to arbitrary rules. The application of 2 or more different tests may lead to more reliable conclusions. The indications as to root-sol and H_2O -sol P_2O_5 agreed better than in the previous study, but H_2O - and citric acid-sol. data were again at wide variance.

C. J. Schollenberger

Compositions of nitrogenous fertilizer salts sold in the American market. Henry E. Cutts. Ind. Eng. Chem. 27, 1491-2(1935).—All constituents whose presence was suspected were detd. in 4 samples of com. $(\text{NH}_4)_2\text{SO}_4$, 3 of domestic and 6 of foreign NaNO_3 , 1 of Ca cyanamide, 2 of Chilean and 2 of synthetic KNO_3 , 1 of Ammo-Phos, 1 of $\text{Ca}(\text{NO}_3)_2$ and 3 of NH_4NO_3 (Calnitro). The analyses are believed to be representative.

C. W. W.

Comparative test of different bedding materials and chemical supplements with cow manure applied in a three-year rotation. T. E. Odland and H. C. Knoblauch. R. I. Agr. Expt. Sta., Bull. No. 251, 3-10(1935).—Straw, sawdust and wood shavings used as absorbents for cow excrement over an 18-year investigation showed no ill effects on crop yields when used as fertilizer. There was no significant change in the soil acidity of any of the plots receiving these materials. When these bedding materials

were supplemented with P and K, normal crop increases were obtained. C. R. Fellers

Further vegetation experiments with Kotka phosphate C. Krügel and C. Dreyspring. *Superphosphate* 8, 201-6, 221-6 (1935); cf. C. A. 28, 3512. —Kotka phosphate is a material made in Finland by treating phosphate rock with a deficiency of H_2SO_4 , approx 55% of the total P is sol in water and approx 63% is sol in water and NH_4 citrate soln. In expts with winter cereals on acid to slightly acid loamy sand soils and sandy loam soils the effect of Kotka phosphate and of basic slag in increasing the initial growth of the plants was inferior to that of superphosphate. As vegetation progressed the differences became less pronounced, and at the end of the period of growth the 3 materials gave practically the same results. When it was applied as a top-dressing, Kotka phosphate gave results decidedly superior to those obtained with basic slag but somewhat inferior to those obtained with superphosphate. K. D. Jacob

The conservation of liquid and stable manures with superphosphate W. Dix. *Das Superphosphat* 11, 105-7 (1935). —Ten-lb quantities of superphosphate were added 3 times during collection to a 5000-l pit of urine. By the addn of superphosphate total solids increased from 1.97 to 3.04%, P 0.26 to 0.58%, K 32.4 to 33.0%, and although the N content decreased from 15.43 to 13.7%, the amt of N per l increased from 3.05 to 4.16 g. Mixts of superphosphate and stable manure showed 40% more N than did the stable manure alone. K. C. Beeson

Can fertilizers be harmful to fish in ponds? P. Vivier. *J. agr. prat.* 99, 328-9 (1935); cf. C. A. 28, 4160. —While ammoniacal salts are much more toxic to the fish than K salts, the concns in the ponds arising from the normal use of these salts as fertilizer on the surrounding soil or in the ponds is so small that they are inoffensive to the fish. P_2O_5 fertilizers are absolutely inoffensive. J. R. Adams

Evaluating liming materials M. Popp. *Deut. Landw. Presse* 62, 487-8 (1935). —The solubilities of several carbonates and quicklimes in $AcOH$ (15 g per l) were detd. The particle size in each case was the same, and the time of contact with the acid soln in each case was 10 min. The 3 softest and most porous limestones were about 86% sol. The remaining limestones averaged 84% sol. Cryst. materials were not less sol than the noncryst. A dolomite showed a soly of 10.7% in 10 min, and after 60 min of contact with the acid soln, the soly reached 22.8%. Several quicklimes low in Mg were about 90% sol, while those contg Mg showed a wide variation in soly. (57.8 to 83.1%). K. C. Beeson

Rates of solution and movement of different fertilizers in the soil and the effects of the fertilizers on the germination and root development of beans Charles B. Sayre and Arthur W. Clark. N. Y. Agr. Expt. Sta., Tech. Bull. No. 231, 67 pp (1935). —Greenhouse and field expts show that different kinds of fertilizers with the same placement may cause vastly different results on the growing plant or germinating seed. When broadcast, fertilizers are less likely to be injurious than when applied in contact with the seed. Contact of highly ionized mineral fertilizers with the seed or plant causes injury by plasmolysis. Many org. fertilizers also show this injury when first applied to the soil. Apparently injury from org. substances is caused by such sol. compds as amino acids or sol. peptides. Org. fertilizers greatly stimulate mold growth in the soil. Possibly some parasitic molds are thus stimulated and attack the plant to a greater extent. Lateral movement of fertilizer in the soil was very limited. Except with $CaCN_2$, the movement did not exceed 0.5 in. Side placement of fertilizer is likely to give better results than direct placement on the row above or below the seed. N compds dissolved out of org. fertilizers more slowly than from inorg. compds. Urea was very injurious to roots when first applied to the soil. With most fertilizers beans could not be planted in the fertilizer band for 14 days after fertilizing without reduction of germination. Castor pomace, cottonseed meal, Milorgaite, fish scrap and dried blood greatly reduced the germination of seeds

planted in contact with the fertilizer band until after the fertilizer had been in the soil for 14 days. When first applied these 5 org. fertilizers were also very toxic to the roots. Animal tankage and garbage tankage did not inhibit root growth, but the animal tankage did reduce the germination of seeds placed in contact with it. No N fertilizer stimulated the root growth. Steamed bone meal did not reduce germination of seeds placed in contact with it, nor did it injure root growth. It had the slowest movement of P out of the fertilizer band of any P fertilizer. The superphosphate reduced germination of seeds when first applied, but after 2 days, there was no injury. The superphosphate had a decidedly stimulating influence on plant root growth, especially the fibrous roots. Ammoniated superphosphate and Ammo Phos A were injurious to germination of seeds planted in contact with the fertilizer until these fertilizers had been in the soil for 14 days. As soon as the toxic action of the sol. N in these compds had worn off (in a few days), there was a very stimulating effect on root growth. The carriers of K had no stimulating effect on root growth. They had a very rapid rate of soln and reduced the germination of seeds planted in contact with the fertilizer bands and also inhibited root growth until the concn of sol. salts had been sufficiently reduced by diffusion so that they no longer plasmolyzed the plant cells. After 2 days, K_2SO_4 and KCl no longer injured germination of seeds or produced root injury. Kainite remained toxic for a longer time. Com. fertilizers showed germination and plant root injuries in accordance with the sep. actions of their ingredients. Fertilizers have a considerable perpendicular movement in the soil. The inorg. N compds. showed the greatest movement, org. N compds. next, and P compds. showed the least movement in the soil. Water-sol. K from the fertilizers was quickly changed to a water-insol. form in the soil. Several small applications of fertilizer are less injurious than a single large application. C. R. F.

Treating ordinary and acid superphosphates with ammoniacal solutions of ammonium nitrate L. Berlin, L. Gontikaya and A. Zasedateleva. *Mineral'noye Udobreniye Insektifungitsid* 1, No. 4, 21-37 (1935); cf. C. A. 29, 3094. —When ammoniacal NH_4NO_3 was introduced into the superphosphates in batches, the following ratios of $N:P_2O_5$ in the product were obtained: (a) Ordinary superphosphate from phosphorite and unconcentrated apatite, $N:P_2O_5 = 0.5-1.2$; (b) ordinary superphosphate from floated apatite after storage for 20-30 days, $N:P_2O_5 = 0.4-0.7$; (c) double superphosphate from Vyatka phosphorite, $N:P_2O_5$ maximum 0.5; (d) double superphosphate from 35 and 40% apatite concentrates, $N:P_2O_5$ up to 0.75. Continuous satn. in the lab yielded a sticky product. Commercial-scale expts were successful. A detailed description of the expts is presented. A. A. Bochtlingk

Microelements A. A. Khalizev and M. V. Katalumov. *Repts. Sci. Inst. Fertilizers and Insectofungicides, Leningrad, 3rd Intern. Congr. Soil Sci., Oxford 1935*, 51-65 (in German). —Pot expts with mustard in water and sand cultures with variations of Hellriegel's soln. of nutrient salts of single and double concn, with and without a special addn of microelements, viz., B, Mn, Zn, Cu, I and F, indicated in the latter case a greater yield of pods when N was supplied as NH_4 salts, but this was due to traces of microelements from the impure chemicals which were still available in the physiologically acid soln. When the microelements were intentionally added, nitrate was the best source of N. Yields of oats, especially of grain, were greatest with the doubled concn of nutrients with a special addn of microelements, but in the absence of the latter, growth was best in the less concd. soln. B and Mn had the greatest effect in increasing yields. Field and pot expts indicated that the depressant effect of overliming podzols, a red earth and *Hymn* peat, as well as an artificially acidified chernozem, is dependent upon deficiency in available B. When the latter was supplied in small amt, the same liming treatments increased yields. A similar expt with barley on the peat soil indicated deficiency in both B and Cu. On peat excessively limed, B

and Mn caused great increases in yields of oats, likewise with wheat upon an alkali soil treated with CaSO_4 . Plants growing on soils deficient in B and Cu often accumulate great quantities of N and ash elements. Mustard is damaged by a light liming of sandy podzol deficient in B, flax does not grow well unless B is supplied, even when this soil is not limed, and similar observations were made on a degraded chernozem. Twelve references. C. J. S.

The effectiveness of organomineral fertilizers. Z. V. Logvinova and A. G. Ivanov. *Repts. Sci. Inst. Fertilizers and Insectofungicides, Leningrad, 3rd Intern. Congr. Soil Sci., Oxford 1935, 67-82* (in German).—"Ammonium humate" (I) was prep'd by treating peats with NH_3 , which caused increases in N from 0.8-2.9 to 2.5-6.3%. Ammoniacal N increased from 1.3-6.3% to 28-50% of the total N. "Humamimophos" (II), ppt'd from NH_4OH exts. of the same peats by a H_3PO_4 ext. of phosphate rock and ammoniated to neutrality, contained 8.4-44.1% H_2O and 5.0-10.0% N on the dry basis, of which 57-85% was in NH_3 , with 7.6-16.1% P_2O_5 . Pot expts in which these in combination with KCl, etc., were compared with $(\text{NH}_4)_2\text{SO}_4$ and superphosphate for flax, hemp, barley and wheat indicated superior action of the humus preps., the N so supplied equaling that of $(\text{NH}_4)_2\text{HPO}_4$ or NH_4NO_3 . The products made from low-ash peat were higher in N and more effective. Some kinds of raw lignite had favorable effects in similar expts., others were of neg. value, but without exception the ammoniated products therefrom, similar to I and II, were superior to inorg. N and P_2O_5 fertilizers, causing large increases in both yields and quality. The first crop of flax utilized 40-90%, of wheat 70-100%, of the ammoniacal N so supplied. Both I and II should be evaluated on the content of ammoniacal N; the P_2O_5 of II is not inferior to that of $(\text{NH}_4)_2\text{HPO}_4$. The org. colloids of these materials are of special value on sandy soils. Twenty-three references. C. J. S.

The effects of fertilizers of various physiological character on Hungarian vine soil types. Dezős Dicity and Gyula Ebsenpauger. *Magyar Ampelol. Évkönyv* 9, 240-7 (1935).—*Sinapis alba* in acid soils (pH 5.07-7.31) gave best yields on fertilization with Rhenania phosphate and either Chile or lime salt-peter or $(\text{NH}_4)_2\text{SO}_4$. In alk. soils (pH 7.65-8.13) Rhenania phosphate and superphosphate were best, combined with $(\text{NH}_4)_2\text{SO}_4$.

S. S. de Finily. An investigation into the influence of ammonium sulfate on stubble-sown oat crops in Victoria. D. Wark. *Proc. Roy. Soc. Victoria* 47, 1, 78-95 (1934).—The final yields of hay and grain were markedly increased by the application of $(\text{NH}_4)_2\text{SO}_4$ at seeding. Marked variations occurred in the NH_3 content of the soil throughout the growing period of the crop. The nitrate contents of the soil increased from June to August on the $(\text{NH}_4)_2\text{SO}_4$ plots. The percentage N content of the crops in Oct was not affected by the different treatments, nor was there any difference in the N contents of the grain or straw at harvest. The total N removed by the crop on the $(\text{NH}_4)_2\text{SO}_4$ plots was in all cases more than that removed on the corresponding no-N plots, but the difference in amts. of N removed by the crops was less than 1/2 the difference in the amts. of N applied in the corresponding fertilizer dressings.

Leopold Schellán. The place of nitrogen fertilizers in a pasture-fertilization program. D. R. Dodd. *J. Am. Soc. Agron.* 27, 533-62 (1933).—A review of the literature on the use of N fertilizers on pasture land under Ohio conditions is given, and the major conclusions are summarized. J. R. Adams.

Fertilization experiments with various nitrogen salts. László Salacz. *Magyar Ampelol. Évkönyv* 9, 203-22 (1935).—Expts. were made on fertilization of grapes with lime nitrogen, or Leuna salt-peter and Nitrophoska. Fertilization increased yield in each case. On heavy soils the sugar content of the must obtained generally increased; total acids almost always diminished. On sandy soils the yield was increased, the sugar content of the must decreased and acidity became higher.

S. S. de Finily. Fertilizer experiments with lime-nitrogen. László

Salacz. *Magyar Ampelol. Évkönyv* 9, 190-203 (1935).—Application of lime nitrogen generally increased the yields of grapes. The sugar content of the must from plots where a yield increase was observed somewhat diminished, the content in acids increased. S. S. de Finily.

Experiments on vines with potassium fertilizers. László Salacz. *Magyar Ampelol. Évkönyv* 9, 223-39 (1935).—The acid content of musts was decreased by fertilization of the vine, the sugar content sometimes decreased, other times increased. Soils poor in K gave good results on application of double doses of K salts, other soils showed better yield with single doses. S. S. de Finily.

Comparison of the effect of potassium fertilizers on grain cultures. V. N. Prokoshchev and E. M. Ustyuzhanina. *Mineral'nue Udobreniya Insektofungitsidus* 1, No. 5, 59-69 (1935).—Expts in great variety were made with sylvinit, carnallite (of various degrees of concn), KCl and mixts of these. The results depended on the soil, weather conditions and the type of plants and their rotation. A. A. Boethlingk.

Influence of aluminum sulfate on *Cyperus malaccensis*. K. Yamamoto. *J. Sci. Soil and Manure* (Japan) 9, 367-76 (1935).—In the cultivation of *Cyperus malaccensis* (a substance used in making Japanese mats) application of $\text{Al}_2(\text{SO}_4)_3$ to the soil has a favorable effect upon growth, yield and quality of fiber. This effect has been considered due to the increase of soil acidity. A similar effect was obtained in another case by applying H_2SO_4 instead of $\text{Al}_2(\text{SO}_4)_3$. In the water culture of the plant, however, the best growth was observed at pH 6 and the yields decreased gradually with decrease of pH, even though the plant grew normally at pH 4. Consequently, it may be concluded that the effect of acidity is indirect. The addn. of acid substance to the soils of paddy field caused an increase of NH_3 in the soils. The N content in the crops from the plot with acid substance was not always high in spite of the fact that the color of the stems was always green. Y. Kamoshita.

Calcium silicate slags. Properties of quenched and unquenched slags and effects of their admixtures with phosphatic fertilizers. W. H. MacIntire, L. J. Hardin and F. D. Oldham. *Ind. Eng. Chem.* 28, 48-57 (1936).—Results of microscopical and chem. examn. of slags from phosphate-reduction furnaces are given. Expts with dry admixts. of slag and triple superphosphate, with and without the addn. of NH_3 phosphates and K_2SO_4 , showed no formation of citrate-insol. P_2O_5 when measured by the citrate extrn. method at the end of a 35-day period. There was no loss of NH_3 from the dry mixt. and no appreciable fixation of K_2O in the "complete" mixt. Similar expts. with admixts. of moistened slag to triple superphosphate caused the complete disappearance of H_2O -sol. P_2O_5 and the formation of considerable citrate-insol. P_2O_5 . With the moistened mixts. contg. NH_3 phosphates there was a partial decline in the H_2O -sol. P_2O_5 , a negligible increase of citrate-insol. P_2O_5 , some loss of NH_3 and a definite fixation of K_2O . The influence of the slags on the solvent power and pH values of citrate soln., the factors of F content and silica value, and the inapplicability of the "official" method for citrate extrn. of such mixts. are discussed. The admixts. are proposed for dilg. triple superphosphates to "standard" concn near the point of usage to improve drillability and to eliminate acidity and F toxicity. John O. Hardesty.

The influence of chloride upon the growth of tomatoes. A. V. Yur'ev. *Konservnaya Prom.* 1935, No. 5, 20-4.—Lab. and field observations establish a concn limit of NaCl of 0.2% by wt. of dry soil for cultivating tomatoes in a soil contg. little other salts. A concn of 0.03% NaCl in the same conditions stimulates their growth.

B. V. Shvartzberg. Influence of sodium salts on the crop of sugar beets in the presence of nitrogen derived from various sources. P. N. Ushkina. *Mineral'nue Udobreniya Insektofungitsidus* 1, No. 5, 98 (1935).—NaCl and Na_2SO_4 had a favorable effect on the crop and the yield of sugar only in containers with nitrogen and phosphate or a complete fertilizer. The expts. are described. A. A. Boethlingk.

The effect of the organic and inorganic fertilizers prepared from peat Z V Logvinova *Mineral nuzi Udobreniya Inskhlofungsidi* 1, No. 5, 69-81 (1935) — Fertilizers prep'd by treatment of peat or coal with NH_3 and H_2PO_4 are better than $(\text{NH}_4)_2\text{SO}_4$ and are better than, or equal to, humic ammonium phosphates and NH_4NO_3 because of the presence of the org. substance in peat. They are higher in the total ammonia N when peat low in ash is used. Field expts are described. Twenty-three references.

Flax investigations J G Hutton and Clarence Strickland S Dak Agr Expt Sta, *Ann Rept* 1934, 20 (1934) — Applications of P trebled the yield of flax seed, the yield of oil was proportionately increased. The P also increased the wt of individual seeds. Both the vegetative and seed-producing stages were advanced 1-8 days where P was used. There was no correlation between oil content and I value of the oil.

Concentrations of mineral nutrients in the corn plant as affected by fertilizer treatment J D Sayre and V H Morris Ohio Agr Expt Sta, *Bull* No 548 (53rd Ann Rept) 25-61 (1935), cf. C A 29, 80611 — From corn plants grown on soils with various fertilizer treatments the sap was expressed and examd for nitrate, NH_4 , amino N, sol org N, inorg P and K. Inorg P showed no consistent increase in the stem tissue with fertilization. On the other hand, inorg N showed definite increases with added N fertilizers.

Spraying experiments on fruit trees B Husz *Bull Ec Hong Hort* 1, 8-22 (1935), *Rev Appl Mycol* 14, 773 — Almost perfect control of red spot on plum varieties was given by 4 applications of 0.5 to 1% Bordeaux mixt., lime sulfur and a combination of lime sulfur and Ca arsenate. The best control of apple diseases (chiefly *Podosphaera leucotricha*) and pests was given by a combination of 1% lime sulfur with Pb arsenate paste (8.75% Pb) or for later applications with Ca arsenate (0.25% Arzola).

Control of the bean weevil and the cowpea weevil S Marcovitch J Econ Entomol 28, 796-7 (1935) — The bean weevil (*Acanthoscelides (Mylabris) oblectus*) and the southern cowpea weevil (*Callosobruchus (Mylabris) maculatus*) were studied with reference to the effects of dust upon them. The latter species is the effects resistant, 1 part $\text{Ca}(\text{OH})_2$ to 1 part cowpeas or 1 part Na_2SiF_6 to 500 parts cowpeas being necessary to protect this commodity. For protection from *A. oblectus* 1 part $\text{Ca}(\text{OH})_2$ to 50 parts beans and 1 part Na_2SiF_6 to 1000 parts beans are required.

Calcium arsenate as a control measure for the tobacco flea beetle and hornworm W W Stanley and S Marcovitch J Econ Entomol 28, 797-801 (1935) — PbH_2AsO_4 , Ca arsenate, Na_2AlF_6 (natural and synthetic) and BaSiF_6 did not seriously injure tobacco foliage. Paris green, however, produced serious injury. The Ca arsenates of tobacco flea beetle (*Epirix parvula*) was most successful. The fully controlled with dust applications of BaSiF_6 or Ca arsenate, slightly better with Pb arsenate dust than with PbH_2AsO_4 and Na_2AlF_6 (synthetic) applied as sprays were about as effective as when used as dusts. Flea beetles were controlled with equal effectiveness by sprays of these 3 compds. Derris and pyrethrum were not satisfactory for the control of these insects. Ca arsenate was the most practical insecticide for these insects on tobacco.

Control of the pecan nut case bearer in the Southeast (United States) G P Mozzette J Econ Entomol 28, 791-4 (1935), cf. C A 29, 59763 — *Acrobasis caryae* was controlled with sprays of summer petroleum oil emulsion nicotine sulfate (contg 40% nicotine) mixt. with fish oil nicotine sulfate mixt., and with Bordeaux-hat a viscosity (Saybolt) of 61-63 secs, unsulfonated residue 92.8-96.8%. The fish oil showed a sp gr of 0.929, free fat acid (calcd as oleic) 8.3, I value (Hanus)

145, sapon value 195. Petroleum oil sprays with time were less effective, and pyrethrum and det in sprays were valueless.

"Brown heart," a new disease of swede, control T. Whitehead *Welsh J Agr* 11, 235-6 (1935) — The disease is characterized by a brown staining, flesh in more or less concentric zones at some distance from the rind of the swedes. Slices of the disease are translucent and the whole appearance is rem of "water core" in apples. A considerable degree of the disease was effected by the application of to the soil at the rate of 10 lb /acre; no further in ment was obtained by doubling the rate of appli.

The zinc sulfate treatment for mottle leaf of trees in the Sundays River Valley I Matthews *Grouer* 1935, No 41, 30-2 — The disease was cor. by spraying the trees in the autumn or early spring mixt of ZnSO_4 (contg 23-25% Zn) 10, hydrated and spreader 0.5 lb per 100 gal H_2O . The bet effect of the treatment was evident in 3-4 months.

The results of experiments carried out at the Enns factory to combat the cercosporiosis of the be (*Cercospora beticola* Sacc) in 1934 H Redlich *inst belge amelior betterave* 3, 275-93 (1935); *Rev A Mycol* 14, 813 — Almost without exception the y foliage, roots, weight and sugar content of beets tr with Bordeaux mixt or CuSO_4 dust against *Cercospora beticola* were higher than for untreated material. Bordeaux mixt proved the more reliable in most tests. A concn was inadequate but a 1% concn was adequate economical, whereas if a 2% concentrate were necessary cost would be too high.

The green peach aphid—further observations Ken M Ward J Dept Agr Victoria 33, 500-6 (1935) cf. C A 28, 55801 — A considerable reduction in the incidence of the insect (*Myzus persicae* Sulz.) was obtained by spraying the trees in winter with either 2-3% tar dilute, 5% red oil or 10% lime-S. The best results were tained with 3% tar distillate.

Economical amounts of nitrate of soda to apply in greenhouse for the growth of tomatoes Basil E Gil and Frederick R Fember. R I Agr Expt Sta, *E No* 252, 3 14 (1935) — For greenhouse tomatoes the of $\frac{1}{2}$ lb of NaNO_3 and 7 lb of org matter per $\frac{1}{2}$ sq ft gave optimum growth and yield. Spring crops of tomatoes grown on the same soil required approx dou these quantities. Cow manure was an excellent sou of org matter for tomatoes. During the short days winter the nitrate content of the tomato plant is high because of lack of utilization of nitrate for elaborating carl hydrates. Under these conditions only small amts of nitrate are required in the soil for optimal growth (C A 25, 2227).

Effects of arsenical sprays on grapefruit, orange tangenness, Temple oranges, limes and lemons Longfield-Smith Fla Dept Agr, Chem Div, *Rept Winter Haven Chem Lab* 1933-4, 3 70 (1935); cf. C A 30, 2224 — In all cases where As sprays had been applied As was found in the rind, rag and juice. If 1 portion of citrus tree was sprayed, the fruit from the unsprayed portion contained only traces of As. There was only very slight translocation of As by the vascular system of the tree. Exptl sprayings were made with As concn of 1.5 and 3 lb of Pb arsenate per 100 gal of water. Although the amt. of As present in the juices was negligible from a health viewpoint, it reduced acidity from 5-20%, de creased sol solids in some cases, and greatly hastened maturity. Growers were enabled to evade the green fruit law and fulfil the maturity standards of acid sugar ratio, although the fruits were of inferior quality, lacked juiciness and acid, and were insipid. Oranges were adversely affected to a much greater extent than grapefruit. Complete data are presented in 38 tables.

Effects of spray applications of triple phosphate of lime to grapefruit and orange trees L Longfield-Smith Fla Dept. Agr., Chem. Div., *Rept. Winter Haven Chem*

Lah. 1933 4, 71-84(1935).—Where the strength of the phosphate soln. used was 20 lb. per 100 gal. and only 1 application in June was made, the acidity was reduced 10% in grapefruit. Where the phosphate concn. was 15 lb. per 100 gal. the acidity decrease was 4.1%. There was no decrease in acidity when the phosphate applications were 5 and 10 lb. per 100 gal., resp. For the 2 largest applications there was a very slight but not consistent increase in sugar content. This is the opposite effect to that of As spray treatment. On oranges, only the 20 lb. per 100 gal. application gave a small decrease in acidity of 2.0%. As in the grapefruit, the phosphate sprays increased the sugar content very slightly. C. R. Fellers

Evaluation of vine sprays. Sándor Ránky and Ágnes N. Ozstroszky. *Magyar Ampelol Fikönyv* 9, 135-45 (1935).—Adhesive factor was detd. according to Paes and Staehelin. For Bordeaux soln. contg. excess lime the adhesive factor was about twice that of a neutral soln. The suspensibility of agents was detd. by sedimentation in cylinders and the data obtained were compared with that of a 1% Bordeaux soln. Sedimentation velocity of agents should always be detd. in evaluating them. S. S. de Finlay

Disinfection of vine shoots. Bertalan Stszehlo. *Magyar Ampelol Fikönyv* 9, 55-6(1935).—Vine shoots were treated with 0.4 to 1.2% solns. of formaldehyde for 2 to 10 min.; 2.5-7.0% of the buds of shoots were destroyed. Thus treatment with CuSO₄ soln. is both cheaper and more effective. A 5-min. treatment in a 1% CuSO₄ soln. or fumigation with 20% formaldehyde is proposed. S. S. de Finlay

Petroleum-kaolin emulsions in viticulture. Sándor Ránky. *Magyar Ampelol Fikönyv* 9, 119-51(1935).—Field expts. showed that petroleum-kaolin emulsions are suitable only for spraying small areas, since the dild. emulsion should be sprayed immediately after prepn. Where storage of the spray is necessary, soap emulsions are better. S. S. de Finlay

Insecticidal effects of nicotine-containing vine sprays. Sándor Ránky and Ágnes Németh Ozstroszky. *Magyar Ampelol Fikönyv* 9, 116-9(1935).—Expts. with various nicotine-contg. sprays proved that they act as tracheal and skin-poisoning agents. S. S. de Finlay

Recent experiments in flax disinfection. A. I. Iabel Nachr. *Schidl. Bekimpf., Leverkusen* 10, 70-3(1935). *Rev. Applied Mycol* 14, 763.—Promising results in the control of wilt (*Fusarium lini*) and anthracnose (*Colletotrichum lini*) on flax seed have been obtained by dusting the seed with Cresan which reduced the no. of diseased plants from 191 out of 600 to 11 out of 500 and also increased germination 13%. Oden E. Sheppard

Effect on transpiration of varying the copper-lime ratio in Bordeaux mixtures. J. D. Wilson and H. A. Rannels. *Ohio Agr. Expt. Sta., Monthly Bull.* No. 177, 206-9 (1935); cf. C. A. 30, 212.—When *Coleus* plants were treated with Bordeaux mixts. in which the Cu and lime ratios were varied by 3 lb. each in 50 gal. of water, the max. effect on transpiration rate was caused by the 3 to 50 formula. As the CuSO₄ increased beyond 3 lb. in 50 gal. of water, the effect on transpiration decreased. This was also true to a lesser extent when the lime content was increased beyond 5 lb. Increases in the CuSO₄ content of Bordeaux mixt. which was applied to plants increased their water requirement slightly. Most plants were injured by the application of a 15 to 50 formula and some by a 12 to 50. Increases in the amt. of Ca(OH)₂ used in the spray formula resulted in a decrease in growth and an increase in water requirement. C. R. Fellers

New observations on the action of boron in beet heart rot. L. I. Fox and H. Burg. *vin. Compt. rend. acad. agr. France* 21, 979-82(1935). cf. C. A. 29, 2257.—The results confirm the value of H₂BO₃ or Na borate as a control against beet heart rot. H₂BO₃ should be used at the rate of 8 to 10 kg. per hectare for a first treatment and Na borate at the rate of 11-16 kg. The best results are obtained by intimately mixing with the fertilizer before spreading. A certain delayed protective action was observed. At the rates recommended there appears to be

no danger of toxicity caused by the accumulation of B in the soil. J. R. Adams

Improving Bordeaux solution. Sándor Ránky and Ágnes N. Ozstroszky. *Magyar Ampelol Fikönyv* 9, 131-5 (1935).—The sedimentation was slower, the adhesive power greater and the fungicidal effect stronger when the CuSO₄ soln. was poured into the dild. lime milk and not the latter poured into the CuSO₄ soln. as originally proposed by Millardet. S. S. de Finlay

Pyrethrin, rotenone and nicotine. D. Mann. *Sesfensieder-Zig* 62, 892-3, 913-5, 934-5, 954, 973-5, 991-3, 1010-17, 1015-7(1935), cf. C. A. 29, 5080.—A review of methods of prepn., testing and using rotenone and derris-root exts. Over 100 references. J. W. Perry

A new source of sulfur for combating insects and agricultural diseases. L. A. Pokrovskii. *Mineral'nue Udobreniya Insektofungusidus* 1, No. 5, 89-91(1935).—

An insecto-fungicidal prepn. was obtained by boiling S tailings (containing 30-55% S) obtained in the flotation of S ore. These tailings were boiled with Ca(OH)₂ and water to the appearance of a black color. The undissolved S was used in the following batches. The same tailings can be used for fumigating by supplying additional heat. A. A. Bochtlingk

"Ultra" sulfur. V. P. Munchev. *Mineral'nue Udobreniya Insektofungusidus* 1, No. 4, 60-61(1935).—

"Ultra" sulfur was prepd. by spraying a heat-treated clay (passing a 200-mesh sieve) with liquid S (mixed with small amts. of I and β -naphthol, to lower its viscosity) at 140°, to give a product contg. 12.13% S. The reports obtained from field operators using the above prepn. as a fungicide were divided. A detailed description of the process is presented. A. A. Bochtlingk

A new method of producing Paris green. Lotorev, P. M. and Artamannov, I. *gorov. Tekhnika* 1935, No. 50.—CuSO₄ soln. is mixed with AcOH, and metarsenite is added to the mixt. The product is filtered and the ppt. of Paris green is washed carefully. B. V. Shvartzberg

Comparative toxicity of anabasine and nicotine sulfates to insects. Joseph M. Ginsburg, John B. Schmitt and Philip Granett. *J. Agr. Research* 51, 319-51(1935).—Anabasine sulfate equals or exceeds nicotine sulfate in toxicity to *Aphis rumicis*, *A. pomi* and *Macrosiphum rosarum* and is decidedly more toxic to *Rhopalosiphum rufumaculata* and *Macrosiphum rosae*. Anabasine sulfate is decidedly less toxic to grasshoppers and to silk-moth larvae as a stomach poison than is nicotine sulfate. W. H. Rows

Controlling cattle grubs on dairy cows. H. A. Herman and Geo. D. Jones. *Mo. Agr. Expt. Sta. Bull.* No. 340 (Ann. Rept. 1933), 45(1933).—Ox warbles were thoroughly controlled on cattle by the use of prepns. of derris. By working in the soln., contg. 0.5% derris plus a fatty base, into the warbles, a kill of 90-100% was obtained. C. R. Fellers

Plot tests with sodium arsenite and sodium chlorate as soil sterilants in California. A. S. Crafts. *Calif. Dept. Agr., Monthly Bull.* 24, 217-50(1935); cf. C. A. 30, 804.—From 2 to 8 lb. of Na arsenite per sq. rd. is an effective and practical chemical for controlling weeds in waste areas such as roadways and banks of irrigation ditches. This chemical is best applied as a spray to the top soil or vegetation. NaClO₃ is also effective against annuals for more than 1 year in heavy alluvial soils where rainfall is light. It is useful against deep-rooted perennials. A combination of 4 lb. of As₂O₃ and 1 lb. of NaOH with 3 lb. of water is another effective weed killer which can be used as a dust. C. R. Fellers

Factors influencing the effectiveness of sodium chlorate as a herbicide. A. S. Crafts. *Hilgardia* 9, 437-57 (1935).—Chlorates may kill deep-rooted perennial plants either by rapid absorption and translocation within the plant or by absorption from the soil by the roots. Application of the same amt. of NaClO₃ to the soil killed morning glory, *Convolvulus arvensis*, and Russian knapweed, *Centaurea repens*, but merely injured hoary cress, *Lepidium draba*. Three years' work shows that proper

vertical distribution of NaClO_2 within the soil by leaching of water rains is essential to success with the soil treatment method. A similar vertical distribution may be accomplished with irrigation water. Application of the NaClO_2 to both soil and plant is more efficient than application to only the soil or to the plant. In many cases roots were destroyed 3 ft below the soil surface. A single spray was usually as effective as 3 light sprays in weed control. Continual leaching with irrigation water proved the best means of ridding the land of residual NaClO_2 . Sterile areas leached with 36 in. of water were returned to cultivation within a season by this practice. Toxicity of sodium arsenite and sodium chlorate in four California soils. *Ibid.* 461-98.—Trivalent As, on a cost basis, was the most feasible chemical for soil sterilization. Toxicity of As was greatest in the Fresno sandy loam and lowest in the Yolo clay loam. Loss of toxicity with time and cropping was greatest in the Yolo soil and lowest in the Fresno sandy loam. Yolo clay had the strongest fixing power for As and held 4 times as much as the Fresno soil. The Stockton and Columbia soils held about twice as much As as the Fresno soil. The amt. of As held by all 4 soils was greater with increased concn. of the solns. applied. Even after leaching the Yolo soil with 169 surface cm. of water, the upper 4 in. of soil was sterile and the chemical had not descended below the 16-in. level. Similar leaching removed all the As from the Fresno soil. Soil application of NaClO_2 as to secure max. absorption by the roots gave optimum results with this chemical. Toxicity of NaClO_2 was highest in the Stockton adobe clay and lowest in the Yolo clay loam. It was only slightly higher in the Columbia fine sandy loam and intermediate in Fresno sandy loam. The fixing power of the 4 soils was much less for chlorate than for Na arsenite. In the Yolo clay loam the chemical was fixed from a slowly moving soln. Rate of moistening had no effect in the Fresno sandy loam. The Stockton soil had little fixing power for NaClO_2 . Chlorate toxicity was greater in soil columns previously moistened with distd. water than in those moistened only with the chlorate solns. Leaching with distd. water moved the chlorate downward in the soil columns. Forty surface cm. of water was sufficient to remove the chlorate from the Yolo and Columbia soils. NaClO_2 was present in the top 20 in. of the soil from sterile areas in a field sprayed 3 yrs. previously to kill morning glory. A leaching with 36 surface in. of water removed the chemical sufficiently so that alfalfa made a good growth. C. R. Fellers

Analysis for fluoride—application to detn. of spray residue on food products (Hoskins, Ferris). 7. Oil of Tennessee red cedar [use in insecticides] (Huddle). 7. Decompos. of raw phosphates with H_2SO_4 (Lehrcke). 18 App. for cooling and aerating ammoniated phosphate fertilizer (U. S. pat. 2,028,413) 1.

Reconditioning soil after killing weeds. I. G. Farber and A. G. (Udo Ehrhardt, inventor). Ger. 622,201, Nov. 25, 1935 (Cl. 42.5). Soil to which a chlorate has been applied as a weed-killer is reconditioned by treatment with a substance which decomps. chlorates. The substance may be (a) a simple reducing agent, e. g., a ferrous salt or a hyposulfite, or (b) a reducing agent convertible into a fertilizer, e. g., a nitrite or hypophosphite, or (c) a substance which accelerates catalytically the decompos. of unstable chlorates, e. g., MgCl_2 .

Fertilizers. John A. Heskett. Brit. 435,763, Sept. 23, 1935. See Australia 16,704/34 (C. A. 29, 2654).

Fertilizers. Société d'études pour la fabrication et l'emploi des engrais chimiques. Ger. 619,834, Oct. 8, 1935 (Cl. 16.2). CaHPO_4 , CaCO_3 and NH_4Cl are formed

by treating natural phosphates with dil. HCl , pptg. the CaHPO_4 by Ca(OH)_2 , sepg. this and treating the CaCl_2 liquor with NH_3 and CO_2 or $(\text{NH}_4)_2\text{CO}_3$. The HCl soln. used contains about 65 g. HCl and 255 g. CaCl_2 per l., the CaCl_2 being provided by adding sufficient of the filtered CaCl_2 liquor. Examples are given. Cf. C. A. 30, 1172.

Ammoniated peat fertilizer. Royall O. E. Davis and Walter Scholl (dedicated to the free use of the Public). U. S. 2,027,766, Jan. 14. Anhyd. NH_3 is brought into contact with peat in a closed autoclave, and the mixt. is heated to 180-300° for 8 hrs., the temp. is then allowed to drop to 50° and the uncombined NH_3 is removed from the mixt.

Superphosphate fertilizer. Beverly Ober and Edward H. Wight (to Oberphos Co.). U. S. reissue 19,825, Jan. 14. A reissue of 1,947,138 (C. A. 28, 2456).

Anticryptogamic products. Compagnie de produits chimiques et électrometallurgiques Alsas, Froges et Camargue. Fr. 788,631, Oct. 14, 1935. Insol. chloro-cupric compds. of the formula $\text{CuCl}_2 \cdot 3\text{CuO} \cdot n\text{H}_2\text{O}$ or $\text{CaCl}_2 \cdot 3\text{CuO} \cdot n\text{H}_2\text{O}$ (n is about 4) concd. or diltd. by inert materials such as hydrated CaSO_4 are made by the simultaneous reaction, in aq. soln. or suspension and at ordinary or raised temp., of 1 or more sol. Cu salts other than the chloride, with 1 or more alkali or alk. earth metal chlorides or any other simple or complex sol. chloride, the aq. solns. of which have a reaction less acid than solns. of CuCl_2 , and with a base such as CaO or MgO or the corresponding carbonates. The ppt. is filtered, washed and dried. Cf. C. A. 30, 806.

Insecticidal sprays. Irwin Stone. U. S. 2,028,109, Jan. 14. To facilitate the removal of spray residues from fruits, there is incorporated in the spray compn. used a water-insol. material such as ZnCO_3 which is inert to the active spray material but which reacts with acid wash solns. to form a gas which dislodges the spray residue film.

Destroying insects. Arthur Balzars. Fr. 787,963, Oct. 2, 1935. An atm. contg. chlorinated hydrocarbons, e. g., $\text{C}_2\text{H}_2\text{Cl}_4$ 80 and $\text{C}_2\text{H}_3\text{Cl}_3$ 20%, is used.

Killing insects, etc., on plant products such as seeds of plants. Thomas J. Headlee (to Endowment Foundation). U. S. 2,027,976, Jan. 14. Plant products or plants are passed along on a conveyor while subjected to an electrostatic field between electrodes by a source of energy having a frequency preferably not less than 1,000,000 cycles and a voltage preferably of about 4000 v. per linear in. between the electrodes.

Seed disinfectants (inner anhydrides of mercurized phenols). Fritz Wolf (to Schering-Kahlbaum A.-G.). U. S. 2,021,277, Nov. 19. Inner anhydrides of mer-

curized phenols of the general formula: $\text{C}_6\text{H}_4\text{X.HgO}$, where X represents either H or any substituted or unsubstituted alkyl, aryl, alkaryl or alicyclic radical, or any other substituent, such as halogen, the nitro, hydroxy and like groups, are good wet as well as dry disinfectants, for seeds. For their manuf., phenols which have been mercurized by treatment with mercuric salts are dissolved in NaOH soln., whereupon the alk. soln. is treated with CO_2 , which ppts. the anhydrides; or the molten phenols are treated at a low temp. with mercuric oxide until the latter has been dissolved. The inner anhydrides obtained in this manner are sol. in phenols without cleavage of the anhydride bond, in contrast to their soln. in NaOH whereby the anhydride bond is changed and split open. The phenol acts as solvent, renders the inner anhydrides water-sol. and allows the application of these compds. as wet and as dry disinfectants. Several examples are given, including the production and use of the inner anhydride of mercurized 1,3,5-xyleneol and some similar compds.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

The action of charcoal on alcoholic fermentation. A Reinhard and V. Obrastova. *Bell. soc. intern. microbiol.*, *Ses. stal* 7, 331-5(1935)(in French).—Powd. wood charcoal increases the alc. fermentation of the solns of sucrose and levulose, even if inactivated by heat for 10 min. at 50°, and stimulates the multiplication of saccharomycetes. G. A. Bravo

Boiling points in the distillation of alcoholic liquors. E. Jacobson. *Destillatør u. Lakorfabr.* 48, 605(1935).—In distg. a mixt. of equal parts of Et and Am alcs.—The percentage of each is given for 7 fractions collected between 80° and 132°. K. Becker

The power alcohol problem and the sugar beet. O. Munerati. *Ird. soccar stal.* 23, 488-96(1935)

Alcohol losses during storage of bottled distilled liquors. C. Luckow. *Wein und Rebe* 17, 165-74(1935).—When brandies and cordials were kept 6 months at room temp. in unopened corked bottles, no appreciable loss of alc. was found. The alc. losses of half-empty bottles kept 6 months varied from negligible to 2.05% by vol., depending upon the nature of closure and temp. of storage. K. Becker

Isolation and possible intermediary role of formaldehyde in the propionic acid fermentation. H. G. Wood and C. H. Werkman. *J. Bact.* 30, 652(1935). J. T. M.

Honey vinegar. Fredereck W. Fabian. *Mech. Agr. Expt. Sta., Extension Bull.* No. 149, 3-14(1935).—Waste or low grade honeys can be easily and profitably converted to vinegar. A satisfactory formula consists of extd. honey 40-45 lb., water 30 gal., $K_2C_2O_4$ 2 oz. and $(NH_4)_2PO_4$ 2 oz. The distd. vinegar stock should contain approx. 15% sugar. The soln. is sterilized by boiling for 10 min., cooled, inoculated with yeast starter and allowed to ferment until the sugar has all been converted into alc. The soln. is then inoculated with *Acetobacter* which changes the alc. into AcOH. The optimum temp. for the fermentation is 24-28°. After the fermentation has been started the film of *Acetobacter* at the surface should not be disturbed. C. R. Fellers

Report on malt analysis during the months of March and April 1935. F. Ancker. *Wochschr. Brau.* 52, 166-7(1935).—A summary of 236 barley malt and 9 wheat malt samples. S. Jozsa

Malting and mashing. Hugo W. Rohde. *Cereal Chem.* 12, 610-20(1935).—A review. L. H. Bailey

Barley and malt studies. I. Developing new varieties of barley for malting and their properties. James G. Dickson, H. L. Shands, Allan D. Dickson and B. A. Burlhart. *Cereal Chem.* 12, 596-609(1935).—The 6-rowed types of barley have predominated in the U. S. throughout the period of barley culture. Exptl. malting equipment is available at several locations for the survey of the malting quality of the barley varieties and the testing of new selections. The equipment at Madison, Wisconsin, is described. The most suitable procedure for the comparative malting of the barley samples is outlined. The development of new malting varieties of barley is in progress. L. H. Bailey

The determination of moisture in barley malt. A comparison of methods and apparatus for this purpose. D. A. Coleman and S. R. Sinder. *Cereal Chem.* 12, 621-45(1935).—The vacuum-desiccator method, i. e., drying of the sample over anhyd. P_2O_5 in a desiccator maintained at a pressure of 10 mm. of Hg or less until a const. loss in wt. has been reached, has been selected as the standard or referee method for making moisture detns. on malt because of the absence of caramelization or decomposition phenomena which commonly accompany the other methods used for moisture-dets. purposes. The 130° air-oven method gave results 0.63% higher than the standard method. A vacuum oven operated at 25 mm. pressure at 100° for 5 hrs. gave results 0.25% higher than

those of the standard method. The Carter-Simon method results were 0.5% higher than those of the standard method. The vacuum oven operated at 25 mm. pressure but at 70° for 18 hrs. produced results that were 0.1% lower than those of the standard method. Malt Analysis Standardization Committee method, i. e., heating for 3 hrs. at a temp. between 103° and 104° gave results practically equal to those by the standard method, being only 0.04% lower. Results by the water-oven method were 0.23% lower than those by the standard method. L. H. B.

Methods of wine analysis. C. H. McCharles and G. A. Pitman. *Ird. Eng. Chem., Anal. Ed.* 8, 55-6(1936).—Methods of making wine analysis are given. The necessity of accurate sampling is pointed out. The use of the ebullioscope, pycnometer and hydrometer in detn. of alc. is discussed. Volatile acidity and total acidity detns. are described. Sugars can be detd. by the Lane and Eynon (cf. C. A. 22, 829), Munson and Walker, and Shaffer and Hartmann (cf. C. A. 15, 1327) methods, the latter a volumetric iodometric method. Analytical methods are given for metals, SO_2 and tannin. C. N. Frey

Analyses of Hungarian and foreign natural wines and vermouths. Ottó Wolf. *Magyar Ámpel. Értékes.* 9, 458-64(1935).—Analyses are given of 112 wines. Natural Hungarian sweet wines contained 7.20-17.74% alc. by vol., 0.58-1.32% total acids, 2.68-40.50 g. per 100 cc. ext., traces to 35.58 g. reducing sugars, 0.14-0.56% ash, 0.040-0.155% phosphoric acid, 0.95-2.40% glycerol, 17.2-57.2 ash alkali. The ratio alcohol glycerol ranged from 100:8.6 to 100:34.5. S. S. de Fmily

Examination of wine by means of a quartz lamp. István Szabó. *Magyar Ámpel. Értékes.* 9, 454-7(1935).—A Hanau lamp was used to compare natural wines with wines from coned musts. The wine samples were (1) extd. with $CHCl_3$ and the luminescence of the soln. was detd. by comparison with a glycerol soln., (2) decolorized according to Werder-Zach by means of carbo animalis and the filtrate examd. as previously. The published results seem to prove that on further modification this method will be available to show whether a wine has been prepd. by means of dried grapes or coned. must or has been produced of fresh grapes as natural wines. S. S. de Fmily

The determination of organic acids of wine. Ervin Wettstein. *Magyar Ámpel. Értékes.* 9, 429-39(1935).—Treatment with $BzCl$ at 153° for 2 hrs. forms insol. benzoate of malic and dibenzoate of tartaric acid, which can be sepd. Succinic acid is pptd. from the filtrate as a basic iron salt, filtered and weighed. AcOH can be detd. in the filtrate by titration after a prescribed purifying treatment. The benzoyl ester acids are then sepd. from benzoic acid after sapon with KOH, the potassium salts treated with H_2SO_4 , the excess K_2SO_4 is removed and the tartaric acid pptd. in an alc. medium as potassium tartrate. The filtrate contg. malic acid is worked up by a longer procedure and the acid detd. by titrating with 0.1 N alkali in presence of phenolphthalein. A table shows deviations from the theoretical contents ranging from 0.06 to 9.07%; thus the method is already more reliable than the present ones. S. S. de Fmily

Bromoacetic acid and normal bromine of wines. L. Chelle and G. Vitte. *Bull. soc. franc. Bordaux* 73, 179-87(1935).—Wines suspected of contg. CH_2BrCO_2H as a preservative were assayed for their Br contents and the results were compared with results obtained with other wines with and without added KBr or CH_2BrCO_2H . Method: Evap. 10, 50 or 100 cc. on a water or sand bath and then heat in an oven. Calcine slowly over an alc. lamp and pulverize the carbonaceous mass. Calcine the powder in a Pt crucible at the edge of a muffle furnace. Wash the ash with hot distd. water and filter. Det. the amt. of Br by using the Demegis and Chelle reaction (cf. C. A. 7, 746) and comparing with known samples run at

the same time. Between 0.1 and 0.7 mg of Br occurred normally in the wines tested. S W G

Tartaric acid content and alkalinity of ash of Hungarian wines with special regard to the identification of wines of American vine types. Géza Requinyi and István Soós *Magyar Ampel Ékny 9*, 425-7 (1935) —Wine from vines of American types (Othello, Noah, Delaware, etc.) contained generally more tartaric acid and had more alk ash than wines from other vines. Hungarian wine contained 0.071-0.665 g. per 100 cc. of tartaric acid and ash alkalinities ranged from 1.64 to 16.20 cc. N acid for 1 g. ash. S S de Finály

A report on fluorides in wine. Frederick F. Johnson and Louis Fischer. *Am J Pharm* 107, 612-14 (1935) —The ordinary volumetric determination of F, such as the titration with Th. nitrate or cerous nitrate, are not practical in the presence of so much organic matter. The following method is a modification of the proxonized Th method (C A 28, 431¹²) which was designed chiefly for the determination of F in spray residues. Thirty-four g. of wine is alkalinized with NaOH and evaporated under steam until the alkali is removed. The residue is washed into a 270-cc. Claisen flask previously charged with a large no. of glass beads and 15 g. of NH₄ persulfate. Fifteen cc. of concd. H₂SO₄ is added and an ordinary Willard and Winter distillation (C A 27, 181) is performed; the distillate is collected in 20 cc. of said K₂MnO₄ in a 200-cc. volumetric flask. If any sulfate distills over, the operation must be repeated. At this stage an amt. of dil. HNO₃ must be added so that a 40-cc. aliquot, made to vol. in a 50 cc. Nessler tube, with TiCl₃, H₂O₂, and Cu(NO₃)₂ for the color reaction, will have a p_H of 1.50 ± 0.02. Since there are different amts. of volatile organic matter present in different wines, there is a varying amt. of reduction of the K₂MnO₄ with the formation of more or less of the alk. products as the case may be. This requires that the exact amt. of HNO₃ must be determined for each individual wine, although some indication can be gained from the amt. of ppt. in the distillate. On account of this difficulty it is preferable to evaporate and ash the samples in the presence of Al nitrate, providing that the temp. can be maintained below 600°. The distillate is then conducted as before. Results are about 10% higher by the ashing method. A series of 6 standard tubes are used containing 0, 1.0, 2.0, 3.0, 4.0, 5.0 mg. of F and of p_H 1.50 ± 0.02. Above the 5.0 mg. tube colors are not satisfactory for comparison so smaller amts. of sample must be taken if necessary. However, if a 34.0 g. sample is used, mg. per sample tube will be equiv. to grains per lb. W G G

The ratio of dextrose and levulose in the grape, in the must and in the wine. István Szabó and László Rakcsányi. *Magyar Ampel Ékny 9*, 346-61 (1935) —Grapes at the beginning of ripening contained more dextrose, during ripening levulose increased and became dominant during drying and thickening of grape. During fermentation (1) under 17-20% sugar content dextrose decreases more rapidly, (2) at 20-25% sugar content both sugars ferment similarly, (3) at high sugar content of 25-30% or more, levulose decreases more rapidly. In natural sweet wines (1) at low sugar content the amount of levulose was 2-6 times as great as that of dextrose, (2) at higher sugar contents levulose was about the same in amount as dextrose and (3) above 25% sugar content levulose was less than dextrose. For wines improved with coned must (1) if the added must had been fermented the ratio of dextrose to levulose was the same as in natural wines, i. e., more levulose was present, (2) wines improved without fermentation showed the same ratios as the coned musts with which they had been mixed. S S de Finály

Experiments to conserve sweet wine and must. István Soós and László Rakcsányi. *Magyar Ampel Ékny 9*, 362-70 (1935) —A combination of SO₂ treatment and asbestos filtering conserved the products for 21 to 42 days. The best method consists of treating the wine or must with not too much SO₂ (300 mg.), then clarifying with K₂Fe(CN)₆ and tannic acid gelatin, sedimenting, filtering through asbestos, and treating again with SO₂. The must treated thus remained unfermented for about 4 months. S S de Finály

Conservation of sweet wines by filtering. István Soós *Magyar Ampel Ékny 9*, 371-2 (1935) —Wine samples were improved with coned must and fermented by means of special yeast cultures. After fermentation the wine was filtered and the procedure repeated until no further fermentation could be observed. Analyses showed that 15-50% of the original N and 11-45% of the original P₂O₅ content could be removed by such treatment. Further experiments should prove whether this method is practically available. S S de Finály

The electro-catalytic treatment of wines. Gyula Pálinská. *Magyar Ampel Ékny 9*, 373-97 (1935) —Expts. with various wines and musts show the practical availability of the treatment in cellars. S S de Finály

Fermentation of musts improved with concentrated must and sucrose. Géza Requinyi and István Soós *Magyar Ampel Ékny 9*, 398-401 (1935) —Musts improved with sucrose fermented much more weakly when inoculated with special yeast cultures. Those treated with must coned under high vacuum showed the strongest and most complete fermentation. This explains why sometimes improved wines begin later on to ferment again. S S de Finály

Clarifying wines fermented with pure yeast cultures. Géza Requinyi and István Soós *Magyar Ampel Ékny 9*, 422-5 (1935) —Wines fermented by Hungarian pure yeast cultures could be well clarified. These yeasts seemed to have better effect than the Champagne Haut-willers pure cultures. S S de Finály

Elimination of the copper of musts and wines. J. Ribereau Gayon. *Compt. rend. acad. agr. France* 21, 862-7 (1935); cf. C A 29, 700¹² —A discussion of the removal of Cu from wines and grape juices through the use of a sulfide and reasons for the authorization of its use. Even in excess the sulfide has no other disadvantage than that of causing a cloudiness and disagreeable taste which soon disappears. J. R. Adams

Decacidifying wines beginning to turn vinegary. Géza Requinyi and István Soós *Magyar Ampel Ékny 9*, 453-4 (1935) —A wine containing 0.70 g. total acids as tartaric acid (of which 0.213 g. was acetic acid) was neutralized with CaCO₃ in 3 phases. In each step 0.2% acid was removed. Details of volatile acids showed that first tartaric and malic acids are neutralized, then acetic acid. Vinegary taste could not be removed by treatment with CaCO₃. S S de Finály

Treatment of wine by ferrocyanide. Complexes of iron in wines. J. Ribereau-Gayon. *Bull. soc. pharm. Bordeaux* 73, 210-32 (1935) —A critical discussion of the problems and defense of earlier results of the author's work. Bibliography. S W Goldstein

Diminishing the sulfur dioxide content of oversulfured wines and musts. László Rakcsányi. *Magyar Ampel Ékny 9*, 442-7 (1935) —Attempts were made to remove excess SO₂ by (1) 30% H₂O₂, (2) perhydrol prepns. combined with urea, (3) hexamethylenetetramine and (4) 40% formaldehyde. (1) and (2) were effective and the sulfate originating from oxidized SO₂ did not rise above the 2 g. K₂SO₄ per l. permitted by the German wine law. (1) caused no detectable changes in the composition of wine or must. The urea introduced by (2) is analytically determinable but is not objectionable. (3) diminished the amount of free SO₂ only and was also observable chemically in the treated products. (4) had similar effects on the free SO₂ only but its use is prohibited by the authorities. The expts. were made in lab. scales only. S S de Finály

Sulfuration methods of wine. Géza Requinyi and István Soós *Magyar Ampel Ékny 9*, 440-2 (1935) —Sulfuration of wines by means of sheets of elementary S, liquefied SO₂, and K metabisulfite was examined. The fixation of SO₂ was the same in each case. The application of K metabisulfite increased the ash content by 5-6%. Also the alkali of the ash was somewhat higher. There was no difference in the tastes of the wines sulfured by the different methods. S S de Finály

Refermentation of wine to determine deficiency of nutrient salts for yeast. Géza Requinyi and István Soós

which covers the liquid surface, the ferment layer is produced on a membrane pervious to the liquid, e. g., parchment paper, or filter paper impregnated with gelatin and nutrient materials. The membrane may be supported by a sieve of coarse mesh. Forms of app are indicated.

Alcoholic fermentations Usines de Melle (Soc anon) Fr 788,126, Oct 4, 1935. The fermentation of yeast is carried out in the presence of CO₂ under pressure, whereby higher yields are obtained and the development of organisms such as *Mycoderma* is prevented.

Citric acid Wilhelm Klapproth Ger 619,977, Oct 10, 1935 (Cl 6 16 02). A soln contg pure sugar and nutritive salts such as NH₄NO₃, K₂PO₄, and MgSO₄, and a trace of FeSO₄ and ZnSO₄, is fermented by the acid of mildew fungus, such as *Aspergillus*. The acid is pptd, as Ca citrate by adding CaO. The Ca citrate is worked up by the free acid by the usual methods.

Fermented beverage Marie Haller (nee Wagner) Ger 619,567, Oct 3, 1935 (Cl 6 21). A refreshing drink is made by roasting oats, wheat and barley, boiling the product with water, filtering, adding cane or sugar and grape sugar to the filtrate and finally adding tansy and yeast and allowing to ferment.

Filter for wines, etc Paul Pinel Fr 787,892, Sept. 30, 1935.

Agung whiskey Carroll A Hochwalt and Wm H Carmody (to Nelson S Talbott) U S 2,027,099, Jan 7. To a vessel contg green whiskey there are added finely divided heat-treated products of wood distn comprising a first component of active charcoal having substantial absorptive characteristics and free from substantial

quantities of extractable alc. solubles and a second roasted wood component of less active and absorptive character but contg a greater amount of alc. solubles (at least 90% of the first component being used), and the whiskey is heated with the added materials.

Agung whiskey Carroll A. Hochwalt and Charles A Thomas (to Nelson S. Talbott). U. S. 2,027,100, Jan 7. See Brit 428,518 (C. A. 29, 66983).

Aging whiskey Charles A. Thomas and Carroll A. Hochwalt (to Nelson S. Talbott) U. S. 2,027,129, Jan 7. Whiskey in the vapor phase, together with H₂, is passed over a hydrogenating catalyst such as Ni on an inert carrier so that hydrogenation is effected while the whiskey is maintained in the vapor phase. App is described.

Beer René Rome Fr. 787,870, Sept. 30, 1935. Beer is aromatized by adding ext. of anise or oil of anise when the fermentation is almost complete.

Beer-brewing kettle with two boiling zones Rudolf Wiedemann Ger. 619,627, Oct 4, 1935 (Cl 6 12).

Yeast Wirtschaftliche Vereinigung der deutschen Hefenindustrie. Ger. 619,555, Oct 3, 1935 (Cl 6a. 17 02). App. with an ascending series of contiguous chambers for the breeding of yeast is described.

Yeast Nils Å Öström Fr. 788,370, Oct 9, 1935.

Dry living yeast in powder form is obtained by nourishing beer or pressed yeast after growth in a substratum poor in glucose and rich in N compounds, e. g., the residues of the fermentation which has served for the growth of the yeast. By this means living spores are formed.

17—PHARMACEUTICALS, COSMETICS AND PERFUMES

W O EMERY

Comparative investigations of thyroid preparations in rats. J. Freud and Ernst Lagueur *Nederland Tijdschr Geneeskunde* 80, 1, 25-32(1936).—Various thyroid preps. are standardized by the Abelin method. The metabolic activity is parallel to the total I content for preps. from all kinds of animals. Parenteral is more effective than oral administration. R. Beutner.

Liquid used in the manometric determination of the oxygen index characterizing the degree of fermentation of yellow types of tobacco. A. I. Smirnov. *Tabachnaya Prom* 1935, No 3, 4-5.—The O number, which is a criterion in the detn. of the degree of fermentation of tobacco, is obtained by measuring the vacuum produced by samples of tobacco in special glass containers. A kerosene fraction b 200-50° and particularly that b 250-60° with added coloring matter is a suitable manometric liquid. Special calibration of the manometer is required because of the difference in the sp. gr. between this kerosene fraction and the liquids ordinarily used for this purpose.

Characteristics of the practical application of commercial scale fermentation [of tobacco] P. G. Asmaev and S. I. Krasnev. *Tabachnaya Prom*, 1935, No 3, 17-19.—The relative humidity of the air close to the tobacco should amount to 70-5% to assure a proper fermentation. An excess of humidity will promote the formation of mildew, while a lowering may retard the process of fermentation. Various expts are described. A. A. Bochtlingk.

Determining the quality of tobacco goods. G. Dükker. *Tabachnaya Prom* 1935, No 3, 30-34.—The quality of tobacco goods depends on the humidity, ash content (sand, clay, etc.), nicotine content, NII content (a lowering of the N no. indicates inferiority of tobacco), and amount of reducing substances (the amount of reducing substances is in direct proportion to the quality). The higher the ratio of the reducing substances to the N no. the better the quality of the tobacco goods. The quality of tobacco can also be detd. by the "Shmuk no.", i. e., ratio of carbohydrates to albumin (the higher the Shmuk no. the higher the quality of tobacco).

A. A. Bochtlingk

Democratized cigarettes. A. Koperina and S. Kalibab. *Tabachnaya Prom* 1935, No. 3, 34-35.—Up to 93% of the nicotine is absorbed by hygroscopic cotton wool when placed in the cardboard cigaret tube, 0.06 g. being required for one cigaret. A still better absorption is obtained by using two cotton-wool filters. Carbon is a poor absorber for nicotine from smoke. The absorption is very little affected by impregnating the cotton wool with picric acid soln. A. A. Bochtlingk.

Forced fermentation of tobacco. Vodop'yanov and Antonadi. *Tabachnaya Prom* 1935, No. 4, 25-26.—The forced fermentation, e. g., at 50°, yields the same quality of tobacco as that carried out under normal conditions, provided that the raw tobacco was of the proper quality. A. A. Bochtlingk.

Colorimetric assay of bismuth pharmaceuticals. C. S. Leonard and Alma Chaplin. *Compt. rend. Congr. Pharm. Liege* No 47, 197-204(1934).—The following products were assayed for Bi content by (I) the sulfide method of Treadwell and Hall, (II) the oxide method of Hillebrand and Lundell and (III) the authors' colorimetric method (C. A. 20, 3044): (1) compressed and powd. products of Bi subnitrate, rhubarb and soda, (2) Bi subgallate, (3) Bi subnitrate and soda, (4) pepsin, Bi and charcoal, (5) CaCO₃ compd. (contg. Bi subcarbonate), (6) bicreol cream and (7) Bi salicylate cream. A comparison of the methods shows that I gives a pos. error, II is about as accurate as III but less rapid and convenient.

H. M. Burlage

Absorption from the human skin. A. Richard Bursle, Jr. *Drug and Cosmetic Ind.* 37, 730-2(1935).—An elaboration of studies previously reported (C. A. 28, 6836). (A) Me salicylate (25%), (B) I (4%), KI (25%) and quinine-HCl (25%) in ointment form with each of the following ointment bases: petrolatum, lard and hydrous lanolin as well as Tincture of I U S P., and compd. soln of I, U. S. P. were applied by inunction on 43 people for 30 min 4 times a day with the exception of the tincture and soln which were applied in single doses of 15 cc. by means of a camel's hair brush. To avoid irritation the sites of application were the inner surfaces of the right and left

thighs and of the right and left arms. Urine samples were collected and tested for presence of the drugs during 72 hrs at intervals. (A) is absorbed the most rapidly and in greatest quantity; (B) is applied more rapidly and effectively as the tincture. The other compds. and forms were not absorbed in amts. to be detected in the urine. Results indicate that the properties and powers of the drugs rather than those of the base are the major factors in the absorption from the skin. The youngest subjects, females, those with soft and finer skin textures, especially blonds and fat individuals, showed more prompt and intense pos reactions.

Astringency E. G. McDonough *Drug and Cosmetic Ind.* 37, 733-4, 736 (1935).—The various astringents and their actions are discussed. H. M. Burlage

Fundamentals of tablet making Harry J. Sander *Drug and Cosmetic Ind.* 37, 737-8, 742 (1935).—The operations and ingredients are discussed. H. M. B.

Water-in-oil emulsions with cetyl alcohol Joseph Kalish *Drug and Cosmetic Ind.* 37, 739-40 (1935), cf. C. A. 30, 567*—A discussion with formulas. H. M. Burlage

Cholesterol Its significance and value in creams and ointments Robert A. Kramer *Drug and Cosmetic Ind.* 37, 741-2 (1935).—A discussion with formulas. H. M. Burlage

Trend in hand lotions Thorpe W. Deakers *Drug and Cosmetic Ind.* 38, 37-8 (1936).—Advantages and disadvantages of the old soap-water lotions are discussed. The requisites of and methods of obtaining an ideal lotion are given. H. M. Burlage

Drugs with volatile oils and their evaluation L. Kofler. *Pharm. Monatsh.* 16, 209-12 (1935).—A previously described modification of the Dalfert method (*Pharm. Ztg.* 79, 972 (1934); C. A. 30, 568*) was used. The following exams are reported: (1) Nine samples of whole cinnamon bark from various com. sources showed volatile oil contents of 0.54-2.10% by wt; (2) 9 samples of *calamus* root 0.51-3.43% by wt.; (3) 9 samples of whole fennel 0.68-5.21% by wt; (4) 10 samples of cinnamon powder 0.05-0.59% by wt; and (5) 8 samples of *calamus* powder 0.48-2.23% by wt. Expts seem to indicate that the low contents of volatile oil in powd. drugs are not due chiefly to pulverization but to storage of the powders. A modification of the method is necessary for the detn. of the volatile oil in *calamus*. H. M. Burlage

The estimation of the tannin-bearing drugs O. Dalfert and M. Fleischer. *Pharm. Monatsh.* 16, 221-6 (1935); cf. C. A. 30, 235*.—The official drugs galls, granatum, hamamelis leaves, Koso flowers, hematoxylon, myrtillus fruit, quercus, tormentilla root, shatian, willow and catechu are subjected to the following tests: (A) *Color reactions*—1 g. drug is boiled with 100 cc. H₂O and treated with (1) solns. of Fe salts, FeCl₃, Fe alum, FeSO₄, and Br water, Mitchell's reagent and Fe NH₄ citrate, (2) Na₂SO₃, (3) NaNO₂, (4) pine shaving reaction, (5) concd. H₂SO₄, (6) HCl, (7) NaOH, (8) NH₄OH, (9) alum, (10) lime water, (11) dyeing of cloth strips stained or dipped in solns. of metal salts whereby the drugs are divided into 5 classes. (B) *Precipitation reactions*—(1) HCHO-HCl, (2) Pb(AcO)₂, (3) Br water, (4) Cu(AcO)₂, (5) gelatin, (6) antipyrine, (7) tartar emetic, (8) K₂Cr₂O₇, (9) (NH₄)₂S, (10) strychnine-HCl. (C) *Capillary analysis*—A procedure for the detection of the tannin groups and individual tannins is outlined. H. M. B.

Estimation of medicinally used tannin-bearing drugs O. Dalfert and M. Fleischer. *Pharm. Monatsh.* 16, 237-6 (1935); cf. C. A. 30, 235*.—Quant. methods are divided into 2 groups: (A) direct methods by which the tannin compds. are sep'd from their solns. as insol. compds. and weighed or det'd directly and (B) indirect methods whereby from measured vols. of soln. the total tannin compds. are sep'd, and from the difference of certain values before and after the detanning of the soln. calcd. (A) includes (1) gravimetric methods with Al(OH)₃, Al₂O₃, and Ca(AcO)₂, (2) measurement of the vol. of the ppt. by allowing it to settle or by use of the centrifuge, (3) by hide powder, (4) titration with TiCl₄ or with Cu salt

1 soln. and (5) colorimetric method with gelatin-Fe paper. (B) includes the shake, filter and Schröder's methods. Biol. methods are discussed. H. M. Burlage

Preparations for the care of the hair. Josef Augustin. *Reichstoff-Ind.* 10, 215-17 (1935).—Shampoo powders, liquid shampoos, shampoo soaps and soapsless foaming shampoos are discussed and formulas offered. H. M. Burlage

Little-known volatile oils III Oil and extract of 2 *Tagetes pumila* Alfons M. Burger. *Reichstoff-Ind.* 10, 218 (1935), cf. C. A. 29, 8228*.—Steam distn. of the fresh plant yields an orange-red oil (0.25%) with a characteristic odor, d_4^{20} 0.899 and n_D^{20} +1.3. The plant ext'd. with low-boiling petr. ether yields an orange-brown concrete (0.7%), incompletely sol. in EtOH. The products appear to be of value in making lavender perfumes and cologne waters. H. M. Burlage

3 *Ipecacuanha decocta* Lajos Dávid *Magyar Gyógyszerészeti Társaság Értesítője* 11, 625-8 (1935); cf. C. A. 30, 569*.—It is recommended that 2 cc. citric acid should be dissolved in the water for each g. of drug used and that the mixt. should be boiled for 10 min. Exts. of 100% were thus obtained. S. S. de Finály

Decocta and infusa Pál Rózsa *Magyar Gyógyszerészeti Társaság Értesítője* 11, 629-42 (1935).—An Al flask 17 cm. high and 12 cm. in diam. is fitted with a stopper and thermometer and with a sieve 1.5 cm. above its bottom. Two 250-cc. glass bottles are put on this sieve contg. the drugs and the extg. liquid. Water (300 g.) is introduced into the flask (under the sieve) and kept boiling. Several infusa and decocta made by this method were much higher in active matter than those made by other methods. S. S. de Finály

Detailed "acid hydrolysis method for opium analysis." G. E. Mallory and Peter Valac, Jr. *Am. J. Pharm.* 107, 515-25 (1935).—A very accurate method of analysis is described step by step in great detail as to washing of solvents, etc. This method may be applied to any opium, any part of the opium poppy plant, and opium refuse and to most all pharmaceutical preps. contg. traces of morphine or large quantities of morphine. W. G. G.

Determination of iodine in organic medicinals. Leon Leclercq *J. Pharm. Belg.* 17, 545-50, 563-70, 585-90, 603-9, 631-5, 641-70, 67-101, 705-8, 721-5, 739-45, 758-62, 778-81, 798-803, 815-22, 837-40 (1935).—The various methods are critically reviewed and some changes are suggested. Ninety-six references. S. W. Goldstein

Aqueous distillate of cherry-laurel. L. van Itallie. *J. pharm. chim.* 22, 452-4 (1935).—The present official ratio of free and combined HCN (1.3/6) is claimed to be too low and a ratio of 1/5 is suggested as representative of a prep'n of good quality. The following test is suggested to det. whether a sufficient quantity of BaH is present. Add 3 cc. of NH₄OH to 10 cc. of cherry-laurel water. The liquid should appear milky after 30 min. at most. Distinction between dist'd cherry-laurel water and an artificial prep'n is impossible at present. S. W. G.

Quinoline derivatives as a source of antimalarial products IV. Compounds with long chains in the 8-position O. Yu. Magidson, O. S. Madavaev and M. V. Rubtsov. *J. Gen. Chem.* (U. S. S. R.) 5, 1506-16 (1935).—See C. A. 29, 7013*, where the 1st author name is incorrectly given. G. G.

A critical study of the preparations of black mustard of the Farmacopea Argentina and a proposed method of analysis Alfredo J. Bandoni. *Rev. centro estud. farm. biolum.* 25, 486-99 (1935). L. E. Gilson

Mode of action of chemical disinfectants. Atilio Roccatagliata. *Rev. centro estud. farm. biolum.* 25, 520-5 (1935).—Discussion. L. E. Gilson

Study of lu-jung, the Chinese drug. H. Historical study in Japan. Tetsuo Mineshita. *Folia Pharmacol. Japon.* 21, Opera Orig. 223-35, Breviaria 53 (1935); cf. C. A. 29, 2661*.—Historical review of lu-jung, a medicine made from young horns of deer and used as an energy builder and rejuvenator in China and Japan for many centuries. It is no longer valued in Japan. G. H. W. Lucas

A new restorative F. Haefner, F. Schellong and W. Baetzner *Med. Klin.* 31, 1861-4 (1935) — N,N,N',N' -Tetraethylphthalimide is a new restorative which appears to have a marked stimulant action on the respiration as well as some action on circulation. G. H. W. L.

Effectiveness of hot hypochlorites of low alkalinity in destroying *Mycobacterium tuberculosis* S. M. Costigan, J. W. Yates, W. A. Hadfield and E. C. McCulloch *J. Bact.* 31, 6 (1935) — Hypochlorites in a concn to yield 50 parts of available Cl per million kill *Mycobacterium tuberculosis* in 2.5 but not in 1 min at 50°, in 60 but not in 30 sec. at 55°, and in 30 sec. or less at 60°. Solns contg. 200 parts per million kill in 60 but not in 30 sec. at 50°, and in 30 sec. or less at 55° and 60°. J. T. M.

An improved method for determining the antiseptic and bactericidal powers of gases and vapors J. L. Posner, A. R. Toder and John T. Myers *J. Bact.* 31, 9 (1935) — Put the reaction mixt. in a 50-cc. Erlenmeyer flask, stopper and allow gaseous equl. to develop. Pass a pin through a cork so that it will project about 3.5 cm. into the flask. Cut disks of lens paper about 11 mm. in diam. with a cork borer, autoclave, soak in a liquid culture and dry between filter paper, suspend them centrally pierced on the pin and insert into the prep. flask. At timed intervals remove and drop one disk into a tube of broth and another on an agar plate for an impression inoculation. John T. Myers

Ukrainian St. John's bread H. Ya. Tropp *Farm. Zhur.* 1934, No. 6, 222-3 (1934), cf. following abstr. — The samples of St. John's bread contained alkaloids 0.10-2.3, fatty oils (acid no. 2-3) 18.24, moisture 5-8 and ash 3-4%. L. Nasarevich

Ukrainian St. John's bread Condition affecting its toxicity during preservation H. Ya. Tropp *Farm. Zhur.* 1934, No. 6, 223-7 — Ukrainian St. John's bread approaches the highest known content of alkaloids (0.23%). To preserve St. John's bread, it should be defatted and dried. The alkaloids are most sensitive to heat, 1 hr. at 100° being enough to decompose 40%. L. Nasarevich

Analysis of ichthyol S. M. Bolotnikov *Farm. Zhur.* 1935, No. 1, 21-3 — Ichthyol should be sol. in 2 parts of H_2O , 4 parts of alc., or 8 parts of ether-alc. mixt. It should contain no cresols, phenol derivs. or foreign sulfo acids. Total S should be over 11%, sulfate S not over 2.8%, thiophene fraction over 12%, dry residue over 55%. An analysis is given. L. N.

Preparation of saligenin I. M. Rotbart and D. H. Kolesnikov *Farm. Zhur.* 1935, No. 1, 27-8 — Phenol (1), formalin (1), CaO (0.5) and alc. (2.5 parts) react until HCHO odor is gone, the mixt. is acidified with $AcOH$, extd. with ether, dried, distd. off and recrystd. The crystals of *m*-hydroxybenzyl alc. are finally crystd. from H_2O . L. Nasarevich

Comparison of tinctures with 70 and 45% alcohol Yu. Petrovskii, K. Shulzhenko and I. Bujoshina *Farm. Zhur.* 1935, No. 2-3, 71-2 — Tinctures of *Digitalis purpurea* and *Adonis vernalis* are richer in glucosides and more active biologically if made with 45% alc. L. Nasarevich

Determination of magnesium in medicines D. S. Belyutskaya *Farm. Zhur.* 1935, No. 2-3, 76-8 — For medicinal mixts. the best methods are direct alc.-acid titration by Knöfner's or Berg's method, in which Mg is pptd. with hydroxyquinoline and brominated and excess of standard Br is titrated with KI and $Na_2S_2O_3$. L. N.

Determination of hexamethylenetetramine in medicines D. B. Yokhel'son *Farm. Zhur.* 1935, No. 5, 172-3 — Hexamethylenetetramine is treated with H_2SO_4 , excess HCHO is added to the $(NH_4)_2SO_4$ formed and the liberated H_2SO_4 is titrated with $NaOH$. L. Nasarevich

Plasmoid I. T. Sirukov *Khim. Farm. Prom.* 1934, No. 6, 14-15 — To obtain a cryst. product instead of an oily mass, 2 moles of methylenedisulphic acid are used for 1 mole of 6-methoxy-8-(γ -diethylamino)propylamine, which is dissolved in HCl (3.6 moles), the methylenedisulphic acid is dissolved in NH_4OH , enough just to neutralize the acid. L. Nasarevich

Determination of halogens in extracts I. Orlov and T. Ksenofontova *Khim. Farm. Prom.* 1934, No. 6, 22 — The color is removed by animal charcoal, then one aliquot is titrated (Volhard) for total halogens, the second aliquot is titrated after the removal of I, and in the third Br and I are removed by boiling with $KMnO_4$. L. Nasarevich

Synthesis of decamethylenebisguanidine (synthallin) K. S. Topchiev and L. N. Pavlov *Khim. Farm. Prom.* 1935, No. 1, 24-5 — Sebacia acid (made from castor oil and KOH) is dissolved in the picoline fraction of pyridine bases, treated with dry NH_3 and $POCl_3$; the aq. soln is extd. with CaH_2 , evapd. on the water bath and the dinitrile of sebacia acid is distd. *in vacuo*. Decamethylene-diamine is obtained from the nitrile with 150 $AmOH$ and Na. Guanidine thiocyanate and the diamine are heated at 135°, poured into boiling 20% KOH and the hardened mass after cooling is ground, washed, dried, dissolved in abs. alc. and treated with HCl to yield decamethylenebisguanidine HCl. L. Nasarevich

Synthesis of acrinoline (2-methoxy-6-chloro-9-diethylaminoacridine) O. Yu. Magidson, A. M. Grigorovskii, V. I. Maksunov and R. S. Margolina *Khim. Farm. Prom.* 1935, No. 1, 26-34 — The synthesis is divided into 2 parts: (1) prepn. of 2-methoxy-6,9-dichloroacridine and (2) prepn. of 1-diethylamino-4-aminopentane and the condensation of the two: (1) *p*-Nitrotoluene \rightarrow *o*-chloro-*p*-nitrotoluene \rightarrow *o*-chloro-*p*-toluidine \rightarrow 2,4-dichlorotoluene \rightarrow 2,4-dichlorobenzoic acid + anisidine \rightarrow *N*-*p*-amyl-4-chloroanthranic acid \rightarrow 2-methoxy-6,9-dichloroacridine. (2) Diethylaminoethanol \rightarrow diethylaminoethyl chloride \rightarrow 1-diethylamino-4-pentanone \rightarrow 1-diethylamino-4-pentanone oxime \rightarrow 1-diethylamino-4-aminopentane. The condensation can be effected either by alkali or acid. L. Nasarevich

Properties of digitalis preparations S. I. Ordynskii *Khim. Farm. Prom.* 1935, No. 1, 49-55 — The digitoxin content varies from 0.240 to 0.643%. No const. ratio exists between the digitoxin content and the biol. action. Seventy % alc. produces the most effective tinctures. L. Nasarevich

Preparation of tripansin A. M. Lvov *Khim. Farm. Prom.* 1935, No. 2, 110-13 — Tripansin, the Na salt of tetrazo-*o*-toluidine-1,8-aminonaphthol-3,6-disulfonic acid is immediately coupled with H-acid in alk. soln. For avoiding decompos. of the tetrazo compd. the temp. should be low and the process not too long. Purification is effected with $EtOH$, varying amts. of impurities ($NaCl$) being eliminated. L. Nasarevich

Colorimetric determination of adrenaline M. I. Shapuro *Farm. Zhur.* 1934, No. 4, 131-4 — The colorimetric reaction with either $NaNO_2$ or phosphotungstic acid can be utilized for the detn. of adrenaline in the presence of $ZnSO_4$, B_2O_3 , antipyrine, procaine and cocaine. Detn. of adrenaline in ointments and in the presence of protargol is only approx. L. Nasarevich

Oil of sweet oranges from French Guinea Y. R. Naves *Parfums de France* 13, 298-308 (1935) (in French and English) — A review of the economic and tech. characteristics of the oil. Analyses carried out since those reported in 1932 (C. A. 26, 4912) and bearing on over 50% of the production in Guinea, indicate some slight modifications in the previously reported const., a frequently reaches 93%, the max. figure observed being 93.16%, a frequently reaches the min. figure of 1.4720 \approx 0.0002 in fresh oil; the aldehyde content frequently exceeds 1.5%, and the max. of frequently observed values should be raised to 2.4%. Oils from ripe fruit have the highest aldehyde and nonvolatile contents. From a discussion of the work of various investigators, it is concluded that the NH_4OH HCl method is the only one that gives accurate results for the detn. of aldehydes. A. P. C.

Practical perfume formulas I. Tesdorpf *Seifen-Industrie-Ztg.* 62, 787-9 (1935) — Recipes are given for the prepn. of perfumes of the types: quelques fleurs, juchten, toska and chypre. J. W. Perry

Alkaline or acidic cosmetics? Th. Ruemele *Seifen-Industrie-Ztg.* 62, 837-8, 827-9 (1935) — A general discussion

of cosmetic powders and creams, shampoos, mouth washes, etc., leads to the conclusion that, as a rule, superior results are obtained when such products have an acidic reaction.

Uses for isopropyl alcohol Th Ruemele *Seifensieder-Zig.* 63, 21-22 (1936).—Although unsuitable for many products, e. g., mouth washes, isopropyl alcohol can often be employed advantageously in others, e. g., perfumes, nail polishes and other cosmetics.

Contribution to the study of the composition of opium A Labb *Riv. sci. essence profums piante officinali* 17, 215-17, 260-1 (1935).—Numerous formulas are given.

Camomile Orlando Gulminelli *Riv. sci. essence profums piante officinali* 17, 272-4 (1935). Roman camomile yielded 700-1000 g. per 100 kg. of oil of d. 0.905-0.915, contg. isobutyl isobutyrate, isobutyl angelate, amyl tiglate and angelaldehyde, a little strychnine and quercitrin. The oil was sol. in 8 parts of 90° alc. and in ether, solidified at 0°, depositing colorless crystals of pleasant balsamic odor and bitter burning taste.

Glucose Methods of use and therapeutic indications Agustina A. Salvatti *Dia med.* 6, 939 (1934). *Anal. asoc. quim. Argentina* 23, 23B.

Pill and lozenge making K. Kromann Jensen *Farm Tidende* 2, 25, *Pharm. J.* 135, 650 (1935).—Formulas and modes of mfg. are given.

New method for the determination of iodobismuthate of quinine Lorenzo Bracaloni *J. pharm. chim.* 22, 49-52 (1935).—To a soln. of (BiI₃), quinine 2Hl in acetone add aq. AgNO₃ in excess, AgI and basic Bi nitrate (A) are pptd., quinine nitrate in soln. is filtered off after the acetone is expelled by water-bath heat and the residual mixt. is treated with 95% alc., quinine is detd. by polarimetry. AgI and A are sep'd. by concd. HNO₃, from A, Bi is pptd. by NH₃, carbonate and weighed as Bi₂O₃. Results of detn. of Bi, quinine and I by this method show good agreement with those of B's previous method (cf. C. A. 25, 5952).

Preparation of a sensibly neutral and permanent 0.1% adrenaline solution Louis Julien *J. pharm. chim.* 22, 53-9 (1935).—The vague formula of the French Codex 1926 is revised by using a corrected relation between d. and percentage of NaHSO₄, and replacing the no. of drops by cc. In the old and the corrected formulas, too much SO₂ is set free by HCl, resulting in pH 2-5-6 which is too high an acidity for the parenteric use of the prepn. Omission of HCl is recommended, reliance being placed on the small acidity of NaHSO₄ itself. Dissolve adrenaline (A) 1 g. and NaCl 7 g. in H₂O contg. 5 cc. soln. of NaHSO₄ (d. 1.33 = 31.60 g. SO₂ per 100 cc.), add H₂O sufficient for 1000 cc. This soln. has pH 6.2, similar to that of the H₂O used, and keeps its content of A unchanged for more than 2 months. If 5 cc. of the NaHSO₄ soln. is reduced to 3 cc. (cf. Bndel, C. A. 17, 2169), pH = 6.6. The 3-cc. formula is recommended for a single ampoule dose, the 5-cc. formula, for use in larger flasks involving repeated renewal of air. If desired, the neutral formula can be modified by addn. of 5.45 cc. N HCl, i. e., the exact quantity to form A.HCl. The resulting pH = 3.8 is an extreme max. of allowable acidity (cf. pH 3.6, Dubouquet, C. A. 16, 2198).

Alkalimetric determination of barbital Ch. Morin *J. pharm. chim.* 22, 59-61 (1935); cf. Isnard, C. A. 18, 2944.—To avoid aq. hydrolysis of the K barbiturate formed in the method, dissolve 0.2 g. substance in 30 cc. neutralized acetone, add 4-5 drops of 0.1% thymol blue in 95% alc. and titrate with 0.1 N KOH soln. in MeOH from yellow through green to pure blue. Previously use the same indicator in titrating the KOH with 0.1 N H₂SO₄. With 6 samples of barbital, results varied from -3 to +0.05%; with neonal (6 samples) from -2 to +2%. Applied to com. tablets also including gardenal, rutilonal and dial, the method is more rapid than that of extn. and detn. by wt.; the accuracy is the same as with the barbital tablets.

A new color reaction of chloral and its application to the identification of sirup of chloral. M. Peser *J. pharm.*

chim. 22, 68-9 (1935); cf. C. A. 30, 1327.—To 2 cc. H₂SO₄ (d. 1.84) in a test tube add 0.1 cc. (2 drops) of the KBr-resorcinol reagent, then 2 drops of chloral soln. and warm to 100°. The colors change from yellow-pink to violet at 90° then to blue at 100°. Upon addn. of 2 cc. H₂O, the blue color turns to orange-red, when NaOH is added, a violet then reddish tint is produced. To detect chloral (A) in sirup of A (French Codex) by this test, ext. 1 cc. of the sirup with a mixt. of H₂O (5 cc.) and Et₂O (2 cc.), sep. and evap. off the Et₂O completely, and apply the test to the residue. As tartaric acid (B) is insol. in Et₂O, the test differentiates sirup of A from that of B.

Iron in chemistry and pharmacy I. Historical G. Malcolm Dyson *Pharm. J.* 133, 356 (1934). II The production of iron and steel *Ibid.* 729. —Historical and technical notes. III Compounds of iron *Ibid.* 135, 679 (1935). Phny's accounts of "shoemakers' black" (Fe₂SO₄ used for blackening tanned leather) as an adulterant for verdigris, and various uses of it in medicine are quoted, also the accounts by Quincy (1720) on the prepn. of "Colicbatch's Stiptick powder," the "astringent saffron of iron," etc. "It has been recently suggested that the most assumable form of Fe is that obtained by the ingestion of raisins from grapes grown on ferruginous soil."

Report on (the assay of) crude drugs H. W. Youngken *J. Assoc. Official Agr. Chem.* 18, 515-18 (1935), cf. C. A. 28, 6527.—The phys. characteristics of roots of *Aconitum napellus* L., subspecies *neomanitatum* Wall, are described, together with the histology of the parent tuberous root and of the daughter tuberous root. Scrapings of both parent and daughter tuberous roots, when exam'd in water mounts, showed the starch grains to be simple, the individual grains were mostly spheroidal, plano-convex, angular-convex to pyriform, and up to 24.5 microns in diam. It is recommended that aconite root should be recognized in the U. S. P. as representing the dried tuberous roots of *Aconitum napellus* L. and its subspecies and varieties contg. aconitine.

Oil of Tennessee red cedar [use in perfumes and medicine] (Huddle) 27. **Bark of *Aspidosperma quadrand* (Florim.) 11D** Emulsions [esp. cosmetics] (Thomassen) 2. **Halogen derivs. of procaine** (Trejka, Vymetal) 10. **Cyclic ketones [having a jasmine perfume]** (Fr. pat. 785,549) 10. **Removing halogens from fluids [products used as bandages for medicinal purposes]** (Brit. pat. 435,738) 13. **Unsatur. aldehydes and ketones [products used in pharmaceutical chemistry]** (Brit. pat. 435,194) 10. **Esters of etherified glycolic acids [used in the perfume industry]** (U. S. pat. 2,027,991) 10. **Oils [cosmetics]** (Ger. pat. 619,928) 27.

Therapeutic compounds Hanns John *Fr.* 786,888, Sept. 11, 1935. Esters of 2-phenylquinoline-4-carboxylic acid (I) its substitution products, isomers and homologs are prep'd. by causing glycerol or haloalcohols of glycerol to act on the acids, their salts, esters or halides. Examples are given of the prepn. of the glycerol esters of I, m 109°, of 2-phenylquinoline-4-carboxylic acid (II), m 110.5°, of 2-phenylquinoline-4'-carboxylic acid, m 113°, glycerol α,α' -diester of I, m 58°, glycerol α,α' -diester of 6-methoxy-I, m 92-4°, glycerol α,α' -diester of II, m 73-5°, glycerol α,β' -diester of I, m 65-8°, glycerol triester of I, m 135°, α -chloropropionyl diester of I, m 109°, and β,β' -dichloropropionyl ester of II, m 101°.

Therapeutic solutions I. G. Farbenund A-G (Carl Ludwig Lautenschlager, Max Bockmuhl and Rudolf Schwabe, inventors). Ger. 622,298, Nov. 25, 1935 (Cl. 30h. 2). Addn. to 446,290 and 447,161. Medicaments of low soly. in water are dissolved in water-sol. ethers of trihydric or higher polyhydric alcs., or in aq. solns. of such ethers. In typical examples, 3,4-diamino-7-ethoxyacridine (0.5 g.) is dissolved in diethylin (10 cc.), and acetylcholine acid (0.5 g.) is dissolved in dimethoxy-trihydroxyhexane (10 cc.).

Therapeutic preparations liberating carbon dioxide

Jean G Waldenmeyer Fr 788,108, Oct 5, 1935 The mixts of substances which by decompn yield CO_2 are coated, separately, in fatty materials contg lipoids, e.g., lecithin. The presence of lipoids allows the passage and action of a catalyst while not impairing the keeping properties of the fat

Therapeutic mixture for oral administration in treating cornea, etc. Harold S Diehl (to Board of Regents of the Univ of Minn.) U S 2,027,722, Jan 14 A salt of codeine such as the sulfate is used in admixt with a salt of papaverine such as the hydrochloride

Local anesthetics Oscar H Stover and Edmund H Brigham (to Oleohess Co.) U S 2,027,125, Jan 7 A procaine base is converted into a salt by reaction with an equimol proportion of a fatty acid contg at least 9 C atoms, such as pelargonic, capric, undecylic, lauric, myristic, palmitic, stearic, oleic or erucic acid. The product may be dissolved in various oils

Thiazoline compounds (local anesthetics) Max Engelmann (to I du Pont de Nemours & Co.) U S 2,027,030, Jan 7 By the reaction of substituted phenyl isothiocyanates such as *p*-tolyl isothiocyanate with halo ethylamines such as bromoethylamine-HBr, products are obtained such as *p*-tolylmimodihydrothiazole, m 131°, hydrochloride, m 154° *p*-fluorophenylmimodihydrothiazole, m 152.3°, hydrochloride, m 134° *o*-butoxyphenylmimodihydrothiazole, m 68° *p*-hydroxyphenylmimodihydrothiazole, m 154°, hydrochloride, m 235-9° *p*-ethoxyphenylmimodihydrothiazole, m 140° *p*-hydroxy-*m*-methoxyphenylmimodihydrothiazole, m 168-9°, hydrochloride, m 211°. General mention is made of some other similar derivs and of their salts

Oxazoline compounds (local anesthetics) Max Engelmann (to I du Pont de Nemours & Co.) U S 2,027,031, Jan 7 Various examples are given of the reaction of substituted phenyl isocyanates with halo ethylamines and further treatment of the resulting product or substituted phenylalkylhalo ureas to produce substituted phenyl dihydrooxazoles, and, as being new products, claim is made to compds such as 2-*p*-ethoxyphenyldihydrooxazole, 2-*p*-butyloxyphenyldihydrooxazole and the like (general mention being made of various similar compds and their salts)

Anthelmintic Wallace P Elmslie and Paul Caldwell (to Moorman Mfg Co.) U S 2,027,967, Jan 14. An anthelmintic ration suitable for treating swine or other livestock comprises an alimentary product such as wheat middlings mixed with a small proportion of a F-contg salt such as NaF or KF

Rectal narcotic Erich Goth (to Winthrop Chemical Co.) U S 2,027,905, Jan 14 An anhyd compn, stable to light and heating and liquid at room temps, comprises tribromoethyl alc together with a smaller quantity of a compd such as acetamide and methylacetamide or carbamic acid Me and Et esters, or tetramethylurea, etc.

Esters of polycyclic alcohols Schering-Kahlbaum A-G Fr 788,545, Oct 11, 1935 Esters of the general formula $\text{C}_{18}\text{H}_{30}(\text{OR})(\text{OR}')$ and the constitutional formula

in which R is an acyl group and R' is H or an acyl group are prep'd by submitting esters of hydroxy ketones of the group of male sexual hormones $\text{C}_{18}\text{H}_{30}\text{O}_2$ and $\text{C}_{18}\text{H}_{30}\text{O}_4$ and their stereoisomers, to the action of agents capable of transforming the ketone group to a secondary alc group and acylation, if desired, of the alc. group. The transformation may be carried out by nascent H. The resulting

esters have the characteristics of the male sexual hormones

Aminoazo compounds Fritz Mietzsch and Josef Klarer (to Winthrop Chemical Co.) U S 2,022,921, Dec. 3 Compds suitable for therapeutic use in combating protozoa and bacteria and which have the general formula $\text{RN}(\text{N}(\text{X}')\text{X}'\text{N}(\text{X}')\text{X}')$, where R represents an aromatic radical, X' stands for H or alkyl, X' represents a bivalent aliphatic hydrocarbon group which may be substituted by hydroxyl, and where the C_{11}H_7 nucleus R! may be further substituted by alkyl, alkoxy or halogen, are obtainable by coupling aromatic, heterocyclic or aromatic-heterocyclic diazo compds with amines of the benzene series, substituted in one amino group by a basic radical and capable of coupling or by causing diazo compds of aminobenzene derivs contg, attached to one amino group a basic substituent to react with aromatic, heterocyclic or aromatic-heterocyclic compds capable of coupling. Or aromatic, heterocyclic or aromatic-heterocyclic nitroso compds are condensed with polyaminobenzenes, contg a primary reactive amino group as well as one amino group substituted by the basic radical or aromatic, heterocyclic or aromatic-heterocyclic amines can be caused to react with C-nitroso benzenes contg an amino group substituted by a basic radical. Various examples and modifications of procedures are described

Amino double compounds I G Farbenindustrie A-G Brit 430,008, Oct 3, 1935 Double compds. of alkali and alk earth metal halides with secondary and tertiary amines contg a hydroxyalkyl group are prep'd by interaction of the components, or of alkali and alk earth metal hydroxides with either the amine and a hydrohalic acid or the hydrohalide of the amine. The products are useful therapeutically in combination with acids, e.g., barbituric acids and 2-phenylquinoline-4-carboxylic acid. Among examples, compds are prep'd from (1) CaBr_2 and triethanolamine, and (2) CaI_2 and tripropanolamine. *N,N'*-Dichloroazodicarbonamidine Franz C Schmuckes and Henry C Marks (to Wallace & Tiernan Products, Inc.) Brit 430,093, Oct. 4, 1935 See U S 2,010,257 (C A 29, 8008'). The product possesses therapeutic properties

Cyclic amines Soc pour l'ind chim. à Bâle, Swiss 175,571-2, May 16, 1935 (Cl 116A). Addns to 172,873 (C A 29, 5603'). Civetone thioxosime is treated with a reducing agent to give a cyclic imine of the formula $\text{CH}_2(\text{CH}_2)_8\text{CH}(\text{CH}_2)_8\text{NH}$ b.p. 128° and m. 28-9° (175,571). Cyclohexadecanone thioxosime is reduced

to give the cyclic imine $(\text{CH}_2)_{14}\text{NH}$ which b.p. 126-7° and m. 58-9°. The substances have physiological action and are used in therapy Cf C A 30,248°.

Guanyl and biguanyl compounds. I G Farbenind. A-G Fr 788,429, Oct. 10, 1935. Guanyl and biguanyl compounds; the C atom of which is joined to a higher aliphatic radical by O or S as an ether, are prep'd by causing aliphatic alcs or mercaptans contg about 10-16 C atoms to react with cyanamide, dicyanodiamide, alkyl or aryl-alkyl ethers of isourea, guanylisourea, isothiourea or guanylisothiourea or their salts. They may also be prep'd by causing esters of higher aliphatic alcs with halogenated and sulfonic aromatic acids to react with guanidine, biguanidine, thiourea, guanylthiourea or their salts, or by causing NH_4 , amines, or guanidines or their salts to react with cyanamides or rhodanides of high mol wt, contg an aliphatic group of 10-16 C atoms. The products have a strong bactericidal action and also have wetting, frothing and dispersing properties making them useful as disinfectant cleansing agents. Examples are given of the prep'n of dodecylisourea, m 78°, HCl salt, m 93°, dodecylguanidine, m 96°, dodecylbiguanidine, m 99°, S-dodecylisothiourea, m 82°, HBr salt, m 111°, HCl salt, m 133°, S-dodecyl- (m 140°) and S-ethyl-guanylthiourea-HBr, m 90°, S-dodecylmethoxythiourea-HCl, m 134°, dodecylthioethylguanidine-HBr, m 68°, and 3-biguandinephenyl dodecyl ether, m 175°, di-HCl

salt, m. 207° (from *m*-aminophenyl dodecyl ether, b_p 204°, m. 63°, HCl salt, m. 115°).

Pyrazolones. I. G. Farbenind. A.-G. Brit. 433,053, Aug. 8, 1935. 1-Aryl-2-alkyl-5-pyrazolones that contain at least at 1 N atom a radical (Y) that is a partially or wholly hydrogenated cyclic hydrocarbon radical and have the formula $RN.NR'.CR''CR'''CO$, where R is Ph

or Y, R' is alkyl or Y, R'' is alkyl and R''' is H, alkyl or the group -N(X)X (where X and X' are H, alkyl, aralkyl or Y), are distinguished by good *seifbruge* and *sedative* action. They are prepd by (a) condensing an acylacetic ester with a hydrazine monosubstituted by Y and causing an alkylating agent or an agent for introducing Y to act upon the resulting product, (b) condensing an acylacetic ester with a symmetrically disubstituted hydrazine contg. at least 1 Y, (c) condensing a hydrazine monosubstituted by Y with an α,β -unsatd carboxylic acid or an ester thereof, oxidizing the pyrazolidone thus obtained and causing an alkylating agent or an agent capable of introducing Y to act upon the resulting product, (d) nitrating or treating with HNO₃ a pyrazolone obtained by (a), (b) or (c), reducing the product in each case and, if desired, causing the resulting amino deriv. to react with an alkylating agent or with a halo substitution product of a wholly or partially hydrogenated cyclic hydrocarbon, (e) causing 1 molar proportion of a halo substitution product of a wholly or partially hydrogenated cyclic hydrocarbon to react with 1 molar proportion of a known 5-pyrazolone compd. substituted in the 1- and 2-positions and contg. a primary or secondary amino group in the 4-position, the product may be further alkylated, or (f) causing an aldehydesulfoxylate or aldehyde bisulfite to act upon the pyrazolones obtained according to (d) and (e) and contg. a replaceable H atom attached to N; soly. of the products in H₂O is thus effected. Five examples are given. Cf. C. A. 29, 4134¹.

Barbituric acids. I. G. Farbenindustrie A.-G. Brit. 435,450, Sept. 23, 1935. *N*-Mono- or di-alkylated barbituric acids substituted in the 5-position by Me and a group X, comprising a said cycloalkyl group, or a said alkyl group which may be substituted by a cycloalkyl residue, or an unsatd. alkyl group or halo deriv. thereof, provided the group contains at least 3 C atoms, are prepd by known methods. Methods involving the treatment of 1-cyano-2-iminobarbituric acids are excluded. The products have *therapeutic properties* and, in the case of the *N*-monoalkyl compds., may be converted into their salts with inorg. or org. bases. In examples, (1) butylmethylmalonic acid diethyl ester is treated with methylurea to give *N*-methyl-5,5-methylthylbarbituric acid, and (2) *N*-methyl-5,5-methylallylbarbituric acid is prepd. from methylallylmalonic acid diethyl ester and methylurea.

Anthracenic products. James Waddell (to E. I. du Pont de Nemours & Co.). U. S. 2,025,364, Jan. 21. Lipoid-contg. material such as cholesterol is heated to above 100° (suitably to 190° for 2.5 hrs. in a Cu pipe in the case of cholesterol) in the presence of a greater quantity of water, so as to increase the amount of activatable substances present without substantial injury to them, and the treated material is subjected to irradiation with ultraviolet rays.

Pregnanolone. Schering-Kahlbaum A.-G. Fr. 788,430, Oct. 10, 1935. Pregnanolone (I) and all-*l*-O or their derivs. are prepd. by transforming to tertiary carbinols, in the form of their esters, the corresponding 3-hydroxy- β -methylolmalonic acids or their derivs., in which the alk. OH group is replaced by halogen or is protected, e. g., by etherification or esterification, eliminating water by means of water-extg. agents between the tertiary OH and the neighboring tertiary H atom, and disoccr. the double bond thus formed in the lateral chain of the mol., by means of appropriate oxidizing means, thus forming the corresponding hydroxy ketones or their derivs. Cf. C. A. 30, 112².

Ketocyclopentanodimethyltetradecahydrophenanthrene. Schering-Kahlbaum A.-G. Fr. 788,431, Oct. 10, 1935.

1 This is prepd. by transforming pregnanolones (I), by the action of organometallic compds., into a secondary-tertiary alc., causing an acylation agent to act on this, submitting the unsatd. ester obtained to an oxidation and finally sapon. the oxidation product. I are obtained from sterols or by the process of Fr. 788,430 (preceding abstr.). The product has an action similar to that of male sexual hormones.

2 **Corpus luteum hormones.** Société pour l'ind. chim. A. Bâle Brit. 435,530, Sept. 30, 1935. The hormones are obtained in cryst. form by causing crude preps thereof to react with reagents for the carbonyl group, e. g., bisulfite, NH₄OH, N₂H₄ or derivs thereof such as semicarbazide and phenylhydrazinesulfonic acid, sepp. the reaction products and decomp. them to liberate the hormones. Among examples, (1) an ext. prep. according to Brit. 426,166 (C. A. 29, 5601⁴) is dissolved in alc and treated with an aq. soln. of semicarbazide-HCl and AcONa, the crude ppt is washed with alc, dissolved in glacial AcOH and heated with dil. H₂SO₄, and (2) an Et₂O soln. of a hormone prep. is shaken with aq. Na bisulfite and the aq. layer is sepd. and heated with H₂SO₄ and the released hormone extd. with Et₂O.

3 **Pituitary gonad-stimulating hormones.** Arthur E. Meyer (to Chappel Bros Inc.) U. S. 2,027,446, Jan. 14. A dil. aq. soln. (suitably a 10% soln.) of a lower aliphatic alc. such as Me, Et, Pr, Bu or Am alc. is used as an extg. agent for extg. alc.- and acetone-insol. hormones from animal material contg. such hormones and which may have been previously treated with acetone.

4 **Bactericidal azo compounds.** I. G. Farbenind A.-G. Fr. 788,679, Oct. 14, 1935. Aromatic, heterocyclic or aromatic-heterocyclic diazo compds. substituted by a *p*-sulfonamide or disulfonamide group are coupled, by known methods, with compds. of the C₆H₅, C₆H₄, pyridine or quinoline series capable of coupling. The compds. contain a basic N atom fixed to the ring, which may be represented by the pyridic or quinolinic nuclear N atom, also one NH or OH joined to the ring and an acid group. The acid group may be a substituent of the NH₂ or OH group. Examples are given of the preps. of 4'-sulfonamide-2-aminophenylazo-4-hydroxy- (or amino)-azobenzene-5-sulfonic acid, 4'-sulfonamide- (or sulfonamethylamide)-phenylazo-2-aminophenylazo-5-naphthol-7-sulfonic acid, 4'-sulfonamide-2-aminophenylazo-4-hydroxy- (or amino)-azobenzene-*N*-methanesulfonic acid, 4'-sulfonamidophenylazo-6-amino-2-naphthol-8-sulfonic acid, 4'-dimethylsulfonamidophenylazo-8-naphthol-1-*N*-hydroxyethylamino-3,6-disulfonic acid and 4'-ethylsulfonamidophenylazo-8-hydroxyquinoline-7-carboxylic acid.

5 **Compositions for cleaning or disinfecting the mouth.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roesler (Wilhelm Schulenburg, inventor). Ger. 622,411, Nov. 27, 1935 (Cl. 30h. 13). Stabilized water-sol. compds. contg. active O are mixed with small proportions of Ag salts and preferably with acid substances. The compds. contg. active O may be stabilized by dehydration or addition of a known stabilizing agent, e. g., Mg silicate. Ag salt of org. or inorg. acids may be used, but salts of acids which have a disinfecting action are preferred. The proportion of Ag in the mixts. should be 0.5-3%. Org. acids are the preferred acid substances, but inorg. acid substances, e. g., H₂BO₃ or an acid phosphate, may also be used. When an alk. substance contg. active O is used the proportion of acid substance is preferably less than that necessary for neutralization. A sp. compn. contains dehydrated NaBO₂·H₂O 30, tartaric acid 11.25 and Ag *p*-hydroxybenzoate 1.6 parts. Sweetening substances, perfumes, etc., may be added.

6 **Dentifrices.** Worcester Salt Co. Brit. 434,985, Sept. 12, 1935. See Fr. 775,290 (C. A. 29, 2666⁹). The suspension of NaCl may also be rendered stable by addn. of a concd. suspension of finely divided substance, e. g., Mg(OH)₂, which may also contain a colloid, e. g., tragacanth.

7 **Dentifrice.** Bernard H. Jacobson (to Klipstein Chemical Processes, Inc.). U. S. 2,027,535, Jan. 14. Finely divided cryst. anthraquinone is used with other ingredients

such as glycerol, soap, cornstarch, Na benzoate, oil of pepper mint and water

Shaving preparations Ralph H Fash Fr. 788,572, Oct 12, 1935 The preps contain substances which protect the blade against oxidation by rendering the steel thereof neutral Such substances include oxidizing compds such as chromic acid, chromates, di- and perchlorates, perchlorates, perborates, persulfates, and nitrates of metals having, in soln, a tension lower than that of Fe or neutral steel It is presumed that a very fine protecting film of oxide is formed on the steel

Cosmetics I G Farbenindustrie A G Brit. 435,811, Sept 30, 1935 Preps for protection against sunburn and allowing tanning of the skin consist of solns or dispersions of org compds that are colorless, free from phenolic OH groups, nonmucous, have a strong absorptn capacity for ultraviolet rays and have a slope in the absorption curve between 310 and 350 mμ corresponding to an increase of the logarithm of the molar extinction coeff by at least 1 within a range of 10 mμ Suitable compds have the formula $RX \cdot CR_2$ —in which R is an aromatic nucleus and X is N or the methine group, the substances

used preferably having the formula $C_6H_5X \cdot CR_2Y$, wherein Y is a member of 1 or 2 groups, e g, CH_3 , $-CH_2CH_2-$, O, S or NH Specified classes of substances are aryl benzimidazoles, aryl benzothiazoles and 2-aryl indoles In examples, the compds are (1) Na phenylbenzimidazolesulfonate, dissolved in H_2O and mixed with

starch, tragacanth, alc and glycerol, (2) 2-p-tolylbenzimidazole, dissolved in wool fat, and (3) 2-(p-methoxyphenyl)benzimidazole, dissolved in wool fat

Cosmetic preparations Berta Hawck (nee Hosp) Ger 622,372, Nov. 27, 1935 (Cl 33h. 13) Cosmetic preps which are ordinarily applied as powders are made into pastes or liquid compns. with the aid of liquids which readily evaporate at the temp of the body A mixt. of alc and CCl_4 is suitable

Apparatus for irradiating wool fat or wool fat alcohols for use in cosmetic creams. Leo-Werke G m b H Ger 622,378, Nov. 27, 1935 (Cl 33h. 13)

Hair cream Nicolas Marchlone Fr 787,918, Oct 1, 1935 The cream contains henna 4, S 15, quinine 1.5, camphor 5, castor oil 1, formal 4.5 g, alc. of 38° 11 and a perfume

Hair-waving solution. Frederic Maeder. Brit 435,213, Sept 17, 1935 Hair is permanently waved by unpregnating with a soln of a sulfide, e g, NH_4HS 2.5, H_2O 97.5 parts, to which an alkali, e g, NH_3 , is preferably added, and heating to a low temp Org substances forming colloidal solns or suspensions, e g, keratin, gelatin, agar agar, gum arabic, starch, resins, dextrin, shellac, viscose, may be added to the soln

Tobacco Tabakforschungsinstitut für das Deutsche Reich Ger 619,680, Oct. 6, 1935 (Cl 79c. 1). Tobacco is fermented in pressed bales containing insulating layer of cotton wool which may contain aromatic substances to flavor or scent the tobacco

Recent observations on the decomposition of raw phosphates with sulfuric acid Hans Lehecke. Ztsch. f. d. Unt. Appl. K. Chem 65, 81-5, 92-4(1935)—The reactions taking place by the treatment of raw phosphates with H_2SO_4 in the manu of H_2PO_4 and phosphatic fertilizers are discussed In the manu of H_2PO_4 , the extent to which the $CaSO_4$ formed is hydrated depends on the temp and concn The less the $CaSO_4$ is hydrated, the better its filtering properties The conditions under which the hemihydrate is formed is expressed by $t = -0.513 P + 0.0087 P^2 - 0.000333 P^3 + 107$, where t is the temp and P the concn of H_2PO_4 in percentage of P_2O_5 This equation is also shown graphically, the field below the curve representing $CaSO_4 \cdot 2H_2O$, the field above $CaSO_4 \cdot \frac{1}{2}H_2O$ At 0° P_2O_5 , the curve intersects the ordinate at 107° which,

as established by van't Hoff, is the transition point between $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ and $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$. The $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ formed under these conditions is, however, readily hydrated by subsequent washing on the filter and the resulting product greatly retards the filtration. When the process is regulated so as to conform to the equation $t = 6.032P + 0.0306P^2 + 254$ a hydration resistant $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ results. The corresponding curve, when extrapolated to the ordinate, indicates an ideal value at 265.4° . However, $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ is converted to nonhydrating anhydrite in water at 190° without initial formation of the stable $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$. It is, therefore, assumed that the presence of H_3PO_4 renders $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ stable at the temps and concns indicated by the curve. At still higher temps. CaSO_4 is obtained as a stable anhydrite, which also gives good filtration. The temp concn curve in this case follows that of stable $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ but is located $15\text{--}20^\circ$ higher. H_3PO_4 contg $40\text{--}45\%$ P_2O_5 as obtained, suffices in strength for most purposes, but in view of the destructive action of this on the filter materials and the high heat consumption, operating at lower temps and concns. ($30\text{--}32\%$ P_2O_5) may be more economical. Contrary to previous experience, it was also possible to obtain $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$, which forms under these conditions in a filterable form when certain precautions were taken. Recent developments in the filtration and concn of H_3PO_4 are described and illustrated. The mechanism of the reactions taking place by the mann of superphosphate (cf. C. A. 29, 3, 938, 4329) and the after-hardening of this are discussed. From detns of the water of crystn and Debye-Scherrer x-ray photographs of CaSO_4 in superphosphate, it is concluded that CaSO_4 is primarily present as anhydrite, which does not take up water. A minor amt. (max. 5%) is also present as stable $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ in the form of very small, poorly developed crystals. This could be expected in view of the concns and temps employed. A hydration of CaSO_4 is, therefore, not the reason for the after-hardening of superphosphate. The x-ray photographs of fresh and of 6-yr.-old double superphosphate indicate that $\text{Ca}(\text{H}_2\text{PO}_4)_2$ originally is formed as an amorphous gel, which very slowly attains a cryst. form. The hardening is then assumed to originate from a progressive formation of a gel of $\text{Ca}(\text{H}_2\text{PO}_4)_2$ interspersed with CaSO_4 crystals and a minor amt. of cryst. $\text{Ca}(\text{H}_2\text{PO}_4)_2$, while the liquid phase diminishes as a result of a progressive reaction between primarily formed H_3PO_4 and still undecomposed $\text{Ca}_3(\text{PO}_4)_2$. A brief review of recent developments in the mfg. methods of superphosphate is given. Cf. C. A. 29, 543, 4339, 6714. D. Thuesen.

The properties of zinc-chromium catalysts for the synthesis of methanol. K. I. Ivanov and V. I. Gusev. *J. Chem. Ind. (Moscow)* 12, 1143-6 (1935).—When a catalyst of $8\text{ZnO} \cdot 1\text{Cr}_2\text{O}_3$ is first used, it is most efficient at 370° , but as its use is continued, the optimum temp. rises slowly to 400° . Very high rates of passing the gas over it favor MeOH formation, while low rates of passing the gas, or temps. above 400° begin to favor CH_4 formation.

H. M. Leicester

Roasting and sintering dusts and powdery ores [phosphatic rocks] (Saint-Jacques, Poupert) 9.

Hydrogen halides. Albert M. Clifford (to Wingfoot Corp.). U. S. 2,028,687, Jan. 14. Equivalent proportions of a halogen such as Cl or Br are treated with H_2S in the presence of a S halide such as S_2Cl_2 or S_2Br_2 and the product may be washed with a solvent such as xylene. Various details of operation are described.

Nitric acid. Fredrik W. de Jahn (to Frank A. Bower). U. S. 2,027,578, Jan. 14. Acid gases under a pressure which may be about 7 atm. are passed into a plurality of sep. absorption chambers, through each of which acid is circulated, and the acid is cooled and maintained in surface contact with the gases under pressure, and acid is drawn off from the chambers. App. is described. This pat. was issued on an application filed Feb. 2, 1928.

Nitric acid. Nikodem Caro and Albert R. Frank. Ger. 351,166, Dec. 11, 1935 (Cl. 12). 26). NH_3 or HCN is

1 catalytically oxidized with O at atm. or raised pressure at a temp. which is regulated in known manner by addn. of steam or H to the mixt. Water is then condensed as completely as possible from the products before the oxides of N are worked up in known manner to concd. HNO_3 .

Concentrated nitric acid. Emil Lüscher (to Lonza Elektrochemische und chemische Fabriken A.-G. (Gampell)). U. S. 2,028,402, Jan. 21. In a continuous process of producing concd. HNO_3 from water or dil. HNO_3 , N oxides, and O at superatm. pressure, the downwardly flowing liquid reaction components and reaction products are brought into contact with upwardly flowing O and gases and vapors through a temp. gradient obtained by heating the acid accumulating at the lowest point of the path of the liquid enriched by HNO_3 and contg. an excess of N_2O , to a temp. corresponding at the pressure used to the boiling temp. of an acid having the highest desired HNO_3 concn and having a content of about $5\text{--}20\%$ N_2O , and the rising hydrous vapors are condensed by cooling at the highest point of the gas path, so that the reaction process is carried out in the form of a fractional distn., the lower N oxides are continually carried upward and N_2O remains in such quantity in the liquid trickling downward that fresh HNO_3 is constantly formed in the downwardly trickling liquid and the liquid HNO_3 having the desired highest content of HNO_3 and a content of about $5\text{--}20\%$ N_2O is obtained at the lower end of its path and may be collected. App. is described.

Purifying hot burner gases in sulfonic acid manufacture. Bernard M. Carter (to General Chemical Co.). U. S. 2,028,318, Jan. 21. For eliminating deleterious impurities from hot burner gases in the contact- H_2SO_4 process, the hot gas contg. water vapor is cooled in stages to cause condensation of the water vapor together with impurities and H_2SO_4 contained in the gas, the condensate from an initial and from a subsequent stage of the cooling being separately collected, initial condensate being discarded and subsequent condensate being retained so that impurities are eliminated with the initial condensate and H_2SO_4 is separated with the subsequent condensate. An arrangement of app. is described. Cf. C. A. 29, 2074.

White alkali cyanide. Grangers Manufacturing Co. Ger. 619,823, Oct. 28, 1935 (Cl. 12b 11). The alkali cyanide, especially in cast sticks, is obtained by heating the cyanides to temps. above the m. pt., e. g., $50\text{--}100^\circ$, and casting. Thus NaCN from sugar-beet slops is heated to 1200° and cast at 650° .

Alkali dichromates. Ernst Hackhofer and Annemarie Beuther (to I. G. Farbenind. A.-G.). U. S. 2,027,477, Jan. 14. CO_2 under superatm. pressure is caused to react with an alkali monochromate soln. at a temp. of at least 80° (suitably about $80\text{--}85^\circ$) and the soln. is cooled down during the reaction and alkali bicarbonate is sep'd from the dichromate formed by filtration.

Alkali nitrates. I. G. Farbenind. A.-G. Fr. 788,821, Oct. 11, 1935. An alkali metal chloride is suspended in a liquid said with NH_4Cl and an alkali metal chloride and to the suspension is added, preferably with agitation and cooling, NH_4NO_3 dissolved in a liquid of the same compn. By this means crystals of NaNO_3 of 1-2 mm. grain size may be obtained.

Alkali titanates. Titanreselschaft m. b. H. (Joachim Rockstroh, inventor). Ger. 619,568, Oct. 3, 1935 (Cl. 12a, 59).

Trialkali phosphates and aluminas. Chem. Werke vorm. H. & E. Albert A.-G. (Ferdinand Bornemann and Hans Huber, inventors). Ger. 622,229, Nov. 22, 1935 (Cl. 12a 31). Crude material contg. Al_2O_3 and SiO_2 , with or without Fe_2O_3 , is dissolved as far as possible in concd. H_2PO_4 soln. and after sep'n. of undissolved matter the soln. is treated with sufficient alkali carbonate to form trialkali phosphate and alkali aluminate. The soln. is then evap'd. and the residue is calcined and dissolved in water. The soln. is filtered and trialkali phosphate is recovered by crystn. Al_2O_3 is recovered in known manner from the alkali aluminate in the mother liquor.

Copper salts. Dambrover Kupferhütte and I. G. Farbenind. A.-G. Fr. 787,927, Oct. 1, 1935. Solns.,

prepd. by leaching residues of roasted pyrites, calcined after the addn. of NaCl and contg. Cu are treated so as to ppt. the Cu in the form of a salt more difficultly sol. than the corresponding salts of other metals in the soln. Such salts are $\text{Cu}(\text{OH})_2$, CuCl_2 , CuCl and a double sulfate of Cu and Na.

Aluminum chloride. Ruhrchemie A.-G. Fr. 788,120, Oct. 4, 1935. The attack of Al by dry gaseous HCl is carried out in the presence of AlCl_3 in media capable of the Friedel-Crafts synthesis. The AlCl_3 may be present as addn. compds.

Carbon disulfide. Michael J. Leahy. U. S. 2,026,840, Jan. 7. A mixt. contg. finely divided C and S together with CS_2 is heated in the absence of free O to a temp. sufficiently high to form addn. CS_2 from the C and S.

Copper sulfate. Marcel Serciron. Fr. 788,242, Oct. 7, 1935. A liquor contg. HCl in soln. or an appropriate chloride and NH_4 ions is caused to attack Cu in the presence of air or O and the Cu salt is afterward converted to sulfate or the attack may be carried out in the presence of H_2SO_4 .

Hydrogen peroxide. B. Laporte Ltd., Isaac E. Weber and Wm. S. Wood. Brit. 439,401, Sept. 17, 1935. The stability of H_2O_2 solns. is increased by adding HPO_3 or a salt thereof and an org. stabilizer, e. g., acetanilide, phenacetin, salicylic acid, Na salicylate.

Stabilizing hydrogen peroxide solutions. Joseph S. Reichert (to E. I. du Pont de Nemours & Co.). U. S. 2,027,838, Jan. 14. A small proportion of a pyrophosphate (suitably about 0.15% or less of $\text{Na}_2\text{P}_2\text{O}_7$) is added and the acidity of the soln. is adjusted to a pH between 1 and 7. U. S. 2,027,839 relates to purification of a H_2O_2 soln. by pptg. $\text{Sn}(\text{OH})_4$ in it at a pH of above 14. Cf. C. A. 29, 5230.

Hydrogen sulfide. Raymond F. Bacon. Ger. 619,693, Oct. 10, 1935 (Cl. 12: 18). App. for obtaining H_2S by treating metal sulfides, especially FeS , with HCl is described. The FeCl_2 soln. produced is evapd. to dryness, the steam produced being heated and passed over the dry FeCl_2 to give FeO and HCl, the HCl is used to treat further FeS .

Iron chlorosulfate. Röhm & Haas A.-G. Fr. 788,094, Oct. 3, 1935. Cl is introduced up to satn. into a ground mixt. of solid anhyd. FeSO_4 and solid cryst. FeSO_4 in a closed vessel at normal temp. and slightly increased pressure, the proportion of the anhyd. and cryst. salts being so calcd. that the resulting FeSO_4Cl contains 6 mols. of water of cryst.

Basic magnesium carbonate. Samuel A. Abrahams (to Plant Rubber & Asbestos Works). U. S. 2,027,714, Jan. 14. Basic Mg carbonate for insulation is prepd. by adding Na_2CO_3 and NaHCO_3 to a Mg salt soln. such as a buttern in amts. suitable for pptg. an initial basic Mg carbonate ppt. which is transformable to an altered form and then introducing steam into the mixt. of ppt. and assoc. liquid until its temp. is about 70-83° for transforming the initial ppt. to a relatively light strongly bonded form having increased volume per unit of wt. and increased bonding properties.

Syngentate, potassium sulfate. Henry E. Z. Raczowski (to Palestine Potash Ltd.). Brit. 435,772, Sept. 27, 1935. See Fr. 776,937 (C. A. 29, 3789).

Sodium azide. Dynamit A.-G. vorm. Alfred Nobel & Co. Ger. 619,753, Oct. 7, 1935 (Cl. 12: 30). In prep. NaN_3 from NaNH_2 and N_2O , an excess of mixed NaN_3 and NaOH is added to stimulate the mass action.

Sulfur dioxide. Metallgesellschaft (Conway Freherr von Gursewald, Hans Weidmann and Gerhard Roesner, inventors). Ger. 621,529, Nov. 8, 1935 (Cl. 12: 21). Addn. to 606,447 (C. A. 29, 1594). See Fr. 771,452 (C. A. 29, 895).

Sulfur trioxide. Charles F. Silsby (to General Chemical Co.). U. S. 2,028,416, Jan. 21. In making SO_3 by the roasting of sulfide ore and conversion of the resulting SO_2 to SO_3 by the contact process, the sulfide ore is permitted to fall in a continuous stream through the roasting zone countercurrent to a rising stream of air supporting its combustion and the supply of air admitted is regulated so

that the concn. of free O in the SO_2 gas is 5-9% and the ore is caused to fall through an active oxidation zone becoming gradually richer in O in the direction of fall of the ore particles. App. is described.

Titanium dioxide. Reginald H. Monk and Archibald S. Ross (to American Zinc, Lead & Smelting Co.). U. S. 2,028,292, Jan. 21. A soln. of a hydrolyzable salt of Ti such as the sulfate is added with water which may contain about 0.5% of a colloid such as a complex polysaccharide, e. g., dextrin, followed by heating to convert the polysaccharide into sugar by boiling.

Zinc chloride. I. G. Farbenind. A.-G. (Hans Dohse and Fritz Spoun, inventors). Ger. 619,694, Oct. 5, 1935 (Cl. 12: 6). ZnCl_2 is obtained by treating sal ammoniac slag or similar slag contg. Zn and NH_4 salts, with Cl at high temps. Thus, slag contg. 41.3% ZnCl_2 , 27.4% ZnO , 17.9% $\text{Zn}(\text{OH})\text{Cl}$, 10.0% NH_4Cl and 3.0% SiO_2 and Fe compds. is suspended in water, heated to 100° and treated with Cl to give a soln. of ZnCl_2 .

Zinc sulfide. Samuel Kremen. U. S. 2,027,440, Jan. 14. An intimate mixt. of a dil. 7n amalgam with S is heated until reaction is completed, the Hg is distd. off, and the residue is heated until any HgS formed is driven off from the ZnS .

Basic alums. Kalunite Co. Ger. 622,230, Nov. 23, 1935 (Cl. 12: 7). See U. S. 1,914,175 (C. A. 27, 4355).

Colloidal solutions of cerium salts. Chem. Fab. von Heyden A.-G. (Carl Hermann v. Hoessle, inventor). Ger. 622,160, Nov. 21, 1935 (Cl. 12: 9). Water insol. or sparingly sol. Ce salts are pptd. in the presence of a protective colloid and the ppt. is ground in water with the addn., if necessary, of a further amt. of the protective colloid.

Apparatus for producing hydrogen by reaction of hydrocarbon gases with steam. Wm. V. Hanks, Geo. H. Freymuth and Geo. Potts (to Standard Oil Development Co.). U. S. 2,028,326, Jan. 21. Various structural details.

Iodine from brines. Leonard C. Chamberlain and Geo. W. Hooker (to Dow Chemical Co.). U. S. 2,023,099, Jan. 14. Iodine is liberated in a natural I bearing brine or the like and is blown out with a current of air, adsorbed by active carbon while maintaining the current at a temp. above its dew point, and the I is extd. from the carbon with a hot soln. of an alkali such as KOH. An arrangement of app. is described.

Krypton and xenon. Vereinigte Glühlampen und Electricitäts A.-G. Fr. 788,304, Oct. 8, 1935. Kr and Xe are extd. from gases contg. them by washing with a liquefied gas which has a vapor tension lower than that of Kr and Xe, these gases being more sol. in the washing liquid than the other constituents of the gaseous mixt.

Active carbon. Andrew McCulloch and Robert E. Hargraves (to Carbo-Norit-Union Verwaltungs G. m. b. H.). U. S. 2,027,695, Jan. 14. See Fr. 765,716 (C. A. 28, 6360).

Active carbon. Robin G. W. Farnell. Brit. 435,345, Sept. 19, 1935. Active C of low apparent d. is obtained by leaching the black ash residue resulting from the digestion of esparto grass and contg. mainly pectocellulose with H_2O until it has a pH of 9-10, heating to 700-1000° in the presence of limited amts. of air or O and continuing the heating with excess of air or O at 400-500°. To increase the d. of the product, a proportion of wood, wood charcoal, coconut shell or charcoal therefrom, corozo nuts, apricot stones, etc., may be added to the black ash residue.

Active adsorbent silica. Herbert J. Wollner and John V. Shinn (to General Chemical Co.). U. S. 2,027,948, Jan. 14. See Can. 352,787 (C. A. 29, 8254).

Catalyst for reduction of sulfur dioxide. Mautland C. Boswell. U. S. 2,026,819, Jan. 7. A hydrated sulfide of a metal of the Fe group or a mixt. of hydrated sulfide material with hydroxides or oxides is partly dehydrated, in the absence of air, and the partly dehydrated material is subjected to the action of O to increase its susceptibility to the action of SO_2 ; it is then subjected to the action of SO_2 at a temp. above room temp. (suitably about 100-

200°) and the material is finally subjected to the action of H and SO₂ at a higher temp. (suitably about 200–300°) to prepare the catalyst.

Crystalline mercurous sulfate suitable for use as a catalyst. Ronald J. Baird. U. S. 2,027,364, Jan. 14 A soln. contg. about 2% H₂SO₄ and 10% NaNO₂ is brought into contact with Hg and treated with a d. c. while using the Hg as anode and maintaining a c. d. at the anode of about 0.5–1 amp per sq. decimeter. App. is described.

Regenerating spent tungsten oxide catalysts. Ralph I. Brown (to Atmospheric Nitrogen Corp.) U. S. 2,027,855, Jan. 14 Spent catalysts which are relatively insol in aq. NH₃ and which may have been used in HOAc

1 synthesis from MeOH and CO are dissolved in a soln. of a strong base such as NaOH to form a sol. tungstate and the soln. thus obtained is acidified (suitably with HNO₃) to ppt. W oxide; the ppt. is dissolved in NH₄OH and the soln. thus formed is acidified to ppt. a catalytically active W oxide.

Vanadium catalyst for promoting oxidation reactions. Edward S. Johnson (to Calco Chemical Co.). U. S. 2,027,316, Jan. 7. A catalyst suitable for promoting reactions such as the production of SO₂ from SO₃ comprises a V compd. homogeneously incorporated in gelatinous curds of hydrous SiO₂, produced by acidification of a silicate soln. under conditions alk. or neutral to Congo

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON AND C. H. KERR

Glass making in Southern California. Roy L. Swain. *Glass Ind.* 16, 333–7 (1935).

Thuringian glass industry. David H. Buffum. *Glass Ind.* 16, 351–4, 357 (1935).

Performance history of glass tanks. J. W. Romig. *Glass Ind.* 16, 271–2 (1935).—Tabulations of the properties and behavior are given to aid in the analysis of glass tanks as production units.

Physical chemistry of glass. Pierre Gilard. *Glass Ind.* 17, 17–21, 27 (1936), cf. C. A. 30, 585.—A general statement of the present status of glass technology.

Microchemical analysis of glasses. VIII. The determination of arsenic in glasses. W. Geilmann and O. Meyer-Hoissen. *Glastech. Ber.* 13, 420 (1935), cf. C. A. 29, 3794.—In detg. the As in glasses it is recommended to volatilize it as arsine in the usual way and to det. the latter. Very small ams. up to 0.025 mg. are obtained colorimetrically with HgCl₂ paper, while for ams. from 0.025 to 10 mg. gravimetric detn. of the reaction product of the arsine with HgCl₂ soln. is useful. Total As is obtained by alk. decompn. of the glass, while quinquavalent As can be detd. by decompn. of the glass with HIF–H₂SO₄ mixt. and fuming off of the As₂O₃. The trivalent As is obtained by difference.

Influence of composition on the color of sulfur amber glass. K. Litzow and G. Brooks. *Glass Ind.* 17, 12–13 (1936); *Sprechaal* 68, 51–3 (1935).—The reducing action of C, Zn, Si and Al on Na₂SO₃ to produce colors in glass is studied. A definite C/Na₂SO₃ ratio was observed for each strength of color produced. Al sticks worked as well as powd. Al, while Zn gave no color.

Fining of soda-lime magnesia glasses. A. E. Badger. *Glass Ind.* 16, 369 (1935).—Substitution of lime for part of the dolomite produced a marked improvement in the fining of the glass melted in closed pots of 2000-lb. capacity.

Clays. J. LeBraz. *Glaces et verres* 1935, No. 45, 2–8.—Their use in glass manuf. is discussed. H. S. W. Structure of phosphorescent glasses. A. Schloemer. *Glastech. Ber.* 13, 424–5 (1935); cf. C. A. 27, 4046.—The view of D. Dobischek (*Ibid.* 13, 370 (1935)) that the phosphorescence of certain glasses examd. could be ascribed to a certain cryst. fine structure is untenable, since nothing is known of P in the vitreous condition.

Defects of glass. Th. Ziehner. *Glas u. App.* 16, 237–8, 247–8 (1935).—The factors influencing the mech. strength of glass are discussed, as well as the causes of failures in operation and use of glass. Examples illustrate such defects.

Survey of insulation practice. C. W. Parmelee and A. E. Badger. *Glass Ind.* 16, 274–7 (1935).—The results are published of a questionnaire to continuous glass tank works to det. the value of insulation in the several parts of the system.

The situation of safety glass made with cellulose as the intermediate layer. Fritz Ohl. *Nitrocellulose* 6, 120–3 (1935).—A review.

Laminated safety glass. J. W. H. Randall. *Chemist* 12, 367–73 (1935).

Old Brussels faience. H. Nicaise. *Verre silicates* 16, 457–60 (1935).

Solid reactions at 1000° to 1200° between MgO or BeO and Ni, Fe, Cr, Mn and their oxides. Louis Navias. *J. Am. Ceram. Soc.* 19, 1–7 (1936).—The elements Ni, Fe, Cr and Mn and their oxides NiO, Fe₂O₃, Cr₂O₃ and Mn₂O₃, in finely divided state, were brought into contact with granular, fused MgO in loose form and in pressed disks and also into contact with slabs of high-fired MgO and BeO. Max temps. were 1000°, 1100° and 1200° in air firings. The degree of reaction was noted by the extent of discoloration of the MgO and BeO near the contact surface. Ni showed the least reactivity, Fe and Cr next, and Mn the most. The elements in oxidizing atm. caused more reaction than their oxides in all cases. There was less reaction with BeO than with MgO with corresponding contact material. Firings were also made with these elements and oxides in contact with pressed disks of fused MgO in an atm. of H₂. Ni and Fe showed no reaction, Cr very slight, and Mn slightly more. NiO and Fe₂O₃ were reduced to Ni and Fe without reaction, whereas Cr₂O₃ did not reduce and gave no reaction, and Mn₂O₃ became semi-sintered and gave a very slight reaction. When air or N₂ was passed, dry or moistened with H₂O, through a mixt. of fused MgO with Mn, MnO₂ or Cr powders at 1200°, most reactivity was noted when the wet air was used.

Jars for preservation of food. A. Shtern. *Konservnaya Prom.* 5, 24–5 (1935).—It is proposed to manuf. jars from a mixt. of different slags and refractory clays. The heat conduction is high. Meat and fish preserved in slag jars were as good as those preserved in tinware. Although the jars are resistant to acids, glazing is necessary. A semifactory production has been started.

Effect of a tremolitic talc in whiteware bodies. Donald Hagar. *J. Am. Ceram. Soc.* 19, 14–23 (1936).—Wall-tile bodies of low moisture expansion and high resistance to delayed crazing can be developed by using tremolitic talc with other body materials. Clay, pyrophyllite and flint are best for use in such bodies. Sometimes limited ams. of feldspar may be advantageous. Bodies of lowest moisture expansion can be developed at cone 10, with either intermediate (20–40) or high (over 60) percentage of talc, but bodies matured at cone 10 require special glazes to fit them. Bodies of high crazing resistance, low shrinkage, good strength and long firing range can be produced at cones 1 and 6. While such bodies do not have moisture expansions as low as those matured at cone 10 they are easier to manuf. and more resistant to crazing than the usual com. wall tile.

Raw leadless glazes for pottery and tile at cone 2. C. W. Merritt. *J. Am. Ceram. Soc.* 19, 23–5 (1936); cf. C. A. 29, 3478.—The base glaze chosen for the color series was ZnO 0.30, K₂O 0.20, CaO 0.25, BaO 0.10, MgO 0.15, Al₂O₃ 0.22, SiO₂ 2.50, B₂O₃ 0.375 equiv. Colemanite was the chief flux, the batch being calcined

ZnO 24.3, Buckingham feldspar 113.2, colemanite 51.5, BaCO_3 19.7, steatite 18.9, flint 60.0, $\text{Ca}(\text{NO}_3)_2$ 2.9 lb. The results with many coloring materials and their blends are given. C. H. Kerr

Red glazes and underglaze red by reduction. C. M. Harder. *J. Am. Ceram. Soc.* 19, 26-8 (1936).—Various formulas are given and requirements in the firing procedure. Consistent development of the red color is dependent upon uniform evenly circulating kiln gases and a proper relation of firing procedure to glaze fusibility. C. H. Kerr

Recent developments and trends in refractory processes and materials. Louis J. Trostel. *Iron Age* 136, No. 21, 18-21, 90-4, No. 23, 26-9, 95 (1935).—See C. A. 29, 6024. F. G. Norris

Advanced and refined technique in the petrographic study of crystalline refractories. R. B. McCormick. *J. Am. Ceram. Soc.* 19, 7-13 (1936).—The new technique for the determination of minerals, as developed by R. C. Emmons, in C. A. 23, 794, is described. There is a discussion of immersion media and a description of the double-variation apparatus, the modified universal stage, and the smithsonite refractometer. C. H. Kerr

Semiacid refractory materials. S. A. Zhukharevich and G. L. Kogan. *Sovetskii Rekonstruktsiya Nauka* 1935, No. 5, 164-5.—Brick for lining open hearth furnaces made of a mix of crystal gravels and plastic refractory clays of low bonding power stood more fusions than the usual refractory brick. B. V. Shvartzberg

Refractories for the electrothermic zinc industry. Winfield B. MacBride. *Bull. Am. Ceram. Soc.* 14, 89-93 (1935).—A low Al_2O_3 refractory of low porosity has given the best service thus far in the electrothermic smelting furnaces at Josephstown. Other types tried included high Al_2O_3 , SiC and magnesite. After extensive tests it was decided that the refractories should meet the following conditions: (1) low porosity to prevent Zn penetration, (2) high refractoriness to prevent softening, (3) high electric resistance at high temperatures, and (4) high resistance to spalling and gradual disintegration due to slag, vapor of gas. C. H. Kerr

Improvements made and desired for glasshouse refractories. W. L. Fabian. *Glass Ind.* 17, 5-8 (1936).—A survey of 28 refractory plants showed marked improvement in quality of products as well as in manufacturing methods. Various specifications for tank blocks for glass furnaces are summarized. H. F. K.

Chemicals in the enameling industry—changes in the demand for opacifiers. W. Astles. *Chem. Trade J.* 97, 527-8 (1935).—The most common opacifiers are SnO_2 , as a mill addition, ZrO_2 and silicate as mill and melt addition, and Sb_2O_3 as a melt addition. There is no difference in actual sp. gr. of the medium and the light Sn oxides. The higher oxides of Sb have little, if any, toxicity. Na. Zr silicate increases the acid-resisting properties of enamels. W. H. Boynton

Opacifying enamel ware. Richard Aldinger. *Glasshutte* 65, 639-42 (1935).—Studies of fluorides as opacifiers in glasses yielded valuable information. Cryolite and NaF are the most stable and are therefore suitable for any type of enamel. Fluorspar and especially Na fluosilicate are more suitable for enamel batches rich in alkalis and having a low m.p., their use is discussed and examples are given. M. V. Kondody

Melting enamel. L. Vielhaber. *Enamelaaren-Ind.* 12, 313-15 (1935).—The melting of enamel in crucibles and tank furnaces, and factors affecting it are discussed. M. V. Kondody

Working enamel batches. L. Vielhaber. *Enamelaaren-Ind.* 12, 306-8 (1935).—A discussion of the working of raw materials for enamels and of the effect of structure and moisture of raw materials, grinding, mixing, drying, firing, etc. M. V. Kondody

Feldspar in enamel. L. Vielhaber. *Enamelaaren-Ind.* 12, 290-1 (1935), cf. C. A. 29, 2674.—Evaluation of feldspar by chemical analysis is misleading. Feldspars differing only slightly in composition may have very different

mineralogical compositions and different thermal expansions. M. V. Kondody

Cerium and zirconium enamels for bathtubs. L. Vielhaber. *Enamelaaren-Ind.* 12, 289-90 (1935).—Comments on the paper by Paquet (C. A. 29, 6007) dealing with the use of Ce and Zr in enamels for bathtubs. M. V. Kondody

Yellow pigments in the enamel industry. L. Stuckert. *Glasshutte* 65, 611-12 (1935).—The use of yellow pigments is limited. Cadmium yellow and Naples yellow cannot be used in ware for cooking. Yellow pigments are often used to change the white color; SnO_2 or another opacifier is added to the enamel batch. Naples yellow consists essentially of pyroantimonate of Pb containing some ZnO and Al_2O_3 . It is obtained by heating 2 mol. $\text{Pb}(\text{NO}_3)_2$ with 1 mol. Sb_2O_3 and from 0 to 1 mol. ZnO, ZnO may be partially replaced by Al_2O_3 . The color tone and refractoriness vary according to composition, but the decomposition temperatures are never reached in enamel practice. Heating is done in an oxidizing atmosphere to obtain the oxidation of Sb which otherwise would produce black spots. The yellow orange pigment thus obtained has a limited coating power, and therefore the addition to the mill amounts to 6 or 8%. The yellow enamel is often applied on a strongly opacified white enamel. The crystal form, color tone and stability of cadmium yellow depend on the method of production. CdS precipitated by H_2SO_4 when cold is the α -modification and is used for light tones, when precipitated hot it is the β -form and is more stable. It is necessary to eliminate the free H_2SO_4 and the CdSO_4 . The sulfide in the enamel is a colorant and an opacifier at the same time, 2.5% is added to the mill. It is usually applied on a white enamel. Oxidation during the firing of enamel containing Cd must be avoided. Vanadium yellow is produced by heating PbO and ZrO_2 with V salts. It is the only yellow of high refractoriness used under glaze. It coats well and is resistant to chemical agents. When various proportions of Se are added to cadmium yellow, a complete gamut of the intermediary color tones is obtained. Cadmium yellow can be mixed with various blue pigments also. M. V. Kondody

Effect of light and moisture on enamel. L. Vielhaber. *Enamelaaren-Ind.* 12, 260-1 (1935).—Enamels did not change color, while laquer tested under the same conditions was greatly affected by moisture. M. V. Kondody

Determining thermal conductivity of enamel. L. Vielhaber. *Enamelaaren-Ind.* 12, 305-6 (1935).—A discussion of the studies of Dawhl (C. A. 29, 7603). It was found that thermal conductance of enamel depends first on the kind and size of pores and secondly on the chemical composition of the enamel. A series of factors with the help of which thermal conductance can be calculated from the chemical composition is given. The value of 0.0027 can be taken as a mean value for ware enamel at 40°. M. V. K.

Fitted or unfitted ground-coat enamel. Hans Hardwiger. *Glasshutte* 65, 738-40 (1935).—It is still impossible to use all unfitted ground-coat enamel for sheet iron enamels because of the chemical reactions occurring during firing. However, good results are obtained by properly mixing a fitted portion with an unfitted portion and increasing the time of firing. M. V. Kondody

Oxidation control in firing ground-coat enamels. Wesley G. Martin. *Ceram. Ind.* 25, 60, 62, 64, 72 (1935). Herbert S. Willson

Enamel for water boiler. L. Vielhaber. *Enamelaaren-Ind.* 12, 258-61 (1935).—Impurities in boiling water have little or no effect on some enamels while others are greatly affected. This is probably due not to ordinary reactions between acids and bases, but to exchange processes. M. V. Kondody

Wavy and net-like structure of enameled ware. L. Vielhaber. *Enamelaaren-Ind.* 12, 235 (1935).—Enameled surfaces sometimes show a reticular structure with slightly uneven surfaces of different color tones. This defect can be partly removed by slightly shaking or vibrating the ware just enameled. However, if the ground coat has such a structure, this will not help. The formation of uneven

surfaces is sometimes due, especially in Sb enamels, to a sepn. of opacifying constituents. M. V. Kondody

How the continuous enameling furnace affects copperheads H. L. Cook *Bull. Am. Ceram. Soc.* 14, 393-5 (1935) —Box-type furnaces seal over the metal more rapidly than do continuous furnaces and the ware thus fired has fewer copperheads Firing conditions are different with a continuous furnace and new problems arise Pickling practice used for box furnaces is not satisfactory for continuous furnaces Copperheading is minimized by using proper frits Often a treatment of 30 sec in the acid pickle or eliminating the acid pickle will greatly decrease copperheading A Ni bath following the pickle is now used as standard practice C H K

Cleaning and preparation of metal parts Martin H. Kipper *Ceram. Age* 27, 274-5 (1936) H S W

De-enameling L. Viehhaber *Emailwaren-Ind.* 12, 300-1 (1935). —De-enameling is especially suitable for cast-iron ware notwithstanding repeated firing, and is easily done by sand blasting The more resistant the enamel is to acids, the more difficult it is to remove it The enamel can be treated by acids, alk. solns or fused alkalis HCl, H_2SO_4 , chromic acid and HF are used The latter dissolved acid-stable enamels but its use is dangerous Cold HCl and H_2SO_4 dissolve soft enamels $MgCrO_4$ (40% soln) is very effective Hot NaOH (50%) dissolves enamel in several hrs An alk. bath at 540° dissolves the enamel in several min. without attacking the metal It is possible also to de-enamel by steam or solns under pressure M V Kondody

De-enameling enameled ware Walter Obst *Emailwaren-Ind.* 12, 233-4 (1935) —Various patents and methods are discussed M V Kondody

App. for heating glass sheets for cutting (Brit. pat. 435,343) 4 Applying refractory linings to rotary kilns (Ger. pat. 622,305) 20

Glass I. G. Farbenind A.-G. (Paul Huppert and Hans Georg Grimm, inventors) Ger. 622,346, Nov. 26, 1935 (Cl. 32b. 1) Strongly refracting glass contg. 20-49% of TiO_2 is obtained in an uncolored form by adjusting the compn. of the initial mixt. in such a manner that the product contains 20-35% of alkali, the remainder being SiO_2 , with or without B_2O_3 The alkali is added wholly or in part as nitrate, and the mixt. is fused in an oxidizing atm. at a temp. not above 1300°.

Gas-burner system for heating glass-melting tanks Glaswerke Ruhr A.-G. Ger. 622,234, Nov. 22, 1935 (Cl. 32a. 5)

Apparatus for manufacture of glassware such as bottles Alexander F. McNich. U. S. 2,026,694, Jan. 7. Various mech. and operative details

Glass objects. Georges Delacroix and Henri Horast 1r. 788,409, Oct. 10, 1935 The primary materials used are mixed dry, then malaxed with a liquid agglutinant composed of an aq. soln. of one or more of the chem. substances entering into the compn. of the glass or one or more of the primary materials, so as to obtain for the fusion, agglomerates of any form, e. g., granules or briquets.

Press for making ply-glass. Adolf Kampler and Adolf C. Plötze Ger. 619,943, Oct. 10, 1935 (Cl. 39a. 17.50)

Apparatus for making sheet glass Libbey-Owens-Ford Glass Co. Ger. 622,468, Dec. 2, 1935 (Cl. 32a. 23.01). See Brit. 409,189 (C. A. 28, 5949).

Apparatus for making sheets of glass. Pittsburgh Plate Glass Co. Fr. 788,454, Oct. 10, 1935

Apparatus for rolling sheet glass. Schliesische Spiegelglas-Manufaktur Carl Tietzsch G. m. b. H. Ger. 622,467, Nov. 28, 1935 (Cl. 32a. 18). The rolled sheet, while still plastic, is passed between supplementary rollers having their axes inclined to the axes of the main rollers.

Bending glass sheets Wm. Owen (to Pittsburgh Plate Glass Co.) U. S. 2,021,197, Nov. 19. Various details of app. and operation are described.

Form for use in bending glass sheets Henry J.

Galey (to Pittsburgh Plate Glass Co.) U. S. 2,021,180, Nov. 19. Structural details.

Apparatus for transporting glass sheets from a rolling machine to a position in front of an annealing lehr. Glaceries de la Sambre Soc. anon. Brit. 435,655, Sept. 25, 1935 Divided as 425,514 (C. A. 29, 63829). In app. comprising a roller-way conveyor fitted, between the rollers adjacent the lehr, with members which are raised to lift the sheet from the rollers during the charging stroke of the pusher, each member is formed with narrow spaced sheet-engaging surfaces

Roller apparatus for conveying sheet glass to cooling lehrs Les Glaceries de la Sambre Soc. anon. Ger. 622,235, Nov. 23, 1935 (Cl. 32a. 34)

Apparatus for tempering glass Pilkington Bros. Ltd. Fr. 787,904, Oct. 2, 1935

Glass-annealing furnace Corning Glass Works Ger. 619,557, Oct. 3, 1935 (Cl. 32a. 29)

Vertical tunnel apparatus for annealing sheet glass Paul L. Geer (to Amco, Inc.) U. S. 2,026,781, Jan. 7. Structural, mech. and operative details

Muffle lehr for annealing glassware such as bottles Leon J. Houze, Sr. (to L. J. Houze Convex Glass Co.) U. S. 2,026,737, Jan. 7. Structural and operative details

Apparatus for charging glass-annealing lehrs Wm. Green & Co. (Ecclesfield) Ltd., Ernest Warren, King, Taudervin & Gregson Ltd. and John H. Webster Brit. 435,488, Sept. 23, 1935 In a "stacker" of the kind comprising a transverse conveyor from which the ware is transferred to the lehr conveyor by a member which is reciprocated to have an operative stroke in the opposite direction to and an idle stroke in the same direction as the travel of the transverse conveyor, the speed of the idle stroke is greater than that of the conveyor and means is provided for delaying the next operative stroke

Etching lamp bulbs Frederick Kallus U. S. 2,027,093, Jan. 14. A bulb is subjected to an etching fluid and then immediately, without washing, is treated with a limited quantity of steam, and then after an interval of time is washed out by flooding with addnl. steam App. is described

Laminated glass Geo. B. Watkins (to Libbey-Owens-Ford Glass Co.) U. S. 2,026,717, Jan. 7. Two sheets of glass are united with an interposed sheet of nonbrittle material such as a cellulose ester compn. treated with a mixt. of esters of phthalic acid such as diamyl and dibutyl phthalates Cf. C. A. 30, 832¹.

Laminated glass. James G. McNally and Sterling S. Sweet (to Eastman Kodak Co.) U. S. 2,026,987, Jan. 7. Glass sheets are joined with an intervening sheet such as one of cellulose acetate compn. bonded to the glass by a film such as one of cellulose acetate acid succinate dissolved in a plasticizing solvent such as benzyl alc.

Apparatus for laminated sheet-glass manufacture. Willard C. McDaniel (to Libbey-Owens-Ford Glass Co.) U. S. 2,026,692, Jan. 7. Various structural, mech. and operative details.

Conditioning clay for ceramic ware manufacture Minor F. H. Gouverneur (to Locke Insulator Corp.) U. S. 2,026,782, Jan. 7. The clay is extruded under pressure and simultaneously subjected to vibration in the direction of extrusion. App. is described.

Ceramic products. Grandes Tuileries de Nemours Fr. 788,194, Oct. 5, 1935. Extra-hard ceramic products are made from sedimentary rocks and volcanic rocks, to which is added about 5% of a decreasing element such as silex or quartz or an alk. flux. The ground ingredients are wetted, mixed, molded and baked at about 1200°.

Apparatus for pressing semi-dry ceramic material under high pressure as in the manufacture of refractory articles Dwight B. Hendryx (to Harbison-Walker Refractories Co.) U. S. 2,026,940, Jan. 7. App. and various operative details are described.

Silica suitable for coating stone, brick, sand molds, etc. Arthur B. Ray (to Carbide and Carbon Chemicals Corp.) U. S. 2,027,931, Jan. 14. For producing a

form of silica capable of adhering to material such as stone, brick, concrete, etc., the material is treated with a soln contg a silicic acid ester of a polyhydric alc such as a glycol or glycerol ester and silica is deposited by hydrolysis. U S 2,027,932 relates to sand molds adapted for use with alloys of high m. p. and having a smooth coating of adherent unfused silica deposited on their surface.

Apparatus for production of shaped ware such as tubing from fused vitreous material. Philip K. Devers (to General Elec. Co.) U S 2,027,155, Jan 7. An elongated stock is drawn from a silica fusion through a die submerged in the fusion (various details of app. and operation being described).

Casting porcelain and stoneware. Giovanni Fuschl and Maurizio Korach. Brit 434,494, Aug 27, 1935. Articles free from air bubbles are cast in plaster molds by circulating the fluid slip continuously through the mold by means of a circulating pump until the necessary thickness has been deposited. App. is described.

Pyroxyl thermometer cases, etc. Glenn A. Cooper (to Cruver Mfg. Co.) U S 2,027,152, Jan 7. Various details of app. and operation.

Refractory products. Compagnie de produits chimiques et electrometallurgiques Alais, Fröges & Camargue (M. Kortschak, applicant in Austria). Fr 788,492, Oct. 10, 1935. Bricks, linings and protective layers for furnaces, etc., are made without baking by intimately mixing powd. clay, grog, SiO_2 and Al_2O_3 , calcined quartzite, zircon, bauxite, kieselsäure, etc., with a binder consisting of substances of high mol. wt., such as residual lye from the sulfite manuf. of cellulose, and a sol. metasilicate, if desired with the addn. of FeSO_4 and crystd

graphite and with or without water. The mixt may be treated with steam to bring it to the required consistency for molding.

Recrystallized chromite suitable for refractory products. Gilbert E. Seil (to E. J. Lavino and Co.). U S 2,028,017, Jan 14. See Fr. 781,276 (C. A. 29, 6384).

Refractory material for glass furnaces. The Carborundum Co. Fr. 787,931, Oct. 1, 1935. See Can 351,679 (C. A. 29, 6722).

Abrasive grinding wheels. Duane E. Webster (to Norton Co.). U. S. 2,027,132, Jan 7. Structural details.

Abrasive sheets. Orello S. Buckner (to Behr-Manning Corp.) U. S. 2,027,047, Jan. 7. A sheet of material such as paper or cloth having an adhesive surface is placed in a magnetic field, so that the lines of force pass approx. perpendicularly through the sheet and magnetically coated abrasive grains such as grains coated with iron or steel are showered onto the surface. App. is described.

Abrasive coatings on materials such as paper or cloth. Elmer C. Schacht (to Behr-Manning Corp.). U. S. 2,027,307-8-9, Jan. 7. Various details of app. and operation are described for applying abrasive particles such as sand to material such as paper or cloth and controlling their deposition by the action of an elec. field.

Tunnel kilns. Bernard J. Moore. Brit. 435,452, Sept. 23, 1935. A kiln for the manuf. of pottery, etc., comprises 3 or more side by side tunnels through which the goods are moved in opposite directions.

Apparatus for propelling a train of abutting trucks through a tunnel kiln. W. G. Allen & Sons (Tipton) Ltd and Wm. H. Jones. Brit 434,377, Aug. 30, 1935.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Special cements for use in mass concrete. H. Elser v. Gronow. Zement 24, 747-9(1935).—The desirable properties and methods of their prep. are discussed generally. H. F. K.

Theory of hardening of lime-pozzuolanic cements. V. N. Yung. Stroitel Material 1935, No. 8, 3-18.—Lime pozzuolanic cements harden very slowly as the result of a slow reaction at ordinary temp. of amorphous silica with Ca(OH)_2 . Adsorption systems of an indefinite compn. are formed and these are converted into amorphous gelatinous hydrated silicates varying from $\text{CaO} \cdot \text{SiO}_2 \cdot n\text{H}_2\text{O}$ to $2\text{CaO} \cdot \text{SiO}_2 \cdot n\text{H}_2\text{O}$. In water hardening the cementing mass consists of gelatinous hydrated silicates. In air hardening the strength ceases to increase as a result of drying and begins to fall on carbonation, owing to formation of a powd. mixt. of SiO_2 and CaCO_3 . In lime-sand brick subjected to the influence of steam under pressure are formed concretions of cryst. hydrated silicates that pass over when carbonated into cryst. concretions of calcite without any decrease of the strength of the brick with quartz grains. The hardening of lime-basic slag cement is followed by a colloidalization of slag under the influence of the Ca(OH)_2 soln. The increase of strength ceases on account of early drying, sufficiently hardened in moist condition, lime-slag cements are much less subjected to carbonation on account of the density of colloidal formations as compared with those of lime-pozzuolanic cements. C. L. Stefanovsky.

Magnesian portland cement. I. L. Lefand and V. V. Serov. Zement 3, No. 7, 7-18(1935), cf. I. L. Lefand and V. V. Serov. Ibid. 2, No. 1, 5-21(1934).—Lab. and plant investigations demonstrated the possibility of obtaining const.-vol. magnesian portland cement. The presence of free MgO (5-6%) in the clinker in quantities leading to inconstancy of vol. can be disclosed by the accelerated method of investigation in an autoclave during 3 hrs. under a pressure of 14 atm. The usual method does not give the required results on account of the slow hydration of free MgO . The excess over 5%

of MgO occurs as $4\text{CaO} \cdot 2\text{MgO} \cdot \text{Al}_2\text{O}_3 \cdot \text{Fe}_2\text{O}_3 \cdot \text{MgO} \cdot \text{Al}_2\text{O}_3 \cdot 2\text{CaO} \cdot \text{Fe}_2\text{O}_3 \cdot \text{MgO}$ and $\text{CaO} \cdot \text{MgO} \cdot \text{SiO}_2$ and as MgO in a solid soln. in these compds.; thus is assured constancy of vol. of the cement up to a content of 11% of MgO . The clinker can be burned in rotary kilns. The optimal conditions are 25-30% of volatile matter in the charge and a moderate calorific value of the fuel. The output and fuel consumption are equal to those in the usual portland cement production. The setting time of the cement with a 2% addn. of gypsum is normal, with 30% of hydraulic additions it does not decrease in the first period of setting as in ordinary portland cement. E. E. Stefanovsky.

The action of magnesium salts on pozzuolanic portland cements. V. V. Kind. Zement 3, No. 7, 42-53(1935).—Solns. of Mg salts attack pozzuolanic cements the more, the higher the percentage of hydraulic addns. Toward dil. solns. pozzuolanic cements are sufficiently resistant, at concns. of over 1% the resistance decreases in a degree depending on the kind of cement. The action of Mg salts is based on the decompn. of Ca silicates and aluminates. Free H ions liberated in the partial hydrolysis of Mg salts can also enter into the action. The slow deterioration of portland cement is explained by the presence of free lime, forming Mg(OH)_2 with MgSO_4 and MgCl_2 , this takes place also in the case of a small pozzuolanic addn., leaving a considerable amount of free lime. E. E. Stefanovsky.

Influence of the temperature of drying of blast furnace slag on the hydraulic properties of slag cement. V. Ya. Eremenko. Zement 3, No. 6, 36-40(1935).—In slag contg. 46-7% of CaO drying temps. of 800° to 1000° decreased the mechanical strength of the cement, but the rate of decrease falls with the increasing temp. The decrease takes place only during the early hardening period and nearly disappears in 28 days. The setting time of the cement decreases only slightly. A drying temp. of 800° is recommended for the case investigated. E. E. Stefanovsky.

The calculation of the raw materials for cement. V. N. Yung. *Tzement* 3, No. 8, 4-18(1935).—The formula for the satn. of clinker with lime in ordinary portland cement is suggested on the basis of a detailed analysis of the chemistry of clinker formation $100(\text{CaO} - \text{CaO}_{\text{bound}} - 0.75\text{SiO}_2) - 2.8(\text{SiO}_2 - \text{SiO}_{\text{bound}}) + 1.65\text{Al}_2\text{O}_3 + 0.35\text{Fe}_2\text{O}_3$. In the production of high-grade cement high in lime, the calcn must be based on close analysis of all factors involved in the conditions of the given plant.

E. E. Stefanovsky

Calculation of the mixture of raw materials for the production of portland cement clinker. V. A. Kind. *Tzement* 3, No. 8, 19-24(1935).—The existing formulas for calcn are critically reviewed. The following is a modification of the Kuhl formula $x = \frac{[(2.8\text{SiO}_2 \times \text{KH} + 1.65\text{Al}_2\text{O}_3 + 0.35\text{Fe}_2\text{O}_3) - \text{CaO}]}{[(2.8\text{SiO}_2 \times \text{KH} + 1.65\text{Al}_2\text{O}_3 + 0.35\text{Fe}_2\text{O}_3)]} \times \text{clay/lime}$ ($\text{KH} = \text{coeff. of satn.}$).

E. E. Stefanovsky

The stability toward mineral salts of pozzuolanic portland cement with additions of burnt clay. V. V. Kind. *Tzement* 3, No. 8, 42-47(1935), cf. *C. A.* 29, 2327^a.—With increase of burnt clay from 20 to 50% the stability increases. Cement contg 20% of burnt clay is less stable than pure portland cement, with 30% clay it is equal to, and with 40-50% clay considerably surpasses, portland cement in stability, but is less stable than the product obtained by addn. of Bryansk diatomite rock. The low stability is probably caused by the formation of Ca sulfoaluminate through the action of CaSO_4 formed from free lime and Na_2SO_4 of the cement.

E. E. Stefanovsky

Tshernometchenskii portland-cement plant. I. E. Bashmatchnikov and Ya. G. Sokolov. *Tzement* 3, No. 8, 25-32(1935).—The following are characteristic features of the plant. Wolff slurry filters reduce the fuel consumption and increase the output; economizers for the utilization of the flue gases have been installed, solid crust, limestone and shale clay are used. High-grade cement is obtained.

E. E. Stefanovsky

Automatic shaft kilns. A. S. Pantelev. *Tzement* 3, No. 8, 32-6(1935).—To obtain high-grade cement clinker in automatic shaft kilns it is necessary to use 1300-1400 cal. of fuel for 1 kg. of clinker and an excess of air. Cylindrical briquets 3-4 cm. in diam. must be used. The mixture of raw materials must be charged continuously and must be homogeneous.

E. E. S.

The stability of the lining at the Leningrad cement plant. Yu. S. Lur'e and S. I. Vorotuntzev. *Tzement* 3, No. 8, 37-8(1935).—High-grade cement is produced from lime tuff, clay and roasted pyrites. The grog brick lining of one kiln was replaced by a clinker-concrete packed lining in the drying and sintering zones. After 3 months, the kiln works normally.

E. E. S.

Fuel requirements for rotary cement kilns. A. S. Dokudovskii. *Tzement* 3, No. 6, 5-13(1935).

E. E. Stefanovsky

Ash from powdered brown coal as a raw material for the production of cement. V. V. Surovitz and A. S. Rasorenov. *Stroitel. Material.* 1935, No. 7, 63-71.—The finely divided ash together with lime can be used for the production of pozzuolanic cements. The mechanical properties of the cement can be improved by adding about 2% of dil. solns of CaCl_2 or NaCl .

E. E. S.

Strength reduction of heated mortar. Heinrich Luftschitz. *Zement* 24, 749-51(1935).

H. F. K.

The hardening of concrete. S. A. Mironov. *Tekhnika* 1935, No. 45.—In the hardening of hydraulic materials swelling is greater at lower temps. Slower formation of the SiO_2 gel delays the formation of the crystals that effects hardening; thus hydration is more complete. Freezing the cement-sand mixt. increased the stability of the cements. It is a mistake to begin the elec. heating of concrete earlier than 1-1.5 days after it is laid and thus must be taken into account also during accelerated lab. tests.

B. V. Shvartzberg

Strength and impermeability of concrete and porous rocks as increased by treatment with siliceous solutions. M. Stamatii. *Rev. ind. minérale* No. 360, 597-602

(1935).—Concrete, sand, calcareous materials, etc., were injected first with a soln. of Na or K silicate, then with a pptg. soln. (dil. HCl or H_2SO_4 ; MgSO_4 , Ca, Mg or Al chloride, or Mg, Zn or Al fluosilicate). The specimens were then tested at intervals for strength in compression, for permeability, and for resistance to corroding agents. Best results in all cases are obtained when the 1st soln. is 30-38% B \bar{e} Na silicate and the 2nd 33-41% CaCl_2 .

C. D. West

The viscosity of road tars. J. G. Mitchell and A. R. Lee. *J. Soc. Chem. Ind.* 54, 407-117(1935).—Measurements were made with a modified Ostwald viscometer (*C. A.* 28, 3221^a). The relationship of Evans and Pickard $\eta T^a = k$, where η is viscosity, T Fahr. temp. and n and k are constants was confirmed. The relative values of η occurring in the above equation were not affected by low-temp. distn. η was linearly related to η at 25° for distn. residues from a tar having η from 10⁴ to 10⁶ poises. The effect of oiling black pitch and of loss of oil from tar by distn. was detd. A working method for estg. amt. of cutting back required to produce tars of specified η was given.

P. S. Roller

Crystalline masses from Tshardzhii loesses for the production of paving blocks. P. S. Kuten. *Stroitel. Material* 1935, No. 7, 43-5.—Loess of the compn. SiO_2 49.26, Al_2O_3 11.25, TiO_2 0.53, Fe_2O_3 6.62, Mn_2O_3 0.38, CaO 12.75, MgO 3.34, SO_3 0.19, K_2O 2.07, Na_2O 1.27, ignition loss 12.95%, m 1140°, was heated at 1350-1400° and cast mechanically into metal molds. In order to obtain a cryst. structure of the block, it was treated after casting in an annealing furnace at 500° to 1000° during 10.5-12.5 hrs. The block had a crushing strength of 5400 kg./sq. cm. and other good mechanical properties.

E. E. Stefanovsky

Roasting and sintering dusts [clinkering cement mixts.] (Saint-Jacques, Poupet) 9. Silica for coating stone, brick [concrete], etc. (U. S. pat. 2,027,931) 19. Bin for homogenizing cement raw meal (U. S. pat. 2,027,697) 1. Wood preservation (Remington) 26.

Cement. Charles H. Breerwood (to Valley Forge Cement Co.). U. S. 2,028,313, Jan. 21. In treating lime-bearing cement raw materials const. an undesirable quantity of at least one constituent such as CaCO_3 and in which the CaCO_3 value varies from time to time as received for treatment, the sands are sepd. from the fine particles of each material, an addnl. quantity of the coarser particles is sepd. from the fines and combined with the sands, the combined coarse particles are subjected to froth flotation so conducted that the concentrate is maintained substantially at a desired CaCO_3 value and the rejects include the undesirable quantity of constituents originally present such as CaCO_3 and the concentrate from the flotation operation is combined with the untreated fines to provide a mixt. of desired CaCO_3 value which is maintained substantially const. by varying the quantity of the coarser particles sepd. from the fines and added to the sands, so that the combined quantity is varied inversely as the CaCO_3 value of the materials varies in the materials as received. An arrangement of app. is described. Cf. *C. A.* 30, 594^a.

Cement. Alton J. Blank (to Cement Process Corp.). Can. 353,934, Nov. 5, 1935. One part material const. lime in a form reactive to Si and Al is mixed with 2 parts of an argillaceous material, e. g. diatomaceous earth, and with portland cement in the presence of a 1% aq. soln. of NaCl . A temp. of 150° is maintained to produce mutual reactions between the lime and the siliceous and aluminous components of the argillaceous material. The tensile strengths for test samples under standard conditions for portland cement was increased considerably.

High-silica cement. Fritz A. B. Finkeldey. U. S. 2,028,386, Jan. 21. Addnl. siliceous and calcareous materials such as crushed shale and limestone are mixed with hot cement clinker as it comes from the clinkering kiln at a temp. of about 700-1050° and maintained in

contact therewith for a time sufficient to effect calcination of the calcareous material, the proportion of the added siliceous material being such as to equal up to about 24% of the combined materials when finished and the calcareous material to yield an added CaO content up to about 6% of the combined finished materials. An arrangement of app is described.

Cement mixture containing calcium arsenate Johan B. Stalhane (to Bolidens Gruvaktiebolag) U. S. 2,023,420, Jan. 21. About 20% or more of Ca meta- or pyroarsenate is used with lime, Ca silicate, portland cement or aluminate cement, and serves to give a low soly.

Sintering cement, agglomerating ores Metallgesellschaft (Bernhard Young, inventor) Ger. 622,146, Nov. 21, 1935 (Cl. 80c 11). In processes for sintering cement or agglomerating ores by burning a mixt. of the material with a fuel on a grate through which air is blown, the proportion of fuel is adjusted so that a part of the material is insufficiently burnt, and this part is added to the next batch of material.

Rotary cement kilns Johan S. Fasting Brit. 434,609, Sept. 6, 1935. A preheater for a kiln comprises a rotary perforated drum encircling the inlet end of the kiln, a fixed wall, having an outlet at its lower part, being provided to cause the waste gases from the kiln to pass downwardly through the lower portion of the drum and the layer of charge material fed thereto.

Applying refractory linings to rotary kilns for burning cement, etc. Didier-Werke A.-G. Ger. 622,305, Nov. 25, 1935 (Cl. 80c 14 01). Manipulative features are described.

Rotary inclined drier and kiln installation suitable for use in cement manufacture Ray C. Newhouse (to Allis-Chalmers Mfg. Co.) U. S. 2,027,039, Jan. 7. Various structural, mech. and operative details.

Light concrete Léon J. Walter Fr. 785,715, Oct. 15, 1935. A soln. for maintaining air in the form of independent small cells in suspension in a milk of cement during the setting of the cement contains anhyd. Na_2CO_3 , brown saponin 20 g., water 100 and cement 21.

Road making substances Maschinenfabrik Kornick G. m. b. H. Ger. 619,973, Oct. 10, 1935 (Cl. 80b 25 09).

A filling material for the spaces between bituminous blocks for roads, etc., consists of dry fine sand mixed with a small amt. of bitumen or tar and a small amt. of $\text{Ca}(\text{OH})_2$. Thus, 100 parts of fine sharp sand is dried by heating to 150–200° and mixed with 2–3 parts of hot bitumen or tar and 0.5–0.75 parts of $\text{Ca}(\text{OH})_2$.

Ceramic paving stones, etc. Henry Behrens Baustoffhandels, m. B. H. Ger. 619,899, Oct. 9, 1935 (Cl. 80b 12 07). Clay and ground unburned stone are mixed and then molded and fired. Thus, brick clay is mixed with sand and basalt, pressed and fired.

Paving blocks Fried. Krupp A.-G. Fr. 788,557, Oct. 12, 1935. Blocks are made of a layer of good supporting power, such as a mixt. of ground cryst. blast-furnace slag, hardening in gases contg. CO_2 , and granulated blast-furnace slag, hardening in an alk. soln., and a layer resistant to wear composed of a mixt. of cement and mineral fragments, e. g., blast-furnace cement and fragments of slag.

Paving Hermann Plauson (to T. R. C. Corp.) U. S. 2,026,988, Jan. 7. A rolled ballast road is formed with ballast stones united and with their interstices filled with a hydraulically set bituminated mortar prep. from an initially pulverulent intimate mixt. of a hydraulic binder such as a mixt. of gypsum with lime or cement and not more than 7% the wt. of the binder of a bituminous material such as asphalt, tar or pitch. U. S. 2,026,989 relates to forming a pavement of similar materials to which water is added to cause the binder to set after the pavement is compressed by rolling *in situ*.

Covering material suitable for use on walls, etc. Abraham B. Miller (to Paraffine Cos., Inc.) U. S. 2,027,744, Jan. 14. A body such as paper, cloth, etc., has a preformed sheet of material such as uncured linoleum against it so as to form a bond between the materials which exceeds the bonding between the particles of the sheet, and the sheet is then peeled from the body so that surface portions of the sheet are split off and retained on the surface of the body.

Fabricated sheets of mica suitable for wall coverings, etc. Francis C. Atwood U. S. 2,027,082, Jan. 7. App. and various operative details are described.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDYER AND ALDEN H. EMERY

Coals from the Chelyabinsk deposits N. G. Titov *Khim. Tverdogo Topliva* 5, 679–83 (1934).—General characteristics of the Chelyabinsk brown coals are presented.

A control chart for interpretation of coal sampling data T. W. Guy *Combustion* 7, No. 6, 29–32 (1935).—A method is given for prep. and using a coal chart that will indicate whether the quality of a given coal is within required limits.

Errors of data of washability curves in coal dressing. G. Tarján *Roy. Hung. Palatin-Joseph Univ. Tech. Econ. Sci., Sopron, Pub. Dept. Mining Met.* 7, 397–424 (1935).—Errors detd. in washability curves amounted in general to 0.1%. Calcs. showed that at an ash content of 30% in coals the probable error reaches 0.1004%. For smaller ash content it decreases somewhat. Also the probable errors of moisture detns. are discussed.

Method for the proper evaluation of effects of coal dressing G. Tarján *Roy. Hung. Palatin-Joseph Univ. Tech. Econ. Sci., Sopron, Pub. Dept. Mining Met.* 7, 378–90 (1935).—Calc. coal output and efficiency of coal dressing from ash contents does not give reliable values. A modification of present calcn. methods is proposed by transforming the "ash" basal curve into the "gang" curve, which latter should serve as a basis for the calcn.

Direct simultaneous microdetermination of carbon, hydrogen and oxygen IV. Analysis of bituminous coals and derived products. W. R. Kurner. *Ind. Eng. Chem.*

Anal. Ed. 8, 57–61 (1936).—The methods previously described, C. A. 28, 6394¹, 30, 459, 205¹, are adapted to the examn. of coal and allied products. With the knowledge available from the previous work on pure compds. contg. N, certain deductions can be made with respect to the probable way in which the N is combined. It would seem that the linkage in bituminous coal is not that of an ammo or amido group but more likely that of a heterocyclic compd. In the case of nitro humic acid, evidence supports the view that an isonitroso-keto linkage is present. The values obtained directly for O are, as a rule, higher than the values obtained by difference, except with coke where the opposite is true.

Purification of coal Vieux. *Rev. ind. minérale* No. 359, 581–9 (1935).—A review of the subject under 3 headings: washing, treatment of fines and slimes and dry methods.

Low-temperature carbonization of Chelyabinsk coals II. I. B. Rapoport and Z. E. Kosolapov. *Khim. Tverdogo Topliva* 5, 702–10 (1934), cf. C. A. 28, 6274¹.—Carbonization at 450°, 500° and 550° yielded 2.5–4% primary tar and 62.4–63.2% semicoke. The sp. gr. and the contents of NH_3 and phenols increases in the tar waters with increase in the carbonization temp. The procedure is described and the results are tabulated.

The determination of volatile substances in anthracites M. P. Lonskaya. *Khim. Tverdogo Topliva* 5, 690–5 (1934).—A weighed amount (1 g.) of air-dry, ground anthracite is placed in a tared crucible and then moistened with kerosene (1–1.5 cc.). The mixt. is heated with a

Bartell alc. burner having a flame of 18 cm., while the distance between the flame and the crucible is maintained at 8 cm., for 3 min. It is claimed that results accurate within 0.3% can be obtained. Kerosene is evaporated and partly decomposed, creating the proper atmosphere in the crucible, whereby undesirable chem. reactions are eliminated.

A A Boethlingk
Rapid determination of nitrogen in coal R D Sheinman and A Z Yurovskii *Khim. Tverdogo Topliva* 5, 696-702(1934)—The method proposed by the authors differs from that of Kjeldahl-Wittacker in that a stronger oxidizing medium is used ($KMnO_4 + CuO$). The amount of substance used in the analysis is 0.2-0.3 g., this is titrated with 0.05 N acid for the detn. of NH_4 , the flask being heated with specially adapted elec. heaters so as to accelerate the oxidation of coal. A detailed description of the method is given.

A A Boethlingk
Experiments on a small coal panel at the Lischansk mine (on underground gasification) I P Kirichenko *Podzemnaya Gazifikatsiya Ugles* 1935, No 7, 8, 312, cf. C. A. 29, 321*—This is a continuation on a larger scale of previous expts. on underground gasification of coal by the "drift-gas-generator" method, consisting in forcing air and steam through bore-holes into a system of drifts through the coal body. The points investigated were: (1) max. distance between drifts, (2) effect of length of drifts on the process of gasification, (3) effect of incline of drift to coal layer, (4) effect of forcing air and steam through the same or different bore-holes and (5) effect of the regime of alternating air and steam blow on the process. Forcing the air and steam through separate bore-holes gave a better control of the process. The water gas produced was of low grade having a heat value of 800-1200 cal. per cu m.

S L Madorsky
More about underground gasification of coal by means of bore holes S I Buyalov *Podzemnaya Gazifikatsiya Ugles* 1935, No 6, 2-6, cf. C. A. 30, 1207* S L M.

Underground gasification of coal as a basis for direct reduction of iron ore L O Trautman *Podzemnaya Gazifikatsiya Ugles* 1935, No 7-8, 18-23—A discussion.

S L Madorsky
Synthesis of liquid fuel from gases obtained in underground gasification of coal. B Dolgov *Podzemnaya Gazifikatsiya Ugles* 1935, No 5, 10-18—Review. Nineteen references.

S L Madorsky
Calculation of heat losses due to heating a layer of damp coal under conditions of underground gasification A V. Lukov and A. A. Pomerantsev *Podzemnaya Gazifikatsiya Ugles* 1935, No 9, 3-14

S L Madorsky
Bitumens and humic acids present in coals G L Stadnikov and A. A. Fal'kovskaya *Khim. Tverdogo Topliva* 5, 6-3-9(1934), cf. C. A. 29, 5630*—The bitumen and humic acid contents of various Russian coals are tabulated.

A A Boethlingk
Brigetting experiments with Hungarian brown coals II. J Finkei. *Roy. Hung. Palatin-Joseph Univ. Tech. Econ. Sec., Sopron, Pub. Dept. Mining Met.* 7, 183-200 (1935); cf. *Ibid.* 5, 1 (1933) and C. A. 28, 3320*—The original method was modified by using a Värpalö lignite ground in the dry state to a max. grain size of 0.073 mm. as a binder. This has previously been dried and mixed with the briquet coal. The ratio of the colloidal binder was varied from 20 to 40%. Värpalö, Komló, Dúsgyőr and Kisterenye brown coals can well be used for brigetting.

S. S. de Finily
The chemical technology of the utilization of peat II Segeberg. *Chem.-Ztg.* 59, 961-3(1935).

E. H.
Three-zone furnace with internal heating for the coking of peat B K. Klimov and V. A. Danilenko *Khim. Tverdogo Topliva* 5, 711-19(1934)—Construction and operation details are given. Repeated recirculation of the gases preliminarily stripped of the valuable fractions is effected.

A. A. Boethlingk
Humic substances VII. Berginization and oxidation of humic acids of peat. N. A. Orlov, V. V. Trishchenko and P. M. Tarasenkova. *J. Applied Chem. (U. S. S. R.)* 8, 501-4(1935); cf. C. A. 29, 6035*—One hundred g. of the humic acid was hydrogenated in a rotating 3-l.

autoclave heated to 410° for 2-2.5 hrs. in the presence of MoS_3 at a cold H₂ pressure of 100 atm. The yield of liquid products amounted to 34% of an oil product composed of phenols, and mainly hydroaromatic hydrocarbons. On oxidation the humic acids of peat yielded a mixt. of benzene-carboxylic acids in addition to volatile acids; no mellic acid was produced.

A A Boethlingk
Production of city gas and gas for synthesis from brown coal by the continuous-current gas process W. Allner. *Z. Ver. deut. Ing.* 79, 1487-92(1935), cf. C. A. 29, 6731*—Structural details.

Joseph H. Wells
Making city gas nontoxic by means of catalytic oxidation of carbon monoxide with steam Fritz Schuster *Wärme* 58, 854-6(1935)—Heating values are calculated; coal gas is compared with water gas. Removal of CO_2 after oxidation of CO is discussed.

W H Bruckner
Content of free oxygen in a fuel gas and its explosiveness A S Kuznetsov *Podzemnaya Gazifikatsiya Ugles* 1935, No 5, 22—Fuel gas contg. CO_2 1.5, O_2 1.0, CO 9.17, CH_4 0.37 and H_2 33.72%, was mixed with air, 5 to 25% by vol., and tested for explosiveness by igniting it in a closed vessel by means of a heated Pt wire. Pressure varied from 4.8 to 14.4% above atm. Signs of explosion begin to appear at 6.42% O_2 content.

S L Madorsky
Water gas at Lischansk coal mine Preliminary report I P Kirichenko *Podzemnaya Gazifikatsiya Ugles* 1935, No 9, 34-5—The method consisted of blowing air and steam through bore-holes into drifts along the coal bed and removing the products of combustion through other bore-holes. In one expt. air alone was used. The gas had a compn. of CO_2 11.0, O_2 0.2, CO 12.0, H_2 12.0, CH_4 5.0 and N_2 59.8% and a heat capacity of 0.30 cal. per cu m. In another expt. air and steam were blown alternately. Compn. of the gas was CO_2 23.8, O_2 0.0, CO 14.0, H_2 41.5, CH_4 5.8 and N_2 11.8%, calorific value, 2075 cal. per cu m.

S L Madorsky
Burning of anthracite plates for the purpose of studying production of water gas A I Semenov, I S Galunkin and V V Kondakov *Podzemnaya Gazifikatsiya Ugles* 1935, No 7-8, 23-30—Anthracite plates measuring approx. $200 \times 250 \times 2650$ mm. were placed in a large pit in the ground, in such a way as to form channels through the pile. The pile was ignited and O_2 -enriched air and steam were blown alternately through the coal pile. The optimum results were obtained by following a regime of 10 min. air (contg. 60% O_2) blow and 20 min. steam blow. The water gas thus obtained had a heat value of 2160 cal. per cu m.

Odorization of gas M M Wilson *Western Gas* 11, No 12, 10-12(1935)—Methods of adding odorous gas are discussed and illustrated.

W H Bruckner
The Fadeev-Cheryatnikov new gas analyzer P T. Kolesnikov *Podzemnaya Gazifikatsiya Ugles* 1935, No 5, 20-7—A special app. adapted to analysis of gases produced in underground gasification of coal is described. A complete analysis can be made in 30 min.

S L Madorsky
The Southern California Gas Co. calcium chloride brine dehydration plant B M Lauther *Western Gas* 11, No 12, 18-19(1935).

W H Bruckner
The reaction between methane and water vapor. Kinzo Kafuku and Toyoyuro Ogura. *J. Chem. Soc. Japan* 56, 1145-59(1935)—The yield of H₂ and CO from CH_4 and water vapor was best by using Ni as catalyst with low pressure and high temp. (5 mm. and 1000°). Use of Ni with Al_2O_3 , MgO or pumice was more effective.

K Kutsuta
Cellophane and Kodapak for pipe-line protection Lee Holtz *Western Gas* 11, No 10, 22-3, 5(1935).—Their use in conjunction with other materials such as asphalt, kraft paper, etc., is reviewed. A table is shown of materials required for pipe of various diams. and 100 ft. long. The use of the wrapper prevents entry of moisture and penetration of tree roots into coating.

W H B.
The sulfur compounds of natural gas and natural gasoline of the Oktyabr district S M Gabrielyantz and S A. Isaeva *Grozneniskii Neftyanik* 5, No 1-2, 49-52 (1935).—The comparatively large amounts of elementary

S were formed from H_2S through oxidation, etc. Compns. of the gas and the gasoline are given. A. A. Boehlingk.

Removing sulfur dioxide from flue gases. B. G. Gaberman. *Khim. Tverdого Topliva* 5, 730-40 (1934). — Up to 76.5% of SO_2 (present in an artificial flue-gas mixt.) was absorbed by passing the gas through a flushing system operated with MnO_2 and Mn ions suspended in H_2O and passing the gas at a velocity of 20.51 per min through one l. of water at 20° , with a final yield of H_2SO_4 of 41-42%. Thus 0.11 ton of H_2O was needed to absorb SO_2 produced by burning one ton of peat contg. up to 8.42% S. A. A. Boehlingk.

Destructive hydrogenation of crude anthracene for the purpose of producing light aromatic compounds. II. V. N. Khadzhinov. *J. Applied Chem. (U. S. S. R.)* 8, 889-902 (in German 902) (1935), cf. C. A. 29, 6727. — Hydrogenation of anthracene in the presence of MoS_3 at 480-500° gives a 32% yield of fractions b below 180° . A yield of 55% can be obtained by recycling fractions b above 180° . At 400° and less, up to 65% of a fraction b 230-300°, resembling kerosene, is obtained without recycling. In the first case almost exclusively aromatic compds. are produced, while in the second case hydroaromatic compds. and naphthenes in addn. to aromatic compds. were found. The MoS_3 remained active up to 32 hrs. The following products were sepd: C_6H_6 , $PhMe$, $PhEt$, naphthalene, tetralin, methyl-naphthalenes and their hydrides, ethyl-naphthalenes, biphenyl, methyl-cyclopentane, cyclohexane, methyl-cyclohexane, decalin and products of its isomerization, bicyclohexyl and products of its isomerization and perhydrides, and probably a mixt. of anthracene and phenanthrene perhydrides. Forty-one references. A. A. Boehlingk.

Investigating the chemical composition, properties and methods of treating primary tars from Chelyabinsk brown coals. I. Destructive hydrogenation of the primary tar from Chelyabinsk brown coals. A. V. Lozovoi and M. K. D'yakova. *J. Applied Chem. (U. S. S. R.)* 8, 488-99 (in French 500) (1935). — See C. A. 29, 1908. II. The chemical composition of the light fraction from the primary tar from Chelyabinsk brown coals and the stabilization of the hydrocarbon part of the "benzine". M. K. D'yakova, A. V. Lozovoi and S. I. Chertkova. *J. Applied Chem. (U. S. S. R.)* 8, 695-705 (in French 706) (1935). — See C. A. 29, 7045. A. A. Boehlingk.

Sulfur compounds that have thus far been found in brown-coal tar. Gerhard Free. *Chem.-Ztg.* 59, 975-7 (1935). E. H.

Sinaia strata of Introsura Buzau, Roumania [occurrence of coal] (Zaharesco) 8. Foundry coke (Mordecai) 9. Gravity sepn. app. [for coal-washing plant] (Brit. pat. 435,080) 1. Polynuclear org. compds. [from coal tar] (Brit. pat. 435,254) 10. Cracking and hydrogenating tars and coal (Fr. pat. 787,780) 22. Flow-controlling device for gas wells (U. S. pat. 2,026,844) 22. Cracking tar oils, bituminous schist oils or primary oils from low-temp. coal distn. (U. S. pat. 2,027,464) 22.

Motor fuels. Johanna M. H. K. Classen (nee Bischoff). Ger. 622,087, Nov. 19, 1935 (Cl. 235 4 01). Liquid fuels of high b. p. are mixed with up to about 25% of 2-furaldehyde. Liquid fuels of low b. p., e. g., benzene or alc., may be added to the mixts. Cf. C. A. 29, 8294.

Fuel for Diesel engines. Wilhelm Wilke, Robert Stadler and Franz Lappe (to I. G. Farbenind. A.-G.) U. S. 2,028,308, Jan. 21. To a hydrocarbon oil heavier than naphtha, an addn. is made of about 0.5-20% of a fluid aliphatic hydrocarbon material contg. more than 2 C atoms and having more than one multiple C bond, such as diacetylene to reduce the pressure at which spontaneous combustion of the oil would normally occur.

Device for mixing air with gaseous internal-combustion-engine fuel. Harrison V. Snodgrass. U. S. 2,027,492, Jan. 14. Structural and operative details.

Acetylene. Herbert P. A. Groll and James Burgin (to Shell Development Co.). Can. 353,604, Oct. 15. A gaseous mixt. of hydrocarbon and O is subjected to in-

complete combustion in an enclosed app. at a linear gas velocity not greater than the flame velocity of the mixt. The linear gas velocity is subsequently increased to exceed the flame velocity throughout at least the greater part of the flame while combustion is maintained by part of the flame proper.

Destructive hydrogenation. Friedrich Uhde. Brit. 435,457, Sept. 20, 1935. In the hydrogenation of carbonaceous materials by treatment with nascent H obtained by the interaction of finely divided metals and H_2O , with or without accelerators, as described in Brit. 339,317 (C. A. 25, 2557) and 405,371 (C. A. 28, 4867), the reacting materials are pumped continuously to the reaction vessel from which the solid products are withdrawn, sepd. from the vaporous products, subjected to reduction to reform the metals and returned to the reaction vessel in a continuous cycle. App. is described.

Breaking up coal and other minerals. Daniel Hilgenstock. Ger. 619,663, Oct. 5, 1935 (Cl. 50c 17 40). The formation of slack splinters, etc., is avoided by carrying out the breaking operations for coal, or other minerals, under a liquid such as water.

Apparatus for separating coal and like fragmentary material to be separated into classes. Kenelm C. Appleyard, Alfred Flint and The Birtley Co. Ltd. Brit. 435,263, Sept. 12, 1935.

Apparatus for separating dust from coal before washing. Westfalia-Dinnendahl-Gröppel A.-G. Fr. 788,232, Oct. 7, 1935.

Device suitable for separating and washing coal, etc. Wm. C. Menzies and Francis H. Blatch (Blatch to Wilmot Engineering Co.). U. S. 2,026,903, Jan. 7. Various structural, mech. and operative details.

Rotary-drum drier suitable for fine coal or other granulated materials. Henry F. Hebley and Klaas Prins. U. S. 2,027,977, Jan. 14. Various structural, mech. and operative details.

Furnace for low-temperature distillation of schists, lignite, coal and tar. Igor Soubbotin. Fr. 788,408, Oct. 10, 1935.

Coal distillation. Carl Stull G. m. b. H. Ger. 622,455, Nov. 28, 1935 (Cl. 10a 19 01). Means is described for effecting a gas-tight junction between a channel in the charge of a coal-distn. retort or chamber oven and a tube for withdrawing gases.

Coal-distillation furnaces. Slamit-Indugas Gaswerks-ofenbau-G. m. b. H. Ger. 619,846, Oct. 8, 1935 (Cl. 26a 1 02). Details of the heating arrangements of small furnaces are given.

Pressure-controlling means for coal-distillation retorts. Archibald A. Macintosh. Ger. 622,175, Nov. 21, 1935 (Cl. 26a 16). This corresponds to Brit. 390,167 (C. A. 27, 5568).

Recovering oils from coal-distillation gases. Carl Stull G. m. b. H. Ger. 622,083, Nov. 19, 1935 (Cl. 26d 10 01). Addn. to 617,355 (C. A. 29, 8297). Gases withdrawn by suction from the interior of a coal-distn. charge are treated as described in Ger. 617,355 to recover light oils, which are then improved in quality by treatment first with a polymerizing agent of limited activity, e. g., moderately concd. or dil. H_2SO_4 , and then with concd. H_2SO_4 . The first treatment may be effected at atm. temp. and the second at $30-35^\circ$.

Gas-collecting main valve assembly for coal-distillation plants. Charles V. McIntire (to Smet-Solvay Engineering Corp.). U. S. 2,027,548, Jan. 14. Various structural and mech. details.

Burning coal containing iron and sulfur. Lawrence P. Creelius. Can. 354,035, Nov. 12, 1935. To prevent FeS from fusing and hardening on the grates and boiler-tube surfaces, a compn. is added to supply Cl in the fuel bed during the burning. The Cl attacks the FeS and forms $FeCl_3$ and SO_2 , SO_2 passes up the flue. The $FeCl_3$ decomposes under heat and forms HCl and Fe_2O_3 . The Fe_2O_3 passes into the ash, and the HCl is broken up into Cl and H_2O by catalytic agents such as MnO_2 or FeO_3 . Thus Cl is always present. A suitable compn. is of $CaCl_2$ with small amts. of $K_2Cr_2O_7$ and MnO_2 .

Cracking and coking coal and oil mixtures. Edgar W. Brocklebank, Wm. B. Milford and Cecil H. Lander. Brit. 435,187, Sept. 9, 1935. Addn to 421,556 (C. A. 29, 45329). The process of Brit. 421,556 is modified in that a mixt. of coking and noncoking coal is used that contains over 10% ash and is ground to a fine powder to distribute the ash finely throughout the mixt. The ground material is incinerated with an equal proportion of oil having a b. p. above 200° by passing it while suspended in air into the oil maintained at 65°. The mixt. is then carbonized in a retort as described in Brit. 393,601 (C. A. 27, 5943).

Organic products from coal. I. G. Iarbenud-A-G (Carl Krauch and Mathias Pier, inventors). Ger. 619,739, Oct. 12, 1935 (Cl. 120 105). Useful org. products are obtained by treating coal-distn. or -extrn. products with H₂ or reducing gases (except H₂S) in a streaming current at a pressure of 150 atm. or over, and in the presence of catalysts consisting of heavy metal sulphides. Thus, powd. Fe is mixed with a small amt. of Al₂O₃ and alkali, and fused in a current of O₂. The product is treated with H₂S at 450°. The resulting catalyst is heated to 450-500° and a current of H₂ and crude cresol vapor from coal tar is passed over at 150 atm. The cresol is reduced or hydrogenated to give hydrocarbons. Other examples are given.

Plant for cooling lignite briquets. Humboldt-Deutschemotoren A-G. Ger. 619,917, Oct. 9, 1935 (Cl. 104 902).

Industrial heating apparatus. Alexander T. Stuart. Can. 354,059, Nov. 12, 1935. Surplus power from a central elec. station is used for the electrolysis of H₂O. Part of the O produced is used to gasify fuel and another part to enrich the air for the combustion of the fuel gas.

Steam generator of the water-tube type. Arthur Lieberherr (to Sulzer Gebrüder Akt. Ges.) U. S. 2,027,443, Jan. 14. Structural and operative details.

Steam superheaters. John Johnson. Brit. 434,465, Sept. 2, 1935.

Steam superheaters. The Superheater Co. Brit. 435,883, Oct. 1, 1935.

Steam superheater with temperature-regulating device. Schmidt'sche Hesselampf-Ges. m. b. H. Ger. 622,032, Nov. 18, 1935 (Cl. 124 1102). This corresponds to Brit. 404,125 (C. A. 28, 38759).

Nonpoisonous fuel gas. Non-Poisonous Gas Holding Co. Ltd. Brit. 435,538, Sept. 26, 1935. See Fr. 783,151 (C. A. 29, 70569).

Purifying gases. N. V. Machinefabriek-en Apparaten Fabrieken "Meaf." Brit. 434,678, Sept. 6, 1935. CS₂ is removed from gases contg. H₂ and H₂S and free from O₂ by passing the gas at 500-600° over Cu or CuO to form CuS, the gas being kept in contact therewith to convert the CS₂ to CH₄ and H₂S, the latter being removed in a subsequent stage. Alternatively, CuS may be present initially, in which case the presence of H₂S is not essential.

Purifying flue gases. Lodge-Cottrell Ltd. and Jens O. Roving. Brit. 435,560, Sept. 23, 1935. Oxides of S are removed from the effluent gases of boiler and like power plants by bringing said gases, without previous moistening, at about 400-625° and substantially at atm. pressure directly into contact with dry solid CaO, Ca(OH)₂, or CaCO₃. Catalysts, e. g., FeO₃, may be mixed with the Ca compounds.

Coal gas. Heinrich Koppers G. m. b. H. Ger. 619,847, Oct. 9, 1935 (Cl. 24 J 9 04). H₂S and other impurities are removed from gases such as coal gas by alk. washing solns. contg. compds. of the Sn group, e. g., S₂As₂O₃ compds., and a small amt. of Mn or Cu compds. as catalysts. Cf. C. A. 29, 10274.

Purifying coal gas. Ges. für Linde's Gasmaschinen A-G (Paul Schulten, inventor). Ger. 619,809, Oct. 9, 1935 (Cl. 24 J 12 01). A process is described for purifying coal-distn. gas by cooling to below 0° and bringing the cooled dry gas into contact with further warm moist coal gas.

Air gas producer. Aldo Curioni. Ger. 619,930, Oct. 10, 1935 (Cl. 24 C 3). App. for producing a combustible gas from air and heavy liquid fuel is described.

Carbureted water gas. Owen B. Evans (to United Gas Improvement Co.). U. S. 2,026,577, Jan. 7. An

ignited fuel bed is air-blasted, the blast gases are burned with secondary air introduced marginally adjacent the upper edge of the fuel bed, and the flow of the blast gases is divided and they are passed in two streams through two heat-exchange vessels so that the amt. of heat stored in each vessel is controlled. Steam and oil are introduced to the fuel bed and the oil is vaporized and the blue water gas formed is carburated by the heat stored adjacent the upper part of the fuel bed. The water gas and oil vapors thus produced are led in by-pass relation to one of the heat-exchange vessels, oil vapors are fired by heat stored in the other heat-exchange vessel, and the gas is led off. A back run is made through the fuel bed with steam passed through the by-passed heat-exchange vessel and heated by the remaining portion of the heat recovered from the blast gases. App. is described. Cf. C. A. 29, 34984.

Apparatus and process for making carbureted water gas. Reginald P. Oliveres (to Somet-Solvay Engineering Corp.). Brit. 435,727, Sept. 26, 1935. In making the gas by passage of oil and steam through an incandescent fuel bed, the back-run or down-run is divided into 2 portions, in the 1st of which all or most of the oil and a small portion of the steam is passed through the fuel bed and in the 2nd the greater part of the steam and little, if any, oil is passed through.

Gas producers. Robert Falconer and Eduardo Colignon. Brit. 435,976, Oct. 2, 1935. A combustible gaseous mixt. is obtained by supplying liquid fuel to an open-ended retort which extends into the fuel bed of a gas producer, the lower end of the retort reaching a point above the reduction zone.

Tubular feed device for gas generators. Wehrle-Werk A-G. Ger. 622,038, Nov. 18, 1935 (Cl. 24 E 9). Addn to 621,343 (C. A. 30, 12149).

Means for removing ash from rotary-grate gas generators. Hermann Gochitz. Ger. 617,364, Dec. 10, 1935 (Cl. 24 11.03).

Demulsifying the sealing oils of waterless gas holders. Hans Dellmann (to Maschinenfabrik Augsburg-Nürnberg A-G). U. S. 2,027,965, Jan. 14. Emulsion-forming impurities such as metal dust, other dust, linseed oil, etc., are removed from used sealing liquids substantially free from sulfonated hydrocarbon material by slightly heating the water-oil emulsion which has formed in use, adding at atm. pressure a mixt. contg. soap and water-glass at least 1% and allowing the mixt. to stand and sep. into layers, water and impurities forming an upper layer which is sep'd.

Removing hydrogen sulfide from gaseous mixtures. Paul E. Kuhl (to Standard Oil Development Co.). U. S. 2,028,336, Jan. 21. In removing H₂S from a gaseous mixt. by carrying out a chem. reaction in 2 reaction zones between H₂S and another reactive gas such as NH₃ or SO₂, the gas mixt. contg. these mutually reactive gases is passed through the first reaction zone concurrently with a liquid medium contg. gases absorbed in the 2nd reaction zone, and in the 2nd reaction zone the gases are subjected to countercurrent treatment with fresh liquid medium such as water. App. is described.

Removing hydrogen sulfide, etc., from gaseous mixtures. Joseph A. Shaw (to Koppers Co. of Del.). U. S. 2,028,124, Jan. 14. Gas such as coal gas, oil gas, etc., is scrubbed with a corrd. aq. soln. of an alkali metal salt of phenol or an alkylated phenol substitution product, the unabsorbed gas is sep'd and the total liquid product from the absorption step is heated substantially to the b. p. to expel H₂S and the aq. liquor is returned to the scrubbing step. Various details of app. and operation are described. U. S. 2,028,125 relates to a process in which a soln. which may contain about 10% of NaOH and 15% of tar acid is used for treating gas for the selective sep'n and recovery of H₂S. App. is described.

Removing hydrogen sulfide and other acid compounds from gases containing ammonia. The Koppers Co. of Delaware. Ger. 622,042, Nov. 18, 1935 (Cl. 24 J 9 04). See Brit. 392,544 (C. A. 27, 5519) and U. S. 1,922,707 (C. A. 28, 6159).

Recovering benzene from coal gas. Carl Stull G. m. b.

11 Ger 622,370, Nov 27, 1935 (Cl 26d 930) Oil used for exg benzene from coal gas is purified by washing the hot, benzene satd oil with hot water. The oil is then sepd from the water and from tar and like heavy impurities by sedimentation at a temp above 100°. A continuously operating app is described Cl C A, 29, 341.

Coking coal in a continuous internally heated retort Arthur W Warner (to Isbell Porter Co.) U S 2,025,923, Jan 7. A column of coal in a retort is ignited at one end to form a combustion zone, and O bearing gases are forced through the combustion zone to maintain it and coke the coal. Coke is introduced into the central portion of the column above the combustion zone so as to form a core for the column, gases generated in the column are removed from its top, these gases passing through the coal column, and the residue is removed from the bottom of the column, so that an upstanding plastic film of conical shape of melted coal is formed and maintained vented at the apex of the coke core. App is described.

Coke-quenching car The Wellman Smith Owen Engineering Corp Ltd and Geo T Purves Brit 435,127, Sept 16, 1935

Coking process H A Brassert & Co Ltd and Herman A Brassert Brit 434,737, Sept 9, 1935 Coal, etc.,

is coked by being charged into a horizontal oven which is heated mainly through the floor, liquid hydrocarbons being sprayed onto the surface of the charge from the roof of the oven.

Coke ovens C Otto & Co G m b H Brit 435,512, Sept 23, 1935 To assist the withdrawal of distillates, holes, which communicate with the space above the charge, are made in the charge by mandrels shortly after the coking seam has reached such a depth from the surface that during further carbonization the shape of the holes is maintained.

Coke ovens C Otto & Co G m b H Brit 435,842, Sept 30, 1935 The walls surrounding the coking chambers and heating flues are made of clay bound chamotte bricks in which the content of binding clay does not exceed 10%.

Coke ovens H A Brassert & Co Ltd and Tom P Colclough Brit 435,938, Sept 30, 1935 In an oven heated by parallel floor flues, adjacent ones of which are fired from opposite ends, the waste-gas flues leading to the exhaust main are arranged between flues supplying air for combustion.

Coke oven Carl Stull G m b H Ger 618,740, Sept 14, 1935 (Cl 10a 36 03) A device is described for installation into coke ovens for producing distn. or middle-temp coke Cl C A 30, 844.

The technical principles of cracking Raphael Fossier *Mot grasses* 27, 10465-6, 10497-60, 10627-8 (1935) Cl C A 29, 3415.—A brief review A P C.

Interfacial tension in the oil industry F Vellingar *Petroleum Z* 31, No 34, 17-21 (1935)—Measurement of interfacial tension is of importance in following the removal of impurities in refining and for detg the aging or the origin of oxidation products. The du Nouy method is described. Plotting the tension against the p_n value of the aq soln gives 2 types of curves one which is nearly parallel to the p_n abscissa and another which falls rapidly at high p_n values. The light fractions of crude oil distillates follow the 1st type of curve, the heavy fractions the 2nd. The surface tension is independent of the mol wt but is a function of the degree of refining. Measurement of interfacial tension is of value in controlling acid treatment, washing, neutralization and bleaching action. Aged oils contg oxidation products have greatly decreased interfacial tension. This is important in studying lubricating oils for turbines and transformer oils.

C B Jenni

The relation between the antiknock properties of light motor fuels and their physical properties. Richard Henzre and Maximilian Marder *Angew Chem* 48, 770-9 (1935), Cl C A 29, 5411.—Twenty-five natural gasolines, 7 cracked gasolines, 1 synthetic gasoline, 6 gasolines from lignite and 4 cracked lignite gasolines were investigated, and the following properties are presented: dia. surface tension, sp paracher, n_D^{20} , sp refraction, corrected boiling no., octane no. (O N) (CIR Motor), O N from sp paracher O N plot, O N obtained from d_{40}^{20} -O N plot, O N obtained from n_D^{20} -O N plot and O N corrected to a boiling no. of 110°. The results agree with and amplify the earlier data, and show that approx detns of the O N can be made from relationships with phys consts other than the paracher.

F M Symmes

The separation and utilization of *o*- and *p*-nitrotoluene from mononitrotoluene prepared from the gasoline fraction of Sykkökö crude oil I Separation of *o*- and *p*-nitrotoluene Masakichi Mizuta *J Soc Chem Ind, Japan* 38, Suppl. banding 576-7 (1935), Cl C A 28, 3017.— o -NO₂C₆H₄CH₃ was sepd from the mixed mononitro compds by vacuum distn, with a 300-cc flask, with a column 13 mm in diam and 1360 mm long, filled with Al Leving rings, having an air-heated jacket and a reflux controlling device. *o*-Nitrotoluene of 98.2% purity was obtained, amounting to 89.2% of the *o*-compd present. The *p*-compd was sepd by repeated crystals from the alc soln of the distn residue with a purity of 98.8% (m. 51°) and a yield of 85%. K K

Classification of lubricating oils Lva Neyman *Petroleum Z* 31, No 30, *Motorentrieb u. Schmierung* 8, No 9, 2-6 (1935).—The quotient of the mol wt divided by the d gives a no which is characteristic and useful for purposes of classification. By reason of the fact that the viscosity of oils of the same class of hydrocarbons increases with increasing mol wt and the observed influence of the mol wt on the temp-viscosity curve, the formula $\frac{1}{d} = \frac{M}{M_0} [d_0 - \alpha]$ was established. This value is believed to characterize the oils. It depends only on the d , the mol wt and the viscosity of the oils investigated at 2 temps.

Regeneration of special and lubricating oils Maurice Van Rysselberghe *Ind chim belge* 6, 471-8 (1935), Cl C A 25, 3314.—A review of work done in countries other than Belgium on the regeneration of elec insulating and lubricating oils.

A. Papineau-Couture

The surface tension of asphalt bitumen R N J Saal *Chem. Beekblad* 32, 440-8 (1915).—Detns of the surface tension of 7 different bitumens of different origins and penetration values, natural and blown, gave at temps 110°, 120° and 140° values all decreasing linearly with

temp. The du Noy app. was used. Detns by Nellensteyn with the Jaeger bubble method (*Z. anorg. allgem. Chem.* 101, 1 (1917)) did not give straight-line decrease, but the σ -T curve had a sharp bend at temps between 117° and 145°. It is concluded that Nellensteyn's values (N. and Loman, *Asphalt bitumen*, etc., Amsterdam (C. A. 26, 1763)) at temps below the bend are fictitious and due to the method used. The latter is unsuited for σ detns at viscosities of more than 15 poises. This was checked by detn. of the total surface energy $L(= \sigma - T d\sigma/dT)$ of the different asphalts and of road tar. The du Noy σ values indicated E values of about 50 ergs per sq cm for asphalts, 70 for tar, this agrees well with known E values of aliphatic compds of around 50, and of aromatic compds around 70 (Harkins, *C. A.* 11, 1558). Nellensteyn's σ values would indicate E up to 150. Conclusions of N. regarding the "semisolid" state of bitumen below the kink in the curve are obviously unjustified.

B. J. C. van der Hoeven

Obtaining camphor from oven turpentine B. N. Rutozskii, V. N. Karacheva, T. P. Andreeva, O. M. Klepikova and L. N. Mogilevskina *J. Chem. Ind. (Moscow)* 12, 1177 83 (1935)—Oven turpentine contg 40% of pinene gives very low yields of camphor by the pinene hydrochloride or the tetrachlorophthalic acid methods, although in the latter case, doubling the amt of the acid used raises the yield somewhat. The isomerization by the (bornyl) acetate method is satisfactory and gives yields of camphor nearly equal to those from natural turpentine.

Purifying petroleum oils Leo D. Jones (to The Sharples Specialty Co.) Brit. 435,826, Sept. 30, 1935 See Fr. 771,988 (C. A. 29, 1617)

Apparatus for treating petroleum vapors, etc. Horace M. Weir (to Atlantic Refining Co.) U. S. 2,027,410, Jan. 14. A bed of solid particles such as clay or fuller's earth is supported on a contacting layer of steel wool (various structural details being described).

Electrical dehydration of materials such as petroleum emulsions of the water-in-oil type Paul W. Prutzman (to Socony-Vacuum Corp.) U. S. 2,027,615-16, Jan. 14. Various details of app. and operation are described.

Purifying petroleum distillates The Standard Oil Co. of Ohio. Ir. 788,470, Oct. 10, 1935. Light petroleum distillates are mixed with an aq. soln. of alkali, the aq. soln. is sep'd. from the distillate and mixed with a soln. of S in an org. solvent which is insol. in water. The aq. soln. of alkali is sep'd. from the soln. of S and mixed with the petroleum distillate. By this means mercaptans are removed from the distillate. The mixt. of the aq. soln. and the distillate takes place countercurrently.

Desulfurizing petroleum distillates Vladimir Kalichevsky (to Standard Oil Development Co.) U. S. 2,028,335, Jan. 21. A distillate such as a West Texas cracked distillate is treated with a substantially anhyd. mixt. of NaOH and KOH contg. about 1.25 lb. NaOH per lb. of sour S in the distillate and about 0.33-0.67 lb. KOH per lb. of corrosive S in the distillate.

Tube still and furnace suitable for use in pyrolytic treatment of petroleum oils John S. Wallis and Stephen B. de Bence (to Alco Products, Inc.) U. S. 2,028,305, Jan. 21. Various details.

Pyrogenic decomposition of hydrocarbon materials such as those of crude petroleum. Ovid E. Roberts, Jr. U. S. 2,027,552, Jan. 14. A plurality of hydrocarbon fractions of different b. ps. are decomposed in the vapor phase by flowing them through a reaction zone in countercurrent contact with a liquid metal catalyst (such as one contg.

1 Pb 90 and Na 10%), each fraction being separately introduced into the reaction zone to bring the liquid catalyst into contact at points which afford the optimum conditions of pyrogenic decomp. and coupling necessary for proper stabilization. App. is described.

Refining products of petroleum cracking Jacques C. Morrell (to Universal Oil Products Co.) U. S. 2,027,648, Jan. 14. A lighter gravity liquid product is first treated with a mixt. of HNO₃ and AcOH and then with concd H₂SO₄.

Cracking hydrocarbon oils Lester Kirschbraun (to Universal Oil Products Co.) U. S. reissue 10,818, Jan. 7. A reissue of original pat. No. 1,824,215 (C. A. 26, 292).

Cracking hydrocarbon oil Victor Stapleton (to Texas Co.) U. S. 2,026,803, Jan. 7. Oil such as a heavy gas oil is heated to a cracking temp. while passing through a heating zone such as a pipe coil and resulting products

3 are discharged into a sepg. zone from which vapors and residual liquid are separately removed. At least a portion of the vapors is passed through a high-pressure fractionating zone to effect condensation of constituents heavier than gasoline. The residual liquid is flashed into a zone of lower pressure to liberate lower boiling constituents in vapor and the liberated vapors are passed through a relatively low-pressure fractionating zone to condense constituents heavier than gasoline, and gasoline condensate

4 is sep'd. from the vapors and gases remaining uncondensed in a low-pressure sepg. zone, remaining vapors and gases are compressed and commingled under the increased pressure with vapors leaving the high-pressure fractionating zone, combined vapors and gases are cooled under a pressure in excess of that of the low-pressure sepg. zone to effect a condensation of gasoline constituents and the gasoline condensate thus obtained is sep'd. from asocd gases under superatm. pressure. App. is described. Cf. C. A. 30, 12,004.

Cracking hydrocarbon oil Norris Goodwin and Robert W. Ponder (to Industrial Process Co.) U. S. 2,027,802, Jan. 14. A continuous process involves preheating a stream of oil such as a refinery residual oil and passing the preheated oil into a revolving still forming a single chamber the diam. of which is at least twice that of the stream while being preheated, to diminish the velocity

6 of flow, subjecting the oil in the chamber to a cracking temp. in the presence of metal balls which may be formed of Ni or Fe and which together with the oil about half fill the chamber, continuously withdrawing all the products of cracking in a single stream from a point near the liquid level in the chamber at a rate of from 2 to 3 gal. of gasoline and (or) 2 to 3 lb. of C per sq. ft. of inner heated surface of the chamber per hr., so that incrustation is prevented and the C is kept in suspension, so that the rate of withdrawal balances the rate of supply and there is maintained in the chamber hydrocarbon oil unpreheated with C particles to accelerate the cracking action. App. is described.

Cracking hydrocarbon oils Gustav Egloff (to Universal Oil Products Co.) Can. 354,136, Nov., 1935. The oil is heated to cracking temp. under pressure, and sep'd. into vapors and an unvaporized oil free from coke. The vapors are dephlegmated and reflux condensate is formed. The unvaporized oil is flash-dist'd. by lowering the pressure, and the residuum combined with portions of the condensate. The resultant mixt. is passed through a second heating zone and heated to cracking temp. The heated mixt. is discharged into an enclosed zone and sep'd. into vapors and a coke-like residue.

Cracking hydrocarbon oils Gasoline Products Co., Inc. Ger. 622,016, Nov. 21, 1935 (Cl. 23b. 1.04). See Brit. 377,510 (C. A. 27, 4067).

Cracking hydrocarbon oils Deutsche Erdöl-A.-G. (Friedrich Schick and Eugen Emilius, inventors). Ger. 622,402, Nov. 27, 1935 (Cl. 23b. 1.04). As a contact mass for use in the vapor-phase cracking of hydrocarbon oils, use is made of coke or semicoke which has been prep'd. from coal or brown coal by low-temp. carbonization and which has been activated by steam at a temp. up to about 650° and then freed wholly or in part from ash,

e.g., by successive extns. with HCl and water. Preferably, coke or semicoke contg. more than 5% of basic compds. of alkali or alk. earth metals, a part of which may be added if necessary, is activated and then de-ashed for use in the process.

Cracking and hydrogenating oils Gutehoffnungshütte Oberhausen A-G Brit 435,809, Sept 30, 1935 Hydrocarbon oils are cracked and (or) hydrogenated by passage together with H and O or O-contg. gas mixts. over catalysts, the reaction proceeding exothermally and without external heating due to the reaction of the H with the O in the presence of catalysts promoting oxidation, e.g., V, W, Mo, Pt, Pd. App. is described.

Cracking and hydrogenating oils, tars and coal I. G. Farbenind. A-G Fr 787,780, Sept 29, 1935 The starting materials are treated, before the heat treatment, with an acid so dild. (10% HCl) that only the N bases are dissolved out while the olefins remain intact. A much higher yield of low boiling compds. is obtained from the subsequent cracking or hydrogenation.

Cracking oils such as gas oil Frank H. Edson (to Standard Oil Development Co.) U. S. 2,027,355, Jan 7. A stream of oil from a source of supply is divided into parts, one of which is passed under pressure into a conversion chamber into which oil is introduced from a heating zone after being heated to a cracking temp., vapors and liquid are separately withdrawn from the conversion chamber, the vapors are condensed, the liquids are brought into contact with the remaining part of the initial heavy oil, the mixt. is fractionated and fractions of different b. ps. are separately recovered, a lower- and a higher-boiling fraction are subjected to pressure, and the lower-boiling fraction of the mixt. is passed in a stream through the heating zone, the higher-boiling fraction is passed into the stream of the lower-boiling fraction after it has been heated to a cracking temp., and the mixt. is heated and passed into the conversion chamber. App. and various auxiliary details of operation are described.

Cracking oil for gasoline production Otto Behmer (to Texas Co.) U. S. 2,027,014, Jan 7. Oil to be treated is forced through a coil in which it is heated to a decomp. temp. without substantial cracking and thence into an enlarged drum under pressure in which decomp. of the oil is effected, while any return to the coil of oil remaining unvaporized in the cracking drum is avoided. App. is described.

Cracking tar oils, bituminous schist oils or primary oils from low temperature coal distillation Louis Boulanger and Ferdinand Emsens U. S. 2,027,464, Jan 14. The oils are oxidized by dild. O₂, washed with lime water and treated in a dehydrator, vaporized in a retort and the vapors are superheated at a temp. above 800°, the major portion of the phenols is condensed from the vapors, they are mixed with O₂ and N monoxide, treated with lime water and magnesia, then passed through a soln. of KOH to retain remaining phenols, and benzene is condensed. App. is described.

Fractionally condensing mixed hydrocarbon vapors such as those from oil cracking Luis de Florez (to Texas Co.) U. S. 2,027,334, Jan 7. Numerous details of app. and operation are described.

Apparatus for hydrolyzing acid sludge from hydrocarbon oil treatment Harry W. Thompson and John T. Rutherford (to Standard Oil Co. of Calif.) U. S. 2,026,714, Jan 7. Various structural and operative details are described of an app. in which flow of tar to a tar-withdrawal outlet is permitted substantially only from the interface between acid and tar layers.

Refining hydrocarbon oil vapors Richard J. Dearborn and Wm. M. Stratford (to Texas Co.) U. S. 2,028,100, Jan 14. Vapors contg. unstable unsatd. constituents are passed horizontally through a bed of solid adsorptive catalyst such as fuller's earth promoting polymerization of such constituents, at a temp. below that of cracking, and the polymers formed are condensed and removed from the lower portion of the bed after they have condensed and flowed downwardly through it. App. is described.

Conversion of hydrocarbon oils Luis de Florez (to

Texaco Development Corp.). Can 353,990, Nov 5, 1935. The color of a condensed sample of a portion of vapors from which the cycle condensate for the cracking process is formed is used as a criterion of the cleanliness of the condensate. The extent of fractionation is controlled in response to variations in color of the sample in order to obtain a condensate without detrimental coke deposition.

Conversion of hydrocarbons Henry Dreyfus U. S. 2,020,731, Jan 7. For producing hydrocarbons contg. a lower percentage of H from satd. hydrocarbons b. below 150° (such as a mixt. of C₁₂H₂₂ and C₁₄H₃₀), the said hydrocarbons in the gaseous phase are heated to 350-900° in the presence of liquid or semiliquid compns. contg. more than 80% of free C in a finely divided form, such as a heavy hydrocarbon oil bath contg. free C in suspension.

Heating-chambers for hydrocarbons H. A. Brassett & Co. and Herman A. Brassett. Brit 434,948, Sept 9, 1935. The floor of a chamber for heating solid, plastic or fluid hydrocarbons, which seps. the heating flues from the chamber proper, is formed of a series of shaped blocks adapted for relative movement so that under expansion the floor may flex.

Destructive hydrogenation of middle oils Mathias Pier, Walter Simon and Walter Kroenig (to Standard-I. G. Co.) U. S. 2,028,348, Jan 21. A middle oil is subjected to the action of H at a temp. of about 440° and under a pressure of 200 atm., in the presence of a catalyst consisting of Mo bromide and W sulfide.

Aqueous dispersions of mineral oils, etc. Leonard G. Gabriel, John F. T. Blott, Wm. L. Peard, Lawrence W. G. Firmin, Louis Meunier and Johan L. van der Munne (to Flintkote Co.) U. S. 2,027,584, Jan 14. A crude petroleum oil, oil fraction or distillate or residue, pitch, bitumen or the like is combined with water-sol. substances such as NaCl or glycerol in sufficiently small proportions that when the material is dispersed in water there are produced within the dispersed particles osmotic pressures which are mutually greater than those exhibited by the continuous phase so that absorption of water from the continuous into the dispersed phase is effected (various details of procedure being described).

Products from mineral oils N. V. de Bataafsche Petroleum Maatschappij Fr 788,676, Oct. 14, 1935. Kerosenes, gas oils, lubricating oils as well as solid resinous products and film-forming oils are obtained by causing mineral oils contg. aromatic compds. or mixts. of hydrocarbons contg. aromatic compds. and derived from mineral oils, to react in the presence of AlCl₃ or like condensation catalysts with acetylenic hydrocarbons or gaseous mixts. contg. them, the reaction mixt. being worked up afterward to obtain the desired products.

Moderate temps. (30-50°) are used.
Refining mineral oils Edwin R. Burkholder (to Atlantic Refining Co.) U. S. 2,026,012, Jan 7. Acetophenone is used as a selective solvent for sepg. paraffinic and naphthenic hydrocarbons.

Refining light oils Walter A. Patrick, Jr. Brit 435,194, Sept 16, 1935. This corresponds to Fr 770,874 (C. A. 29, 919).

Flow-controlling device for use at the top of oil or gas wells James L. Minahan U. S. 2,026,844, Jan 7. Structural and operative details.

Motor fuel Nicolaas Max (to Shell Development Co.) U. S. 2,023,372, Dec 3. For rendering it "non-knocking" a fuel of the gasoline type is treated with about 0.025-0.05% metal of the Cu salt of hydroxymethylene camphor or other suitable metal compd. of the general formula RCOC(CH₃)X'R', in which X represents OH or NH, R represents an O-substituted hydrocarbon radical and R' represents H or a member of the org. radical represented by R.

Motor fuel Carbo-Norit-Union Verwaltungs-Ges. m. b. H. Fr 787,920, Oct. 1, 1935. Crude gasolines and benzenes are treated with anhyd. FeCl₃ before or during distn. so as to reduce the content of resin forming, odoriferous and coloring substances therein. The FeCl₃ may be used in alc. soln.

Stabilization of motor fuel Richard G. Clarkson and Claude G. Wolff (to Canadian Industries Ltd.). Can. 353,560, Oct. 15. A small amt. of a gum inhibitor is added to the fuel after cracking and before the final distillate. The gum inhibitor has a vapor pressure above 50 mm. at the h. p. of the motor fuel.

Stabilizing cracked gasoline. Edward W. McMullan (to Gasoline Antioxidant Co.). U. S. 2,027,304, Jan. 14. Stabilization against gum formation is effected by adding a small proportion (suitably about 0.1% or less) of azobenzene, azoxybenzene or hydrazobenzene.

Stabilizing cracked gasoline. Eugene Ayres and Mark L. Hill (to Gulf Refining Co.). U. S. 2,027,462, Jan. 14. A small proportion (suitably about 0.01% or less) of a crude condensation product formed by reaction of di- α -naphthylamine with cresol is added to the gasoline to inhibit gum formation.

Treating cracked gasoline to effect stabilization. Wayne L. Benedict (to Universal Oil Products Co.). U. S. reissue 19,804, Jan. 7. A reissue of original pat. No. 2,014,923 (C. A. 29, 7636).

Gasoline N. V. de Bataafsche Petroleum Maatschappij. Brit. 435,230, Sept. 17, 1935. See Fr. 789,916 (C. A. 29, 6042).

Gasoline of high octane number. Oceola P. Cottrell (to Fdeleann G. m. b. H.). U. S. 2,024,121, Jan. 14. In converting substantially all of a straight-run gasoline into high octane number gasoline, the gasoline is sep'd into a low-boiling and a higher-boiling fraction and the latter is treated with a solvent such as liquid SO_2 , the raffinate and ext. are sep'd, the solvent is removed, the raffinate is cracked, the cracked raffinate is recycled by mixing it with the straight-run gasoline stock entering the cycle, and the ext. is blended with the low-boiling fraction to produce the high octane number gasoline.

Refining benzine I. G. Farbenund. A.-G. (Hans Häuber, inventor). Ger. 622,017, Nov. 10, 1935 (Cl. 23b 1.03). Benzine is freed from unsat'd resin-forming hydrocarbons by treatment at about 50° with a previously prep'd. double comp'd. of AlCl_3 and an olefin. The double comp'd. may be prep'd by treating AlCl_3 suspended in an org. solvent with C_2H_4 or C_3H_6 at 40–60°. Sp. processes are described.

Ceresin from ozocerite. Peter J. Wievech (to Standard Oil Development Co.). U. S. 2,029,307, Jan. 21. Ozocerite is treated at a temp. above its m. p. with a light hydrocarbon solvent comprising a major proportion of hydrocarbons contg. 3–5 C atoms such as liquefied C_3H_8 and under a pressure sufficient to retain the light hydrocarbon material in the liquid phase at the working temp., undissolved material is sep'd, and the soln. thus formed is heated, without substantial intermediate cooling, to a temp. (suitably about 90°) close to the crit. temp. of the solvent so that a portion of the ozocerite is ppt'd. and carries with it a substantial proportion of the colored material present in it, the ppt. is removed, the remaining soln. is filtered through a bed of finely divided clay, and the ceresin is recovered from the filtered soln.

Dewaxing hydrocarbon oils. Francis X. Gowers (to Texaco Development Corp.). Can. 354,130, Nov. 12, 1935. The oil is mixed with a solvent comprising 28–35% of an aliphatic ketone such as acetone and MePtCO , 45–60% benzene and 45–60% toluene by vol. The proportion of toluene is sufficient to prevent sepn. of the oil from the mixt. at -10°F . The mixt. is chilled and the ppt'd. wax removed. Cf. C. A. 29, 49317.

Removing paraffin from oils. Aktiebolaget Separator-Nobel. Brit. 435,648, Sept. 25, 1935. This corresponds to Fr. 778,880 (C. A. 29, 49319).

Removing paraffin from oils. The Sharples Specialty Co. Fr. 785,328, Oct. 8, 1935. Paraffin is removed by adding 1,3-dichloro-2-methylpropane to the oil as solvent, cooling to about -22° and filtering.

Dewaxing mineral lubricating oils. Bernard Y. McCarty and Wm. E. Skelton (to Texas Co.). U. S. 2,027,340, Jan. 7. The oil is treated with a solvent such as a mixt. of propylene dichloride with ethyleneglycol ethyl ether which at a temp. of about -22° is a selective

solvent for the oil but not the wax, and the mixt. is chilled to ppt. the wax, it is filtered out of the oil with the use of filter-aid material and the solvent is removed from the filtrate to produce a low pour-test oil.

Lubricating oils. John M. Harris, Jr. (to Standard Oil Development Co.). U. S. 2,025,387, Dec. 21. A wax-contg. hydrocarbon oil is treated to produce a lubricating oil which is resistant to oxidation and has low haze-forming and sludge-forming tendencies, by subjecting the oil to the action of O-contg. gases at a temp. of about 65–200° for a time insufficient to oxidize more than about 5% of the oil, and then dewaxing the oil. App. is described.

Lubricating oil. Erwin R. Lederer. U. S. 2,027,734, Jan. 14. For producing a -18° cold test distillate fraction of paraffin base lubricating oil from the neutral fraction normally produced as part of a paraffin base long residuum in dewaxing it to -19° cold test, a portion of the undewaxed residuum is mixed with the neutral fraction, the mixt. is chld. (suitably with naphtha) and after chilling to about -30° to -50° the ppt'd. wax is removed from the chilled oil, the diluent is removed and the neutral and residual fractions are sep'd so as to provide a -18° cold test distillate fraction having a viscosity of 100* to 300* at a temp. of 34° and a -18° cold test residuum fraction stock having a viscosity of 50* to 200* at a temp. of 99°.

Lubricating oil. John V. Starr and David F. Edwards (to Standard Oil Development Co.). U. S. 2,028,361, Jan. 21. A lubricating oil stock is agitated with a selective solvent such as phenol, aniline or furfural and the ext. layer is sep'd from the raffinate layer, the raffinate layer is subjected to fractional distn. in the presence of its absorbed selective solvent and in the presence of an adsorbent clay and the adsorbent clay is removed from the distn. residue. App. is described. Cf. C. A. 29, 16224.

Lubricating oils. International Hydrogenation Patents Co. Ltd. Fr. 788,260, Oct. 7, 1935. Products b. above 300°, from the hydrogenation under pressure of lignite, are treated to remove asphalt and resins, the paraffin is removed by adding a diluent such as an oil of lower b. p. and gradually cooling, and the remainder is treated catalytically with H under pressure and at a high temp. to produce a lubricating oil.

Hydrocarbon lubricating oil. Ulric D. Bray and Claude E. Swift (to Union Oil Co. of Calif.). U. S. 2,026,720, Jan. 7. A process for the fractionation of a hydrocarbon oil mixt. contg. paraffinic and nonparaffinic constituents comprises commingling the oil with a light-hydrocarbon diluent such as liquid propane and a selective solvent such as PhNO , and forming a raffinate-oil phase comprising paraffinic-oil constituents and a portion of the nonparaffinic constituents dissolved in the light-hydrocarbon diluent and an ext. phase comprising nonparaffinic constituents dissolved in the selective solvent. The diluent is removed from the raffinate phase and the diluent-free raffinate-oil phase is re-ext'd. with selective solvent and further seps are effected. An arrangement of app. is described. Cf. C. A. 29, 56483.

Petroleum lubricating oil. John D. Fields. U. S. 2,027,770, Jan. 14. Lubricating stock is thinned with a light hydrocarbon solvent to form a mixt. of low viscosity, and the substantially anhyd. mixt. is brought into contact with a solid alkali metal in a comminuted state and at not substantially above room temp. until impurities have been coagulated, oily materials and coagulated impurities are sep'd from each other before chem. reaction of any substantial proportion of the alkali metal with hydrocarbon compds. is effected, and the light hydrocarbon solvent is dist'd. from the lubricating stock.

Nondestructive distillation of easily decomposable materials such as petroleum lubricating oils. Warren K. Lewis (to Standard Oil Development Co.). U. S. 2,028,340, Jan. 21. The material is evap'd in a distn. zone whence gases are withdrawn through a restricted outlet, and a stream of vaporized high-boiling hydrocarbon material such as gas oil substantially free from constituents of high vapor pressure is discharged through the restricted

outlet so that the distn. zone is maintained at a sub-atm. pressure, and the vaporized hydrocarbon is condensed. App. is described.

Apparatus (with a light-sensitive cell) for determining the lubricating quality of oils such as used engine crank case oils. Mead Cornell and Charles C. Curtis (to Charles C. Broadwater). U. S. 2,027,518, Jan. 14. Various structural and operative details are described.

Separating paraffinic and nonparaffinic hydrocarbons in refining oils such as lubricating oil fractions. Louis A. Clarke (to Texas Co.) U. S. 2,027,354, Jan. 7. A nitro-alc. such as nitrobenzyl alc. is used as a selective solvent for sepn. of nonparaffinic constituents.

Filter suitable for treating lubricating oils. Robert H. Pennebaker U. S. 2,027,876, Jan. 14. Various structural and operative details.

Oil filter containing filter screens and filter clay and suitable for use with engine lubricating oil. Robert H. Pennebaker U. S. 2,027,870, Jan. 14. Structural and operative details.

Lubricants I. G. Farbenindustrie A.-G. Brit. 435,548, Sept. 17, 1935. Lubricants are obtained by mixing with lubricating oils or greases a lubricant prep. synthetically in presence of S or of such org. S compds. as are antioxidants, e. g., thioacetdehyde, thiazole, thiocresol, thionaphthol, thiobenzamide, dimethylthiophene, aminothiophene, Et mustard oil, dihydroxypropyl sulfide, diphenylthiourea. The synthetic may be prep'd. by "volatilization", polymerization or condensation, e. g., of olefins, mineral or tar oils, waxes, fats, high-mol. acids or alcs., in presence of $AlCl_3$, $ZnCl_2$, $FeCl_3$, etc.; or hydrogenation of rubber, resins or other polymers of high-mol. wt. In examples, (1) hard paraffin 100, ceresin 20 and S 0.5 lb. are treated for 45 hrs. at 80° and 5-10 mm. pressure with silent elec. discharges of 7000 v. and 1000 periods, then freed from unchanged paraffin and low-boiling constituents by vacuum distn. and 1 lb. of the product is added to 100 lb. of a petroleum machine oil to stabilize said oil and reduce its setting point, and (2) chlorinated paraffin 100 is condensed at 30-40° for 24 hrs. with CH_4 5 and Ph_3S 10 lb. in presence of kerosene, $AlCl_3$ and ZnO , the org. materials, diluent and low-boiling products are removed and 3 lb. of the synthetic is added to 100 lb. machine oil. In 435,567, Sept. 17, 1935, divided on 435,548, synthetic processes for the manuf. of lubricants are carried out in the presence of added org. O compds. that are antioxidants and contain a cyclic radical and at least 1 O atom directly connected with

1 2 C atoms, e. g., aromatic ethers, diphenyl ether, alkyl derivs. thereof, and naphthyl ethyl ether. In 435,598, Sept. 17, 1935, divided on 435,548, the synthetic processes specified above, except "volatilization," are carried out in presence of added nitriles, amides or other org. bases, e. g., $PhNH_2$, naphthylamine, phenyl-naphthylamine, aminodiphenylamine, aminoanthraquinone, aminobenzaldehyde, aminobenzophenone, benzylamine, pyridine, quinoline, carbazole, naphthotriazole, acetaminide. Cf. C. A. 30, 282².

Hydrocarbon lubricant mixture. Mathias Pier and Friedrich Christmann (to I. G. Farbenind. A.-G.). U. S. 2,028,349, Jan. 21. A lubricant which has a lowered setting point contains paraffin wax together with a small amt. (suitably about 1-5%) of a hydrocarbon product having a mean mol. wt. of at least 1000 and capable of increasing the viscosity and flattening the temp. viscosity curve of hydrocarbon oils, it includes polymerization products of unsatd. hydrocarbons capable of forming polymeric homologous series, their hydrogenation products or isomerization products, hydrogenated rubber, hydrogenated resins sol. in high-boiling oils, hydrogenated balata or gutta-percha, together also with a small amt. of another material for lowering the setting point such as high-mol.-wt. volatilization products of waxy hydrocarbons rich in H, condensation products of paraffinic hydrocarbons having a high mol. wt., with or without cyclic hydrocarbons or condensation products of high-mol.-wt. aliphatic O-contg. compds. Cf. C. A. 30, 608¹⁴.

Aqueous bituminous dispersions. Jacob M. Fain (to Patent and Licensing Corp.). U. S. 2,027,582, Jan. 14. At least about 50% of bitumen is used with a mixt. of sol. soap and a mineral powder colloid such as bentonite as the primary emulsifying agent, and not less than 25% of water as the continuous phase, the soap and mineral powder colloid constituting less than 1% of the dispersion.

Bituminous emulsions suitable for subjection to low temperatures without breaking. James B. Small (to Glidden Co.). U. S. 2,027,494, Jan. 14. Material such as a Mexican petroleum asphalt is emulsified by use of a soap of rosin such as the Na or K soap heat-treated at about 250-315°.

Asphalts. Planktököll chemische Fabrik G. m. b. H. and Johannes B. Carpsow. Fr. 788,105, Oct. 4, 1935. See Brit. 434,925 (C. A. 30, 853⁹).

Thickening wood oil. Badenol G. m. b. H., Ger. 622,390, Nov. 27, 1935 (Cl. 224. 2). Wood oil is treated with O_2 and then heated to about 150°.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Identification of cellulose derivatives by chemical means. Harold A. Levey. *Chemist Analyst* 25, No. 1, 14-17 (1936).—A general discussion of methods for the identification of cellulose and cellulose products by the use of solvents or by the behavior toward dyestuffs, etc.

W. T. H.

The refractivity of cellulose as a function of the degree of swelling. Madeline Meyer and A. Frey-Wyssling. *Helv. Chim. Acta* 18, 1429-35 (1935).—In detg. no. of cellulos subject to swelling, an immersion method (in which the entire fiber is encased with, but not penetrated by, the immersion liquid) must be used. The imbibition method (i. e., the procedure in which the fiber is soaked for 2 days in mixts. of known no.) was found unsuitable. Abs. immersion without penetration cannot be attained, but it can be approximated by shortening the periods of imbibition as much as possible. As the swelling increases, the n_{\parallel} (parallel to the fiber axis) and the n_{\perp} (perpendicular to the fiber axis) of cellulose, decrease steadily, although very slightly. In ramie fiber, starting with 0% H_2O and ending with 24.4% H_2O , the n_{\parallel} changes from 1.5062 to 1.4960, and n_{\perp} from 1.5316 to 1.5231. These results are discussed in the light of previous data, especially those of Kanamaru (C. A. 29, 2737¹).

Louis E. Wise

Adsorption of caustic soda by cellulose. S. M. Neale. *J. Phys. Chem.* 39, 1247 (1935); cf. C. A. 29, 3151¹⁴. Bancroft and Calkin (C. A. 29, 2737¹) do not emphasize the fact that the concn. of the adsorbed soln. removed falls markedly as centrifuging proceeds. This was shown by N. from values derived from B. and C.'s own data, and would follow if the concn. of free OH ion in the adsorbed soln. is det'd. by the Donnan equation (cf. Neale, C. A. 24, 3110⁹).

Louis E. Wise

Cellulose wool and its utilization. M. Loescher. *Z. ges. Textil-Ind.* 38, 698-9 (1935).—Of the 3 grades of cellulose wool, the acetate cellulose wool is considered better than the Cu or the viscose cellulose wool, although each of these grades has its particular advantages. On account of their differences in properties the 3 grades must not be intermingled in manuf. operations. AcOH dissolves acetate cellulose wool and not the others. Conc'd. H_2SO_4 turns the viscose and Cu cellulose wool brown and yellowish, resp. Various uses and directions are given.

Leopold Scheffan

The influence of moisture content of cotton on acid consumption in pyroxylin manufacture. N. L. Kostetzkii. *Voennaya Khim.* 1935, 11; *Nitrocellulose* 6, 109 (1937); cf. C. A. 29, 675⁹.

E. M. Symmes

A method for isolating a cotton fiber-like material from rice straw. Munenari Tanaka. *J. Chem. Soc. Japan* 56, 1525-6 (1935); cf. C. A. 29, 7639¹.—A method of purification of cellulose by treating the straw in alkali, vegetable glue and resinous substance, etc. K. K.

Lignin in Douglas fir—composition of the middle lamella. A. J. Bailey. *Ind. Eng. Chem., Anal. Ed.* 8, 52-6 (1936); cf. C. A. 29, 337¹.—A sample of middle lamella (wt 0.521 mg) removed by using a chisel-pointed sewing needle contained 71.4% lignin (The micro-method for lignin is given in *Mikrochemie*, in press) Samples of wood rays, springwood and summerwood, weighing approx 3 mg each, yielded, resp. 41.1, 35.2 and 31.6% lignin The mech microprocedures are fully described and errors are discussed 25 photographs and 25 literature references Louis E. Wise

The problem of motive power in rayon plants. Otto Th Kornting. *Deut. Wollen-Gewerbe* 67, 803-5 (1935).

Power and heat in rayon plants. Otto Th Kornting. *Deut. Wollen-Gewerbe* 67, 923-5, 935-6 (1935).

Drying sulfite pulp, with examples from the Scandinavian pulp industry. F. A. Ernstler. *Zellstoff u. Papier* 15, 394-6 (1935).—The drying of pulp on machines and in drying chambers is discussed S. I. A.

Cooking beech pulp by the sulfite process. Hans G. Klein and Egon Kurzhaas. *Zellstoff u. Papier* 15, 486-7 (1935).—Earlier reports that pulp produced from beechwood by the sulfite process was dark and unsuitable, were in error The beech bark must be completely removed prior to cooking A cooking liquor of as low as 11% CaO content was found satisfactory Beechwood needs more impregnation time than conifers, because of its smaller pore size and hardness This increase in impregnation time is compensated for by a decrease in total cooking time The color, adhesiveness or odor of the black liquor give no sure indication of the progress of cooking A very characteristic odor is produced, however, at the point when the pulp begins to turn dark Titration with I₂ gives no definite indication that the cooking is progressing satisfactorily Examin. of sample blows is the best method of detg. the progress of cooking The hard beech chips in the digester change very rapidly into a soft pulped mass Av. good yields are obtained The cooked knots are easily bleached S. I. A.

Preparation of sulfite pulp with selenium-containing cooking acids. Erik Haglund, C. H. Bäckström, Mladen Karanović, Lars Runquist and Olof Vincent. *Zellstoff u. Papier* 15, 482-7 (1935); 16, 12-15 (1936).—See C. A. 30, 856¹ S. I. Aronovsky

Improved methods for the examination of paper. H. N. Lee. *Tech. Studies Field Fine Arts* 4, 93-100 (1935); cf. *Ibid.* 4, 3-14 (1935).—These methods are adapted to the examn. of papers in books or works of art. A mixt contg. 5 vols. CaCl₂ (satd. soln.), 10 vols. H₂O and 4 vols. of aq. 2% KI satd. with I gave the following color reactions when applied to dry fibers: red (with cotton, linen, bleached hemp and paper mulberry); orange-pink (with purified, bleached coniferous sulfite pulp); very pale lavender (with bleached coniferous sulfite pulp); pale reddish violet (with purified, bleached hardwood sulfite pulp and with the long-fibered parts of esparto pulp); blue-violet (with bleached coniferous sulfate pulp), grayish blue (with bleached and unbleached soda pulp and with the shorter part of bleached esparto), blue (with bleached straw and bleached bamboo); deep yellow (with groundwood pulp, jute and lignified fibers generally); yellows of various shades (with unbleached sulfite and some other unbleached pulps). Formulas are given for other staining solns. more complex, but which give similar colors. Without resorting to an admixt. of acids, a soln contg. 10 g. KI and 10 g. I in 5 cc. H₂O serves to differentiate between various fibers. All turn brown at first, but after washing, rag turns red, soda pulp blue, sulfite pulp violet, groundwood yellow, while unbleached pulps remain brown These colors are ephemeral Simple tests are also given for resin, starch, loading materials, glue, casein and formogelatin. By the

use of a hitherto unpublished technic in sectioning, applied by F. J. Hoxie to cotton yarns, the study of paper structure is facilitated The dry material is soaked in 2 changes of Am acetate, then in 3-4 progressively stronger solns of cellulose nitrate in Am acetate, the final one being highly viscous After removal, the fibers are hardened in CHCl₃, stored and cut in Phil, and then mounted in castor oil Sections may then be cut by microtome or common hand method Permanent papers should have a pH of not less than 5 Louis E. Wise

Determination of the acidity and alkalinity of paper. Kurt Berndt. *Zellstoff u. Papier* 15, 487-91 (1935); 16, 15 18 (1936).—B discusses methods of measuring the acidity or alkali of paper, the uses to which papers of varying degrees of acidity are put, and the effects of acidity and alkali on the permanence of the papers The acidity of paper is detd by the use of indicators on aq. exts of the paper, with or without a colorimeter, the use of indicators on the surface of the paper, and by titrating the aq. exts., hot or cold, with a standard alkali The rating, pH according to surface measurements, and types of these papers, resp., are given as follows: (1) strongly acid, 3.2-3.6, hard sized and parchmentized papers, (2) normal acid, 3.6-4.5, writing, printing, and carton papers, (3) weakly acid and practically neutral, 4.5-7.0, metal wrapping papers, and (4) alk and strongly alk, 7.0+, unsized and coated papers The effects of pH on the strength and permanence of paper are briefly reviewed S. I. Aronovsky

The mechanical extension of paper in the printing press. Julius Beck. *Zellstoff u. Papier* 15, 493-4 (1935).—A brief discussion of the mech. extension brought about by the pulling and stamping requirements of the printing rolls and the compression strain in multicolor printing S. I. Aronovsky

The effect of loading materials upon the light fastness of dyed papers. S. Pestalozzi. *Zellstoff u. Papier* 15, 496-8 (1935).—Loading materials affect the light fastness of dyes in paper to a considerable extent. Talk, kaolin, blanc fixe, satin white, zinc white, chalk and TiO₂ were used by P. on a series of yellow dyes, i. e., brilliant yellow, sulfate yellow extra, paper yellow G C concentrate, and solarflavin R (Sandoz). Papers loaded with these fillers and tinted with the various dyes were subjected to direct sunlight The different fillers caused varying degrees of fading, dependent to some extent on the alkali of the filler The pH of filled or unfilled papers is generally reduced by exposure to sunlight. Papers of lower pH are more easily faded. Dyes which are fast to light are generally acid-resistant. S. I. Aronovsky

Determination of viscosity of small samples of oil from oil-impregnated paper. Method and apparatus. H. F. Schneider, Jr., and T. A. McConnell. *Ind. Eng. Chem., Anal. Ed.* 8, 28-9 (1936).—An inclined tube viscometer is described applicable to small samples The range of viscosities covered is about 0.70 to 25 poise. Calibration consisted of comparison with known oils. A. S. S.

Monel metal in the rayon industry of Japan (Arita) 9 Lignin derivs. (Can. pat. 353,896) 13. Proofing agents (for paper) (Ir. pat. 788,057) 13. Treating paper, etc. (Ir. pat. 787,950) 25. Evapg. black liquor from cellulose manuf. (U. S. pat. 2,027,115) 1

Bleaching cellulosic material. Maurice C. Taylor and James F. White (to Mathieson Alkali Works). Can. 353,906, Nov. 5, 1935 The following is one of several examples given: Heat 2500 parts of kraft pulp to 80°, add 152 parts of 50% NaOH, 570 parts of glacial AcOH and 2000 parts H₂O, again heat to 80°, add 231 parts of Ca(ClO₂)₂ and 4500 parts of H₂O, after 3 hrs. sep. the bleach liquor, wash the pulp, add water to a d. of 4% and 50 parts of 50% NaOH, agitate at 17-20° for 10 min., and wash the pulp

Cellulose derivatives Robert Haller and Alphonse Heckendorn (to Soc. pour l'ind. chim. à Bâle). U. S. 2,025,660, Dec. 24. New cellulose derivs. of the probable

general formula $C_{2H}O_2(ON)_x(OY)_z$, where X stands for an alkyl or an acyl group, Y for the grouping $=C=N-$, which grouping, on the one part, is united by the ether linkage $-O-$ to the $C_{2H}O_2$ radical and, on the other part, belongs to the cyanuric chloride nucleus, and where Z stands for H, and p, q, and r represent numbers whose sum is equal to 3, p and q being greater than 0 and r being 0 or greater, which products are sol in the solvents for alkylated or acylated cellulose and differ from the parent materials by an enhanced stability toward alkali are produced by treating cellulose derivs. such as acetylcellulose or "commercial" ethylcellulose with heterocyclic compds. which contain at least one $-N=C$ (halogen)—group such as cyanuric chloride or tetrachloropyrimidine. Various other examples and details of procedure are given.

Cellulose derivatives Camille Dreyfus. Fr 788,614, Oct 14, 1935. A soln. of a cellulose deriv., e.g., the soln. obtained by acetylating cellulose with Ac_2O in $AcOH$, is dispersed by passing a gas or vapor, e.g., dry steam, therethrough, and is then subjected to the action of a pptg. agent such as water.

Cellulose esters Soc. pour l'ind. chim. à Bâle. Ger. 560,036, Dec. 12, 1935 (Cl. 120 6). Cellulose esters not contg. S are obtained by treating cellulose xanthates or cellulose xanthic acids with org. acid anhydrides. The reaction may be effected at a temp. up to 140° in the presence or absence of a solvent and a catalyst. The process may be applied to filaments, films, etc., of cellulose xanthates or cellulose xanthic acids under such conditions that the materials retain their shape. Thus, it may be applied to filaments, etc., prepd. by coagulating a viscose soln. without regenerating cellulose therefrom, or to cotton which has been treated with alkali and CS_2 under such conditions that its fibrous structure is retained. Sp. processes are described.

High viscosity mixed esters of cellulose Carl J. Malm (to Eastman Kodak Co.). U. S. 2,026,986, Jan. 7. A high viscosity cellulose acetate propionate or acetate butyrate contg. at least 40% of the total acyl as propionyl or butyryl is prepd. by pretreating cellulose such as cotton linters with a mixt. of $HOAc$ and propionic or butyric acid, contg. at least 20% $HOAc$, and then esterifying in a bath contg. a catalyst such as H_2SO_4 and a mixt. of propionic or butyric anhydride with at least 20% of Ac_2O . Cf. C. A. 30, 1230⁴.

Cellulose ester solutions I. G. Farbenind. A.-G. (Rudolf Hofmann and Ludwig Lock, inventor). Ger. 619,931, Oct. 9, 1935 (Cl. 295 3 03). See Fr. 773,380 (C. A. 29, 1635⁵).

Apparatus for slitting lengths of foil such as that of cellulose acetate Charles E. Stafford (to Celanese Corp. of America). U. S. 2,026,754, Jan. 7. Structural, mech. and operative details.

Cellulose triacetate solutions I. G. Farbenind. A.-G. Fr. 785,036, July 31, 1935. Cellulose triacetate is dissolved in acetone or a mixt. of acetone and dioxane at below 0° and afterward heated to above 0° . The solns. obtained are used for making rayon, films, varnishes, etc.

Cellulosic "bulking agent" suitable for use in foods John Campbell and Robert G. Quinn (to International Paper Co.). U. S. 2,026,865, Jan. 7. Regenerated cellulose scrap is comminuted, treated to remove impurities (suitably by use of acids and alkalis or water and alc. or ether) and then dried at a temp. below that at which cellulose decomps. products are formed.

Nitrocellulose compositions suitable for films, etc. Lucas P. Kyrides (to Monsanto Chemical Co.). U. S. 2,028,399, Jan. 21. A neutral ester of a dicarboxylic acid contg. a cyclohexylcyclohexanol residue in at least one ester group, such as a phthalate ester of hydrogenated phenyl phenol is used as a plasticizer in nitrocellulose compds.

Removing water of gelation from cellulose films Milton J. Shoemaker (to Carbide and Carbon Chemicals Corp.). U. S. 2,028,296, Jan. 21. A film such as one of regenerated cellulose which has been coagulated from an aq. soln. and which contains nonreentrant water of gla-

tion is immersed in an aq. refrigerating soln. of a salt such as $NaCl$ or $CaCl_2$ which is at a temp. below the freezing point of water and is kept in the liquid until the nonreentrant water of gelation freezes and diffuses into the refrigerating soln.

Transparent films Friedrich Eichmann and Herbert Nerad. U. S. 2,027,682, Jan. 14. See Fr. 760,626 (C. A. 28, 4191¹).

Pxyrolyn films, etc. Merlino M. Brubaker (to E. I. du Pont de Nemours & Co.). U. S. 2,027,466, Jan. 14. Flexible and nonbrittle films and coatings are formed of a cellulose deriv. such as nitrocellulose and an oily reaction product such as a phthalate of hydrogenated castor oil or the reaction product of hydrogenated castor oil with trimelic, chlorophthalic, trimellitic, naphthalic or diphenic acids, etc. U. S. 2,027,467 relates to the prepn. of such oily reaction products of polycarboxylic acids and hydrogenated castor oil.

Apparatus for conveying long webs or sheets of material such as films of foil undergoing processing James H. Rooney and Robert J. Ward (to Celanese Corp. of America). U. S. 2,027,451, Jan. 14. Mech. and operative details.

Films, threads and similar shaped articles I. G. Farbenindustrie A.-G. Brit. 435,864, Sept. 26, 1935. In partic. shaped articles from solns. of plastic masses, more particularly cellulose derivs., in org. solvents, a haloalcohol of a polyhydric alc. in which all the free OH groups are esterified with an aliphatic carboxylic acid contg. at least 8 C atoms in an unbranched chain or with a naphthenic acid is employed as a softener for the plastic mass. Among examples, polyvinyl chloride contg. 63-65% Cl. 300 and ethylenechlorohydrin naphthenate 60 are dissolved in a mixt. of C_2H_5 350 and Me_2CO 350 g. Cf. C. A. 30, 1229⁵.

Artificial filaments, films, etc. Henry Dreyfus. U. S. 2,027,419, Jan. 14. In forming products such as those of cellulose acetate, the material after extrusion is stretched while in plastic condition by the action of a moving body of liquid contg. a solvent or swelling agent and which moves in the same direction as the material. App. is described. Cf. C. A. 29, 4581¹.

Artificial filaments or threads Henry Dreyfus. U. S. 2,026,730, Jan. 7. For the production of voluminous filaments of a cellular or tubular character, an org. cellulose deriv. such as cellulose acetate is dissolved in a solvent contg. at least 2 volatile constituents such as alc. and methyl formate the b. ps. of which differ by at least 40° and one at least of which is itself a solvent of the cellulose deriv. (the lower-boiling constituent being 50-75% of the total solvent mixt.), and dry spinning is effected at a temp. near to but not substantially above the b. ps. of the higher-boiling constituents.

Apparatus for extrusion of sheets, films, etc., such as those formed from viscose or cellulose acetate Edward Kinsella and Robert J. Ward (to Celanese Corp. of America). U. S. 2,026,740, Jan. 7. Various structural and operative details.

Apparatus for stapling a band of continuous artificial filaments I. G. Farbenindustrie A.-G. Brit. 434,250, Aug. 28, 1935.

Artificial staple fibers and yarns spun therefrom British Celanese Ltd. Brit. 434,858, Sept. 10, 1935. Continuous artificial filaments, threads, yarns, etc., are formed from spinning solns. having a basis of org. derivs. of cellulose and contg. wax-like compds. that are formed by reaction between higher fatty acids, e.g., stearic, palmitic, oleic, and di- or poly-hydric alcs., alkylolamines or NH_3 and which are readily dispersible in aq. media. The filaments, etc., are converted into staple fibers and crinkled and delustered by treatment with hot aq. media. The last-mentioned treatment must be more vigorous, e.g., at a higher temp., than for mere delustering. In an example, diethylene glycol stearate is dissolved in heated Me_2CO and added to an Me_2CO soln. of cellulose acetate (I) to form a soln. contg. 5% of the stearate based on the wt. of the I. The soln. is dry spun to form filaments which are crinkled by treatment in 0.2% aq. soap soln. at 95° for 30 min. and then stapled.

Apparatus for production of rayon by the dry-spinning process. Robert P. Roberts and Edgar B. Johnson (to Celanese Corp. of America). U. S. 2,027,450, Jan. 14. Structural and operative details.

Guide funnels for centrifugal machines for spinning rayon. Kirkless Ltd and Arthur Bennett. Brit. 434,954, Sept. 12, 1935.

Rayon. Friedrich Lappe (to North American Rayon Corp.). U. S. 2,027,047, Jan. 7. Extruded filaments are passed to and over a take-up device (of a described app.) thence to a guiding device and back to the same take-up device, such as a spool for collection.

Rayon, etc. Glanzstoff-Courtaulds G m b H Brit. 435,948, Oct. 2, 1935. Rayon, films, etc., of modified luster are produced by adding styrene to the soln. to be spun or otherwise formed. The styrene may be added as such or as a di- or poly-styrene, and is preferably first dissolved in CCl_4 , CS_2 , C_6H_6 , xylene, dipentene, pineoil, etc.

Rayon production by the stretch-spinning process. Gotthard Rummel and Ewald Knehe (to American Bemberg Corp.). U. S. 2,027,895, Jan. 14. After forming a thread preliminarily by the cuprammonium stretch-spinning process in a stream of ppg liquid, the thread is subjected to considerable stretching and is wound upon a rigid winding device under reduced tension. App. is described. (This pat. was granted upon an application filed Nov. 12, 1928, based upon an application filed in Germany Nov. 21, 1927.) Cf. C. A. 29, 4940.

Desulfurizing viscose rayon. Alfred Stein Ger. 622,403, Nov. 27, 1935 (Cl. 295 3 (2)). See Fr. 766,577 (C. A. 29, 3599).

Creped rayon. Zellstofffabrik Waldhof and Hans Rade- stock Fr. 788,291, Oct. 7, 1935. Creping is obtained by subjecting the thread, during winding on the bobbin in the course of the spinning operation, by stretching and contracting the free length of thread in rapid successive movements.

Wood pulp suitable for esterification. Raphael L. Stern (to Hercules Powder Co.). U. S. 2,028,083, Jan. 14. A sheet of felted wood pulp is sheared in one direction and the material is split in a direction transverse to the direction of shearing (by a described app.).

Screen for wood pulp. Joseph J. Moravec. Can. 334,031, Nov. 12, 1935. Structural details.

Pulp shredder. John J. Warren. Can. 333,905, Nov. 5, 1935. Structural details.

Refined pulp from straw of graminaceous plants. Kenta Kodama. U. S. 2,028,000, Jan. 7. Straw such as that of rice, wheat, etc., is digested in an acidic soln. contg. NaHSO_4 and HCl obtained by adding H_2SO_4 to sea water or brine so that decomposition may take place in part of pectin substance and other impurities, and the material is then digested with NaOH soln. to remove remaining impurities, and the cellulose is sep'd. and collected.

Apparatus for the continuous treatment of fibrous materials as in cooking cotton linters with soda solution. Luke H. Sperry (to Hercules Powder Co.). U. S. 2,028,419, Jan. 21. Various structural and operative details.

Treatment of d-ester liquor. Albert D. Merrill (to Chemupul Process Inc.). Can. 333,568, Oct. 15. Structural and operative details.

Recovery of ammonia from pulp liquor. Roger W. Richardson (to Canadian Industries Ltd.). Can. 333,924, Nov. 5, 1935. Hot cooking liquor of the NH_4HSO_4 paper-pulp process is alkalinized and passed countercurrent

to an inert gas, such as air. The resulting gas is cooled to about 25° . Part of the condensable NH_3 is absorbed in the condensed liquid. The uncondensable NH_3 is recovered by scrubbing the uncondensed gas free of NH_3 .

"Freeness detector" for testing paper stock or pulp. Harold D. Wells. U. S. 2,027,060, Jan. 14. Various structural and operative details.

Multi-knife machine (Jordan engine) for refining paper stock and pulp. Walter H. Hermann and Ludwig H. Wesel (to Hermann Mfg. Co.). U. S. 2,027,041, Jan. 7. Various structural and mech. details.

Paper. Nikolaus J. Nils. U. S. 2,027,611, Jan. 14. Various details of app. and operation.

Paper. Ernest Poirier. Can. 334,033, Nov. 12, 1935. The cross-sectional area of a stream of stock to the machine is varied so as to maintain an approx. const. rate of delivery of solid constituents notwithstanding variations in the consistency of the stock.

Mousteining device for paper. Jagenberg-Werke A.-G. Ger. 619,836, Oct. 4, 1935 (Cl. 55e 3). Addn. to Ger. 616,773 (C. A. 30, 6169).

Suction box for paper-making machine. Rohrbacher Lederfabrik Jos. Poeschl's Söhne A.-G. Ger. 622,283, Nov. 28, 1935 (Cl. 55d 16 01). This corresponds to Austrian 133,780 (C. A. 27, 4923) and 135,816 (C. A. 28, 2349).

Drying cylinders for paper-making machines. Firma J. M. Vouth. Ger. 619,482, Oct. 4, 1935 (Cl. 55d 28 30). Addn. to 608,512 (C. A. 29, 5272).

Steam-heated drier roll for use in paper-making. Adam E. Bridge (to The Black-Clawson Co.). Brit. 433,689, Sept. 25, 1935.

Dispersing materials in special papers or the like. Win. W. Carter (to Braxton Morton, as trustee). U. S. 2,027,000, Jan. 7. Sep'd. particles of added material such as a gel contg. abrasives, etc., are first attached to fibers so that the ends of fibers project from the particles, and the material thus prep'd. is then mixed with a liquid suspension of fibers such as a paper pulp and the mixt. is formed into paper or the like.

Paper suitable for labels, seals, etc. Gov'n D. Mackrell. U. S. 2,027,741, Jan. 14. Portions of paper contain fibers crushed more than in other portions and the crushed fiber portions are treated with glycerol so that indicia such as identifying designs are visible when the paper is moistened and invisible when the paper is dry.

Toweling paper. Milton O. Schur (to Brown Co.). Can. 333,339, Oct. 15. The paper contains about 3% of tanned glue solids, and has a preservative against the putrefaction of the glue soln. Cf. C. A. 29, 5274.

Waterproof and greaseproof paper. Clifford S. Johnson (to International Latex Processes, Ltd.). Can. 334,114, Nov. 12, 1935. Paper is treated with an aq. dispersion of rubber contg. a minor proportion of protein material such as casein. A protective material, such as cellulose acetate lacquer is applied, and the solvent evap'd. The rubber deposit is then vulcanized. Cf. C. A. 29, 4942.

Apparatus for waxing paper so as to leave wax-free stripes. Rosenstiel & Cie. Ger. 619,900, Oct. 10, 1935 (Cl. 55f, 11 01).

Fibrous product suitable for fiber-board manufacture. Geo. H. Ellis (to Insulate Co.). U. S. 2,027,581, Jan. 14. A mass of vegetable fibrous material has distributed through it an insecticide and fungicide comprising a toxic agent such as creosote which has been mixed with melted resin with subsequent fine division of the resulting mixt.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

Advances in the explosives industry in 1934. Konrad Nitrocellulose 6, 123-4, 143-5 (1935).—A review.

E. M. SIMMONS

New nitrocellulose propellant powders and explosives. Oscar Kausch. Z. ges. Schuss-Sprengw. 30, 361-4 (1933).—A review of patent literature. C. G. Storm

The stability of certain explosives toward heat. Mario Tognetti. *Chimica industriale* (Italy) 17, 517-21 (1935).—By the Talami method (C. A. 29, 6661) the stabilities of a no. of explosives, such as gun cotton, picric acid, T. tetra and TNT, were det'd. by measuring the pressure developed on heating to 120° , 125° and 130° . T. and

mixts of T, with TNT are more stable than pentrite or its mixts A. W. Conti

The explosive effects of hexogen and pentrite Ph Naoum *Nitrocellulose* 6, 8-8(1935) — Polemical with Stettbacher (C. A. 29, 3841)

The mechanism of explosive reactions K. K. Andreev *Bull. soc. chim.* 15, 2, 2128-34(1935) — An attempt is made to apply the theory of chain reactions in explaining the behavior of explosives The ability of detonating explosives to detonate by simple ignition and their marked sensitiveness to mech. influence such as shock are considered as consequences of the high value of the relation of the energy of the reaction to the energy of activation, and as favoring the development of chains The phenomena of the "dead pressing" of detonating explosives and reduction in sensitiveness to detonation caused by increase in cubic d., common to all explosives, are explained as the result of the existence of intermediate reactions and "wall effect" C. G. Storm

The effect of temperature on the inflammability limits of mixtures of air with combustible vapors Marius Briand *Ann. combustibles liquides* 10, 112-85(1935) — The lower (lean mixts) inflammability limit is detd. between 100° and 300° for mixts of air with 100-C₄H₁₀, C₄H₁₀, C₄H₈, C₄H₆, PhH, PhMe, cyclohexane, cyclohexene, MeOH, i-PrOH, PrOH, Me₂CO and some of their binary and ternary mixts The variation with temp. is linear, and the mixts. follow the laws of Le Chatelier

Chemical and mechanical incendiary devices Alfred Stettbacher *Nitrocellulose* 6, 202-4, 220-5(1935) — A review I. M. Symmes

Inflammation of firedamp by incandescent lamp filaments Eugene Cotté *Compt. rend.* 201, 1454-5 (1935) — An incandescent lamp (4 v) was placed in an explosive mixt. of coal gas and air When a small hole, not more than 2 mm. diam., was made therein no explosion occurred, but with a larger one it did so, more and more regularly and invariably with a hole 12 mm. diam. With a still larger hole explosion occurred less certainly, and not at all if the lamp were completely smashed, the cooling effect of the air on the filament preventing it The spark on breaking the filament of the 4-v. lamp does not cause explosion C. A. Silberrad

Rocket propulsion Willy Ley. *Aircraft Eng.* 7, 227-31(1935) — Review of the theory of rocket propulsion shows the use of high exhaust velocities of the gases generated is more important for high speed than ejection of large quantities of gases The fuels required for ascension against gravitational force are reviewed, modern fuels have adequate power O₂ carriers such as KClO₄, KNO₃, HClO₄, etc., are ruled out because of poisonous, corrosive or explosive conditions assoc. with their use, and the only possible oxidants considered are O₂ or O₃ A list of the possible fuels is given, and the greatest power is seen to be obtainable with a 1:8 mixt. of H₂ and O₂ Expts. are reviewed in the matter of devices to cool the rotor and to inject the fuel Thermal efficiency of powder rockets is about 57%, and when power is supplied by burning of H₂, efficiency rises to 80% L. believes that this latter efficiency will be increased to a greater efficiency than that of internal combustion engines, however, about 50% of the thermal energy of a powder rocket is converted into kinetic energy Diagrams and photographs are given for the various types of rockets Materials of construction are reviewed The most difficult problem is the combination of strength at high temp. and oxidation resistance for the metal which forms the exhaust nozzle W. H. Bruckner

The critical explosion limits in the oxidation of carbon oxysulfide and silicon hydride Henz Gutschmidt and Klaus Clusius *Z. physik. Chem.* B30, 265-79(1935) — The crit. explosion limits were studied for mixts of COS

and O between 190° and 490° in quartz vessels and in glass vessels of various diams. For the lower limit, the results agree with the theories of Hawn and of Thompson, Howde and Cairns (C. A. 27, 2302) The upper limit is somewhat indefinite and does not agree with the theory of Semenov (*Chem. Kinetics and Chain Reactions*, Oxford, 1935, cf. C. A. 29, 1706) which is not applicable over a wide temp. range The exptl. results obey the relation $(p_1 + p_2)d^m = C$, where p_1 and p_2 are pressures of COS and O₂, d is the diam. of the vessel, $m = 0.7$ and C increases from 75 at 200° to 251 at 190°. For SiH₄, the expts. were concerned only with the lower explosion limit and the Semenov expression, $p_1 p_2 d^m = \text{const.}$, was not obeyed The results indicate this to be due to 2 different end products obtained in the explosion Deviations from the ideal case of Semenov are apparently found in a dependence of the reaction path on the concn. The single general method so far discovered for identifying nonstationary chain reactions is the fact that such explosions occur without change in the no. of moles G. M. Murphy

Content of free O in a fuel gas and its explosiveness (Kuznetsov) 21.

Explosives Harcourt T. Simpson *Brit.* 435,588, Sept. 24, 1935 An explosive specially suitable for mining and quarrying comprises a mixt. of Al or Al alloy, which may be coated with a waterproofing material, e. g., paraffin, a metallic oxide and NH₄, K or Na nitrate One example contains NH₄NO₃ 90, Al to 5 and MnO₂ 3.5%

Explosives Imperial Chemical Industries Ltd. *Brit.* 436,002, Oct. 9, 1935 NH₄NO₃ explosives are made from NH₄NO₃ of low bulk d. not exceeding 0.75, which may be prep'd. in various ways Thus, an NH₄NO₃ soln. may be atomized and caused to crystallize quickly in a current of warm air, or a conc'd NH₄NO₃ soln. may be introduced quickly with stirring into alc., or NH₄NO₃ may be treated in a colloid ml.

Smokeless powder. Fredrick Olsen, Gordon C. Tibbitts and Edward B. W. Kerone (to Western Cartridge Co.). U. S. 2,027,114, Jan. 7. A smokeless powder base such as nitrocellulose is agitated in a nonsolvent vehicle such as water with a solvent such as EtOAc which is substantially immiscible with the vehicle, to form globules of dissolved base, and the solvent is removed from these globules to form solidified droplets of gelatinized smokeless powder base. An arrangement of app. is described Various details of compns. and procedure are described

Priming mixtures for ammunition Geo. H. Jacobs (to Peters Cartridge Co.). U. S. 2,027,825, Jan. 14 Zr 2-30% is used in admixt. with nitrates and chromates such as Ba(NO₃)₂, Pb chromate, Pb (CNS)₂, ground glass and Hg fulminate.

Blasting-charges James Taylor and Imperial Chemical Industries Ltd. *Brit.* 436,144, Oct. 7, 1935. In cartridges comprising a casing contg. a mixt. of an alkali metal nitrite with 1 or more NH₄ salts, with or without other ingredients, said mixt. being adapted to produce gas which is released when it has acquired sufficient pressure, as described in *Brit.* 431,935 (C. A. 30, 617), granules of such a compn. are mixed with an incombustible compn. of the kind described in *Brit.* 430,258 (C. A. 29, 833) in powdered or granular form, the proportions being such that the latter compn. is substantially decomp'd. when the charge is ignited in a confined space

Ignition composition suitable for use in delay detonators Charles F. Sosson (to Imperial Chemical Industries Ltd.). U. S. 2,027,208, Jan. 7. Zr 50-95 is used with a Pb salt of a nitrophenol such as basic Pb 2-nitroresorcinate 50-55%

Miners' and other safety lamps Ernest A. Hallwood *Brit.* 434,164, Aug. 27, 1935, divided on 419,594 (C. A. 29, 3164), 434,812, Sept. 6, 1935

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Some recent developments in the application of sulfur dyestuffs John L. Crist. *Am. Dyestuff Repr* 25, P 11-13(1936).—The use of $\text{Na}_2\text{S}_2\text{O}_4$ in connection with Na_2S and NaOH gives beneficial results with certain leuco types of S blues. NaHSO_3 may be used in place of $\text{Na}_2\text{S}_2\text{O}_4$, it acts as a reducing agent and lowers pH . Recent org. derives from sugars and sugar alcs are employed in the dyeing of cotton. $(\text{NH}_4)_2\text{SO}_4$ and NaHSO_3 have given satisfaction as exhausting agents. NaBO_3 has been used for finishing off S color dyeings but their wash fastness is usually impaired by this usage. W. H. Boynton

A new group of dyes [The immediate leuco dyes] George Rudolph. *Z. ges. Textil-Ind* 39, 24 5(1936). The immediate (I) leuco (L) dyes can be used for all plant fibers including rayon and are particularly useful in those cases which should correspond in fastness to those produced with I or sulfur dyes. The new dyes are water-sol., faintly alk. and can be absorbed in a nearly cold bath. Dyeing directions are given. All IL dyes may be mixed with each other. The fastness of some of the dyes to light may be improved by after-treatment with CuSO_4 or $\text{K}_2\text{Cr}_2\text{O}_7$. This after-treatment has an effect upon the shade. The following dyes are available in this group: IL yellow 3GT, IL orange RT, IL brown 5G, IL brown BR, IL brown T, IL bordo R, IL violet Beta, IL blue B, IL blue FGL, IL blue CL and IL green FFG. This new group of dyes can be employed for the dyeing of mixed fabrics from cotton and viscose rayon. Leopold Scheflan

Indigoid dyes Sisir Kumar Guha. *J. Indian Chem. Soc.* 12, 659-64(1935), cf. C. A. 28, 6315. The condensation of 5-methyl-3-hydroxythiophenone (I) with aldehydes readily takes place with the production of crystalline solids which are easily sol. in H_2SO_4 with characteristic coloration. On addn. of H_2O the substances are reprecipitated in a finely divided condition suitable for dyeing wool from an acid bath. They are not suitable for the dyeing of cotton from an alk. hypochlorite vat. The addn. of 0.244 g. of glyoxal- NaHSO_3 in 5 cc. H_2O to a soln. of 0.324 g. of I in 25 cc. of hot abs. alc. and treatment of the mixt. by shaking with 5 cc. of concd. HCl gave deep red fine silky needles of bis(5-methyl-3-thiophenyl)ethyleneindigo, $\text{C}_{12}\text{H}_{10}\text{S}_2\text{O}_2$, m. above 300° . Condensation of I with p-Me- $\text{NC}_6\text{H}_4\text{CHO}$ similarly yielded shining red prisms of 2-(4'-dimethylaminobenzylidene)-5-methyl-3-thiophenone, $\text{C}_{12}\text{H}_{12}\text{NOS}$, m. $198-9^\circ$. A similar condensation with m-H- $\text{NC}_6\text{H}_4\text{CHO}$ gave brownish yellow needles of 2-(3'-aminobenzylidene)-5-methyl-3-thiophenone, $\text{C}_{12}\text{H}_{11}\text{NOS}$, m. 157° . Condensation of I with p-O- N_3 , m- O_2N , p-Cl, p-MeO, p-HO, m-HO, p-Me and m-MeO-p-HO derivs. of BzH , piperonal, 3,4-(HO) $\text{C}_6\text{H}_3\text{CHO}$ and PhCH $_2$ CHO gave the corresponding dyes, m. 204° , 233° , 178° , 157° , 232° , 200° , 159° , 194° , 248° , 231° and 184° , resp. Their colors with concd. H_2SO_4 , shade given on wool from acid bath, shade on cotton and solubilities are tabulated. They are all sol. in O_2NPh , PhNH $_2$, pyridine, AcOH and AcOH and all, except the HO compds., are insol. in concd. NH $_4\text{OH}$ and caustic alkalis. In boiling glacial AcOH, acanthraquinone (C. A. 27, 1759) and I yielded an indigoid dye, 2-(5-methylthiophenyl)-1'-acanthraquinone, $\text{C}_{12}\text{H}_{10}\text{S}_2\text{O}_2$, m. above 310° , whose properties of dyeing wool in orange-brown shades from an acid bath and cotton in light red ochre from a yellow vat have been compared with those of 2-(5-methylthiophenyl)-acanthraquinone. C. R. Addinall

Influence of position isomerism (structural differences) in azo dyes on their fastness to light and washing. Marion F. Griffith. Ohio Agr. Expt. Sta., Bull. No. 548 (53rd Ann. Rept.), 80-1(1935); cf. C. A. 28, 7021. The influence of the position of sulfonic acid groups in the diazotized nucleus of isomeric naphthol-sulfonic acid dyes on the properties of these sulfonic acid dyes was detd. The presence of a sulfonic acid group in the C_6H_4 nucleus of phenylazo-1- or -2-naphthol dyes has a decided influence upon the exhaustive properties of the dyes. When the

sulfonic acid group occupies the o-position the degree of exhaustion is the greatest. Substitutions in the naphthol ring have little effect on the exhaustive properties. The presence of a sulfonic acid group in the C_6H_4 nucleus of phenylazo-1- or -2-naphthol dyes increases the fastness of the dyes to washing. The position of the sulfonic acid group has no effect on fastness or washing. Substitutions in the naphthol nucleus do not greatly affect fastness to washing. The combined effect of fading and darkening by exposure to fadometer light is least with the o-sulfonic acid dyes. The m-substitution has decidedly the greatest effect on the fastness to light. In general, the dyes having an OH group in the 2 position are superior to those in which the OH group is in the 1 position. The exceptions to this generalization are 1-naphthol-4-sulfonic acid which is comparatively fast to light, and 2-naphthol-3,6-disulfonic acid which is fugitive. The combined effects of light and washing indicate that the o-sulfonic acid dyes are the least affected. p-Sulfonic acid dyes are more affected than o-sulfonic acid dyes but less affected than m-sulfonic acid dyes. The presence of 2 sulfonic acid groups in the naphthol nucleus does not decrease the fastness of the dyestuff. C. R. Fellers

Color tolerance—its measurement and specification for dyed textiles Robert D. Nutting. *Am. Dyestuff Repr* 25, 1-4, 21-5(1936). The Universal method of color specification was applied to the practical problem of color tolerance in the study of numerous com. matches from woolen and cotton mills. Data show that no dyeings are ever matched "exactly," but it is possible to guarantee a color match "exact" within a specified tolerance limit. The adoption of such a universal method of specifying color would aid materially in creating a more satisfying situation for the dyer and for his customers.

The behavior of artificial textile fabrics with respect to dyes Herbert Brandenburger. *Monatsh. Textil-Ind* 50, Trade Issue III, 90-2(Nov., 1935)—A survey.

Absorption of dyestuffs by cellulose. VI. Effect of modification of the cellulose, and a theory of the electrolyte effect J. Hanson, S. M. Neale and W. A. Stringfellow. *Trans. Faraday Soc.* 31, 1718-30(1935); cf. C. A. 29, 347. Rates of absorption of dyestuff (Sky Blue FF, Color Index No. 518) by cotton cloth, mercerized cotton, hydrocellulose, cotton cloth, after HBrO $_3$ oxidation, Cellophane, viscose, rayon and cupra rayon were studied. Increased rate of motion of the sample relative to the dye bath has a profound effect on the rate of absorption by yarns and fabrics, but little effect in the case of the sheets. Mercerized cotton takes up dye more rapidly than natural cotton in a ratio unaffected by NaCl concn. Oxidation of cellulose reduces dye absorption, an effect more pronounced at low salt concn. The Donnan-type equilibrium is used to explain the action of electrolytes and the effect of oxidation. An equation was developed relating dye absorption and concn. of dye and salt from theoretical considerations, and was found to agree satisfactorily with exptl. results. C. E. P. Jeffreys

Progress in the coloring and finishing of textile materials A. J. Hall. *Chem. Age* 33, 597-8(1935).

E. H. The spray dyeing of silk and rayon fabrics. Remington C. Cayser. *Deuts. Wollen-Gewerbe* 67, 1465(1935). Various precautions are given. The solns. used must be thin fluid. The following substances may be used for the prepn. of spraying liquids in the ratio of 5 to 50 per 1000 parts of water on silk and rayon fabrics: tragacanth, glue, gelatin, carrageen, flaxseed, agar-agar and glycerol. Very few patented preps. are suitable on account of their irritating effect on the dyer. Only high-grade gum tragacanth may be employed. Powdered glue facilitates the prepn. of the soln. and yields better results. Glycerol increases the wt. without any noticeable injurious influence on the luster. Leopold Scheflan

The stripping and dyeing of reclaimed wool H Feld *Monatsh. Textil-Ind* 50, 206-7(1935).—A review.

Leopold Scheflan
The dyeing of clothing H Feld *Monatsh. Textil-Ind* 50, 222-3(1935).—A discussion dealing with the effect of light on textile fabrics, the choice of suitable dyes, simple chemical methods for detecting the kind of textile fiber at hand and the proper cleaning. Directions are given for removing the color from faded textile fabrics previous to the dyeing.

Leopold Scheflan
The dyeing of Vistra and Vistra products Georg Rudolph *Monatsh. Textil-Ind* 50, Trade Issue III, 89-90(Nov., 1935).—Directions for dyeing are given.

Leopold Scheflan
Is it possible to dye Vistra or a mixed yarn from cotton and Vistra fast with Turkey old red? Heinrich Rantisch *Monatsh. Textil-Ind* 50, Trade Issue III, 92(Nov., 1935).—This dyeing operation can be carried out to utilize old red oil, a water-sol product obtained from cactor oil and rank olive oil. Detailed directions are given.

Leopold Scheflan
Printing cotton—an outline. S L Parker *Am. Dyestuff Repr* 25, 16-10(1936). W H Boynton

The German textile industry in 1935. A retrospect of the past year A Niemeyer *Z. ges. Textil-Ind* 39, 2(1935).

Leopold Scheflan
The inventor's activity in the textile industry during the last 50 years F C Boettcher *Monatsh. Textil-Ind* 50, 212-14(1935).—A study of the no. of German textile patents shows maximums in 1910 and 1920 and a min. in 1919. The no. of patents has been steadily decreasing since 1920.

Leopold Scheflan
The origin and meaning of the names of [textile] fabrics A Hamann *Spinner u. Weber* 53, No 13, 3-5, No 14, 4-7(1935).

Leopold Scheflan
Textile materials which are called for by the present fashion. Otto Pennekamp *Deut. Wollen-Gewebe* 67, 869-2(1935).—An alphabetical survey of modern textile raw materials and yarns with particular emphasis on the German products.

Leopold Scheflan
From laboratory and practice. [Four cases of chemical examinations of improperly reacting commercial materials.] Kehren *Z. ges. Textil-Ind* 39, 26-8(1935).—The chem. examn. of the following cases is discussed in detail: (1) the occurrence of brittleness in a rubberized cotton fabric during vulcanization, (2) the hardening of a rubberized fabric, (3) the hardening of the paper roller of a calendar and (4) the excessive incrustation of the gravel filter of a lime-soda water-purification installation.

Leopold Scheflan
From practice and science [in the textile industry]. H Russina *Z. ges. Textil-Ind* 39, 2-4(1935).—Nageli's melle theory is described in its applications to starch, cellulose and various textile fibers. Difference in the quality of German and English wool and the fact that the character of the wool can be varied by raising previous to drying are explained by analogy to the colloid chemistry of gelatin.

Leopold Scheflan
A review of recent analytical methods with special applications to textile analysis. Irvine W. Grote *Am. Dyestuff Repr* 25, 114-16(1936).—Several semimicro-methods of analysis are outlined. Adsorption indicators, elec. cond. or resistance methods for analytical operation, the refractometer, the glass electrode *pn* outfit and oxidation and reduction indicators and their possible applications in the textile analysis field are discussed.

W H Boynton
Fiber surface studies. Can even the slightest damages in wool fibers be made visible? H Reumuth and H. Schwerdtner *Z. ges. Textil-Ind* 39, 12-18(1935).—Microscopic methods of examn. of fiber are described and an improved method is developed. Photomicrographs show the results obtained by this method on a variety of wool fibers.

Leopold Scheflan
Methods and apparatus for the determination of the uniformity of threads and yarns H. Ottensmeyer *Monatsh. Seide Kunststoffe* 40, 372-8, 411-14(1935).—A review dealing with optical, volumetric, weighing, strength

and elongation methods and the app. employed. Many illustrations are shown.

Leopold Scheflan
The determination of stiffness in individual yarns Irving J. Sasi *Textile Bull* 49, No 20, 8-9, 28(1935).—A method for measuring stiffness has been developed that consists essentially of detg. the force necessary to bend a piece of yarn, held at one end, through various angles. A new instrument designed for this purpose is used in conjunction with an analytical balance. Some older testing methods and stiffness testers are briefly described and results obtained by this new method are given.

L. S.
Preservatives for raw materials of the textile industry Justin Haussner. *Spinner u. Weber* 53, No 3, 10-11(1935).—CuSO₄ has in general only very slight preservative power and cannot be employed in liquors which are alk. or which contain soap or glue. ZnCl₂ and MgCl₂, being strongly acid owing to hydrolysis, will attack cotton, linen and rayon. ZnCl₂ cannot be used in alk. or soap-contg. laths. Formalin cannot be employed in the presence of glues or gelatins. Phenol and salicylic acid are unsuitable for preserving alk. and Fe-contg. materials.

Amurcol is more efficient in neutral or acid baths than in alk. baths, is more effective than salicylic acid and does not harm proteins. Amurcol CB is effective for preserving neutral and acid materials. Tests are described for detg. the amt. of preservative necessary for a particular purpose.

One kg. of potato starch paste will be preserved for the same length of time by 10 g. ZnCl₂ as by 0.6 g. Amurcol. Size from carob-bean flour can be preserved more easily than that from rye flour. A size contg. 0.65 g. Amurcol CB per kg. of carob-bean flour was still satisfactory after 70 days, while a similar mixt. of potato-starch size developed molds after 9 days.

Leopold Scheflan
Defects and sources of defects [in textiles], where they are and how to recognize and avoid them. Günt. *Deut. Wollen-Gewebe* 67, 893-901(1935).

Leopold Scheflan
New methods for the treatment of wool, [a discussion of] solvents and nonfatty assistants for the washing operation. E. Meissner. *Deut. Wollen-Gewebe* 67, 143-4(1935).—A survey.

The era of artificial wool. Preussische Textilfachschule Forst (Lausitz). *Z. ges. Textil-Ind* 39, 4-5(1935).—A discussion dealing with the utilization of artificial wool in the German textile industry and with chem. and mech. technological exams of a mixed fabric.

L. S.
Artificial-wool manufacture. A. Kauerz *Deut. Wollen-Gewebe* 67, 751-3(1935).—A review of the chem. and mech. operations.

Leopold Scheflan
Vistra and Wollstra. Georg Rudolph. *Deut. Wollen-Gewebe* 67, 463-5(1935).—A review, giving directions for washing, bleaching and dyeing. Numerous dyes are listed that can be used on Vistra and Wollstra (a mixt. of Vistra and wool).

Leopold Scheflan
New finishes for knit goods from rayon Alexander Prior. *Monatsh. Textil-Ind* 50, Trade Issue III, 84-6(Nov., 1935).

Leopold Scheflan
Stockings from rayon H. Engel. *Monatsh. Seide Kunststoffe* 40, 420-5(1935).—A review of the manuf., washing, dyeing, finishing and drying.

L. Scheflan
Partially substantivized acetate rayon and its utilization for the production of various effects in fabrics. Erich Wagner and Paul-August Koch. *Z. ges. Textil-Ind* 39, 18-22(1935).—A cellulose fabric can be dyed in either of 2 ways both of which depend on the fact that partly or completely esterified cellulose is affected differently by dyes than is pure or hydrated cellulose. (1) Cellulose is immunized to the action of direct dyes by slight esterification. When completely or locally immunized cotton fibers are mixed with untreated cotton fibers and the mixt. is treated with substantive cotton dyes the immunized fibers will appear colorless while the others will have been dyed in the normal manner. The dyeing properties of such yarn can be altered in such a way by modification that it can be dyed with acid and basic dyes. (2) Acetate rayon threads are sponified (substantivized) locally but completely and mostly only at the surface up to hydrate cellulose. The chem. fundamentals of the acetate formation of cellulose are reviewed together with the 3 theoretical stages of

acetylation. The phys., optical and dyeing properties of acetate rayons are discussed Leopold Scheffan

The sizing of rayon yarns. R. Hünlich *Monatsh. Seide Kunststoffe* 40, 409-500(1935); cf. C. A. 29, 7665f.—Rayon threads are sized with drying oils instead of starch and glue. On application of the oil size in solution in a volatile organic solvent the oil may become coned, on the exterior of the yarn layer after the evaporation as a result of capillary action and diffusion. This irregular distribution can be avoided by applying a solution of the oil and then adding a second liquid which is miscible with the first solvent but is not a solvent for the oil. Particularly good results are obtained with drying oils which in contact with air, O₂, ozone or other suitable agents at elevated temperatures oxidize and polymerize sufficiently to render them insoluble in the volatile paraffin hydrocarbons. Such products are still very soluble in acetone, benzene, pyridine, dioxane, etc., but precipitate on the addition of paraffin hydrocarbons. Three examples are described in detail Leopold Scheffan

The delustering of rayon. A. Prior. *Monatsh. Seide Kunststoffe* 40, 415-20, 456-8, 460, 462, 500-3(1935) —A detailed survey dealing with the Foulard delustering method, the black-dull finishing operation, historical development of the technique, spinning and piece delustering, luster as a factor in the textile industry and the patent literature Leopold Scheffan

Strength and stretch in cotton yarns. H. Pomfret *Textile Bull.* 49, No. 18, 6, 9(1936) —The effects on the strength and stretch of a yarn of the type and quality of raw cotton used, the fineness of the yarn, and the turns per inch are discussed. The numerical magnitudes of strength and stretch depend in part upon the length of specimen tested, the rate of loading of the specimen, and the moisture contents of the sample. Sizing increases the strength of the yarn and protects the surface against the raising of entangling hairs before the thread is formed into cloth. Sized cotton is more extensible at higher than at lower humidities. Leopold Scheffan

A survey of the finishing operation for textile goods made from cotton. R. Kling. *Spinner u. Weber* 53, No. 9, 26-8, 30-2, 34-6(1935) —The survey covers singeing, desizing with water, enzymes, alkalis or acids and with oxidizing agents, boiling in lye, bleaching, mercerization, starching, fulling, drying and stretching. L. Scheffan

Cotton-yarn testing as an indication of weaving qualities. David Atkinson *Textile Bull.* 49, No. 14, 5-6(1935) —Physical tests are discussed. L. Scheffan

Cotton-cleaning installations. A. Koltermann. *Deut. Wollen-Gewerbe* 67, 1011-12, 1014(1935). L. S.

Stratons in the warp of acetate textiles delustered in boiling baths. Emilio Debenedetti. *Boll. reparto fibre tessili vegetali staz. sper. ind. carta fibre tessili vegetali* 30, 88-104(1935) —Cloth with acetate warps had light and dark warp stratons of 1 mm to some cm in width due to fine point cavities in the filaments causing opaqueness. The cavities were produced by boiling delustering soap and phenol baths. The striped effect was due to tension differences and irregular sapon. All acetate threads had deficient elasticity, different with the light and dark threads. Color discharging removed the stratons completely from some parts and partially from others; this indicates superficial sapon. R. Sansone

Bleached fabrics that turn yellowish, spotty and streaky, with particular reference to surgical, bale, padding and absorbent cotton. H. Rehmman. *Monatsh. Seide Kunststoffe* 40, 265-6(1935) —Medical cotton will turn yellowish in time if it has been bleached too little or excessively, boiled, rinsed or washed insufficiently, and if it contains residues of fats, Cl, acids, soaps or Ca compounds. The discussion deals with the proper bleaching of medical cotton and the purity of the water employed. Various other factors which cause a spotty and streaky appearance are pointed out. L. S.

Practical tests of the wearing quality of porous mixed fabrics which had been rendered impervious to moisture by impregnation. Fritz Ohl. *Spinner u. Weber* 53, No. 49, 12, 14, 16-17(1935) —The tests were made on mixed fabrics of wool and cellulose (1:1) which had been impregnated with alumina (A), paraffin preps (B), gelatinous

plant extracts (C) and similar preps. (D). By the use of 4 different methods the samples were tested before and after they had been subjected to ordinary wear. Wearing lowers the waterproofness of porous fabrics no matter what impregnation medium had been used. An increased stress, such as exposure to rain or creasing, decreases the waterproofness still further. Washing with soap flakes, benzene, an O-contg., an enzymic and a synthetic washing agent all greatly diminish the waterproofness of the fabrics. The chemical nature of the washing agent is an important factor because of its relation to the chemical properties of the impregnation medium used. Leopold Scheffan

The resistance to tear of cloth for uniforms. Peer. *Spinner u. Weber* 53, No. 6, 8-11(1935). —Calcs are given and various factors are discussed which affect the tear resistance Leopold Scheffan

The testing of materials in the ribbon-weaving mill. E. Peuster. *Deut. Wollen-Gewerbe* 67, 1055-60(1935) —Discussion of various methods dealing with (1) the moisture contents of the yarn (conditioning), (2) the uniformity, strength, elasticity and torsion of the yarn and (3) the strength and elongation of the fabric in its raw and finished state. Leopold Scheffan

The impregnation technique [for textiles]. Fritz Ohl. *Spinner u. Weber* 53, No. 15, 8-13(1935) —A critical review of com. preps and suggested methods for waterproofing textile fabrics Leopold Scheffan

The impregnation (of cellulose) with ammoniacal copper oxide. Gustav Durst. *Monatsh. Seide Kunststoffe* 40, 267-9(1935), cf. C. A. 29, 1940f. —Detailed directions are given for prep. ammoniacal Cu oxide on a large scale and for carrying out the impregnations. The value of this impregnation lies in the very shiny surface produced, its stiffness and its powerful resistance to putrefaction and the action of termites, which is due to its high Cu content. Disadvantages are the rapid fading of the color in the sun and the rapid etching of the Cu by weak acids. L. S.

The prevention of the precipitation of lime by means of Calgon. C. Steiner. *Spinner u. Weber* 53, No. 39, 13-14(1935). —Calgon (Na₂PO₃) prevents the pptn of insol. soaps by formation of sol. complex Ca and Mg salts. The formation of ppts was avoided with (1) hard water and soda of 6° and 15° hardness by the use of 0.5-1.0 and 1.0-2.5 g./l., (2) 6° and 15° hard water and soap with 1.0-2.5 g./l. (while a clear soln. required 2.5-5.0 g./l.) and (3) 6° and 15° hard water, soap and soda with 1.0-2.5 and 2.5-5.0 g./l. of Calgon. Ca soaps already pptd. could be dissolved by Calgon. Leopold Scheffan

What is meant by calgonizing? Anton Volz. *Z. ges. Textil-Ind.* 38, 563-4(1935). —To calgonize means to treat a textile fabric with Calgon in order to obtain certain improvements of the quality. Calgon increases the absorptive capacity of the fabric and gives it a better feel and color. Calgon is not suitable for general water softening purposes as the well-known softening methods are more economical. It is used to neutralize residual hardness formers in softened waters and to prevent the formation of ppts in various baths at any time and without any app. Leopold Scheffan

Methods for the determination of the degree of mercerization. Kann Schulze. *Monatsh. Seide Kunststoffe* 40, 472-8(1935) —Numerous chem. and phys. methods are briefly described and references are given. Only very few methods of detg. the degree of mercerization are quantitative and no one method can be used alone to det. with certainty either this value or the cause of mercerization defects. Some of the industrially valuable properties of mercerized cellulose fibers, as luster and heightened strength and better feel have very little to do with the processes used for the detn. of the degree of mercerization. Therefore, the correct detn. of this value gives no guarantee of the outcome of industrial mercerization. L. S.

The felting operation. W. Haussner. *Spinner u. Weber* 53, No. 2, 8-10(1935) —A review covering the use of fats, soaps and acids and discussing various causes of defects. Leopold Scheffan

Warp sizing. II. Paul Seydel. *Cotton* 99, 44-6(Dec., 1935); cf. C. A. 30, 619f. —The details of the

process and the dextrins and starches employed are discussed. W. H. Boynton

Desizing agents and their action. Fritz Ohl. *Spanner u. Heber* 53, No. 20, 8-10 (1935).—Desizing agents are classified as (1) Oxidizing agents (a) those containing perborate as *Astral powder*, *Alston powder*, *Perborat Cembra Superlatex*, *Terhid C*, (b) organic chlorine compounds as *Aktive*, *Amidonit*, (2) diastatic agents (a) malt diastases as *Diastasi*, *Diastafin*, *Diastase*, *Degmalin*, *Gabulu*, *Konings-Diastase*, *Maloforin*, *Malosol*, (b) pancreatic diastases as *Adresin*, *Delavan*, *Degomma*, *Novofarmol*, *Veroral*, (c) bacterial diastases as *Biolase*. The diastatic desizing agents are most commonly used in cotton operations on account of their efficiency. The removal of linseed oil and its preps from textiles is reviewed as well as the use of various desizing agents which contain soap or other constituents that take the place of soap. The employment of textile acids which avoid the formation of lime soaps is discussed. Various hints are given on the proper desizing procedure. Leopold Scheffan

Textile oils. Hans G. Meyer. *Allegem Oel- u. Fett-Zig* 32, 443-4 (1935).—A review of the type of oils used in the textile industry. M. M. Piskur

Hot-air drying machines and oxidation machines. Their importance today for the printer and dyer. Richard Golbs. *Z ges Textil-Ind* 38, 556-7, 588-9 (1935).

Is soap coming into its own again? Anton Volz. *Monatsschr Textil-Ind* 50, Trade Issue III, 93-4 (Nov., 1935).—A literature review shows that the action of soap is important for numerous textile purposes and that soap cannot be entirely displaced by Ca-resistant detergents. This is particularly true for the degumming of natural silk, the dissolving of linseed oil size, the alk. felting of wool and a variety of washing operations in the textile industry. Leopold Scheffan

The use of higher sulfonated fatty alcohols in the laundry. A. Bresser. *Z ges Textil-Ind* 38, 505-9 (1935).—The manifold use of sulfonated alcs are described. The following washing and cleaning agents were found to be very useful to the textile industry: *Sopidol*, *Mersapal* (a) *B* and *Mehron* of unknown sulfonate constitution, "CFD 1931" containing a fatty alc sulfonate, *Perpapon* and *Superlax* TS contain a fatty alc sulfonate and a solvent and *Purion* contain a fatty alc sulfonate and a bleaching agent. Leopold Scheffan

Injuries to textile fabrics due to the application of fireproofing impregnations. Hans-Joachim Henk. *Monatsschr Textil-Ind* 50, 223-4 (1935).—Most fireproofing materials cause a damage when the impregnated fabric is exposed to an elevated temp. $Al_2(SO_4)_3$ attacks various dyes and damages white curtains during ironing. NH_4Al sulfate hydrolyzes, forming H_2SO_4 which causes damages. $(NH_4)_2HPO_4$ is unstable, forming $NH_4H_2PO_4$, which is injurious by reason of the presence of the free acid radical and in addition the salt ppts on the surface of the fabric. $(NH_4)_2SO_4$ forms NH_3 and H_2SO_4 , when both which destroy the fiber and the dye. $MgSO_4$ acts similarly. Boric acid and Na borate have a gradual damaging action. Pb silicate should not be used on account of its low efficiency and its very poisonous character. $ZnCl_2$ damages the fiber. Fireproofing impregnations which do not affect the fiber and dyes and which have a good and permanent action are obtained with Na tungstate, Na vanadate, Na stannate, titanate and NH_4Br . Na tungstate is used either alone in 10-20% solns or dissolved together with Na phosphate (20% Na tungstate + 4% Na phosphate). In order to avoid the suffening of the fabric by impregnation with the other fireproofing agents it is advisable to use additions of salts of low hygroscopicity as, e.g., lactates. When a fabric is treated with Na stannate it is first dipped into a 25% soln of this salt, then dried and finally treated with Zn acetate soln. Titanate acid ppts from its compds as an insol solid in the fiber. The effect can be increased by impregnations with Na tungstate or stannate. Leopold Scheffan

Effect of loading materials on the light fastness of dyed

11A. Regenerating fatty substances from waste waters of the wool industry (Sololow) 27. Cleansing agents (for textiles) (Brit. pat. 435,445) 23. Mono-N-alkyl derivatives of aromatic diamines and polyamines (U. S. pat. 2,022,245) 10. App. for drying cloth (U. S. pat. 2,027,317) 1. Reaction products of substituted methylenethiurones (Ger. pat. 619,246) 10. Lecithin preps. [used in the textile industry] (Fr. pat. 788,632) 27. Wetting agents [for making dye pastes and rinsing dyed textiles fast to rubbing] (Brit. pat. 435,451) 13.

Dyes. I. G. Farbenindustrie A.-G. (Georg Kramlein, Hans Schliebmacher and Ludwig Schornie, inventors). Ger. 619,521, Oct. 3, 1935 (Cl. 22e 3). See U. S. 2,016,022 (C. A. 29, 5663) where the word "aldehyde" should be "anhydride".

Dyes. John D. Kendall. Brit. 412,628, July 23, 1935. Divided on 431,141 (C. A. 29, 7541). Comps. containing an ethylene linkage or a polymethylene chain are prep. by causing an org. compd. containing a ketomethylene (CO-

CH_2) group and of formula $=C(CH_3)COX$ or $=C(CH_3)COCH_2X$, where X is C, S or O, to react with a

quaternary salt of a heterocyclic N compd. containing a reactive group an aryl, alkyl or aralkyl thio ether or seleno ether, an amino-, arylamino-, acetamido- or acetylaminovinyl or halo group. Alternatively, the org. compd. containing the ketomethylene grouping, the heterocyclic base and an alkyl salt are mixed together and heated to effect quaternary salt formation simultaneously with the condensation reaction. The products are also obtained by condensing with a heterocyclic quaternary NH_4 salt having a reactive group, the condensation product of the compd. containing the ketomethylene group and a formamidine or a formimino ether. Among examples, (1) 1,3-indandione is condensed with diphenylformamidine in Ac_2O and the product with 1-methylpiperazine to Et p-toluenesulfonate, lepidine-Mel and guanidine EtI to give products having a dimethenyl linkage, indandione and heterocyclic radicals, and (2) 1-hydrindone is condensed with the product of 1-methylquinoline-2-thione and ethyl-p-toluenesulfonate to give N-methylidihydroquinolyl 2,2'-indan-1-one.

Dyes, intermediates. Societe pour l'ind. chim. à Bale. Brit. 433,574, Aug. 16, 1935. Anthraquinonecarbazole dyes are prep. by treating with a diazotizing agent a compd. of formula 1-(ANH)-2(H,N)C₆H₃, where A is anthraquinonyl or a nuclear substitution product thereof where at least 1 o-position to the NH_2 is occupied by H and X is H or a univalent substituent, and the product is heated to above 100°, followed, if desired, by treatment with a halogenating or nitrating agent. On diazotization, an anthraquinone-azimide is probably formed and this loses N on heating to form a carbazole. Among examples, (1) o'-nitroaminoanthraquinone (prep. by the reaction of 1-aminoanthraquinone with o-nitrochlorobenzene) (II) is reduced by hyposulfite, diazotized and heated in $PhNO_2$ in presence of 1 NH_4Et , the product may be nitrated in $PhNO_2$. (2) 1-aminoanthraquinone is condensed with nitro-p-dichlorobenzene, the product reduced, diazotized and boiled in diphenylamine (II); bromination of the product in $PhNO_2$ yields a yellow vat dye, (3) 4-amino-1,1'-anthranilide is condensed with I, the product reduced, diazotized and boiled in II to give a gray dye.

Dyes of the anthraquinone series. Klaus W. Wenzel and Ernst Kalkbrenner (to General Aniline Works). U. S. 2,027,658, Jan. 14. Anthraquinone compds. of the general formula $A(NHRSO-alk)_n$, where A stands for a radical of the anthraquinone series, R stands for a radical of the benzene series, alk stands for an alkyl group, and n stands for one of the numbers 1 and 2, and where at least one sulfonic acid group is present in the molecule, being in form of their alkali metal salts generally crystalline dark metallic lustrous powders, easily sol. in water and

dyeing wool from an acid bath generally bluish to greenish shades, are prep'd by various methods, e. g., there may be first prep'd. anthraquinone-sulfonic acids contg one or two substituents which can be replaced by radicals of amines, such as halogen atoms or hydroxy groups. These substituted anthraquinone-sulfonic acids are then caused to react with an amine of the general formula: $\text{NH}_2\text{R}^1\text{SO}_2\text{R}^2$, wherein R means a radical of the benzene series, or the said substituted anthraquinone-sulfonic acids are condensed with an amine of the general formula $\text{NH}_2\text{R}^1\text{R}^2$, R meaning a radical of the benzene series, in which case an oxidation of the sulfide to the sulfoxide must be carried out, this oxidation can be performed either simultaneously with the condensation process or afterward in a separate step. Various examples, details and modifications of procedure are described.

Dyes of the anthraquinone series Donald P. Graham (to I. du Pont de Nemours & Co.) U. S. 2,024,140, Jan 14 Dyes producing yellowing dyestuffs are obtained when 1-benzoylamino-6-aminoanthraquinone or other similarly reacting, 1-acylamino-6-aminoanthraquinone is treated with benzotrichloride and S or with other thiazolizing reagents to convert it to the 1-acylaminoanthraquinone-5,6-thiazole, which may then be hydrolyzed to give the new intermediate, 1-aminoanthraquinone-5,6-thiazole. This primary amino comp'd may then be condensed with alkyl or aryl acid chlorides or chloro comp'ds of the anthraquinone series to give a series of 1-aryl-aminoanthraquinone-5,6-thiazole and 1-arylaminoanthraquinone-thiazoles, and the latter class may be converted into other dyes by treating them with acid-condensing agents. Several examples with details of procedure are given.

Dyes of the dibenzanthrone series Alexander J. Wuerz (to E. I. du Pont de Nemours & Co.) U. S. 2,024,117, Jan 14 When diketodibenzanthrone, dihydroxydibenzanthrone or the substitution products of the latter are reduced in alk. suspension by boiling with finely divided metals which liberate H, the dye is brought into soln, while the org. and inorg. impurities are put in or remain in an insol form, whereby they may be sepd by filtration. When the same comp'ds are vatted with alk. hyposulfite, there is no such selective action, and much of the org. material is brought into soln. The org. impurities removed by the use of Zn or equiv. metals, after being freed from such metal, are sol in alk. hyposulfite, and give very dull bluish green dyestuffs. The dyestuffs obtained from the purified product are materially increased in purity and brilliance. Several examples with details of procedure are given.

Dyes of the oxazine series Georg Kranzlein, Heinrich Greune and Max Thiele (to General Aniline Works) U. S. 2,026,092, Dec 31 2,5-Di-(N-ethylcarbamoyl-3'-amino)-3,6-dichloro-1,4-benzoquinone and other benzoquinones of the formula

where X stands for H or halogen, Y for H or alkyl and R and R' for aromatic groups of the benzene or naphthalene series, one of the R's being an aromatic group of the benzene series, or R, R' and N' together stand for a carbazole ring system, yield, when being treated as such alone or with the addn. of an oxidizing agent and, if necessary, of a catalyst with high boiling solvents, bluish condensation products, from which, by sulfonation, water-sol dyes are obtained which dye blue, bluish gray or bluish green tints. For the reaction there may be used as high-boiling solvents nitrobenzene, trichlorobenzene or the like, as oxidizing agents K_2FeCl_6 , MnO_2 , FeCl_3 or similar products and as catalysts there may be used PbCl_2 , SbCl_3 and others. Instead of first condensing and then introducing the sulfo group it is also possible to introduce the sulfo group before the oxazine has been formed, by starting for instance from diaryl-amino- or amino-carbamoyl-sulfonic acid. The products have good fastness to light, are suitable for dyeing silk and when treated with bases as described in U. S. 1,500,299 (C. A. 25, 3495) yield blue, bluish gray or bluish green pigments suitable for

use in varnishes and lacquers. U. S. 2,026,093 relates to various pigment dyes, similarly produced, suitable for coloring wall papers, rubber, sugar, varnishes and printing comp's. Several examples with details of procedure are given. Cf. C. A. 29, 83401*, 30, 620*

Pigmentary dyes I. G. Farbenindustrie A.-G., Brit. 435,817, Sept. 30, 1935. See I'r 787,453 (C. A. 30, 1237*)

Lakes Gustave Widmer (to Soc. pour l'ind. chim. à Bâle) Brit. 435,767, Sept. 27, 1935. See I'r. 771,423 (C. A. 29, 039*)

Complex metal compounds of dyes I. G. Farbenindustrie A.-G. Brit. 435,108, Sept. 9, 1935. These comp'ds are made by treating the disazo dye humidine (I) \Rightarrow a naphthol or a hydroxynaphthol acid arylide with a heavy metal salt of an org. carboxylic acid of high mol. wt., e. g., a higher fatty acid, resin acid or naphthenic acid. Org. solvents or substances that depress the m. p. of the salt may be added. The products from stearates may be used for coloring candles. Among examples, (1) a mixt. of the dye I \Rightarrow β -naphthol, Cu stearate and xylene is boiled, the blue product is suitable for printing-varnishes, and the dye of (1) is boiled with Cr stearate and trichlorobenzene (bluish green)

Azo dyes Max Raack (to General Aniline Works) U. S. 2,019,830, Nov. 5 Dyes of the general formula $3,5-(\text{O}_2\text{N})_2-2-(\text{HO})\text{C}_6\text{H}_3\text{N} \cdot \text{NC}_6\text{H}_4\text{X}-2,4-(\text{NYZ})_2$, where X means H, halogen, an alkyl or alkoxy group and Y and Z stand for H, a hydroxyalkyl or polyhydroxyalkyl group, at least one Z however being a hydroxyalkyl or polyhydroxyalkyl group, being dark powders which are easily sol in water, and which dye wool in the presence of a Cr mordant reddish brown to Bordeaux tints are obtained from components such as diazotized 1-hydroxy-2-amino-4,6-dinitrobenzene and 4-chloro-1-amino-3-(β, γ -dihydroxypropyl)-benzene, etc. (several examples being given).

Azo dyes Heinrich Clingestem and Karl Dolmayer (to General Aniline Works) U. S. 2,019,844, Nov. 5 Various examples are given of the production of dyes of the general formula $(\text{HO}-\text{alk})\text{XNO}-\text{SR}^1\text{NR}^2$, where "HO-alk" stands for a hydroxyalkyl group, X stands for H, alkyl, aryl, hydroxyalkyl or hydroaralkyl, R stands for the radical of a coupling component suitable for producing an azo dye which has been coupled in an alk. medium, said coupling component contg. as substituent at least a sulfonic or carboxylic acid group, and where the benzene nucleus R' may be substituted by substituents selected from the group consisting of alkyl, alkoxy, hydroxy, a substituted amino group, the nitro group and halogen. In the form of their alkali metal salts the dyes are generally yellowish to orange to red to brown powders, sol in water, dyeing animal fibers generally yellow to orange to red to brown shades of good fastness to fulling.

Azo dyes Carl Taube and Josef Hülger (to General Aniline Works) U. S. 2,026,920, Jan. 7. Disazo dyes generally dyeing cellulose fibers red to violet shades of good fastness to light are produced from components such as a diazotized 2,4-dihaloaniline b-sulfonic acid, m-toluidine and 2-benzoylamino-5-naphthol-7-sulfonic acid or the like.

Azo dyes Gerald Bonhote (to Soc. pour l'ind. chim. à Bâle) U. S. 2,027,897, Jan. 11. Dyes which when prep'd on the fiber produce vivid scarlet to red tints are formed of components such as diazotized 2-amino-4-acetyl-1,1'-diphenyl ether and 2,3-dihydroxy-naphthoic acid-5'-chloro-2'-methylamide or the like.

Azo dyes I. G. Farbenindustrie A.-G. Fr. 785,638, Aug. 14, 1935. 2-(Alkoxy- or halo-aminoaryl)arylenethiazole

comp'ds of the formula $4-(\text{H}_2\text{N})-3-\text{XC}_6\text{H}_4\text{C}_2\text{N} \cdot \text{C}_6\text{H}_4\text{S}$, in which X is alkoxy or halogen and the C_6H_4 rings may contain other substituents, are diazotized and coupled with coupling components. Thus, 2-(4'-amino-3'-methoxyphenyl)-6-methylbenzothiazole-sulfonic acid (by condensing 4-nitro-3-methoxybenzoyl chloride with 4-amino-3-mercaptotoluene, reducing and sulfonating) is diazotized and coupled with 2-phenylamino-5-naphthol-7-sulfonic acid. Reddish violet shades are obtained on cotton with this dye. Other examples are given.

Azo dyes 1 G. Farben und A. G. Fr. 787,733, Sept. 27, 1935 Dyes are prepared by coupling diazo compounds of amines of the formula $\text{H}_2\text{N}-\text{C}_6\text{H}_4-\text{N}=\text{N}-\text{C}_6\text{H}_4-\text{N}=\text{N}-\text{X}$, (X is C_6H_5 , SO_2NH_2 , and the benzene ring may contain substituents) with halogenated 1-aryl-5-pyrazolones and treating the dyes in substance or on the fibers by agents furnishing Cr Thus, 3-(*m*-aminobenzamido)-5-sulfo-6-hydroxybenzoic acid \rightarrow 1-(*o*-chlorophenyl)-3-methyl-5 pyrazolone gives yellow dyes on wool which are little changed by chroming Other examples are given

Azo dyes J. R. Geigy S. A. Fr 788,247, Oct. 7, 1935 (Retrazotized diamino bases of the formula $H_2N-RSRNH_2$ (R is an aromatic radical) are coupled with para-substituted phenols, neither of which contain solubilizing groups. The dyes may be used for coloring cellulose esters, lacquers, etc. In an example triazotized thioaniline is coupled with 4-hydroxy-1-methylbenzene and the dye formed colors cellulose esters pure yellow shades Cf. C. A. 30, 872¹

Azo dyes. Soc pour l'ind. chim. à Bale. Fr. 787,483, Sept. 23, 1935 Fast dyes are prep'd in substance or on the fiber by causing diazo comp'ds of the formula 2-X-5-X-4-(ROCH₂CONH)C₆H₄N.OH (R is an aromatic radical of the C₆H₅ series and X is alkoxy) to react with arylides of *o* hydroxy carboxylic acids coupling in position ortho to the OH, operating in a medium the *pH* of which does not pass 6.5 and is not appreciably below 5. Thus 4-(1'-methylphenyl)acetamido-2,5-dimethoxyaniline \rightarrow 2,3-hydroxynaphthoic acid naphthalide gives a bright blue on cotton and 4-(3'-methylphenyl)acetamido-2,5-dimethoxyaniline \rightarrow 2,3-hydroxynaphthoic acid 4'-ethoxynaphthalide a bright violet shade.

Azo dyes. See pour l'ind chum à Bile. Fr 788,349, Oct 8, 1935. Dyes are prep'd by causing 1-nitroaminonaphthalene, in which the para position to the nitroamino group is free, to react with diazo compds. which are not or only very slowly modified by dil. alkalis, e.g., 1-diazo 2-ethoxy (and methoxy) benzene.

Azo dyes I-G Farbenund A-G (Hans Schindhelm, inventor) Ger 618,810, Sept 16, 1935 (Cl 22a 13)

Stilbene dyes are obtained by condensing nitrostilbene compds of the general formula 4-X-2-HO₂C₆H₄CH=CH₂SO₂NH-2'-NO₂-4', where X represents a NO₂, arylazo, or arylazoxy group, with aminostilbene compds of a similar general formula, the NO₂ being replaced by NH₂, and the X representing NO₂, or arylazo or arylazoxy groups different from those in the nitrostilbene compd. The condensation takes place at the NO₂ and NH₂ groups and is effected by heating the compds with alkali. In an example Na 4,4'-diaminostilbene-2,2'-disulfonate is heated with 4 nitro-4'-aminostilbene-2,2'-disulfonate in 10% NaOH to give a dye. The shades of the dye can be brightened by aftertreatment with Cl₂. Other examples are given. Cf C A 29,4950¹

Azo dyes I G Farbenind A G (Karl Holzach and Ludwig Neumann, inventors). Ger 622,409, Nov. 27, 1935 (Cl. 22a 1) The diazo compds. of aromatic monoamines not contg. SO₃H groups are coupled with 2,4-dihydroxyquinolinesulfonic acids or with the sulfonic acids of N-alkyl-4-hydroxy-3-quinolones. Yellow dyes, particularly useful for printing acetate rayon, are obtained. Sp dyes are described.

Azo dyes 1 G Tarbenind A-G Brit 432,353, July 18, 1935 Dyes are made by coupling a diazotized amine of formula AXNH₂, in which A is the residue of an aminobenzene, B is the residue of an o-hydroxybenzoic acid and X is CO or SO₂, with a pyrazolone contg the residue of an o-hydroxybenzoic acid and corresponding to 1 of the formulas (a) 3-HO-C₅-Y-[3-HO-C₄-R(R = -N N' CZ CH₂ CO), (b) 5-Y-2-[3-HO-C₄-HOC₂H₅SO₂]-5-C₆H₄R, (c) m-(3-HO-C₄-HOC₂H₅NHSO₂)C₆H₄R, (d) m-(3-HO-C₄-HO-5-HO-SC₂H₄NHCO)C₆H₄R, in which Z is alkyl, aryl, COOH, COO-alkyl, CONH₂ or CONHR (R is an org radical) and Y is H, SO₂H, CH₂, Cl or NO₂, the OH being attached to 1 of the o-positions to the COOH in the nucleus marked A. The Cr compds of the dyes (prepd in substance or on the fiber by after-chroming the

1 dyeing or by dyeing chrome mordanted fibers) have a good leveling power and dye animal fibers yellow shades that are fast to light, washing, fulling and carbonizing. Among dyes and their Cr compds prepd in examples are (1) 1-hydroxy-4-(4'-methyl-3'-aminobenzoyl)aminobenzene-2-carboxylic acid, 1-hydroxy-4-(3'-amino-benzoyl)aminobenzene-2-carboxylic acid-6-sulfonic acid, 1-hydroxy-4-(1'-aminobenzene-3'-sulfonyl)aminobenzene-2-carboxylic acid (I) or 1-hydroxy-4-(4'- or 3'-aminobenzoyl)aminobenzene-2-carboxylic acid-1-(2'-hydroxy-3'-carboxy-5'-sulphonyl)-3-methyl-5-pyrazolone, (2) I or 1-hydroxy-4-(3'-amino-benzoyl)aminobenzene-2-carboxylic acid-1-(5'-sulfo-4'-hydroxy-3'-carboxy-2'-diphenyl sulfone)-3-methyl-5-pyrazolone

3 Monoazo dyes are made by coupling a diazotized *o*-nitroaniline with a *N*-sulfatoethyl deriv. of a *p*-coupling amine of the Celli series. They give yellow and orange colorings on acetate rayon, wool, silk and leather and are suitable for printing rayon. In examples dyes are prep'd from *o*-nitroaniline, 3-nitro-4 toluidine, 4-chloro-2 nitroaniline; the *N*-sulfatoethyl derivs of *o*- and *m*-toluidine, PhNH₂ and 3-amino-4-methoxytoluene. Cf. *C. A.* 29, 7669.

4. **Azo dyes, dyeing intermediates** I. G. Farbenindustrie A-G Brit 435,711, Sept. 26, 1935 H₂O-sol dyes are made by diazotizing a base of formula 3 (or 4): $\text{H}_2\text{NCH}_2\text{NHCOROR}'$, where R is an aliphatic radical, particularly an alkylene group, and R' is alkyl, alkoxy-alkyl, aralkyl or a hydrogenated aromatic radical and in which the C₆H₅ nucleus may contain nonsolubilizing substituents, e. g., alkyl, alkoxy, halogen, and coupling in substance or on a substratum, particularly on vegetable fibers, with an arylamide of an α -hydroxy carboxylic acid that couples in o position to the OH. Among examples, cotton is impregnated with the arylamide from amino-hydroquinone dimethyl ether and 2,3-dihydroxy-naphthoic acid and developed with diazotized 1-amino-4-methoxy-acetyl-amino-2,5-dimethoxybenzene to yield a clear reddish-blue. The amines of above formula are made by condensing a *p*- or *m*-nitroamine of the C₆H₅ series free from solubilizing groups with a carboxylic acid of formula HOOC-R₁OR₂, or a functional deriv. thereof, e. g., a halide or ester, and reducing the NO₂ group, or by acylating an amine of the C₆H₅ series free from solubilizing groups and subsequently introducing the amino group into the *m*- or *p*-position to the acylamino group by nitration and reduction.

Blue azo dyes. Gerald Bonhote (to Soc. pour l'Ind. chim. a Bâle, U.S. 2,027,766, 1934, 14). Various examples are given of blue azo dyes formed by diazotizing an initial material such as 4-(4'-methylphenyloxy)aniline, 2,5-dethoxyaniline and coupling the diazo compd thus formed with an arylide of 2,3-dihydroxyaphthoic acid, which is itself obtainable by condensing 2,3-dihydroxyaphthoic acid with an analog or homolog of aniline which can be regarded as an ortho substitution product thereof, such as *o*-toluidine, *o*-anisidine, *p*-xylydine, *m*-xylydine, cresidine, chloroanisidine (NH₂, OCH₃, Cl = 1, 2, 5), amino hydroquinone di-Me ether, 4-chloro-2-toluidine, 2,4-dimethoxy-5-chloroaniline, 1-aminotetraol or the like, or amines which are substituted in *o*-position to the amino group by an *O*-alkyl group whose alkyl groups contain more than one atom, e.g., *o*-phenetidine, further the mixed ethers from *o*-aminophenol and aliphatic alcs such as Pr, Bu, Am alc, or also ether alc, such as glycol mono-Bu ether, glycol mono-Et ether, glycerol di-Bu ether, or the like. The dyes may be formed on the fiber. Cf. C. A. 29, 8335.

9. Substantive azo dyes I G Farberund A-G. Fr 788,104, Oct 4, 1935 The monoazo dye prepd. by coupling 1 mol proportion of 1-amino-8 naphthol-3,6-disulfonic acid (I) and 1 mol proportion of a diazotized mononitroarylamine in acid medium is coupled with 1 mol proportion of the same or another diazotized mononitroarylamine in alk. medium and the disazo dye obtained is reduced to a diaminodisazo dye of which is tetrazolized and coupled with 2 mol proportions of *m*-aminotriethanols which

contain 1 atom of halogen in the position para to the NH_2 group. The nitroarylamines may be replaced by monoacylated diamines and the acyl group afterward sepd. by sapon. The dyes give black shades fast to acids on cotton and rayon. Thus, the dye *p*-nitroaniline \rightarrow I \leftarrow *p*-nitroaniline is reduced, tetrazotized and coupled with 2 mols of 6-chloro-3-aminophenol.

Water-insoluble azo dyes Friedrich Muth (to General Aniline Works) U S 2,026,908, Jan 7. Numerous examples are given of dyes (dyeing brown to black shades) which have the general formula

where X stands for a S or an O atom, R and R' for aromatic radicals and n stands for one of the nos 1 and 2 Cf C A 28, 5240⁹

Ethylene azo dyes Robert Wizinger (to I G Farbenindustrie A.-G.) Brit 435,449, Sept 16, 1935. The dyes, or acid addn products thereof, are prepd by coupling with diazonium salts ethylenes of formula $\text{R}(\text{R}')\text{C}(\text{CH}_3)(\text{R}')_2$, where R and R' are aryl groups substituted by at least 1 group imparting a pos. character, e. g., MeO, HO, NH₂, NMe₂, PhNH and R' is a univalent atom or group, or acid addn products thereof. In examples, (1) 2-naphthylamine-6,8-disulfonic acid is diazotized and coupled with tetramethyldiaminodiphenylethylene, the product dyes wool Bordeaux-red shades from an alk. bath and, on acidifying, an intense blue shade is obtained, and (2) *p*-nitrophenyldiazotized is coupled (acid) with diaminylethylene.

Pyrazolone azo dyes Walther Benade (to General Aniline Works) U S 2,026,861, Jan 7. Monoazo dyes dyeing wool by the single bath process in the presence of a chrome mordant orange to red tints of good fastness are made from components such as diazotized 4-nitro-6-chloro-2-amino-1-hydroxybenzene and 1-(2'-naphthyl-6'-sulfo)-3-methyl-5-pyrazolone or the like.

Azo dyes containing metals I G Farbenind. A.-G. Fr. 788,031, Oct 2, 1935. Salts of fat acids of low mol. wt. and contg. halogen along with compds of metals capable of forming complex compds. with dyes are caused to react with azo dyes capable of forming complex metal compds. Thus, 2-aminobenzoic acid \rightarrow 1-phenyl-3-methyl-5-pyrazolone is heated in water to 135° with Cr_2O_3 and CH_3CICOOH . Other examples are given. Cf C. A. 30, 1240⁹.

Azo dyes and soluble copper compounds thereof I G Farbenindustrie A.-G. Brit 436,095, Oct 4, 1935. Dyes are obtained by condensation of a mono- or poly-azo dye contg. at least once the grouping $\text{hal}-\text{NR}'\text{OH}$, in which R and R' are residues of the C_6H_5 or C_6H_4 series, the OH is in *o*-position to the azo bridge and the halogen atom, hal, is in *o*- or *para*-position to the azo bridge, with NH₂, amines, alcohols, phenolates, sulfites or sulfonates, in presence of a Cu compd. An acid-binding agent and (or) a nitrogenous base may be present. The products are in some cases free from Cu. Cu may be removed from the Cu complex compds by treatment with acid, alkali sulfides or alkali cyanides. Among examples, (1) the dye 2,4-dichloroaniline-6-sulfonic acid \rightarrow β naphthol is heated with $(\text{AcO})_2\text{Cu}$ in EtOH to 78°, KOH is added and the whole boiled 1 hr.; the product on treatment with Na_2S in aq. soln. is converted into the Cu-free dye which gives orange dyings on wool, and (2) the dye 1-chloro-2-naphthylamine-6-sulfonic acid \rightarrow 2,7-naphtholsulfonic acid is heated 1 hr. at 85-90° with an aq. soln. contg. CuSO_4 , Na_2CO_3 and Na_2SO_3 ; the product dyes wool red.

Monoazo dyes. Imperial Chemical Industries Ltd., Arthur H Knight and Henry A Piggott. Brit. 434,126, Aug. 23, 1935. Dyes for coloring acetate rayon are made by coupling a diazotized *p*-nitro aniline of the C_6H_4 or

C_6H_3 series, free from COOH and SO₃H groups, with a compd. or mixt. of compds. of formula $\text{ArRNCH}_2\text{CH}_2(\text{OCH}_2\text{CH}_2)_n\text{OH}$, where Ar is a Ph residue free from COOH and SO₃H groups and has an unsubstituted para coupling position to the N, R is Me, Et, β -hydroxyethyl or $\text{CH}_2\text{CH}_2(\text{OCH}_2\text{CH}_2)_n\text{OH}$, n and m being integers greater than 0 such that $n + m$ does not exceed 10 and preferably does not exceed 4. They may be converted into dispersible dye powders by means of known dispersing agents. They may be used in admixt. with other insol. azo or anthraquinone dyes. In examples, dyes from the components, 2,4-dinitroaniline, 6-chloro- or 6-bromo-2,4-dinitroaniline, 2-chloro-4-nitroaniline, *p*-nitroaniline, 2,4-dinitro-1-naphthylamine, 5-nitro-2-aminidine, 2,6-dichloro- or 2,6-dibromo-4-nitroaniline, and the products obtained by condensing various quantities of ethylene oxide with *N*- β -hydroxyethyl-*m*-toluidine, *m*-toluidine, *N*-ethylamine and 3 PhNH₂, are described. The coupling components may also be obtained by condensing a suitable amine with a mixt. of ethylene chlorohydrin and NaOH.

Disazo dyes Arthur H Knight (to Imperial Chemical Industries Ltd.) U S 2,027,178, Jan. 7. See British 395,005 (C A 28, 335⁹).

Disazo dyes J R Geigy S. A. Fr. 788,119, Oct. 4, 1935. See Ger 620,258 (C A 30, 874⁹).

Mordant disazo dyes Ernst Hug and Max Müller (to Durand & Huguennin S. A.) U S 2,027,777, Jan. 14. Dyes yielding violet-brown shades of good fastness on cotton by chrome printing and which have the general formula 1,4-(alkyl-O)-2-R¹N-5-R²N NCH₃, where R¹ stands for a sulfonated benzene nucleus and R² stands for a benzene nucleus contg. as substituents a hydroxyl and a carboxyl group in *o*-position to each other, are produced by diazotizing a sulfonated amine of the benzene series (NH₂R¹), combining the diazo compd. thus formed in an acid medium with an aminohydroquinone dialkyl ether, then diazotizing the aminoazo compd. thus formed and finally combining it with an *o*-hydroxy carboxylic acid of the benzene series. Several examples are given.

Trisazo dyes. Ernst Hug and Max Müller (to Durand & Huguennin S. A.). U. S. 2,024,797, Dec. 17. Trisazo dyes yielding in chrome printing on cotton green to blue-green shades of good fastness (especially to Cl), which can be discharged to a pure white by hyposulfite and are suitable for chrome printing on cotton and correspond with the general formula (naphthalene deriv.) 1-HO-8-H₂N-2-R¹N NR²N-7-R³N N-3,6-C₆H₃(SO₃H)₂, where R¹ represents a benzene nucleus, substituted by SO₃H, NO₂, COOH groups or halogen, R² means a sulfonated benzene nucleus, R³ means a benzene nucleus bearing as substituents a hydroxy and a carboxylic group in *o*-position to each other and which may contain as further substituents a CH₃ group or halogen are made by combining a 1-amino-5-hydroxynaphthalene-3,6-disulfonic acid first in an acid medium with a diazotized amino compd. of the type R¹NH₂ and subsequently in an alk. medium with a diazotized amino azo compd. of the type R²N NR³NH₂, where R¹, R² and R³ have the meanings defined. Several examples with details of procedure are given.

Tetrakisazo dyes suitable for dyeing leather brown shades Francis H Smith and Crayton K. Black (to E. I. du Pont de Nemours & Co.) U S 2,027,206, Jan. 7. Numerous examples are given of dyes of the general formula (R¹N NR²N N₂)(HO)₂XCH₃, in which R¹ and R² represent aryl groups and X represents groups such as halogen, alkyl, alkoxy, nitro, carbonyl, sulfonic, hydroxyl and H. These compds are produced by coupling two equivalents of a diazotized mono-acyl-diamino or nitro-amino deriv. of an aromatic compd. with a dihydroxybenzene, treating the resulting compd. with the monoacylamino or nitro groups to amino groups, then diazotizing and coupling with two equivalents of an aromatic coupling component. Cf. C. A. 30, 324⁹.

Polyazo dyes I. G. Farbenind. A.-G. Fr. 788,238, Oct. 7, 1935. Dyes which give black shades fast to acid on leather are prepd by coupling in mineral acid medium 1 mol. of a tetrazotized *p,p'*-diaminoaryl with 1 mol. of a 1-amino-8-hydroxynaphthalene-3,6-disulfonic acid (I) and

uniting this compd in alk. medium with 1 mol of a mono-diazo compd and 1 mol of a 3,5-diaminophenol in which each of the 2 NH₂ groups contains an aryl group. Thus, tetrazotized benidine is coupled in mineral acid medium with 1, then united with diazotized *p*-sulfanilic acid and finally coupled in alk. medium with bis(*p*-chlorophenyl)-3,5-diamino-1-hydroxybenzene.

Vat dyes I G Farbenind A-G (Karl Köberle and Christian Steigerwald, inventors) Ger 622,173, Nov. 21, 1935 (Cl 226 3 09). Nitroindibenzanthrones containing more than 4% of N are heated with S or other sulfurizing agent. The reaction may be effected by boiling the materials in a solvent, e. g., naphthalene in the presence or absence of a catalyst, e. g., Cu or Mo or a compd thereof. Black or olive dyes are obtained. Sp. processes are described.

Vat dyes I G Farbenind A-G Ir 785,275, Aug. 6, 1935. Dyes of the anthraquinone series are made by prep., by processes known in themselves, aminoanthraquinone-oxazoles, -thiazoles or -imidazoles of the formula

in which X is O, S or NH, R is an anthraquinone radical, R₁ a cyclic radical and which may also contain one or more other amino or acylamino groups. Several examples are given. Thus, 1-amino-4-nitro-2-anthraquinonyl 2',3'-anthraquinone-oxazole (by condensing 1-amino-4-nitro-anthraquinone-2-carbonyl chloride with 2-amino-3-hydroxy-anthraquinone and treating with *p* toluenesulfonic acid) is reduced to the 1,4-diamino compd which dyes cotton greenish blue from the vat. Several examples are given.

Vat dyes I G Farbenind A-G Fr 785,168, Aug. 28, 1935. Asymmetric indigo dyes are prep. by condensing 7-alkoxy-3-hydroxythionaphthene, containing either in the 4- or 5 position a halogen or an alkyl group or a halogen and an alkyl group, according to the usual method, with 3-hydroxythionaphthene or isatins of the C₁₀H₇ series, to form bis(hionaphthene-2,2'-indigo or thionaphthene-2-ido-2'-indigo), and, if necessary, subsequently halogenating the products obtained. Thus, 4-methyl-5-chloro-7-methoxy-3-hydroxythionaphthene is heated with 4-methyl-5,7-dichloro-2,1-diketodihydrothionaphthene-2-(*p*-dimethylamino)anil in AcOH giving a product which dyes cotton violet shades from the vat. Other examples are given. Cl C A 30, 875.

Vat dyes I G Farbenind A-G Fr 784,782, Sept. 9, 1935. Dyes are prep. by treating with acid-condensing agents, such as AlCl₃, bis(anthraquinonylamino)-1,4,5,8-naphthylenebis(arylimidazoles), prep. by the reaction of aminoanthraquinones on naphthylenebis(arylimidazoles) containing an atom of halogen. Examples are given of the prep. of compds of the formula

R is 1-anthraquinonylamino group, its 2-Me deriv. or its 4-benzamido deriv. Cl C A 30, 623.

Vat dyes of the anthracene series Wilhelm Eckert and Otto Brunsdorf (to General Aniline Works) U S 2,028,384, Jan. 21, 1936. See Ger 612,930 (C A 29, 6433).

Vat dyes of the anthraquinonecarbazole series Donald P. Graham (to I. du Pont de Nemours & Co.) U S 2,028,103, Jan. 14, 1936. Anthranthide is fused with AlCl₃ at temps. not materially above 250° and the product is

subjected to oxidation (suitably by use of Na₂Cr₂O₇ in dil. H₂SO₄ soln.). A dye of brighter and greener shade is obtained than results when higher fusion temps. are used. NaCl and Na₂CO₃ are also preferably included in the mix subjected to fusion.

Indigoid vat dyes Norbert Steiger and Edward Albrecht (to General Aniline Works) U S 2,021,367, Nov. 19, 1935. Dyes of various colors and having the general formula

where one of the X's means methyl and the other halogen and R means the radical of a component capable of forming indigoid dyes, have good affinity for vegetable fibers. In some cases their tinctorial properties may be further enhanced by after-halogenation. Alkoxychloromethylhydroxythionaphthene, starting materials for making these dyes, may be obtained by converting the corresponding alkoxychloromethylbenzenesulfonic acids into the sulfonyl chlorides, mercaptans, thioglycolic acids and ring-closing the latter or also by introducing a S-contg. radical into the ortho position to the amino group of a corresponding alkoxychloromethylaminobenzene. These hydroxythionaphthene series, are themselves or after the transformation into their reactive 2-derivs. condensed with isatins or hydroxythionaphthene of the benzene or naphthalene series or with the reactive 2-derivs thereof. Several examples with details of procedure are given. Cl C A 30, 875.

Reducing vat dyes Louis S. Bale (to F. I. du Pont de Nemours & Co.) U. S. 2,027,141, Jan. 7, 1936. An aq. suspension of indigo is treated with HCl, H₂SO₄, NH₄Cl or ZnCl₂ and then with SO₂ and Zn to produce Zn hyposulfite and reduce the dye to its leuco compd. Other vat dyes may be similarly reduced.

Brominated derivatives of vat dyes of the anthraquinone series Karl Krauer (to Soc. pour l'ind. chim. A. Bale) U S 2,027,914, Jan. 14, 1936. Bromination of a fat dye such as an isodibenzanthrone is conducted in an inert solvent such as PhNO₂ and in the presence of ZnCl₂.

Indigoid dyes Soc. pour l'ind. chim. A. Bale Fr 788,724, Oct. 15, 1935. This corresponds to Swiss 176,362 (C A 30, 297) with the addn. that 5,7-dihaloisatin derivs. may be used. Fr 788,724. See Swiss 174,270 (C A 30, 297).

Indigoid dyes Ernst Stocklin (to Soc. pour l'ind. chim. A. Bale) U. S. 2,027,889, Jan. 14, 1936. Dyes of various colors suitable for dyeing cotton, wool and silk are produced from thionaphthene derivatives.

the general formula, $\text{CY CX CY CX C C CO C (Z) S}$,

where X represents halogen, Y alkyl, and Z a reactive group, such as O, aml, 2H, NOH, halogen or H and COOH, by condensing the thionaphthene with an indigoid component, the indigoid dye produced may be subsequently halogenated, e. g., 4,6-dimethyl-5-chloro-7-bromo-3-thionaphthene, 4,6-dimethyl-5,7-dichloro-3-thionaphthene, 4,6-dimethyl-5-bromo-7-chloro-3-thionaphthene, 4,6-dimethyl-5,7-dibromo-3-thionaphthene, the 2-amis, such as for example 2-*p*-dimethylaminoanis and 2-*p*-hydroxyanis, 2-carboxylic acids, 2-oximes, 2-dihals of these compds, as well as 4,6-dimethyl-5,7-dihaloanthionaphthenequinones obtainable from the above 2-amis by saponification with aq. acids may be used, with thionaphthene of the benzene, naphthalene, anthracene and anthraquinone series, indoxyls and isatins of the benzene, naphthalene and anthracene series, phenols, naphthols, hydroxyanthracenes and hydroxycarbazoles, and also α -diketones of the isocyclic series and the products of these hydroxythionaphthene, phenols, hydroxycarbazoles and α -diketones substituted in the aryl nuclei by halogen

groups, such as, for instance, Cl or Br, alkyl groups, alkoxy groups, such as, for example, methoxy or ethoxy groups, wherein only one of several substituents, which may be similar or different, can be present. Numerous examples, details and modifications are described.

Anthraquinone dyes I. G. Farbenind. A.-G. (Berthold Biebert, inventor) Ger. 622,311, Nov. 23, 1935 (Cl. 22b 3 02). Blue acid wool dyes are prepared by the following process: 1-Chloro-2-methyl-1 (I) denotes anthraquinone is chlorinated to yield 1-chloro-2-chloromethyl-I. The latter, heated with aq. Na_2SO_3 soln., yields 1-chloro-1,2-methanesulfonic acid, which is then heated with NH_3 or an aliphatic or hydroaromatic amine to yield a 1-amino-1,2-methanesulfonic acid. This is halogenated to yield, e.g., a 1-amino-4-bromo-1,2-methanesulfonic acid and finally this is heated with a nitrogenous base, e.g., PhNH_2 , p -aminoacetanilide or cyclohexylamine, whereby the halogen is replaced by a substituted amino group. Suitable conditions for each reaction are described.

Azine dyes Wolfram Vogt and Eugen Huber (to I. G. Farbenindustrie A.-G.) Brit. 435,479, Sept. 23, 1935, addn. to 417,388 (C. A. 29, 12614). Dyes of the azine series contg. in the mol. at least once the group $\text{alk-SO}_2\text{H}$ attached to N, where alk is an alkylene group of 3 C atoms of which 2 form a bridge between the N and the SO_2H , are synthesized by standard methods by use at least once of an aromatic sulfonic acid of formula $\text{aryl-N(R)-alk-SO}_2\text{H}$, where R is H, alkyl, hydroxyalkyl, sulfoalkyl or aralkyl and alk is an alkylene group as described above. In examples, (1) 1,3-bis(phenylamino)naphthalene-8-sulfonic acid is oxidized in the usual manner with an equimol. proportion of 4-aminobutylphenylaminopropanesulfonic acid, the product dyes wool greenish blue shades, and (2) 3-diethylsulfosindoline-1,6-disulfonic acid is condensed with 4-aminophenylbutylaminopropanesulfonic acid, wool is dyed blue shades.

Dibenzanthrone-azole dyes Alexander J. Wuertz and Myron S. Whelen (to E. I. du Pont de Nemours & Co.) U. S. 2,028,115, Jan. 14. Vat dyes of the dibenzanthrone-azole series, yielding upon cotton gray to dark blue and black dyestuffs, are obtained by alkali fusion of a benzanthrone-1,2-thiazole or a benzanthrone-1,2-selenazole. Several examples with details of procedure are given and general claim is made to new dyes consisting chiefly of a dibenzanthrone- $\alpha\beta,\alpha'\beta'$ -dithiazole or -diselenazole. U. S. 2,028,116 relates to the production of compds. of the

general formula R-S-CX-N , where R stands for a bivalent benzanthrone radical to which the S and N are connected in the α - and β -positions, resp., while X stands for H, alkyl or aryl, such as $\alpha\beta$ -benzanthrone-C-phenylselenazole or $\beta\beta'$ -1-halogen- $\alpha\beta$ -benzanthrone-C-phenylselenazole, by reducing an anthraquinone-1,2-selenazole which contains no substituent in the remaining α -positions and causing the same to react with glycerol in the presence of concd H_2SO_4 . Several examples with details of procedure are given.

Cyanine dyes Kodak Ltd. and Bernard Beilenson Brit. 435,542, Sept. 19, 1935. In mfg. dyes of the cyanine type by the use of an acid-binding agent, the latter consists of an alkali metal salt of a weak org. acid, preferably in substantially anhyd and finely-divided form. Thus 1-methylbenzothiazole is condensed with diphenylformamidine in presence of anhyd Na_2PO_4 and 2-iodoquinoline-1 (I) is condensed with quinaldine-EtI in presence of K_2CO_3 .

Gallocyanine dyes I. G. Farbenindustrie A.-G. Brit. 436,090, Oct. 4, 1935. Addn. to 417,975 (C. A. 29, 16547). Dyes are prepared by condensing gallic acid or a deriv. thereof, e.g., gallamide, gallic acid arylamides or esters, pyrogallallic acid, with nitroso compds. of secondary or tertiary aromatic amines of formula $\text{aryl-N(R)-alk-SO}_2\text{H}$, where R is H, alkyl or substituted alkyl and alk is an alkylene group of at least 3 C atoms. For examples, cf. C. A. 29, 6433⁹.

Mordant dyes Durand & Huguennin A.-G. Brit. 437,513, Sept. 23, 1935. This corresponds to Ir. 743,107 (C. A. 29, 70919).

Oxazole dyes I. G. Farbenind. A.-G. Ir. 787,918, Sept. 30, 1915. Oxazole dyes of the anthraquinone series are prepared by heating 1-hydroxy-2,4-diaminoanthraquinone (I) with aromatic carboxylic acid chlorides, advantageously in the presence of a diluent of high b. p. and advantageously also in the presence of an acid condensation agent and exchanging, in the condensation products obtained, the acylated groups joined to the N with other acylated groups. The products have the formula

R and R' are aryl groups which are different if they both belong to the C_{6}H_5 series. Examples are given of the prepn. of dyes from I with benzoyl, p -chlorobenzoyl and 2,4-dichlorobenzoyl chloride, p -toluyl chloride, 1-chloroanthraquinone 2 (and 4)-carbonyl chloride, biphenyl-4-carbonyl chloride and β -naphthyl chloride.

Pyrone dyes I. G. Farbenind. A.-G. Ir. 786,405, Sept. 3, 1935. Dyes of the formula

(R is a cyclic radical contg. more than 2 rings, X is alkyl or aryl contg. a COOH group, 1 or 2 of the Y's are halogens, the others H, n is a whole no. not greater than 4) are prepared by condensing fluorescein chloride or bromide or their substitution products with the following amines and subsequently sulfonating: aminodiphenylazenes, amino-hydroxydiphenylbenzenes, aminophenyl-naphthalenes, aminobiphenyls, aminofluorenes, aminofluoranthenes, aminochrysenes, aminopyrenes, aminocyanaphthalenes, 1- or 2-aminocarbazole, 3-amino-N-ethylcarbazole or their substitution products. They may also be prepared by condensing phthalic anhydride or its derivs. with aryl-m-aminophenols and sulfonating or by condensing 4-aryl-amino-m-hydroxy- α -benzoylbenzoic acids with aryl-m-aminophenols and sulfonating. Examples are given.

Sulfur dyes Paul Schetelig (to Soc. pour l'ind. chim. & Bâle) U. S. 2,027,323, Jan. 7. Aromatic compds. such as pyrene, fluoranthene, chrysene or aminochrysene are reacted with S at 200-300° to produce dyes which generally dye brown shades.

Sulfur dyes I. G. Farbenind. A.-G. (Werner Zierweck, inventor) Ger. 622,274, Nov. 25, 1935 (Cl. 22d. 3). See Brit. 111,431 (C. A. 28, 70373).

Red to violet acid wool dyes Klaus Weinand (to General Aniline Works) U. S. 2,025,921, Dec. 31. Anthrapyridone- and anthrapyrimidone sulfonic acids are prepared by reacting with a neutral sulfite upon a compd. of the probable formula

where V means halogen, such as Cl or Br, X stands for

nitrogen, the group —CH— , —C—CN , —C—COOR ,

$\text{R}_1 = \text{alkyl}$, such as Me, Et, Pr, iso-Pr, Bu, etc., R means an unsubstituted or substituted alkyl, Ph, benzyl, or hydroaryl group and wherein, furthermore, the nucleus marked I may be substituted by univalent substituents, such as alkyl groups (Me or Et, for example), halogen atoms (Cl or Br), hydroxy, alkoxy or sulfonic acid groups, etc. Suitable neutral sulfites for performing the reaction are, for example, Na_2SO_3 , methylamine sulfite, ethylamine sulfite, etc. Several examples with details of procedure are given.

Colored reserves. Durand & Huguenin S. A. Fr 788,336, Oct 8, 1935. Colored reserves are obtained by adding to the reserve, in addition to the quaternary NH_4^+ compd and the usual ingredients such as thickener, ZnO , etc., an azo dye of alk. nature prep'd with a stable diazo compd (e.g., diazoamino compd or nitrosoamine) and β -naphthol or an arylidene of 2,3-dihydroxy-naphthoic acid or acetylacetic acid, the azo dye being developed by an acid treatment. The printed cloth is dried, steamed in a steamer into which a volatile org. acid is caused to pass to develop the colored reserves. Afterward the cloth is steeped in a soln. of an ester of a leuco deriv. of a vat dye and the basic color is developed in the usual manner. Examples are given.

Carbazole derivatives. Hermann Hauser and Max Bommer (to Soc. pour l'ind. chim. & Râle). U. S. 2,027,908, Jan 14. Various examples are given of the production of dyes and dye intermediates by treating compds of the general formula

where the carbon pair C_1C_2 belongs to a polynuclear radical capable of being vatted in which at least one C atom in *o*-position to the imino group is unsubstituted, and in which the amino group is in *o*-position to the imino group, with diazotizing agents, and heating the azimides thus obtained. The carbon pair C_3C_4 may belong for example to an anthranthrene, dibenzopyrenequinone, dibenzanthrone, indigo or thionindigo radical, particularly to an anthraquinone radical whose 1- or 2 position is connected with the imino group, and which is substituted by halogens, alkyl, nitro, alkoxy or by aroylamino groups, such as benzoylamino groups which may be in 4-, 5- or 8-position. The aryl radical may for instance be a benzene, naphthalene or anthracene radical, and these radicals may contain various substituents, such as, for example, halogens, or alkoxy groups, nitro or acylamino groups or alkyl groups. The compds having the above general formula, and which serve as parent materials, may be made by reducing the corresponding nitro compds. Products of the general formula II, where the carbon pair C_1C_2 belongs to an anthraquinone radical substituted by a benzoylamino group and the carbon pair C_3C_4 belongs to an aryl radical whose carbon atom standing in para position to the imino group is unsubstituted, constitute olive to brown to red to yellow colored powders which dye cotton from the vat olive to brown to red to yellow tints of very good fastness. U. S. 2,027,909 relates to the production of carbazole dyes of the general formula

where the carbon pair C_1C_2 belongs to a phenyl radical, the

carbon pair C_3C_4 to an anthraquinone radical, and where the carbon pair C_1C_2 is linked with the carbon pair C_3C_4 and the carbon pair C_3C_4 is linked with the carbon pair C_1C_2 , which dye cotton from gray to brown to Bordeaux vats brown to Bordeaux to gray to green tints of very good fastness. Numerous examples with details of procedure are given.

Tetrahydro-3-hydroxyquinoline derivatives. I. G. Farbenind. A.-G. (Hans Lange, inventor). Ger. 619,825, Oct 7, 1935 (Cl. 12p. 110). Alkylated and arylated amines of the C_{10}H_8 series are treated with epichlorohydrin at temps. above 130° with or without pressure and in the presence or absence of solvents. The free bases are obtained from the reaction products by usual means. Thus, butylaniline is heated with epichlorohydrin and the product heated with NaOH to give 1-butyl-3-hydroxytetrahydroquinoline, b. $177-9^\circ$. The prepn of 1-ethyl-3-hydroxy-3-methyltetrahydroquinoline, b. $171-2^\circ$, 1-benzyl-3-hydroxytetrahydroquinoline, b. 227° , 1-butyl-3-hydroxy-8-methyltetrahydroquinoline, b. $175-6^\circ$ and 1-methyl-3-hydroxytetrahydroquinoline, b. $165-6^\circ$, is also described. The derivs. are used for making dyes.

N-(Nitrophenyl)- α -tetrahydroanthrylamines. Henry C. Olpin (to Celanese Corp. of America). U. S. 2,026,744, Jan 7. Compds. such as α -tetrahydro- α - and β -naphthylamines and their monoalkyl and monoacetyl nuclear substitution derivs. are condensed with a nitrated compd of the benzene series contg. at least one labile H atom, such as 2,4-dinitrochlorobenzene (suitably by refluxing in the presence of NaOAc) to form products which are suitable for dyeing cellulose acetate.

Amino halo anthraquinonesulfonic acids. Fritz Baumann (to General Aniline Works). U. S. 2,025,370, Dec 24. 1-Aminoanthraquinonesulfonic acids having halogen in the 2 position, H or halogen in the 3 position and H or H_2N in the 4-position are produced by heating initial materials such as 1,4-diamino-2,3-dichloroanthraquinone and like compds with fuming sulfuric acid of 12-30% strength at temps. of about $110-160^\circ$. Several examples with details of procedure are given, and the products dye wool from an acid bath blue-violet shades of good fastness.

Benzanthranthrazoles (dyes and dye intermediates). Alexander J. Wuerz and Myron S. Whelen (to E. I. du Pont de Nemours & Co.). U. S. 2,024,114, Jan 14. Compds. such as $\alpha\beta$ -benzanthranthrazole and its methyl and phenyl substitution derivs. are obtained from an anthraquinone-1,2-thiazole by reduction (suitably with Fe, glycerol and H_2SO_4) and reaction with glycerol to form a benzanthranthrazole compd. Numerous examples with details of procedure are given.

Azabenanthrone derivatives. I. G. Farbenind. A. G. (Max A. Kunz, Gerd Koehnle, and Karl Koller, inventors). Ger. 622,461, Nov 28, 1935 (Cl. 22b. 3.09). Products useful as dyes or intermediates are obtained by introducing substituents into an azabenanthrone (I) by standard processes. The substituents may then be converted into other substituents in known manner. Numerous methods of procedure are indicated, and examples are given of the prepn of *inter alia*, a bromo-8-I, m. $214-5^\circ$, a dibromo-8-I, m. above 300° , a nitro-8-I, m. $245-6^\circ$, an amino-8-I, m. $267-8^\circ$, a hydroxy-8-I, and its Me ether, a sulfo-8-I, m. above 330° , a cyano-8-I, m. $203-7^\circ$ and β -1- α -anthraquinonylamino-8-I.

Dye intermediates. Joseph F. Turski. U. S. 2,022,579, Nov 26. Amino compds of the hydroxynaphth-anilide type having the general formula $2,3\text{-C}_{10}\text{H}_6(\text{OH})(\text{CONHR}^1\text{NH}_2)$, where R^1 is a group of the benzene series selected from the class having the following formula $[(p)-\text{C}_6\text{H}_4\text{R}^2]_n$, where R^2 represents H, an alkyl or alkoxy group and n is 1 or 2, are obtained by the reaction of an amino nitro, amino hydroxy or diamino aromatic compd with carboxylic acids of aromatic compds and treating the condensation product to form the dye intermediates which can be converted into azo dyes by diazotization and self-coupling and are suitable for use in dyeing animal, vegetable and artificial fibers. Numerous examples with details and modifications of procedure are given, for production and use of dyes of different colors.

Dye intermediates. Norman H. Haddock, Frank Lodge and Robert Robinson (to Imperial Chemical Industries Ltd.) U S 2,026,629, Jan. 7. Dye intermediates of the general formula $\text{HO}_2\text{C}-\text{O}-\text{O}_2\text{NCH}_2\text{SCR}'\text{R}''\text{CO}_2\text{R}$, where R, R' and R'' individually represent H or an alkyl, aryl or aralkyl group are obtained by a process which comprises prepolymerizing a dicarboxy-di-*o*-dimetro-diaryl disulfide, reducing to a carboxy-*o*-nitroaryl mercaptan, and reacting upon the latter with a compound of the general formula $\text{XR}'\text{R}''\text{CO}_2\text{R}$, where X stands for a halogen atom, while R, R' and R'' each individually stands for H or an alkyl, aryl or aralkyl radical. Several examples with details are given.

Dye intermediates. Ernest G. Beckett (to Imperial Chemical Industries Ltd.) U S 2,027,955, Jan. 14. 2-Aroyl-4-chloro-5-nitrobenzoic acids such as 2-benzoyl-4-chloro-5-nitrobenzoic acid are made by condensing 4-chloro-5-nitrophthalic anhydride with an aromatic hydrocarbon such as C_6H_6 by the Friedel-Craft reaction, and the nitro compound thus formed may be reduced to the corresponding amino compound. Several examples with details of procedure are given.

Intermediates and dyes. I. G. Farbenund A.-G. Fr 787,361, Sept. 21, 1935. Compds. of the formula

in which n is 1 or 2 and R is an aryl radical, are prepolymerized by condensing 4-hydroxybiphenyl-3-carboxylic acid (I) with arylamines in known manner. Examples are products obtained by condensing I with PhNH_2 , m 231', bisaniline, m 247', *o*-anisidine, m 155', *o*-toluidine, m 208', m 217', m 222', *p*-toluidine, m 244', 2,4-xylidine, m 240', 4-chloroaniline, m 268', 2-aminonaphthalene, m 240', 3,6-diaminocarbazole, m 332-4', 1,4-diaminobenzene, m 383-4', 4,4'-diaminostilbene, m 392-4', 4,4'-diaminodiphenylmethane, m 305-7', 1,5-diaminonaphthalene, m 357-8', and 4-nitroaniline, m 253-5'. Examples are given of dyes obtained by coupling these compounds with diazo, tetrazo and diazo-azo compounds. In most cases fast brown to olive-green dyes are obtained.

Intermediates for azo dye production. Robert E. Etzelviller (to E. I. du Pont de Nemours & Co.) U S 2,026,618, Jan. 7. Details are given of the production of compounds such as $\text{Me}-N-(5\text{-amino-2-methoxyphenyl})\text{-carbamate}$, $\text{Me}-N-(4\text{-amino-2-methoxyphenyl})\text{-carbamate}$, $\text{Me}-N-(4\text{-amino-5-methyl-2-methoxyphenyl})\text{-carbamate}$, $\text{Me}-N-(4\text{-amino-2,5-dimethoxyphenyl})\text{-carbamate}$, $N-(4\text{-amino-2,5-dimethoxyphenyl})\text{-}\beta\text{-methoxyurethane}$, Me , iso-Pr , Bu and benzyl $N-(4\text{-amino-2,5-diethoxyphenyl})\text{-carbamates}$ and $N-(4\text{-amino-2,5-diethoxyphenyl})\text{-urethane}$, by processes such as may involve condensing a 2,5-dialkoxy-4-nitroaniline with an organochloro carbonate of the general formula XOCOCI , where X stands for an alkyl or aralkyl radical, recovering the intermediately formed 4-nitro-2,5-dialkoxyphenylcarbamate, and reacting upon the latter with a reducing agent to reduce the nitro group to an amine. U S 2,026,619 relates to the process of producing a $N-(4\text{-amino-2,5-diethoxyphenyl})\text{-carbamate}$ acid ester, which comprises condensing 2,5-diethoxyaniline with a chloroformate of the general formula XOCOCI , where X stands for alkyl or aralkyl, nitrating the resulting $N-(2,5-diethoxyphenyl)\text{-carbamate}$ acid ester, and reducing the nitro compound to the corresponding amine.

Arylcarbamodisulfonatesulfonic acids (dye intermediates). Samuel Coffey and John C. Schofield (to Imperial Chemical Industries Ltd.) U S 2,027,150, Jan. 7. A nitrophenylcarbamyl chloride is caused to react with 2,5- or 2,8-aminonaphthol-7- or -6-sulfonic acid to produce an unsymmetrical diaryl urea which in the free acid form has the general formula 2- or 3-($\text{O}_2\text{NCH}_2\text{NCONH}$)-5-110-7- $\text{HO}_2\text{C}_6\text{H}_3\text{R}$, where R is an arylene radical of the benzene series. The novel compounds are useful as intermediates for dyes. By reduction of the nitro group other intermediates may be prepolymerized. Several examples with details of procedure are given.

Aminochrysenesulfonic acid. I. G. Farbenund A.-G. (Werner Schultze, inventor). Ger. 619,755, Oct. 5, 1935 (Cl. 12g 6 03). See Fr 782,756 (C A 29,69069).

Naphthalene derivatives. Imperial Chemical Industries Ltd. Fr 788,707, Oct. 15, 1935. 1-Hydroxyalkylamino-5-naphthol and (or) 1,5-bis(hydroxyalkylamino)naphthalene (I) are prepolymerized by causing 1,5-bis(hydroxy)naphthalene to react with a hydroxyalkylamine sulfite in an aqueous medium or with a hydroxyalkylamine in the presence of an aqueous solution of a sol bisulfite. To suppress the formation of I a corresponding amount of I is added to the reaction mixture. The products are intermediates for azo dyes (cf. Brit. 410,843 (C A 28,05739)).

Dyeing textiles. H. Th. Böhme A.-G. Brit. 435,431, Sept. 20, 1935. Level dyeings with vat dyes are obtained on cotton, rayon, linen, wool, etc., by adding to the vat a substance that gives rise to cations that reduce the surface tension, e.g., quaternary NH_4^+ and PH_4^+ compounds or tertiary sulfonium compounds containing an aliphatic residue of at least 8 C atoms, and then adding a substance that gives rise to anions that reduce the surface tension, e.g., sulfonation products of fatty alcohols or other compounds containing an aliphatic or cycloaliphatic residue of at least 8 C atoms and 1 or more true SO_3H , sulfuric ester or phosphoric ester groups. Among examples, a bleached mercerized cotton twist is dyed a light level shade by soaking 20 min. in an aqueous vat at 60° containing soda lye, hyposulfite, laurylpyridinium sulfate and Indanthrene blue-green FFB powder, lifting, replacing in the same vat after addition of an aqueous solution of the Na salt of the H_2SO_4 ester of the lower-boiling fractions from the fatty alcohols obtained by reduction of coconut oil acids and adding a further quantity of the reduced dye to complete the dyeing.

Dyeing textiles. The Calico Printers' Association Ltd., Louis A. Lantz and Alexander L. Morrison. Brit. 435,808, Sept. 23, 1935. To improve the fastness to washing of dyeings normally loose to washing, and to make possible dyeings with dyes having little or no affinity for the fibers, upon regenerated cellulose fibers, vegetable fibers, e.g., cotton or silk, the fibers are impregnated or dyed with acid or direct dyes, impregnated simultaneously or subsequently with an aqueous solution of materials that yield in acid medium a synthetic resin of the urea-, thiourea- or dicyanodiamide- CH_2O type, dried and the resin is subsequently insolubilized by heating to 180-210° for 30-60 sec. Among examples, a cuprammonium rayon fabric, dyed with Chlorazol fast scarlet 4BS, is impregnated with an aqueous solution containing urea and AcONH_2 with an addition of CH_2O and allowed to stand 30 min. and the impregnated fabric is dried and heated 30 sec. at 200°. Cf. C A 30,626.

Dyeing textiles. Imperial Chemical Industries Ltd. Fr 788,034, Oct. 14, 1935. Natural and regenerated cellulose are dyed by treating with an aqueous solution of a quaternary ammonium, phosphonium or sulfonium salt the mol. of which contains an aliphatic chain, saturated or not, of at least 10 C atoms, and afterward dyeing the material by a Cr dye. Salts used include octadecyl- and cetylpyridinium bromide, cetyltrimethylammonium chloride and bromide, octadecyltrimethylammonium methylsulfate, dimethylcetyltrimethylammonium bromide (from 1 mol. of NH_4Me and 2 of cetyl bromide), methylsulfate of dimethylcetyltrimethylammonium (by treating the mercaptan from cetyl bromide with Me_2SO and NaOH), benzylmethyldecylsulfonium methylsulfate (by treating the mercaptan from dodecyl bromide with EtONa and benzyl chloride).

Dyeing organic derivatives of cellulose such as cellulose acetate. George H. Ellis (to Celanese Corp. of America). U S 2,020,075, Nov. 12. The material is treated with an

indigoid dye of the general formula R X A B , in which R represents a benzene nucleus, X represents S and of A and B one represents the group CO while the other represents a C atom directly united to a C atom forming part of a naphthalene nucleus, such as 2-thionaphthene-1'-naphthalene indigo or the like.

Stripping dyed textiles. Imperial Chemical Industries Ltd., Charles Dunbar, John G. Evans and Leslie G. Lawrie. Brit. 436,076, Oct. 2, 1935. Addition to 400,239

(C. A. 23, 2197). Textiles dyed with azoic colors are stripped by a modification of the process of 400,239 by including in the stripping bath a small proportion, e. g., 0.05%, of anthraquinone or anthraquinone carrying as substituents OH, halogen, amino and (or) alkyl groups. Among examples, cotton yarn dyed with 4-chloro-2-aminotoluene — (on the fiber) diacetoacetic toluidine is treated 30 min at 85–90° in 40 times its wt. of an aq. soln. contg. NaOH, Na hyposulfite and trimethylcetylaminium bromide and having dispersed therein powd. anthraquinone.

Printing textiles. Imperial Chemical Industries Ltd. and Allec Wormald. Brit. 435,111, Sept. 16, 1935; Fr. 746,445, Sept. 3, 1935. White resist effects are obtained in dyeing cellulosic material with such sulfuric esters of leuco vat dyes as have affinity for cotton by applying locally to the material at least 1 of the salts, K alum, $Al_2(SO_4)_3$, $Al(CNS)_3$, Cr alum, $FeNH_4$ alum, $K_2Fe(CN)_6$, $SnCl_4$ and stannic oxalate, drying, overprinting or padding with the sulfuric ester of the leuco vat dye and developing the color. Among examples, (1) cotton is printed with an aq. paste contg. British gum and $SnCl_4$, dried, overprinted with an aq. paste contg. Soledon brilliant purple 2R, diethylene glycol, neutral starch tragacanth thickening, NH_4CNS , $NaClO_3$, and $(NH_4)_2VO_4$, dried, steamed 5–10 min, washed and soaped at the boil.

Printing textiles. Durand & Huguenin A.-G. Brit. 435,701, Sept. 20, 1935. Vegetable or animal fibers or fibers of regenerated cellulose, or mixed fabrics thereof, are printed with Cr mordant dyes, other than alizarin dyes, with incorporation in the printing paste of lactic acid, or a salt or ester thereof, and development of the color by steaming. Among examples, a viscose or viscose-cotton fabric is printed with an aq. paste contg. Mordene violet, AcOH, gum arabic thickening and Cr lactate, dried, steamed for 45 min, washed and, if necessary, soaped.

Printing textiles. Walter Huggenböhler, Jacob Bänziger, E. Bänziger and Victor Zollikofer. Ger. 622,227, Nov. 23, 1935 (Cl. 8m 1.01). Use is made of anhyd printing pastes contg. all the reagents necessary to fix the dye on the fiber, as well as an oily or fatty thickening agent and glycerol or like compd., e. g., glycol, the purpose of which is to facilitate the penetration of the dye. Sp. compns. are described. The thickening agent may be removed after the printing, e. g., by extr. with a solvent. For reserving parts of the textile material, use is made of compns. contg. Canada balsam or like resin, one suitable compn. being specified.

Printing textiles. Soc. pour l'ind. chim. à Bâle. Ger. 622,355, Nov. 26, 1935 (Cl. 8m 1.02). See Swiss 177,231 (C. A. 30, 3019).

Apparatus for printing materials such as pile fabrics or floor coverings by impregnation with dye compositions, etc. Melvin R. Greiser (to Carthage Mills Inc.). U. S. 2,027,820, Jan. 14. App. is described for applying liquid mordant, printing and steaming, in timed sequence.

Dye baths and printing colors for naphthol dyeing. Heinrich Bertsch (to H. Th. Böhm, A.-G.). U. S. 2,026,817, Jan. 7. A naphthol dye component is mixed with a dispersing agent comprising an aliphatic higher-mol. alc. ester of an inorg. O-contg. acid such as the octadecanetriol ester of H_2SO_4 or H_3PO_4 (the ester used contg. at least one free OH group).

Dyeing apparatus with circulating liquid. Clermont-Bonte & Fils (S. & R. I.). Fr. 788,712, Oct. 15, 1935.

Supports for use in dyeing hank yarns. Ernst Littke. Ger. 622,354, Nov. 26, 1935 (Cl. 8a 36.01).

Treating textiles. Fritz Drechsel. Brit. 435,642, Sept. 25, 1935. See Fr. 777,097 (C. A. 29, 38560).

Treating textiles. Soc. pour l'ind. chim. à Bâle. Brit. 435,871, Oct. 1, 1935. Acid-free solns. of H_2O -sol urea- CH_2O reaction products of noncolloidal character and consisting substantially of methylol compds. are mixed with a nonvolatile, neutral and easily H_2O -sol substance of noncolloidal character to yield stable solns. which may be used for treating textiles. The solns. may be dried or the ingredients may be mixed dry to yield an easily sol. powder. Among examples, (1) a soln. of dimethylolurea

(I) produced by condensing urea and CH_2O in the presence of active C is mixed with urea to yield a stable soln. that may be dried, (2) a soln. of I is dried, the product ground with a soln. of dimethylolthiourea (II), $NaCl$ and Na_2SO_4 , and the product dried, and (3) I is ground with a soln. of II and the product, after drying and grinding, dissolved in H_2O contg. cane sugar to give a stable soln. for use for producing antireflecting effects on viscose.

Treating textiles. I. G. Farbennnd A.-G. Fr. 758,128, Oct. 4, 1935. Threads and textiles made from artificial and vegetable fibrous material are made uncrushable by impregnating them with compds., e. g., urea or derivs. thereof, which are condensable with CH_2O to form a resin, and treating them after drying, in a closed vessel, with vapors of CH_2O , if necessary in the presence of a solvent for CH_2O , at a temp. above 100°. In a modification a sol. compd. sepg. CH_2O on heating is added at the same time as the urea, and the whole is then heated without further addn. of CH_2O . Cf. C. A. 29, 8358*¹⁴.

Treating textiles, paper, etc. Lilly Pollak (see Hissberger). Fr. 787,950, Oct. 1, 1935. Impregnation by hardenable synthetic resins, e. g., to render cloth uncrushable, is improved by adding hydrotrope wetting agents, such as those known as "Leonol S," "Nekal" and "Tekal" acid, to the solns. of resins used.

Finishing textiles. La Cellulose (Soc. anon.) Fr. 788,020, Oct. 2, 1935. A permanent finish resistant to washing and wrinkling is obtained on textiles by impregnating the fiber with an aq. or aq.-alc. soln. contg. a tannin and an org. compd. capable of combining with tannin (if necessary in the presence of acids or substances yielding an acid) to give, on simple drying or heating, an elastic water-insol. compd. The org. compd. may be CH_2O , an amine or a polyvinyl alc.

Surfaces of textiles. Robert Mermoz. Fr. 787,902, Oct. 1, 1935. Brilliant or glazed effects are obtained on textiles by stretching the textile on a polished surface and applying one or more printing pastes which traverse the textile and form a glaze in contact with the polished surface. Examples of pastes contain gum lac, alc., olive oil with or without TiO_2 , Au powder or a dye. The surface may be only partly polished to give mixed effects and a thin layer of paraffin may be applied to it to facilitate removal of the textile therefrom.

Steeping bast fiber plants. Ivan A. Makrakov. Ger. 619,770, Oct. 7, 1935 (Cl. 29b. 2). The plants are steeped in a liquor contg. anaerobic bacteria which destroy the stalks to form mainly CO_2 and H_2 . The liquor contains the pectinobacteria *amylphilum* as the anaerobic bacteria.

Oil composition for treating textile fibers such as wool. Augustus H. Gull (to Gull Corp.). U. S. 2,026,735, Jan. 7. A fatty acid oil such as olive oil or cottonseed oil associated with linoleic acid is hydrogenated to a stage where substantially only the linoleic acid has been largely transformed into oleic acid, thus substantially preserving the fluidity of the oil for fiber treatment while largely eliminating a constituent that tends to form gum on the fiber.

Artificial wool. I. G. Farbennnd A.-G. Brit. 435,968, Oct. 2, 1935. Addn. to 424,229 (C. A. 29, 4603*). The process for the manuf. of wool-like fibers described in 424,229 is applied to spun material obtained by using a viscose having a ripeness corresponding with a salt point of 0.1–0.2 or lower. In an example, viscose is ripened for 3 days at 20° and, having attained a salt point of 0.1, is spun, treated in thread or skein form to remove acid and S and washed. Excess H_2O is removed by squeezing or centrifuging and the material is treated in countercurrent with aq. MeOH of 35–92% strength. Adhering alc. is removed by pressing or centrifuging.

Wooly threads of rayon. Wolfgang Gruber (to A. Wacker Ges. für elektrochemische Industrie G. m. b. H.). U. S. 2,026,736, Jan. 7. See Ger. 594,378 (C. A. 25, 3598*).

Artificial filaments, films, etc. British Celanese Ltd., Henry Dreyfus, Robert W. Moncreiff and Frank B. Hill. Brit. 435,806, Sept. 27, 1935. Threads, fabrics, ribbons, etc., having a basis of a cellulose ester, are treated at greater than atm. pressure with a sapon. medium con-

prising a non-metallic nitrogenous base, e. g., an aq. alc. or other soln. of NH_3 , MeNH_2OH , MeNH_2 , Et_3N , allylamine, piperidine, diammoniohydroxypropane, ethylenediamine. In 435,947, Sept. 27, 1935, divided on 435,800, the treatment at superatm. pressure is with a medium contg. a mineral spongy agent, e. g., an aq. or alc. soln. of caustic alkali, NaOH contg. AcONa , NaOH contg. gelatin, egg albumin, casein, leucine, aspartic acid, proline, potato starch, dextrin, etc.; Ba(OH)_2 , Na_2HPO_4 , Na_2SiO_3 , Na_2CO_3 , Na_2O .

Conditioning artificial threads Hugo Hofmann (to American Bemberg Corp.) U. S. 2,027,911, Jan. 14, 1935. Threads such as those formed from cuprammonium cellulose soln. are subjected to a fixing soln., stretching and shrinking, and then treated with a fixing soln. App. is described.

Acetate rayon Karl Beck Ger. 619,978, Oct. 10, 1935 (Cl. 8k 1). The rayon is improved by treatment with an aq. soln. of CH_3CO and MeOH or other substances forming acetal-like substances with CH_3CO , e. g., BuOH . The treatment gives the rayon a mat silky gloss and a soft touch.

Ornamenting cloth containing cellulose esters or ethers Rhodiacta Ir. 788,592, Oct. 12, 1935. Designs are obtained by local destruction of the cellulose esters or ethers by treatment with org. peroxides, e. g., benzoyl peroxide, at a high temp.

Washing dyed textiles I. G. Farbenind. A.-G. Fr. 786,390, Sept. 2, 1935. Quaternary NH_4 salts obtained by alkylating the products formed from ethylenediamine polymers, either by elimination (by distn.) of the parts of low b. p., or by condensation with substances contg. at least 2 acylating groups, are added to the washing bath.

Washing and other processing of artificial threads I. G. Farbenindustrie A.-G. Brit. 436,003, Oct. 3, 1935. Self-supporting hollow windings or packs of the thread are washed and treated by sucking H_2O or a treating liquid through a no. of packs threaded in superimposed relationship on a vertical perforated tube (a) that lies closely against the inner surface of the packs and is open at its upper end, a closure being maintained at the upper end of the column by means of an impermeable tube that is closed at its upper end and fits closely over a and is held with its lower end pressed against the topmost pack owing to the reduced pressure within a, so that it follows the contraction of the column. After treatment, the packs may be dried while threaded on a.

Bleaching and washing preparations Henkel & Cie. G. m. b. H. Brit. 436,235, Oct. 8, 1935. Preps. comprising a per compd. together with a salt of a phosphoric acid contg. less H_2O than H_3PO_4 are stabilized in an alk. medium by the addn. of Al(OH)_3 or of Al salts that yield Al(OH)_3 under prevailing extl. conditions. Among examples, soap, Na_3PO_4 , NaAlO_2 , Na_2CO_3 and Al(OH)_3 are mixed in an edge-runner mill and used for washing textiles.

Starch for finishing linen. Chemische Fabrik Joh. A. Benckiser G. m. b. H. Fr. 788,602, Oct. 14, 1935.

Alkali metaphosphates, e. g., Graham salt, are added to the starch, whereby a more regular brilliance is obtained.

Apparatus for the wet treatment of stockings and like textile goods on cores of appropriate shape. Fritz Schuster Ger. 622,028, Nov. 10, 1935 and 622,029, Nov. 18, 1935 (Cl. 8b 9 04).

Felt hats Julien van Puymbroek Brit. 435,076, Oct. 2, 1935. Hat contg. nonsecreted fibers, e. g., wool, and secreted fibers, e. g., rabbit's hair, are made by oiling the material with a product contg. mucilaginous substance, forming a lap from the material in a carding machine, winding the lap upon a forming cone and filling in an acid bath.

Organic sulfur compounds Charles A. Pfeifferberger Ir. 784,285, Oct. 7, 1935. Comps., of the formula I which are used to protect cloth from moths, etc., and for the manuf. and application of dyes, are made by causing dichlorobenzene to react with a sulfonating agent contg. SO_3 , preferably at below 100° . The products may be submitted to a further condensation with amines, imines, amides, alcs., phenols, mercaptans, carboxylic, sulfonic, sulfine and sulfamic acids, giving products of the formula II, in which X is NH , SO or O and Y is a hydrocarbon radical, substituted or not. The prep. of bis(2,5-dichlorobenzene-4-sulfonic acid anhydride) sulfone and of condensation products of this with PhNH_2 , BuOH , benzene-sulfonic acid, 1,8-ammonaphthol, 3,6-disulfonic acid, arsenous acid, derivs. of P, Sb, N, Bi and CN, β -chloroaniline and 1,2-dichlorobenzene-4-sulfonic acid is described.

Apparatus for resizing and drying garments after dry cleaning Walter Alcorn and Lloyd Hamiter U. S. 2,027,491, Jan. 14. Various structural and operative details.

Dry cleaning Warren T. Reddish Brit. 435,576, Sept. 21, 1935. Fabrics, etc., are cleaned by treating with a solvent, withdrawing the solvent, adding H_2O thereto and then returning the mixt. to the washing machine. Homogenizing and other app. are described.

Dry cleaning, etc. Compagnie de produits chimiques et électrometallurgiques Alais, Iroges & Camargue. Ir. 788,415, Oct. 10, 1935. Tetrachloroethylene is used in place of trichloroethylene in all chem. or phys. operations where the medium is alk. or may become alk. in one of the steps. This is particularly so in dry cleaning where NaOH is used to regenerate the cleaning agent. The formation of spontaneously inflammable compds. is thereby avoided.

Composite fabric suitable for foot coverings Charles E. McLean (to Patchogue-Plymouth Mills Corp.) U. S. 2,026,693, Jan. 7. Various structural details of a fabric comprising stuffing warp threads made of paper and holding warp threads of twisted textile fibers such as cotton or wool and filling threads such as a yarn of mixed fibers.

26—PAINTS, VARNISHES AND NATURAL RESINS

A. H. SAHN AND CARLTON H. ROSE

Health hazards among painters with reference to industrial lead poisoning. L. Holstein. Med. Welt 9, 183-5, 221-6, 302-4 (1935). U. S. Pub. Health Eng. Abstracts 15, 1185, 7 (Sept. 28, 1935).—A valuable paper on lead poisoning and dangers arising from use of solvents and lacquers.

Are there paints which have a deadening effect on sound? C. R. Fellers. C. Hornemann. Farbe u. Lack 1935, 557.—Paints which produce a rough uneven surface sometimes lead in deadening sounds and improving acoustics.

Paints—their disinfectant properties—steps in the production of a germ-proof film. Samuel Wetchler, Anna Lewis and Frederick Battline. Paint & Varnish Production Mfr. 14, 12, 14, 16, 18 (Jan. 1, 1936).—Exptl. data is given for the development of a permanently bactericidal

paint. A standardized bacteriol. technic using typhoid bacillus and *Staphylococcus aureus* has been developed, which has led to the following conclusions: (1) The nature of pigments, oils and natural and synthetic resin varnishes has no bearing on the germicidal activity; (2) ordinary com. types of paints are only temporarily germicidal; (3) the addn. of the common disinfectants does not render a paint permanently germicidal; (4) the use of a halogenated oil base products a nontoxic paint which will kill bacteria applied to the dried paint film, even after 3-4 yrs. of drying; (5) the germicidal properties are maintained against the washing of the film with soap and water. Ten references.

Naphthenate driers M. D. Curwen. Oil Colour Trade J. 88, 1711-14 (1935).—A discussion of naph-

W. H. Roynon

thetic acids, the manuf. of naphthenic driers and the qualities of a good drier. General properties of the naphthenates are discussed. W. H. Boynton

Rust protection. A. V. Blom. *Korrosion u. Metallschutz* 11, 245-9 (1935).—Some of the phys. phenomena affecting the life of paint films are discussed. L. P.

The behavior of pigment suspensions in the electric high-tension field. Erich A. Becker. *Angew. Chem.* 48, 691-6 (1935).—Nine pigments and 6 binders were investigated in an app. which permitted a max. potential difference of 20,000 v., amounting to 6700 v. per cm. The exptl. app., procedure and results are described in detail. The explanation of sediment formation in oil paints, lacquers and enamels, by pptn. due to oppositely charged pigment particles and colloidal particles of the binder could not be substantiated. Three of the lacquer binders did not show any electrically charged particles, while in two lacquers both the disperse phase of the binder and the pigment particles had a positive charge. The proper sedimentation problem is det'd. by three factors. (1) gravitation, which in the first approximation can be expressed by Stokes' law, (2) the elec. charge, which acts as a deterrent factor, (the smaller the pigment particle the greater the effect of the charge and the smaller that of the mass; the pigments are polydisperse throughout), (3) adsorption; it is possible that the pigment particles do not float freely, but are surrounded by adsorptive layers which det. if the particles cling together on collision or sep. freely, and in case of adsorption of resinous substances by the pigment particles a cumulative mass effect and increased sedimentation takes place. K. K.

Hempseed oil. Harry Friedman. *Am. Paint J.* 20, 48, 50 (Jan 13, 1936).—Raw hempseed oil makes an excellent vehicle for grinding colors in oil. Its color is not a serious defect, since its staining power is weak. Its acid no. is neither very high nor very low, and it has the property, unique among the thorough-drying oils, of dispersing hard-grinding pigments and keeping them in smooth paste form over long periods of time. It has a marked absence of after-ellowing tendencies.

Experiences with chlorinated rubber paints. G. Schulze. *Akutschuk* 11, 231-2 (1935).—A discussion, dealing with the various essentials of technic for obtaining successful results. C. C. Davis

Polymerization of hydrocarbons of synthetic rubber manufacture into a paint vehicle, on the plant scale. L. V. Lopatin and B. Ya. Soldatov. *Sintet. Kaschuk* 1935, No. 6, 22-9.—The hydrocarbons of different fractions (25-45°, 45-60° and 60-100°), obtained during the process of synthetic rubber manuf., were washed with water to remove the water-sol. substances and then polymerized in an autoclave (the charge was up to 850 kg.) in the presence of 20% of catalyst (Glukhovskaya clay, that had been heated at 420°) for 30 hrs. at 100°. The products were distd. *in vacuo* to remove unchanged gases and bring the viscosity to 79-87% of that of glycerol det'd. in the Ostwald viscometer. Paint prep'd. from 100 parts of the product per 100 parts of ZnO, dried after 12-22 hrs. and adhered well to the surface. The paint is waterproof. A. Pestoff

Flax studies. W. F. Geddes. Can. Dept. Trade & Commerce, Dominion Grain Research Lab., *6th Ann. Rept.* 1934, 31-4.—Practically the same values for the I nos. of the Et₂O ext. of finely ground flaxseed meal were obtained by drying the meal in (1) a Freas or DeKhotinsky vacuum oven for 15 hrs. at 100°, (2) a Freas air oven for 10 hrs. at 100° in a current of CO₂, and (3) an Abderhalden app. (with P₂O₅) at the temp. of boiling water. There was no appreciable difference between the I nos. of the Et₂O exts. when the exts. were either (1) dried to const. wt. at 100° in either a Freas or a DeKhotinsky vacuum oven, (2) distd. and dried at 100° in a current of inert gas or (3) distd. in CO₂ and dried in a DeKhotinsky vacuum oven at 100° for 3 hrs. A study of the refractometric method for detg. the oil content of flaxseed with a mixt. of bromonaphthalene and chloronaphthalene indicated a high correlation between the η and the oil content as det'd.

by the Et₂O-extn. method. Satisfactory extn. of flaxseed pigments was obtained by using 4 g. very finely divided flaxseed (ground in a high-speed burr mill), adding 100 cc. solvent (a mixt. of varnish makers' naphtha 93 and EtOH 7% by vol.) and shaking for 2 hrs. in a mech. shaker. The novelty variety of flaxseed was definitely higher in pigment than the Bison, Linota and Premost varieties. The concn. of pigment was considerably reduced by aging or storing. The carotene content amounted to about 22-30% of the total carotenoids. The northern areas of Canada yielded flax of somewhat higher oil content and I value than did the central and southern districts. K. D. Jacob

The influence of the structure of alcohol radicals on the film-forming properties of the esters of the acids of linseed oil. A. Ya. Drinberg and A. A. Blagomiravova. *J. Gen. Chem.* (U. S. S. R.) 5, 1229-32 (1935).—Thurman and Crandall (C. A. 23, 5335) and other investigators showed that Me and Et esters of unsat'd. high-mol. acids (linoleic and linoleic acids) do not give films. Only the esters of trihydric alcs. form hard films. Mixed linseed-oil acids were esterified at various temps., with and without the aid of HCl, with iso-Am alc., a mixt. of ceryl and myristyl alcs. (obtained from beeswax), ethylene glycol, propylene glycol, glycerol, pentaerythritol and mannitol. The tabulated results show that with the increasing no. of OH groups in an alc. the film-forming properties of the ester of unsat'd. acid improve, while the rate of esterification rapidly declines. The film-forming ability of the esters of dihydric alcs. is directly related to the position of the 2 OH groups in the alc. The esters of mono- and dihydric alcs. (the OH groups in the position 1,3) do not tend to autopolymerize and, therefore, do not form films. Esters entirely incapable of forming hard films show the min. value of O nos. The work is being continued. About 20 references. Chas. Blanc

Polymerization: some applications in the organic industry. H. I. Waterman and C. van Vlodrop. *Chimie & Industrie* 34, 1036-44 (1935); cf. C. A. 29, 64437.—The polymerization of linseed oil was studied by applying the diagram of the sp. refraction ($n_D^{20} - 1$)/($n_D^{20} + 2$) as a function of unsatn. The graphic theoretical representations based on the const's of Auwers and Eisenlohr were corrected for deviations in the values of the sp. refraction due to unsat'd. glycerides. Two sets of expts. were carried out on a semimicro scale and the results were interpreted by means of the above-mentioned diagram. Supposing that, in the polymerization all the ethylene linkings have been sat'd., and the nature of the O linkings remained unchanged, a theoretical line can be drawn representing the polymerization of linseed oil. As a matter of fact at the beginning of the reaction the sp. refraction decreases relatively slowly, but subsequently the decrease is more rapid so that toward the end the curve reaches the theoretical line. The relatively high specific refraction obtained at the beginning is in agreement with the results of van der Hulst who, by means of the absorption spectrum, showed that at the beginning the polymerization product contains conjugated double bonds. Formation of a conjugated system by isomerization is related to an increase in the sp. refraction. Application of distn. in cathodic vacuum with internal condensation showed that polymerized linseed oils frequently have a higher I no. than the corresponding distillates and residues; this is explained by the presence in the polymerized oil of volatile unsat'd. decompn. products. If polymerization is pushed further, the I nos. of the distillate and residue become approx. equal; simultaneously the percentage of high-mol.-wt. oil increases, or in other words, continuously increasing polymerization is not the only phenomenon involved in the reaction. A. Papineau-Couture

Softening of linseed-oil films. Carlton H. Rose and Don S. Bolley. *Ind. Eng. Chem.* 28, 115-18 (1936).—Unpigmented films of linseed oil, with and without drier, dried and hardened when exposed under const. temp. and humidity to ultraviolet light, then softened again on continued exposure. The percentage of the film mol. in MeAc reached a max. at about the point of max.

hardness and decreased as the film softened again. The less said linseed oils gave dried films which softened less and were less sol in MeAc. A method is given for the detn. of dryness semi-quantitatively on a numerical scale. Drier (Pb, Mn) delayed and reduced the amt. of after-softening. When pigmented with white lead, the films became progressively harder and less sol (no after-softening). The I no., which was about the same for the sol and insol portions of the film, decreased during exposure in all cases and was not related to the softening or soly of the film.

Tung oil as a raw material for varnishes and synthetic resins I. Ewald Fomroth. *Paint Manuf.* 5, 364 7 (1935)—A paper dealing with the cultivation, yield, quality and chem. compn. of tung oil. The quality of a tung-oil stand oil as a varnish ingredient increases proportionally as its tendency to frost decreases. "Curing" of tung oil requires heating the oil to a temp. of 270-280°, and this temp. should be attained as rapidly as possible. The α -eleo-stearic acid triglyceride is the essential constituent of tung oil on which its desirable varnish properties depend, as in contrast to the β -glyceride it shows less tendency to crystallize or "throw out". This α -form changes over readily and rapidly into the β -form on heating or under chem. influence. For varnish prepn. the tung oil should receive a treatment to minimize this action. Rapid heating causes the rate of polymerization to exceed that of transformation. II. Ibid. 6, 4-7 (1936)—An outline is given of the prepn. of tung-oil stand oils, of mixed tung-linseed stand oils, and the Am. method of heating the raw materials required for the varnish in one operation. The Albertol tung-oil varnishes prep'd by the European method are paler in color, have less tendency to skin and yield somewhat better-flowing and slightly harder films. The varnishes cooked by the Am. method are more gas proof, show less tendency to wrinkle on stoving and when combined with the harder Albertols are a trifle more alkali-resistant. Alkylphenol and alkyl resins are briefly discussed. The frosting tendency of tung oil is minimized by adding an amt. of 1-2% of the tung oil in solid form, after having dissolved it previously in a varnish solvent. W. H. Boynton.

Future of natural resins T. Hedley Barry. *Paint Manuf.* 5, 374-6(1935); cf. C. A. 30, 631.—A review indicating that the use of natural resins is bound to increase. W. H. Boynton.

Direct liquid extraction process for pure lac resin. Lal C. Verman and R. Bhattacharya. *London Shellac Research Bur. Tech. Paper* No. 5, 30 pp (1935); cf. C. A. 29, 27631.—Of the methods previously developed for the prepn. of "pure lac, resin" (I) from whole lac, that of direct liquid extn. is considered the most suitable for a large-scale production. Extns. with various solvents proved that the partition-coeff. theory is untenable in this case. Trichloroethylene (II) as extn. agent gave promising results except that, because of a slight acid decompn., it polymerized the lac strongly. This was, however, conveniently overcome by the addn. of 0.1% triethylamine (III) as a stabilizer. III is recovered together with II, the b. ps. being 89° and 80-8°, resp.

Extn. equal curves in all cases where lac wax is absent follow a simple power law, i. e., they satisfy the equation $y = ax^n$, where y represents the concn. of "ether-sol. resin" (IV) in the extg. solvent and x the concn. of IV in the product, a and n being consts. characteristic for the particular process. The curves representing the extns. with II follow the same law also in cases where lac wax is present. Fit to extn. curves follow an exponential law, i. e., $y = be^{mx}$, where y and x have the same significance as above and b and m are characteristic consts. for this process. The utility of the curves in relation to the design and development of efficient extn. processes is demonstrated. Certain secondary factors render extn. calcs. approx., viz. (1) the dispersion of I in the solvent, (2) the retention of solvent by the product and (3) the loss of solvent by evapn. The film-forming qualities of I improve with the progressive improvement in its purity obtained by successive extns. up to about five. App. are described and illustrated for the quant. extn. of lac by solvents lighter and heavier than the extd. material and for the production of 1 lb. batches of I. D. Thuesen.

Air-drying asphaltum finishes E. Assheton. *Paint Manuf.* 5, 371 3(1935). A brief review of various pitches in common use and a few representative formulas of air-drying asphaltum blacks. The blackness of a sample of asphaltum can be evaluated by the following method. I use 10 g. of the pitch with 40 g. rosin. Cool to 149° and add turpentine till the bulk is 100 cc. Place 10 cc. of this soln. in a 1000-cc. cylinder and make up to 1000 cc. with turpentine. Compare with a standard made in the same way. W. H. Boynton.

The yellowing of paints Chas. S. Farmer. *Paint Manuf.* 5, 282-3(1935). A brief consideration of chem. yellowing, the choice of oil media, acid values, after-treatment of stand oils, driers, resins pigments and yellowing of phenolic media. W. H. Boynton.

Some notes on wood preservation J. Stewart Remington. *Paint Manuf.* 6, 8-10(1936).—Forms of rot and decay are briefly discussed, also preservatives such as creosote, cuprinol and synthetic-resin varnishes. Several metallic naphthenates are widely used as driers. Diatomite may be used in priming paints. It carries more oil than barytes. A priming coat that limits fungoid attacks contains 35% leaded ZnO 73 kg., bleached diatomite 9.1 kg., raw linseed oil 18 0 l. and white spirit contg. 3% Cu naphthenate 3-8-7 l. W. H. B.

Complex metal compds. of dyes [product for printing-varnishes] (Brit. pat. 435,108) 25. Azo dyes [for coloring lacquers] (Ir. pat. 788,217) 25. Refining resins (Ir. pat. 788,239) 27. Disazo dyes [for coloring lacquers] (Fr. pat. 788,119) 25. Pigment dyes (Brit. pat. 435,817) 25. Varnishes (Brit. pat. 435,762) 13. Preventing corrosion (Brit. pat. 435,420) 9. Cellulose triacetate solns. [for making varnishes] (Ir. pat. 785,030) 23.

Paints and printing inks August Chwala. Tr. 788-001, Oct. 2, 1935. Basic or amphoterie pigments in paints or inks, are protected against attack by the oily or resinous binders used and consequential thickening by a protective coating incapable of dissolving or swelling in the binder. The coating may be formed by salt compds. on the surface of the particles or by solns. of org. compds., preferably colloidal. Coatings may be formed with oxalic acid, H_2PO_4 , phosphates, Ca glycerophosphate, tannin, $Al_2(SO_4)_3$ or aluminum.

Dissolving rubber to form a paint, varnish or insulation, etc. John P. Henharen U. S. 2,028,008, Jan. 14, 1936. Brit. 432,405 (C. A. 30, 6329).

Hand-operated paint mixing device Frank Trampusch U. S. 2,027,297, Jan. 7 Mech. details.

White pigments I. G. Farbenund. A.-G. Fr. 787-384, Sept. 21, 1935. At least 0.0 mol. of ZnO with 1 mol. of TiO_2 or the corresponding amt. of a Ti compd., is submitted to calcination at 500-1000° until practically all the TiO_2 is combined with the ZnO as titanate in the form of spinel and (or) corundum. Part of the Zn may be

replaced by Mg, and the pigment obtained is reheated in the presence of ZnO and (or) MgO until the addn oxides are wholly or partly absorbed by the titanate.

Titanium pigment. Joseph Blumenfeld and Max Mayer (to Krebs Pigment & Color Corp.). U. S. 2,026,862, Jan. 7. A pigment which has good weather resistance is prep'd by suspending TiO_2 in a soln. of a comp'd of Ce, Th or Zr and treating the suspension to ppt. an oxide from the soln in the presence of the TiO_2 , and calcining the resulting mixt.

Apparatus for mixing pigments and other powders. Eugen Fässen. Ger. 622,247, Nov. 23, 1935 (Cl. 50/2 01).

Printing color. I. G. Farbenund, A.-G. (Walther Lützendorf, inventor). Ger. 619,501, Oct. 2, 1935 (Cl. 15/7 01). See Fr. 774,851 (C. A. 29, 2265). The manuf. of bronze printing ink for use with rubber type is rendered possible by using highly viscous polymerization products of aliphatic vinyl compds, sol in alc, as the binding agent for the bronze powder. Thus, the ink may contain powd Cu bronze, polyvinyl methyl ether, EtOH and the acetate of glycol ethyl ether.

Printing ink. P. Chouanard & Fils & Co (Soc. veuve). Fr. 788,400, Oct. 10, 1935. A white or clear-tone ink for printing on colored paper is composed of TiO_2 dispersed in a soln. of casein, e. g. TiO_2 100 is added to a soln. of casein 100 in water 1000 contg. NH_3 13 g.

Inks. Encrea Antoine. Fr. 788,383, Oct. 9, 1935. The d. of inks is decreased by incorporating therein 3-10% of aliphatic compds of d. below 1 and sol in water, e. g. acetone, MeOH, AcH, etc.

Sulfonated drying oils. Chem. Fab. Stockhausen & Cie. Ger. 622,202, Nov. 25, 1935 (Cl. 12/23 02). Linseed oil and like drying oils are converted into sulfonic esters by treatment with H_2SO_4 of a concn. not above 90%

at a temp. not above 30°. Sp. processes are described. The products resemble Turkey-red oil.

Synthetic varnish bases. Adolf Heck (to Cook Paint & Varnish Co.). U. S. 2,027,338, Jan. 7. A condensation product of a phenol 2 mols. with an anhydride of an aromatic dicarboxylic acid 1 mol., formed in the presence of a chloride of Sn, Al, Fe or Zn, is fused with a fatty acid such as that of linseed oil and sufficient glycerol is added to the molten mixt., to produce esterification, with heating to at least 200° until esterification and resinification are effected, so that a resinified material is obtained on cooling, suitable for use in varnishes or plastic compns. U. S. 2,027,339 relates to the manuf. of varnishes by condensing a phenol 2 mols. with 1 mol. of a "polybasic" aromatic carboxylic acid such as phthalic anhydride in the presence of a chloride of Al, Fe, Sn or Zn, heating the condensation product to partially resinify it, fusing it with about 4 times its wt. of rosin and heating with a polyhydric alc. such as glycerol to effect esterification and further resinification, so that on cooling a product is obtained which is sol in coal-tar hydrocarbons, gasoline and drying oils.

Drying varnished surfaces under the action of ultra-violet radiation. John J. Brophy (to Turner Tanning Machinery Co.). U. S. 2,020,296, Nov. 12. Various details of app. and operation are described suitable for treating varnished leather, etc.

Rosin sizing. Wm. H. Harding and Albert W. Montgomery (to American Cyanamid & Chemical Corp.) U. S. 2,027,166, Jan. 7. For making a low free rosin size contg. over 50% of solids, a soln. of an alkali metal compd such as Na_2CO_3 and rosin mixt. is subjected to a drying heat above 93° but not above 260°, relatively suddenly, so that the mixt. is carried rapidly through and beyond gelling and foaming stages and saponification is accelerated. App. is described.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

The titer of fat mixtures. C. Bergell *Seifen- und Ztg.* 62, 839-40 (1935).—Tabulated data on the titer of mixts. of varying proportions of either (1) rosin, (2) coconut-oil fat acids or (3) soybean-oil fat acids with either (a) tallow fat acids or (b) palm-oil fat acids show that the titer of such mixts. cannot be predicted from their compn and the titer of their components.

Notes on the coconut-fat treatment in the confection industry. Holscher. *Allgem. Oel- u. Fett-Ztg.* 32, 496-7 (1935).—Notes on treatment and storage to prevent spoilage.

Jaboty fat. Alph. Steger and J. Van Loon *Chemistry and Industry* 1935, 1095-7.—There are 2 species of trees whose fruits yield Jaboty fat, *Erisma uncinatum* and *E. calcaratum*. The extd. fat of the former had the following constns: d₄²⁰ 0.8760, n_D^{20} 1.4360, I no. (Wiss) 5.4, sapon no. 233.0, acid no. 20.0, Ac no. 10, R.-M. no. 0.93, Polenske no. 3.1, m. p. 41.5°, Hehner no. 93.0, unsaponifiable 0.7%. The constns of the fat acids were n_D^{20} 1.4260, I no. 4.9, neutralization no. 246, mean mol. wt. 228, m. p. 41°. All of the constns practically agree with those of the com. fat. The compn. of the fat acids showed 78.1% palmitic and 21.7% oleic acid. The fat could be used for edible purposes after refining. E. S.

Regenerating fatty substances from waste waters of the wool industry. V. N. Sokolov *Sherstyanos Delo* 1935, No. 4-5, 24-6.—A description of a simplified H_2SO_4 method of regenerating fats from waste waters and of soap-making by boiling.

Fatty acids and soaps in 1935. T. P. Hilditch *Chem. Age* 33, 599-600 (1935).

Standardization of testing methods. Anon. *Seifen- und Ztg.* 62, 751 (1935).—A proposed standard method of the Deutscher Verband für die Materialprüfungen der Technik for detg. the pour point of oils is described in detail.

Modified apparatus for determining the hexabromide number of oils and fats in tropical countries. P. S. Varma, N. N. Godbole and G. M. Garde, *Allgem. Oel- u. Fett-Ztg.* 32, 456-7 (1935).—The filtering app. for hexabromide ppts. proposed for use where room temps. are high consists of a regular suction filtering app. that has an attachment contg. a cooling mixt. by means of which the ppt. and Gooch crucible can be maintained at low temps.

The Procter and Gamble oil colorimeter. H. B. Stevenson *Oil and Soap* 13, No. 1, 18-20 (1936).—The colorimeter is a modification of the Bailey instrument and consists of a light box and a color glass magazine. The box is made of cast Al and one side is formed by a sliding panel which completely exposes the interior. The color magazine is also made of Al and is bolted on the end of the light box. It consists of 4 Al disks or plates which are operated by means of hand wheels attached to concentric hollow shafts extending through the top of the case. The disks are slotted along the periphery. The color glasses are held in the slots by means of spring-steel clips. The disks are supported on ball bearings, and ball bearings are used as spacers between the disks. The concentric hollow shafts are of steel and are fastened to the disks with machine screws. The operating hand wheels are keyed to their resp. shafts and are held in position by lock nuts. The edges of the wheels are notched. A simple ball and spring brake system is mounted on top of the case, the balls engaging the notches in the hand wheels. This device enables the disks to be manipulated one at a time. The disks contain 15 slots for glasses and the values of the glasses in each disk are stamped on the surface of the hand wheels in corresponding positions. In reading a color, the disks are moved until the proper match is obtained and the values of the glasses used are read from the hand wheels. The use of this instrument obviates the

continual breakage of the glasses inherent in any instrument where the glasses are placed by hand. The glasses are also always clean.

The determination of the oil content of seeds with a new extraction apparatus II. P. Jaichenko. *Mashbolno-Zhivore Delo* 1934, No. 5, 18-19; cf. C. A. 29, (1935).—The extn tube is attached by means of a tinned Cu wire to the condenser and is provided at its flat bottom with a hole which is covered with a disk of filter paper. The seeds are thus exposed to the hot vapors of the solvent.

E. Bielous
The determination of the oil content [of seeds] by the refractometer. A. Rasteyeva. *Mashbolno-Zhivore Delo* 1934, No. 3, 10-11.—Cover 2 g. of the ground seeds with 15 cc. CHCl_3 and allow to stand for 12 hrs. at room temp. Calc the percentage oil content (P) from the difference (D) of the n_D of CHCl_3 and the CHCl_3 soln by the formula $10 \times D = 55P \times 10 \times 15$. The method is exact within 0.5%.

I. Bielous
The flash points of vegetable oils A. S. Slaschev. *Mashbolno-Zhivore Delo* 1934, No. 3, 18-19.—Benzene (0.01-0.03%) lowers the flash point of vegetable oils by 40°. The flash point is also affected by the conditions of the crop and storage.

E. Bielous
Oils from *Althaea officinalis* and *Malva arborea*. H. Ya. Tropp. *Farm. Zhur.* 1934, No. 4, 134-8.—Complete analyses of the oils are given, showing high percentages of unsatd acids of the linoleic type. The oils (especially that from *Althaea officinalis*) show good drying qualities and can be substituted for linseed oil.

L. Nasarevich
The Barbados nut in the Cape Verde Islands. Jose Cunha da Silveira. *Anais inst. super. agron. Univ. tech. Lisboa* 6, No. 1, 116-26 (1935).—The H_2O -free shelled nuts contain 56.34-66.04% oil suitable for making soap.

O. W. Wilcox
The effect of drying castor beans on the oil. M. Zhdan-Pushkin and M. Sokolova. *Mashbolno-Zhivore Delo* 1934, No. 6, 15-17.—The drying of the castor beans at temps. of 150-175° for 1-10 min. decreases the acid no. (owing to volatilization of the free acids) and causes polymerization of both the free acids and oil.

E. B.
Oil of Tennessee red cedar. H. B. Huddle. *Ind. Eng. Chem.* 28, 18-22 (1936).—The history of the production of red-cedar oil is reviewed and the method of production described. The consts. of 3 samples of cedar oil distd. in 1932, 1933 and 1935 are, resp.: d_4^{20} 0.9331, 0.9361, 0.9441; n_D^{20} 1.4534, 1.4554, 1.4574; n_D^{25} 1.5042, 1.5053, 1.5063; sapon. no. 8.71, 5.93, 6.76; acid no. 2.63, 2.50, 0.80. Ac. no. 43.65, —, 27.66; ester no. (calcd.) 6.08, 3.43, 5.06; I no. 60.96, 64.30, 61.79; H_2O 0.35%, trace, trace. The uses of the oil in perfumes, as immersion oil for microscopes, in insecticides and in medicine are discussed.

E. Scherubel
Elm-seed oil. H. A. Schuette and Carl M. Lunde. *Oil and Soap* 13, No. 1, 12-13 (1936).—The chem. and phys. characteristics of Am. elm-seed oil from Wisconsin elms are: d_4^{20} 0.9288, n_D^{20} 1.4534, coeff. of viscosity at 20° 0.3381, surface tension at 20° (dynes/cm.) 30.72, uter 14°, I no. (Wys) 24.1, sapon. no. 273, thiocyanogen no. 16.18, hydroxy no. 13.45, R-M. no. 2.1, Polenske no. 33.9, sol. acids as butyric 0.8, Hehner no. 82.23, I no. of fatty acids 23.08, thiocyanogen no. of fatty acids 15.51, sapon. no. of fatty acids 288.7, unsaponifiable matter 1.50%. In its major aspects, elm-seed oil appears to be the counterpart of coconut oil growing in the temperate zone. Capric acid is present to the extent of 50%.

E. Scherubel
Essang oil. Alph. Steger and J. van Leen. *Rec. trav. chim.* 54, 988-94 (1935).—Essang oil, also known as masana and sanga-sanga oil, comes from a West African tree belonging to the family Euphorbiaceae. The seeds contain 48.8% oil having the following consts.: n_D^{20} 1.4841, n_D^{25} 1.4810, n_D^{30} 1.4780, n_D^{35} 1.4750, Reichert-Meissl no. 0.4, I no. 19.2, thiocyanogen no. 8.6, sapon. no. 193.1, acetyl sapon. no. 194. The percentage compn. of the oil as detd. is as follows: unsaponifiable matter 0.5, satd. acids 9.7, 9-oleic acid 16.0, 9,12-linoleic acid 11.0, linoleic acid 10.0, eleostearic acid 46.0, glycerol 4.4, volatile matter 1.2. The oil is related to Chinese wood oil but is

not poisonous and can be used for edible purposes.

E. Scherubel
Alcoholysis of olive oil. Yves Volmar and Björge Hanssen. *Compt. rend.* 201, 968-70 (1935).—The fat acids of olive oil were converted to the Me esters and fractionated at a pressure lower than 1 mm. Olive oils from various sources contained 0.19-0.23% arachidin and 1% linolein.

W. Gordon Rose
Composition of citric acid. R. S. McKinney and G. S. Jamieson. *Oil and Soap* 13, No. 1, 10-11 (1936).—Until recently it was believed that the chief unsatd. constituent of citric acid known as couepic acid was an isomer of eleostearic acid, but it has recently been shown to be a 4-keto-3,4,4,4-octadecatenoic acid ($\text{C}_{18}\text{H}_{31}\text{O}_5$) which m. 74-5° (cf. Brown and Farmer, C. A. 29, 8249). The name suggested for it is *heamic acid*. The consts. and compn. as found by the authors are: n_D^{20} 1.5145, sapon. no. 192.6, I no. (calcd.) 218.0, thiocyanogen no. 76.2, unsaponifiable 0.57%, I no. of unsaponifiable 110, satd. acids (Bertram method) 10.7%, oleic acid 5.9, heamic acid 76.2, glycerides of satd. acids 11.2, of oleic acid 6.2, and of heamic acid 81.2%.

E. Scherubel
Oil from *Peganum harmala*. H. Ya. Tropp. *Farm. Zhur.* 1935, No. 2-3, 72-4.—The oil has d_4^{20} 0.924, n_D^{20} 1.4787, acid no. 6.6, sapon. no. 177.85, Hehner value 93.85, I value 131, ester no. before acetylation 171.25, after acetylation 146.8, Norman's HO value 25.55, Reichert-Meissl value 1.5, Polenske value 2.9, unsaponifiable matter 3.15, thiocyanate value 79.6, hexabromide value 0. The oil contains about 55% of linoleic acid and is best suited for soapmaking.

L. Nasarevich
Composition of rape-seed oil. Ruchiro Yamauchi and Kentaro Ichihara. *J. Chem. Soc. Japan* 56, 1332-4 (1935).—Fat acids of the oil consisted of behenic 0.8, erucic 55, oleic 14, linoleic 24, linolenic 2 and palmitic 3.5%. It contained also myristic, palmitoleic and stearic acids but the amt. was small. The presence of rape-seed oil in the other oils can be identified by the detection of erucic acid, and the presence of the other oils in rape-seed oil by estg. stearic acid.

K. Kutsuta
Detection of rape oil in edible fat. J. Grossfeld. *Chem. Ztg.* 59, 935-6 (1935).—The method for detg. the amt. of rape oil in other oils depends on the estn. of the content of erucic acid by detg. the I absorption of the insol fat acid Pb salts obtained from the sample. The method is similar to the Grossfeld and Peter procedure for estg. isoleic acid in oils. The sensitivity is increased by adding palmitic acid to the test sample so that the insol. Pb salt of the erucic acid is absorbed by the Pb palmitate. As little as a 2% admixt. of rape oil to linseed oil can be detected.

M. M. Piskur
The adsorption of oil by the hulls of sunflower seeds I. Krasutskii. *Mashbolno-Zhivore Delo* 1934, No. 3, 9-10.—The hulls of sunflower seeds can adsorb as much as 24.51% of oil at a pressure of 400 atm.

E. Bielous
The determination of moisture in whole ground sunflower seeds, press cake and hulls in Trinkler's apparatus. G. V. Vugovskii and M. L. Ginzburg. *Mashbolno-Zhivore Delo* 1934, No. 3, 21-2.—Concordant results in the detn. of moisture are obtained with Trinkler's app. at 130° by drying the whole seeds, 40, the ground 25, the press cake 25-30, and the hulls 25 min., resp.

E. B.
Wheat-germ oil. Walter Cusack. *Ann. chim. applicata* 25, 417-23 (1935).—An oil has been obtained by expressing wheat germ which is purer and more stable than the oil obtained by extn. with solvents. (The method is to be published elsewhere.)

A. W. Coniari
Orientation of molecules of beeswax, and its effect on solidity of the comb. Paul Woog and N. Yannaquis. *Compt. rend.* 202, 78-80 (1936); cf. C. A. 30, 1250.—Of 2 portions of honeycomb one was kept at 15° and the other at 38° for 5 months, the latter was much stronger; of 2 portions of beeswax made into ribbons and similarly treated the latter was 58% stronger than the former. The heated wax was more translucent and darker colored. The bearing of these facts on the construction of the comb is discussed.

C. A. Silberrad
Triethanolamine and other alkylolamines in the oil,

fat, wax and other industries Emil J. Fischer. *Allgem. Oel- u. Fett-Zig.* 32, 489-95(1935)—An extensive review of patents and literature M. M. Fiskur

Progress of the soap industry in year 1935 A. van der Werth. *Allgem. Oel- u. Fett-Zig.* 32, 503-6(1935).—A review of patents M. M. Fiskur

From the notebook of the soap manufacture. Karl Pfaff. *Rieschstoff-Ind.* 10, 223-4(1935), cf. C. A. 30, 8031.—Haas' colloid soap, Spanish hardened olive-oil, mangrove-peel and antiseptic soaps are discussed

H. M. Burlage

Soap, soap fillers and washing powder. Ernst Jaschke. *Seifensieder-Zig.* 62, 859-62, 879-81, 901-3(1935)

Methods for filling soaps are illustrated with a no. of practical examples J. W. Perry

Determination of volatile hydrocarbons in soaps Procter and Gamble Laboratories *Oil and Soap* 13, No. 1, 9-10(1936)—The method requires a source of dry oil-free steam which is passed through the sample, treated with sufficient acid to liberate the fat acids from the soap. The steam is next passed through strong caustic soda to scrub out any volatile fat acids, while the volatile hydrocarbons are condensed with the steam in a suitable arrangement which allows the excess water to flow away leaving the volatile hydrocarbon in the measuring buret. The method can be applied to samples containing substances immiscible with water and volatile with steam. For solvents heavier than water a Bülwell-Stirling tube should be used. The app. and its arrangement are shown E. S.

Water glass in soap, soap powder and self-acting detergents Fritz Ohl. *Allgem. Oel- u. Fett-Zig.* 32, 453-6(1935)—A review giving the amt. usually used and advantages of using Na silicates in soaps M. M. Fiskur

The development of soap rancidity in the manufacture of fine soap Oculus. *Seifensieder-Zig.* 62, 820-1(1935)—A discussion of how to distinguish between soap rancidity due to (1) the catalytic action of metals, (2) the use of fats bleached with oxidizing agents and (3) the use of unsuitable fat material J. W. Perry

Soap from coriander-seed oil F. Nevelin and A. Kol'yu. *Maslobolno-Zhirmoe Delo* 1934, No. 3, 26—Coriander seeds contain after distn of the volatile oil 11-20% of fatty oil which gives soft Na and K soaps of pleasant odor E. Biellouss

The effect of fat solvents and heavy hydrocarbons on the detergent properties of soap M. Nikiforov and K. Chernyak. *Maslobolno-Zhirmoe Delo* 1934, No. 6, 23-5—The light and medium solvents (b 200-25°) improve the detergency of soap, especially the chemically uniform solvents, such as turpentine, tetralin, decalin. Heavy hydrocarbons (b 250-75°) considerably lower the detergency. The addn of 10% of solvent to a hard soap softens the latter to an extent equiv. to the lowering of the titer by 2-3 E. Biellouss

The use of alginate acid for soaps Anon. *Maslobolno-Zhirmoe Delo* 1934, No. 3, 28—Expts. showed that Na alginate does not possess any detergent properties E. Biellouss

Starch as a component of soap Th. Ruemele. *Allgem. Oel- u. Fett-Zig.* 32, 502(1935)—The use of starch in cosmetic and shaving soaps is recommended M. M. P.

Dry-cleaning soaps and solvents S. W. Putnam. *Soap* 12, No. 1, 25-8, 63(1936).—Chlorinated solvents are replacing petroleum solvents in dry cleaning. The desirable characteristics for a soap for use with any chlorinated solvent are discussed E. Scherubel

Soaps or emulsions for silk degumming? J. I. Springer. *Soap* 12, No. 1, 29-32(1936)—A degumming oil is best in those cases where the softness of the water cannot be relied upon. Soap to which a small quantity of mild alkali has been added is recommended for hosiery except when rayon is mixed with the silk. E. Scherubel

Textile oils (Meyer) 25 Flax investigations (Hutton, Strickland) 15 Is soap coming into its own again? (Volz) 25.

Oils, etc Isser Davidsohn and Robert Strauss, Ger. 619,928, Oct. 9, 1935 (Cl. 23a 3). Oils, fats, waxes or their mixts and products such as soaps and cosmetics are prevented from becoming rancid by addn of up to 3% of aliphatic high-mol. halogenated hydrocarbons, such as chlorinated or brominated paraffins

Refining oils, waxes and resins Planktokoll Chemische Fabrik G. m. b. H. and Johannes B. Carpow. *Fr.* 788,239, Oct. 7, 1935. The material in the liquid, liquefied or dissolved state is weakly acidified and treated with such an amt. of a dry pulverized slime, from sea or fresh water, containing chemically active compds. of Si (i. e., poor in O) that the refined product, sep'd from the purifier by pressing or distn., is not fully neutralized

Apparatus for cooking materials such as fish, scraps, etc., to release oils and fats Charles B. Upton. U. S. 2,027,131, Jan. 7. Various structural, mech. and operative details

Lecithin preparations Noblee und Thorl G. m. b. H. *Fr.* 788,632, Oct. 14, 1935. Stable aq. emulsions of vegetable lecithin and oil are obtained by heating fresh soybean residues, bleached, e. g., by H₂O₂, and adding while still hot a soln of water glass. The product is useful as an addn in making soap and in the leather and textile industry. *Fr.* 788,633. Powd. mixts containing lecithin are prep'd by intimately mixing, at a slightly raised temp., fresh soybean residues (bleached if desired) with one or more appropriate substances such as calcined Na₂CO₃, water glass, sugar, cacao, chocolate powder or starch, reducing to powder and drying under vacuum at about 60°. Oil may be removed from the residues by means of acetone or AcOEt before the mixing.

Soap from sperm oil. Walther Schrauth (to "Umchem"). *Chemikalien Handels, A.-G.* U. S. 2,027,936, Jan. 14. Sperm oil is saponified, and the alcs. formed by treating the material with concd. alkali such as NaOH at a temp. of 200-280° are oxidized by use of about 1-2% more of the alkali than the stoichiometrically calcd. proportion

Soap composition suitable for use with hard water Heinrich Bertsch (to American Hyalcol Corp.). U. S. 2,026,810, Jan. 7. A water-sol soap is used in combination with a water-sol salt such as the Na salt of an acid sulfuric acid ester of lauryl alc. in sufficient proportion (suitably about 25%) to prevent pptn. of the soap when used in hard water.

28—SUGAR, STARCH AND GUMS

J. K. DALE

Notes on cane milling and mill train design. Leandro S. Fibro, Jr. *Sugar News* 16, 515-17(1935)—The standard equipment in the Philippine Islands consists of 11 rolls, 34" X 78". High grinding rates prevail with sucrose extns of 92-4%. Knives, Maxwell shredders and Nobel hot maceration have been introduced lately. L. C.

Diffusion battery work H. Claassen. *Deut. Zucker-Ind.* 60, 751-4(1935).—A restatement of the known principles of correct diffusion work aimed at recent tendencies working counter to these principles. Reply H. Gaertner. *Ibid.* 792. F. R. Bachler

Diffusion battery losses W. Paar. *Deut. Zucker-Ind.* 60, 809(1935)—Sugar losses are often hidden because of faulty methods of analysis. Sugar losses in pulp should be det'd. only by hot aq. digestion and never in a superficially prep'd press juice. F. R. Bachler

Morgan disintegrator at Agurte Norman Kay. *Facts About Sugar* 30, 471(1935).—The disintegrator has made it possible to increase the cane tonnage ground by 15%, and also the sucrose extn. Tramp iron was completely removed in front of the disintegrator by means of the detector coil of the General Elec. Co. F. W. Z.

Temperatures in vacuum pans. Alfred L. Webre. *Facts About Sugar* 31, 13-14 (1936); cf. *C. A.* 29, 8385¹.—The temp. of a boiling massecuite is affected not only by the vacuum, but also by the hydrostatic head of the massecuite, and increases downward to such an extent that the lower strata are below the satn point when the top stratum is supersatd. This is the principal cause of unsatisfactory pan operation, especially with high strikes. Mech. circulation greatly improves conditions by creating a more uniform temp throughout the pan. After the grain has set, supersatn becomes less important as a criterion for boiling, and fluidity serves as a much better guide. F. W. Zerban

The influence of the presence of inorganic nonsugars on the rotation of sucrose solutions. E. Landt. *Deut. Zuckerrind* 60, 902-4 (1935).—An attempt is made to form the basis for a working hypothesis for an explanation of the cause of rotational changes in sucrose solns by taking into consideration the ionic properties possessed by the inorg. nonsugars that are present. proof for this is still lacking because existing older measurements cannot be evaluated in the light of modern phys.-chem. viewpoints. F. R. Bachler

Viscosity measurements in sugar solutions by measurements of power used during stirring. F. Horn and W. Tagener. *Deut. Zuckerrind* 60, 939-40 (1935).—Molasses solns of various concns were stirred at 20° with an elec.-driven stirrer. The power consumed was found to be in direct relation to the viscosity. F. R. Bachler

Contraction occurring on dilution of sugar solutions. W. Paar. *Deut. Zuckerrind* 60, 937-8 (1935).—Plato's earlier data are reviewed. A table has been calcd showing contraction occurring at 20° when solns contg 10-80% of pure sucrose are dil to 5-75%. In impure sugar solns, contraction is appreciably greater explaining the fact why the 1 l diln. method of analysis gives too high an apparent dry substance value. F. R. Bachler

New method for the determination of true dry substance in solid and liquid products. P. Morizot. *Bull. assoc. chim.* 52, 830-2 (1935).—The material is dried in glass bottles of special design, which are inserted in a double-wall drying oven, the necks of the bottles protruding through the cover. The drying process is hastened by drawing dry air through the bottles by means of an aspirator. The results on sirups, massecuites, molasses and flours agreed well with those obtained by the usual drying method. F. W. Zerban

Determination of dry substance in sugar solutions, especially in sugar factory products. P. Morizot. *Bull. assoc. chim.* 52, 833-9 (1935).—The usual method of drying on sand or pumice stone requires 5-6 hrs., and great attention to details. In the new method (cf. preceding abstr.) less diln. is necessary (1 + 2 for molasses or massecuites). Six to 7 g absorbent cotton is placed in the drying bottle, the soln contg about 2 g of dry substance is poured over it and dried at 105-6°, while a current of air is drawn through the bottle. Const. wt is obtained in 1 1/2 to 2 1/2 hrs., and the result checks with the usual method within $\pm 0.24\%$. If desired, the H₂O given off may be collected and weighed. F. W. Z

Does optimum flocculation correspond to an effective maximum defecation? M. Garino. *Ind. sacchar. ital* 28, 550-2 (1935).—So far the practical results have been excellent for the physicochem. conditions of the juice. No information has been obtained, however, concerning the elimination of the N compds, which are considered undesirable. The search for supplementary criteria of maximum defecation. *Ibid.* 552-3.—The ultramicroscope has been an important tool. More satisfactory methods for the detection and detn. of melassigenic compds. are required. Final elimination of colloids. *Ibid.* 553-6.—The plant practice has advanced beyond the scientific knowledge of the phenomena involved. L. Cusachs

Variations in the pH of lime solutions. Renato Salami. *Ind. sacchar. ital* 28, 539-41 (1935).—There is a decrease in pH with increase in temp. of Ca(OH)₂ solns and suspensions. Sucrose does not disturb the pH of the soln

in the presence of the original solute in the solid phase; otherwise the soln. is less basic. L. Cusachs

The application of physicochemical theories to the purification of crude sugar-beet juices. E. J. Hugel. *Bull. assoc. chim.* 53, 3-10 (1936); cf. *C. A.* 28, 2936¹.—The opinion generally held that beet juice has 2 isoelec. points, 1 in the acid and 1 in the alk. range, is erroneous. Flocculation by electrolytes may occur over a wide range of pH , depending on the nature and relative concn. of the electrolytes added. However, flocculation by oppositely charged colloids always occurs at a definite pH provided that the degree of dispersion is the same. *Salfozol*, recommended for the purification of beet juices, is a mixt. of inorg. colloids, of high flocculating power. Its use makes it possible to cut the lime in half, and greatly to reduce filter press work and sugar losses. F. W. Z.

Effects of different treatments at harvest upon the yield of sugar cane. Valeriano C. Calma. *Sugar News* 16, 558-9 (1935).—Topped cane should be harvested immediately, except if the milling of unburned cane is delayed. It is better to cut the burned cane than to allow it to stand in the field. The covering of sound cut cane with trash in the field is a waste of labor and is favorable to deterioration. L. Cusachs

Bacteriological standards for refined cane sugars. Wm. L. Owen and Roy L. Mobley. *Facts About Sugar* 30, 451-2 (1935).—Refined sugars have for some time been controlled as to their content of thermophilic bacteria. They are frequently infected to an even greater extent with other bacteria, yeasts or molds, which may prove detrimental to users of these sugars and also affect their keeping quality. The following tentative standards are suggested: (1) that the percentage mold infection in any lot should not exceed 20, (2) that the no. of mold spores per g. should not exceed 20, (3) that not more than 20% should contain viable yeast cells, (4) that the no. of yeasts per g. should not exceed 50, (5) that the percentage of infection with bacteria other than thermophiles should not be over 50, certainly not over 100. F. W. Z.

Cane sirup. J. O. Carrero. Puerto Rico Agr. Expt. Sta., *Rept.* 1934, 9-12 (1935). cf. *C. A.* 28, 7576¹.—The juices from 10 cane varieties were studied with respect to their value for sirup manuf. Grinding began when the canes were 6 months old and continued at 15-day intervals. Analyses were made for sucrose, reducing sugars, P, K and coloring matter. S. C. 12/4, P. R. 803 and M. 42 yielded juices of lightest color. Filtration was slightly faster when lime was supplemented with H₂PO₄ than with lime alone. The lime darkened the juices but the color was restored by the addn. of acid. Juices filtered with Filter-cel only yielded sirups of the best flavor. The care exercised in the boiling and concn. of the juice affected the color and quality. The longer the concn. period, the darker became the final sirup. If the temp. was raised unduly in the last stages of concn. caramelization with resultant darkening occurred. When sirups from different varieties were compared, those from Mayaguez 42 ranked 1st, with those from F. C. 999 and B. H. 10 as very close seconds. Sirups which had been fermented were lightest in color and were very attractive.

Decided reductions in color were obtained by the use of activated C or by slightly increasing the acidity of the juice with H₂C₂H₃O₄. The use of activated C resulted in a loss of flavor. By means of controlled fermentation, the sugar was partly inverted which prevented crystn. of sucrose in the sirup. Natural fermentations were objectionable. C. R. Fellers

Effect of freezing temperatures on cane in the Florida Everglades. B. A. Bourne. *Facts About Sugar* 30, 453-5 (1935).—See *C. A.* 30, 638¹. F. W. Zerban

Cane-juice purification. H. C. Prinsen Geerligs. *Bull. assoc. chim.* 52, 825-30 (1935).—The principal aim of clarification is the removal of colloids. This is effected in practice by addn. of lime to the isoelec. point, by adsorption on finely divided ppts. of carbonate, sulfite, or phosphate of Ca, and by mutual flocculation.

F. W. Zerban
Physicochemical studies on sugar-cane jaggery. A

preliminary communication. T. Varahalu *Madras Agr. J.* 23, 389-93 (1935).—The optimum relative humidity for the storage of all types of jaggeries is 50-60%. In good jaggeries the particles usually consist of a hard core of crust sucrose surrounded by a thin envelope of a more deeply colored material with more of the matrix. In bad jaggeries the sucrose is deposited in rhythmic bands or veins of varying widths and sometimes in widely sep'd patches of varying sizes bounded by thicker layers of the damp matrix material. Independently of the purity (high percentage of sucrose), the most potent of the constituents in the jaggery, affecting the crystn. of sucrose, and thus conditioning the phys. structure and other related properties, is the nonsugar org. matter fraction. In bad jaggeries this fraction contains substances which cause high viscosities, retard the progress of boiling, cause the tenacious retention of moisture and offer resistance to the formation of nuclei and the growth of sucrose crystals. The corresponding fraction in good jaggeries does not seem to have these adverse effects. Juice from cane fertilized with castor cake contained the smallest and least harmful amt. of nonsugar org. matter; the reverse was true in cane fertilized with $(\text{NH}_4)_2\text{SO}_4$ alone. When cane was grown under dry conditions or on saline soils or when it was irrigated with brackish water, the nonsugar org. matter fraction was present in comparatively larger amts or in a more harmful condition, than when the cane was grown under normal conditions. K. D. J.

The crystallization of sucrose from cane juices. Considered theoretically and practically. L. S. Birkett. *Intern. Sugar J.* 38, 12-15 (1936), cf. C. A. 29, 4198*.—The theory of crystn. of sucrose from cane juices involves (1) the soly. relationships of those juices, (2) the formation of the crystal nuclei, and (3) the growth of the nuclei into larger crystals. The soly. relationships are described by reference to the phase-rule principles, a ternary system, sucrose-nonsucrose-water, being taken. By reference to this phase-rule diagram the degree of supersat. necessary to produce crystal nuclei at 70° has been det'd. for purities from 30° to 100°. The following table is given.

Purity	100	90	80	70	60	50	40	30
Supersatn	1 20	1 25	1 30	1 35	1 40	1 44	1 49	1 54

It is also possible to det. in advance, by use of the diagram, the conditions necessary to obtain a given purity mother liquor (molasses).

D. P. Langlois

A neglected industrial plant the sweet sorghum. *J. Pariss. Ind. sacchar. stal* 28, 497-508 (1935).—A review with 45 citations. L. Cusachs

1 The behavior of sorghum in a diffusion battery. Cesare Grossi *Ind. sacchar. stal* 28, 542-4 (1935).—Preliminary expts suggest that a diffusion battery may be superior to mills because of the better quality juice and higher extn. The battery was run at 100°, with 150% draft. There was a purity rise, and the juice was clear and altogether suitable for the distillery. L. Cusachs

A new method for purifying starch milk and for the preparation of potato starch. Waldemar Kröner and Gerhard Knoblich *Chem. Fabrik* 1935, 510-12.—On the under side of the lower end of an inclined pipe of suitable length and diam is an outlet for the washed starch, and on the upper side of this end is a H_2O inlet. About half way up on the top side is the starch milk inlet, and between this and the wash- H_2O discharge at the upper end of the pipe are a no. of metal sheets parallel to the length of the pipe but with 1 side lower than the other. The washed starch settles on the sheets and slides off on to the lower side of the pipe and down to the outlet. Economical and complete purification are claimed. J. H. Moore

Power alec problem and the sugar beet (Munerator) 16 *Starch for finishing linen* (Tr. pat. 783,602) 25

4 Clarifying sugar cane juices. Francis R. Forter (one-fifth to Frank G. Campbell). U. S. 2,027,423, Jan. 14. Primary juices from sugar-cane mills are collected in one app; secondary mill juices are collected in a secondary app and subjected to a treatment to effect quick pptn and which involves heating to a relatively high temp and, without decantation, the temp of the secondary juices is quickly reduced and they are delivered with their pptd. and consolidated impurities back to and upon the bagasse mat and are collected for further clarification after they have been strained by passing through the mat (all in a continuous operation). An arrangement of app is described.

Starch. Stärkelfabrik Naugard, eingetr. Genossenschaft in b H (Alfred Parlow, inventor). Ger. 619,984 Oct. 11, 1935 (Cl. 53k 2 01). Food starch is produced by air-drying potato starch and heating it to 60-100°. The starch may be treated with 0.2% of acid before heating.

6 Sugar-cane mills. Charles McNeil Brit. 434,967, Sept. 12, 1935

Feeding apparatus for starch tables. Samuel Shorback (to International Patents Development Co.) Can. 353,958, Nov. 6, 1935. Structural details

29—LEATHER AND GLUE

ALLEN ROGERS

Processing New Zealand [dewooled sheep] pelts. D. Jordan Lloyd and P. White. *J. Federation Carriers & Light Leather Tanners* 16, 234 (1935). *J. Intern. Soc. Leather Trades Chem.* 20, 37 (1936).—Recommendations for eliminating "mottled" and "leopard grain": (1) Use the min. concn of Na_2S in dewooling, (2) after pulling, wash with old lime liquor instead of H_2O , (3) lime for 24 hrs. with intermittent stirring, using not more than 0.26 g. Na_2S and not less than 4 g. CaO per 100 cc. soln. and employing a mellow lime, (4) stack the limed pelts not longer than 5 days and preferably not over 2, (5) delime with NH_4Cl , pickle with H_2SO_4 + NaCl .

H. B. Merrill

Tungsten tannage. V. Casaburi and E. Simoncini. *J. Intern. Soc. Leather Trades Chem.* 20, 2-9 (1936).—"Very satisfactory" leather can be made by tannage with metatungstic acid, phospho-, boro- or silico-tungstic acid. About 40% WO_3 is fixed. The tannage more nearly resembles vegetable than Cr tannage. Combination tannages with Cr, Al or vegetable tannin are feasible. Analyses of various W leathers are given without description of the tanning methods. H. B. Merrill

Study of grease stains on leather. VII. A comparison of solvents for removing kidney grease stains. I. K. Moore. *J. Am. Leather Chem. Assoc.* 31, 4-32 (1936). cf. C. A. 29, 1676*.—Surface stains can be removed by scrubbing with solvents or detergents, but the improvement is not lasting because interior grease diffuses to the surface. Stained leather can be degreased and the stains removed by immersing in any one of a large no. of solvents. This process is economical only when dealing with a large no. of badly stained skins. The lower alcs., ethers, ketones and pyridine darken the leather and make it very hard. Ability to remove stains was det'd. by immersing pieces of naturally stained leathers in solvents for 24 hrs. Rate of removal was judged by immersing artificially stained pieces of known fat content in the solvent (16 ml. per g.) for 2 hrs. and detg. the percentage of total grease removed. Time for disappearance of residual odors, at room temp. and at 28-30°, was noted. Cost, toxicity and fire hazards are discussed. Most rapid grease removal was obtained with low boiling solvents such as petr. ether, CHCl_3 and various ethers. These are all impractical for reasons of cost, fire hazard

or toxicity. The other solvents examd. differed little in rate of stain removal. "Stoddard solvent" is recommended because of its cheapness, low toxicity and relatively low fire hazard, although its action is rather slow. CCl_4 in a closed system is also suggested. The solvent may be reused until its grease content reaches about 7%.

H. B. Merrill
A method for obtaining casein films of high water resistance on chrome calf leather. M. W. Maslovsky, *Curr. tech.* 24, 382-90 (1935).—Untreated casein films possess little resistance to H_2O regardless of the kind of alkali used for dissolving the casein and regardless of whether the leather surface is previously treated with NH_4OH , AcOH or EtOH . The findings of Haupt (*C* 26, 4136) on the HCHO -albumin reaction are confirmed. The HCHO -casein reaction is different, because the compd is not broken up by steam distn. Most water-resistant coatings are obtained by using a finish high in casein and treating with 10% HCHO soln after the coating has dried.

H. B. Merrill

Sturrr for the manuf. of glues and adhesives (Wollenberg) 1. Lecithin preps. [used in the leather industry] (Fr. pat. 788,632) 27. Cleansing agents [for leather] (Brit. pat. 435,465) 13. Drying varnished [leather] under the action of ultraviolet radiation (U. S. pat. 2,020,296) 26

Leather J. R. Geigy A.-G. Ger. 622,213, Nov. 22, 1935 (Cl. 28a 2). For the manuf. of very soft and flexible leather, the deplated hides are treated, before tanning, with an aq. bath contg. small proportions of a neutral pyrophosphate (or neutral pyrophosphate mixt.) and an animal or vegetable albumin, e. g., casein. An example is given.

Azo dyes suitable for dyeing leather in an acid bath. Werner Lange (to General Aniline Works) U. S. 2,022,243, Nov. 26. Dyes dyeing leather red to black tints of good fastness are produced by coupling any diazo compd. with a triazole (pseudoazimino compd.) of the general formula

where R is a phenyl or naphthyl radical substituted by at least one nitro group and contg., if desired, further substituents such as sulfonic acid or carboxylic acid

1 radical, halogen, a substituted or unsubstituted amino group (acylamino, alkyl or phenylamino group), an alkyl, hydroxy or alkoxy group, and where π means 1 or 2. These triazoles are obtainable, for instance, by combining in an acid medium an aminohydroxynaphthalenesulfonic acid with a diazotized nitrophenylamine or nitronaphthylamine which may be substituted as indicated above, and by oxidizing the intermediate product thus obtained. Various examples with details of procedure are given.

2 Leather. Georges A. Favre. Fr. 788,387, Oct. 9, 1935. Leather obtained by tanning skins is stabilized by immersing it in an aq. soln. of hydrolyzable and reducing salts, e. g., oxychlorides of Ti and Sb, and "ous" salts of Sn, Sb, Si, Th and Ce and double salts in which one of the elements is one of the above metals.

Dyeing leather. F. M. Senn (to J. R. Geigy A.-G.). U. S. 2,025,618, Dec. 24. Leathers are dyed (usually yellow or orange in the case of numerous examples given), with deep penetration even of chrome leathers, by dyes from diazotized 3-aminobenzenesulfonic acid and bis(hydroxyethyl)aminobenzene or bis(β , γ -dihydroxypropyl)aminobenzene or other aminoazobenzenesulfonic acid dye of the general formula

where X_1 represents H or SO_3H , X_2 represents H, NO_2 , Cl, Me or OR (R being Me, Et or hydroxyethyl), X_3 represents H, NO_2 , Cl or Me, Y_1 represents H or NO_2 , with the restriction that at least one of said X_1 , X_2 , X_3 and Y_1 must be other than H, Y_2 represents H or SO_3H , Y_3 represents H, CH₃, Cl or OH, Y_4 represents H, Me or OMe; R_1 represents H, ethyl, hydroxyethyl or dihydroxypropyl, and R_2 represents hydroxyethyl or dihydroxypropyl.

Dyeing leather. E. I. du Pont de Nemours & Co. Brit. 435,477, Sept. 23, 1935. Chrome- or vegetable-tanned leather is dyed by applying thereto a diazo dye obtained by coupling with *res-cetol* (I) either diazotized aminosalicylic acid (II) or diazotized picramic acid (III) and coupling the monoazo product with either diazotized II or diazotized III. In an example, chrome calf leather is tumbled in a dyeing drum at about 55° with aq. NaHCO_3 until neutral to litmus, an aq. soln. of the dye II (2 mols) \Rightarrow I is added, the tumbling is continued 20 min., an aq. soln. of com. HCOOH is added and tumbling continued a further 30 min.; the leather, thus dyed a full level yellowish brown, is fat-liquored and dried. The dye may be replaced by II \Rightarrow I \Rightarrow III or by III \Rightarrow I.

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Semi-ebonite II. P. A. Gibbons and F. H. Cotton. *Trans. Inst. Rubber Ind.* 11, 354-76 (1935); of *C* A 29, 6465.—By a special app. and technique, which are described and illustrated, the volatile products formed during the aging of semi-ebonites in air at 70° were detd. Water, SO_2 , CO_2 and H_2S were evolved, and at the same time there were gains in wt. as a result of the formation of non-volatile oxidation products. Practical sole-wearing tests of semi-ebonites showed that they have greater resistance than ordinary leather, but have a greater tendency to premature cracking. A special app. to judge the resistance to bending and to compare pliability, and another app. to measure resistances to flexing are described and illustrated. The pliability diminished with increase in S content and was increased by an antioxidant (Nonox). The resistance to flexing increased with decrease in the S content and in the toughness, so that the lowest forms of

semi-ebonite showed the highest resistances. Aging in air at 70° slowly destroyed the resistance to flexing, and an antioxidant did not retard this deterioration. On the other hand, semi-ebonites vulcanized with an accelerator deteriorated less rapidly. Exposure to ultraviolet light also reduced rapidly the resistance to flexing, and this deterioration was not influenced by an antioxidant. After 6 months of natural aging, semi-ebonites vulcanized with an accelerator lost relatively little resistance to flexing, whereas unaccelerated products deteriorated tremendously. An antioxidant had little effect. The tensile (stress-strain) properties of the various products are also given. With increase in S, the tensile strength increased, and the elongation increased to a max. and then diminished. An optimum combination was reached with 22.5-25% S (based on the rubber). The lowest proportion of S which yielded a semi-ebonite was 17.5-20% for un-

accelerated mixts. and less for those contg. an accelerator. The latter also increased the toughness and ultimate elongation, whereas an antioxidant decreased the toughness. The best of the semi-ebonites compared favorably with a black soling contg. a high proportion of C black. In aging naturally, semi-ebonites toughened and became harder and less elastic, with formation of an inert oxidized film. An antioxidant did not retard these changes. The permanent set after elongation of semi-ebonites was very low, but the recovery was sluggish. C. C. Davis

The internal heating of ebonite during vulcanization. H. A. Daynes. *Trans. Inst. Rubber Ind.* 11, 336-42 (1935).—Math. Theoretical equations for the heat produced and for the rate of loss of heat in the vulcanization of ebonite are derived, and the effects of various factors (reactivity, thermal cond., thickness, temp.) are discussed. There are complicating factors which prevent the quant. application of any such simple theory to practical cases, and for a complete math. solution of the problem, it would be necessary to express in simple algebraic form the relations between temp., degree of combination of rubber with S, and rate of heat production, so that the temp. could be calcd. as a function of time. C. C. Davis

Accelerators of vulcanization. F. Jacobs. *Caoutchouc & gutta-percha* 32, 17336-8 (1935). cf. C. A. 29, 8400.—The properties and uses of a few com. accelerators (S P D., Pipolol X, Pipolene and R-2) are described. C. C. D.

Combined use of two different accelerators. VI. Diphenylguanidine and di-*o*-tolylguanidine. Ichiro Aoe. *J. Soc. Rubber Ind. Japan* 8, 593-602 (1935); cf. C. A. 29, 955.—Ftn of the softening and m. ps. of mixts of various proportions of diphenylguanidine (I) and di-*o*-tolylguanidine (II) indicated that I and II do not form a eutectic mixt. Scorching at 100° was the highest around equal parts of I and II, but it was not bad enough to cause danger in practice. Vulcanization tests showed that acceleration was first manifest around equal parts of I and II, but the differences were not very striking. That stearic acid in the rubber neutralized the accelerators and retarded vulcanization was confirmed by adding stearic acid to the mixts. K. Katsuta

A new method of estimation of mineral substances in vulcanized rubbers by adding an organic accelerator to the solvent. Kiyoshi Maruyama. *J. Soc. Rubber Ind. Japan* 8, 525-33 (1935).—Mercaptobenzothiazole (I) or its K salt (II) in the petroleum solvents used in deig the mineral ingredients in rubber increases the soly. of the rubber. Mix 1 g. of sample with 0.04 g. of II, add 10 g. of paraffin and heat in a weighing flask in an oil bath at 180°. When the sample is completely melted add 0.02 g. of I and shake well. When the mineral ingredients have settled dil with petr. ether, centrifuge, decant the clear soln twice, wash 3 times with a soln of equal parts of acetone and CHCl₃, dry at 100°. K. K.

Determination of total and free selenium in vulcanizates. E. Kheraskova and L. Vaisbrut. *Ind. Eng. Chem. Anal. Ed.* 7, 407-8 (1935).—Total Se.—Destroy 2 g. of rubber sample with hot HNO₃ (d 1.4), evap. with water to dryness, dil with 100 cc. of hot water, cool, filter, add excess (250 cc.) aq. HCl (d 1.19), then excess cryst. Na₂SO₄ in small portions, heat overnight at 40-50°, filter, wash the Se residue exhaustively, dry and weigh. As a more expensive alternative, but still better otherwise, treat 2 g. of sample with HNO₃, dil with 150-200 cc. of water, filter (from nitrosites), neutralize the filtrate with 10% NH₄OH, acidify with HCl, heat with excess (75-100 cc.) said aq. H₂NNH₂·H₂SO₄, let stand overnight, filter, wash the residue with hot water, EtOH and Et₂O, dry and weigh. Free Se.—The method depends on the fact that the aq. Na₂SO₄ exts. S and Se, and HCHO ppt. only Se from the resultant soln. Heat 1 g. of sample with 200 cc. of 10% aq. Na₂SO₄ for 30 hrs., repeat, filter, wash, boil the filtrate with 75 cc. of formalin for 1 hr. (cf. Bolotnikov and Gurova, C. A. 29, 2026), filter (free S can be

detd. in the filtrate), wash the residue with HCl, hot water, EtOH and Et₂O, dry and weigh. C. C. Davis

Chlorinated rubber paints (Schultz). 26. Polymerization of hydrocarbons of synthetic rubber manuf. into a paint vehicle (Lopatun, Soldatov). 26. Heat capacity, entropy and free energy of rubber hydrocarbon (Bekkedahl, Matheson). 2. Plastic materials (resembling rubber) (I. r. pat. 788,645). 13. C black (U. S. pat. 2,027,732). 4. Active C (U. S. pat. 2,027,695 and Brit. pat. 435,345). 18. App. for extruding plastic material such as in making molded rubber articles (U. S. pat. 2,028,044). 13. Amides of carboxylic acids contg. S [as softening agents for rubber] (Ger. pat. 619,299) 10.

Machine for spreading rubber latex, etc., on moving sheet material. International Latex Processes, Ltd. Ger. 622,277, Nov. 25, 1935 (Cl. 39a. 10.06). See Brit. 429,235 (C. A. 29, 6806).

Rubber. Egon Meier. Ger. 619,944, Oct. 9, 1935 (Cl. 39b. 5). Conc'd rubber solns. are made by treating a paste of rubber and org. solvent with 61.9% HNO₃, interrupting the oxidation by adding BaCO₃, drying by anhyd. Na₂SO₄ and treating the product with an agent which robs rubber of its stickiness such as water free ZnCl₂ or SnCl₄, NH₄CNS, (NH₄)₂S, Al stearate, PhNO₂, BzH, quinine, etc. Examples are given.

Halogenating rubber and like materials. Metallges. A.-G. (Otto Schweitzer, inventor). Ger. 622,471, Nov. 29, 1935 (Cl. 39b. 3). See Fr. 785,257 (C. A. 30, 647).

Preserving rubber. Winfield Scott and Horace G. Byers (to Rubber Service Laboratories Co.). U. S. 2,027,001, Jan. 7. About 3% of a condensation product of an aliphatic aldehyde such as acetaldehyde with a diamine comp. two amino groups such as a diamino diphenylamine is added to a rubber compn.

Thermoplastic rubber. Russell J. Reaney. Fr. 788,241, Oct. 7, 1935. A product which may be used for joining rubber to metal, for making a waterproofing lacquer or varnish and as a substitute for gum lac, is made by combining with rubber chem. compds. which do not separately react with it but which together react with it, at normal or raised temp. Thus, Al₂(SO₄)₃, 18H₂O, 17.6 PCl₃ and 12 and rubber 100 parts are mixed together and heated to 160° for 5-15 hrs. and afterward homogenized and purified.

Rubber threads. Thomas L. Shepherd. Fr. 788,456, Oct. 10, 1935. A stream of liquid rubber is brought into contact with a coagulating agent and is drawn while in the state of partial coagulation. App. is described.

Machines for making rubber threads. Caoutchouc Laboratories, Inc. Fr. 788,112, Oct. 4, 1935.

Microporous rubber sheets. I. G. Farbenind. A.-G. Fr. 788,075, Oct. 3, 1935. Very thin sheets suitable for diaphragms, etc., are planed or cut from thick sheets of rolls by machines such as are used in the cellulose and wood industries.

Rubber articles. International Latex Processes Ltd. (Giuseppe Venosta, inventor). Fr. 788,499, Oct. 10, 1935. See Brit. 433,441 (C. A. 30, 8024).

Molding hollow rubber articles such as balls. Lewis J. Clayton (to Viceroy Mfg. Co. Ltd.). U. S. 2,027,634 Jan. 14 App. and various operative details are described.

Molding hollow articles such as pipes from materials such as rubber or fiber. Harry Raffovich. U. S. 2,026,906, Jan. 7 App. and various operative details are described, involving heating assembled materials to harden a binder such as by vulcanizing a rubber compn. which is used.

Water bottles of rubber and fabric. Milton B. Reach. U. S. 2,027,290, Jan. 7. Various mfg. details.

Tire tube. Walter E. Shively (to Wingfoot Corp.). Can. 354,002, Nov. 5, 1935. A rubber inner tube is covered on one side with a gas-imperious polyglycol-contg. coating which is made water-resistant by a covering of rubber.

CHEMICAL ABSTRACTS

Vol. 30

MARCH 20, 1936

No. 6

1—APPARATUS, PLANT EQUIPMENT AND UNIT OPERATIONS

W. L. RADGER

Modern developments in chemical balances J. L. Buchan, *J. Sci. Instruments* 13, 1-4 (1936) E. H.

A simple oil micromanometer Otto Beeck, *Rev. Sci. Instruments* 6, 399-400 (1935) —An oil-Hg combination app. is described, with 1 cut. It is sensitive to about 0.0003 mm Hg J. H. Moore

A new method for the registration of density O. Spengler, F. Todt and St. Böttger, *Z. Wirtschaftsprüfung* 85, 680-8 (1935) —A new registering densimeter, Speziometer, registers d to within 0.1° Brix regardless of temp. and purity changes F. R. B.

Improvement of the micro-Kjeldahl method Béla Grod, *Biochem. Z.* 283, 59-61 (1935) —Description of an all-glass app. in which all the stages of the process (except the digestion) are carried out, whereby greater accuracy in parallel detns. is secured S. Morgulis

Glass vessel for water distillation Bernhard Siede, *Chem.-Ztg.* 59, 925 (1935) —H₂O-resistant glass is recommended over Sn for cheapness. An automatic small-scale still is described. P. S. Rollet

Some new calorimetric apparatus W. A. Roth, *Chem. Fabrik* 1936, 10-12 —An elec. microbomb with evacuable mantle, a transparent app. for precision measurements with thermoelements and a twin-scale calorimeter are described Six references, 3 cuts J. H. M.

Sedimentometer of new construction Jar Mithauer, *Z. anal. Chem.* 103, 419-22 (1935) —For detg. in tech. analyses the rate at which floating particles sep. out in fluids, the phototelec. cell can be used to advantage. The light rays from the elec. lamp, whose intensity is kept const. by an automatic regulator, pass through a thermo filter, a slit and then into the vessel in which sedimentation is taking place. After this the light passes through another slit and an achromatic condenser before coming in contact with a very sensitive phototelec. cell. The resulting p. d. is measured with a very fine, aperiodic microvoltmeter. Although the principle is very simple, a no. of difficulties had to be overcome W. T. H.

A simple type of humidity chamber F. C. Mead, *J. Sci. Instruments* 12, 394-5 (1935) —An app. designed for making elec. tests on small specimens of material under controlled conditions of temp. and relative humidity. One cut. J. H. Moore

Practical milk-of-lime scale for laboratory and factory H. V. Raven, *Centr. Zuckerrind.* 43, 830 (1935) —A one-l. vessel is filled with milk of lime and weighed on a balance, the pointer of which shows on a quadrant g. of CaO per l. F. R. Bachler

New apparatus for the quantitative recovery of dialyzates F. Loch, *Z. anal. Chem.* 101, 385-8 (1935) —It is sometimes desired to make a complete sepa. of a dissolved crystalline from a dissolved colloid. The usual method of using a semipermeable membrane and running water is out of the question because of the large vol. used in removing all the crystalline. The device here described is based upon the principle of the Soxhlet extra. app. The original soln. is placed in a tube of parchment paper, or Cellophane, and the tube is placed in a rectangular vessel which is about 1/4 filled with water. A siphon tube is placed in the water so that when the level rises above a certain point, the excess is siphoned off, as in the Soxhlet app. The siphoned water, or aq. soln., flows by gravity into a neighboring flask, which is provided with a siphon tube and is connected with a condenser. The liquid in

this flask is boiled gently, the distillate passes into the condenser and runs into the vessel in which the dialysis is taking place. There fresh water is, therefore, constantly being added. The vol. of the aq. soln. at the end of the extra. is merely the vol. of water originally placed in the flask and this can be made as small as desirable. Whenever desired, the soln. in the flask can be siphoned off. W. T. H.

New process for controlling surfaces in the chemical and related industries Alfred Salmony-Karsten, *Industrie chimique* 22, 737-9 (1935) —A brief discussion of the merits of the microcomparator which is essentially a low-power microscope constructed so that it can be removed from its base and applied directly on the surface to be examd., and so that the latter can be observed simultaneously (and in the same field) with a standard surface A. Papineau-Couture

Returnable drums for handling chemicals R. W. Lahey, *Chem. & Met. Eng.* 43, 28-31 (1936), cf. C. A. 29, 4475 E. H.

Protective coating for wood in sodium sulfate Kenneth A. Kobe and Frank A. Morey, *Chem. & Met. Eng.* 42, 682-4 (1935) —Test panels of seasoned Douglas fir coated with a Bakelite-base varnish stood up for 24 days in a boiling satd. soln. of Na₂SO₄ at 102°, but were darkened E. R. Rushton

Machines for the production of packing and similar products Max Pollmann, *Gummi-Ztg.* 59, 9-10, 34-5 (1936) C. C. Davis

Separation of gases from mixtures by E. Mazza's patented processes. Judes Rabu, *Industrie chimique* 22, 890-900 (1935) —Mazza's centrifugal gas separator (C. A. 29, 4218) is described and numerous possible applications are pointed out A. Papineau-Couture

Tentative standard system of nomenclature for unit operations proposed by A. I. of Ch. E. A. B. Newman, et al. *Ind. Eng. Chem., News Ed.* 14, 59 (1936) E. J. C.

Extraction of acetic acid with isopropyl ether in a spray column J. C. Elgin and F. M. Browning, *Trans. Am. Inst. Chem. Engrs.* 31, No. 4, 639-70 (1935) —Exptl. data are presented for the rate of mass transfer of AcOH between com. iso-Pr₂O and water in a 2.03-in. diam. Pyrex section spray extn. column whose effective height is 48.75 in. and effective vol. 0.0013 cu. ft. Relations applicable to rate of extn. are discussed briefly and capacity coeffs. calcd. from the data by the equation $K_{a\omega} = (N/\theta) / V \log \text{mean } \Delta C$, in which V is the effective column vol. and N/lb. mols. per hr. transferred. $K_{a\omega}$ depends on the rates of flow of both dispersed and non-dispersed phases, on whether the water or ether phase is dispersed, on the direction of acid transfer, on the inlet acid concn. of the phases and on the diam. of the entrance nozzle for the dispersed phase. Diam. and velocity of transport of the dispersed drops vary greatly with the phase dispersed and acid concns. Data for phys. properties of the 2 solvents as a function of acid concn. are reported C. L. Mantel

Fractional distillation in ring-filled columns Voland Mayor, *Industrie chimique* 22, 730-2 (1935) —Math. A method is given for calcg. the dimensions of a ring-filled fractionating column. The advantages of ring-filled columns are pointed out. A. Papineau-Couture

Heat-transfer coefficients during drop-wise condensa-

tion of steam W. M. Nagle, G. S. Dais, L. M. Blendenman and T. B. Drew, *Trans Am Inst Chem Engrs* 31, No. 4, 593-601 (1935).—A detailed discussion of expts which gave steam side coeff. for drop-wise condensation on Cr-plated pipe with temp. differences from 5.2° to 13.9°F having values between 11,000 and 17,000 B.t.u./hr./sq ft/°F C. L. Mantell

The conditions for drop-wise condensation of steam T. B. Drew, W. M. Nagle and W. Q. Smith *Trans Am Inst Chem Engrs* 31, No. 4, 605 21 (1935); cf C. A. 28, 545.—Clean steam, whether or not it contains noncondensable gas, always condenses in a film on clean surfaces, rough or polished. Drop-wise condensation of steam does not occur unless the cooling surface is in some way contaminated. Although numerous substances, while actually on the surface, make it nonwettable, only those that are strongly adsorbed or otherwise firmly held are significant as drop-promoters in a condenser. Some contaminants seem to depend for their activity as promoters on the amt of noncondensable gas present. Some contaminants are specifically effective on certain metals (e.g., mercaptans on Cu alloys), others are quite generally effective (e.g., fatty acids). Boiler steam at the Mass Inst. of Tech. naturally contains drop-promoters which are effective on some metals but not on others. Drop-wise condensation is induced and maintained more easily on smooth surfaces than on rough C. L. Mantell

Efficient truck refrigeration H. W. Krotzer *Ice Cream Trade J.* 31, No. 11, 33 7 (1935).—Insulators, refrigerants, construction and operation of refrigerating systems are discussed in relation to their use for truck refrigeration A. H. Johnson

A method of obtaining and controlling high humidities at high temperatures W. Lethersich, *J. Sci. Instruments* 12, 348-91 (1935).—Addnl and sep heating is supplied by an immersion heater to a tray of H₂O in the oven, and the addn of a thermostat in the H₂O gives close control. In an oven 18 × 20 × 30 in. high a relative humidity of 90% was held const. to 0.1% at 75° for a day. J. H. Moore

Heat transmission in evaporators H. Claassen *Centr. Zuckerrind* 43, 852-3 (1935).—The applicability of the results of researches by the polytechnical school in Karlsruhe for sugar evaporation problems is discussed. Heat transmission in vertical evaporator tubes H. Claassen *Ibid* 968-9.—An analysis of the results obtained in evaporator tests by the polytechnical school in Karlsruhe with special reference to their applicability in vertical evaporator tubes F. R. Bachler

Heat savings through insulation of flanges Forschungs Heim für Wärmeschutz *Centr. Zuckerrind* 43, 950 (1935).—Heat losses suffered by a pair of unprotected flanges in a pipe line 100 mm in diam. and with temp. differences between flange and air of 50-400°, measured in still air, ranged between 0.4 and 1355 cal. per hr. Suitable insulation reduced these to 7.6-151 cal. With smaller or larger diam. the saving is in proportion. In open air heat losses can be twice as high F. R. Bachler

Modern materials for high-pressure vessels (McAllister)

British Standard Specifications No. 604—1935 Graduated Measuring Cylinders No. 605—1935 Crow Receivers No. 611—1935 Petri Dishes No. 612—1935 Nessler Cylinders London Brit Standards Inst. 2s 2d each

Laboratory fume cupboard V. I. Karmazin and A. T. Cherniul *Russ* 36,060, Apr. 30, 1934. The fume cupboard is provided with a rotatable floor.

Piezoelectric crystal device René Lucas (to Compagnie générale de télégraphie sans fil). U. S. 2,029,729, Feb. 4. Structural details.

Compensation colorimeter. P. M. Nemzer. *Russ* 34,184, Jan. 31, 1934. Construction details. Viscometer Harry T. Booth (to Lubrication Control

Corp.). U. S. 2,028,188, Jan. 21. Structural and operative details of a device with a spring-opposed piston.

Self-luminous devices John E. Paul (to United States Radium Corp.). U. S. 2,028,241, Jan. 21. An elongated glass tube is filled with self-luminous material such as radioactive material (the tube being closed at one end) and surplus air is expelled from the tube by passing the tube through a flame from the closed end to the open end, and the open end is sealed by fusion in the flame without withdrawing the tube from the flame after the air-expelling operation.

Electric timing apparatus suitable for the control of various apparatus Frederick G. Kelly, Jr. (to Engineering and Research Corp.). U. S. 2,029,622, Feb. 4. Various details.

Thermostatic control for electric circuits Carlton W. Bondurant (to Bishop & Babcock Mfg. Co.). U. S. 2,028,893, Jan. 28. Mech. and operative details.

Apparatus for generating heat by catalytic combustion Fr. Weber & Co. Fr. 789,362, Oct. 28, 1935.

Thermostatic valve suitable for steam-heated water heaters, etc. Sten F. B. Soderberg (to Leslie Co.). U. S. 2,029,203, Jan. 28. Various structural and operative details.

Portable thermometer suitable for use with molten solder, etc. William C. Dillon. U. S. 2,028,969, Jan. 28. Various structural details.

Thermometer and associated apparatus for determining the temperature of oils in tanks, etc. Philip S. Williams and Oliver W. Johnson. U. S. 2,028,887, Jan. 28. Structural and operative details.

Thermometer and associated apparatus for determining the temperature of oils in tanks, etc. Philip S. Williams U. S. 2,028,888, Jan. 28. Structural and operative details.

Pyrometric device suitable for exposure to kln gases Herbert B. Henderson and Edward O. Henderson U. S. 2,028,507, Jan. 21. Structural details.

Seamless tanks such as those of copper and nickel layers suitable for holding chemicals Blasius Bart U. S. 2,029,011, Jan. 28. Various mfg. details are described.

Closure for containers such as cans for light oils, etc. Rollin L. Drake (to Texas Co.). U. S. 2,029,259, Jan. 28. Structural details.

Apparatus for dissolving salts Thomas F. Courthope (to Retsof Mining Co.). Can. 351,444, Nov. 26, 1935. A vat has an open top and double bottom in spaced parallel relation to enclose a liquid chamber and inclined at an angle of 40° to insure removal of solid materials. The upper bottom has an opening in its lowest part and acts to support solid materials as a filtering medium. Liquid is conducted into the top of the vat and discharged from the upper part of the chamber between the 2 bottoms.

Apparatus for gelatin and glue extraction, etc. Wm. V. Knoll U. S. 2,028,935, Jan. 28. Various structural, mech. and operative details.

Apparatus for treating and cleaning articles such as those of metal with solvents such as carbon tetrachloride Clarence F. Dunley (to James H. Bell). U. S. 2,028,739, Jan. 28. Various details of app. and operation.

Fractional-distillation apparatus Gerrit Baars (to Shell Development Co.). Can. 354,566, Dec. 3, 1935. Bubble plates in a series consisting of stepwise progressively lowering sections are alternately inclined in opposite directions. Overflow partitions are provided between the plates, and bubble caps for passing vapors through the plates. An overflow pipe is provided at the lower side of the plate for discharging the liquid, and means for supplying the liquid at the upper side.

Distilling apparatus Le Pyrex. Fr. 789,493, Oct. 29, 1935. Means is provided to maintain the level of liquid in a distg. flask constant, the liquid being heated by heat-exchange with the condensing vapors before entering the flask.

Apparatus for distilling wash oils, etc. Percy D. Walmsley and William B. Kendall. Brit. 435,867, Oct. 1, 1935. Volatile constituents are distd from wash oils,

etc., by flowing the oil down a vertical, packed still provided with a central steam-heated tube around which the packing of Raschig rings, etc., is arranged in annular form and onto which the oil is directed by notched conical rings.

Water-column displacement weight Alfred L. Aicher (to Varnal-Waring Co.) U S 2,028,858, Jan 28. An iron shell with a filling of Al is used for gage floats, etc.

Rectification of air Mark Benson Can 355,114, Jan 7, 1936. In sep. O and N from air, the air is cooled and passed through a rectifying column the top of which is at approx. -195.8° and the bottom at approx. -183° . The N condensed from the air flows downward in the column, and gaseous O flows upward.

Rectification of gases Mark Benson Can 355,115, Jan 7, 1936. Process air is rectified by cooling a primary working fluid composed of air enriched with O. A secondary working fluid mixt. of gases which do not react with one another is cooled by the first fluid, and then further cooled by compression and expansion, and brought into heat exchange with N at atm. pressure from the process air in condensers arranged in series. Liquid N and O are withdrawn from the bottom of the 1st condenser, and liquid N from the bottom of the 2nd condenser, and helium and neon from the top of the 2nd condenser.

Apparatus for the wet purification of gases Atehrs J. Hanez, Soc. anon. Belg. 407,264, Feb 28, 1935.

Apparatus for distilling gas solutions Gerald J. Horvitz Brit 436,003, Oct 3, 1935. In app. for regenerating a soln. used for scrubbing acid gases, e.g., CO₂, H₂S, by flowing down a tower heated at its lower portion and having a portion for gradually heating the soln. by recirculating regenerated hot soln. and by the evolved gases to cause its dissociation, a portion for heating the incoming soln. by evolved gases alone is superimposed on and connected with a portion for heating by recirculated hot soln., the lower heated portion completing the dissociation.

Cups for bubble-tower plates B. N. Gubrichevskii Russ 34,531, Feb 28, 1934. Construction details.

Fractional distillation of materials such as petroleum Earle W. Gard (to Union Oil Co. of Calif.) U S 2,029,528, Feb 4. A vaporizer is connected with a main fractionating column to condense and fractionate the vapors from the vaporizer, and a portion of the reflux condensate from the main fractionating column is withdrawn and transferred to an auxiliary vaporizer whence vapors pass to an auxiliary fractionating column. Overhead fractions are withdrawn from the auxiliary fractionating column and reflux condensate is transferred from it to a point in the main fractionating column lower than that where the reflux condensate is withdrawn from it. Various features of app. are described.

Heating fluids such as hydrocarbon oils to be cracked in banks of conduits connected in series. Joseph C. Alther (to Universal Oil Products Co.) U S 2,029,291, Feb. 4. App. and operative details are described. U S 2,029,292-3-4 also describe app. and operative details for heating oils for cracking.

Filtering materials Antigas Werk für Luftschutzgeräte G. m. b. H. Fr. 789,336, Oct 26, 1935. Materials, particularly for gas masks, are made by impregnating animal, vegetable, mineral or artificial fibrous material with solns. of org. substances of high mol. wt., such as resins, and then drying or pptg. the substances on the fibers and then drying.

Continuous separation of partially miscible liquids A. I. Krasul'shchikov, Russ. 37,696, July 31, 1934. The mixt. of liquids is sep'd. in a settling vessel into 2 layers, each of which is led into a sep. fractionating tower. The vapor from the top of the towers is returned to the settling vessel.

Circulatory evaporator. Emil Kirschbaum. Ger. 620,907, Oct. 31, 1935 (Cl. 12a. 2).

Evaporators and condensers in structural combination John R. Courtney and Harry Ward. Brit. 436,586, Oct 14, 1935.

Bulk evaporators comprising a vessel housing an in-

lined-tube calandria Charles McNeil Brit 436,592, Oct. 14, 1935.

Evaporating aqueous solutions such as cyanide solutions Alexander D. Macallum (to E. I. du Pont de Nemours & Co.) U S 2,029,826, Feb 4. In evap. an aq. soln. of a substance such as NaCN which tends to hydrolyze at elevated temps., the soln. is contacted with a heating device such as a steel cylinder maintained at a temp. above the b. p. of the soln., at such a rate that the soln. is substantially instantaneously evap'd to dryness before substantial decomposition occurs, the pressure during the evapn. being such that the temp. of the evapg. soln. is maintained above the temp. at which substantial hydrolysis would normally occur. App. is described.

Drying apparatus for fluids William E. More and George L. Simpson (to Pittsburgh Research Corp.). Can 355,221, Jan 7, 1936. A fluid is passed through a mass of adsorbent material to remove H₂O from the fluid. The material is heated to free the H₂O. A dry wash gas is heated and passed through the heated material to remove the H₂O. The process is repeated with the reactivated adsorbent material.

Hot air or vapor drier for flat bands, etc. G. Siempelkamp & Cie. Ger. 620,974, Oct. 31, 1935 (Cl. 82a. 25.06).

Device for drying moist suspended materials. Techno-Chemical Laboratories Ltd. Ger. 620,973, Oct. 31, 1935 (Cl. 82a. 1.02).

Filter P. D. Silin Russ. 37,690, July 31, 1934. The filter is composed of two perforated plates so arranged that the openings of one plate are opposite the solid parts of the other plate.

Filters. Siemens-Planwerke A.-G. für Kohlefabrikate (Oswald von Wartburg, inventor) Ger. 620,692, Oct. 25, 1935 (Cl. 12e. 3.02). Addn. to 618,563 (C. A. 30, 9099). The filter formed from C or graphite embedded in a plastic mass, as described in 618,563, is fired as a whole.

Filters, purifying water, etc. Victor Ricardo Torcal Ratta and Pedro I. Ondevilla Urizar. Brit. 435,543, Sept. 18, 1935. Bacterial bodies for the sterilization of H₂O and other liquids are made in 3 different ways. (1) materials, e.g., sand, kaolin, usually used for making filtering bodies are mixed with a colloidal sol of an oligodynamically active comp'd. of such a metal and the mixt. is formed into rigid filtering bodies of the desired shape, (2) rigid porous filtering-bodies are impregnated with a sol of such active colloids and coagulation of the colloidal impregnating material is produced by addn. of an electrolyte, and (3) rigid, porous filtering-bodies are introduced as a diaphragm into an electrolytic cell in which the anions of the cathodic compartment and the cations of the anodic compartment ppt. in the interior of said bodies an oligodynamically active gel.

Porous filters. Jenae Glaswerk Schott & Gen. Fr. 789,307, Oct. 28, 1935. A layer of large-grained particles of glass are agglomerated by fusion and this layer is afterward coated with a paste of finer particles of glass which is then dried and the particles agglomerated by heating. Cf. C. A. 29, 2401.

Apparatus containing porous parts I. G. Farbenind. A.-G. Fr. 789,737, Oct. 15, 1935. The porous plates, etc., of filtering or diffusion app. are made of a refractory material, such as Si or its alloys or carbides, porcelain, Zr, graphite, SiO₂, or of metals or their oxides, e.g., Fe, Ni, Cu, Ag, MgO and Al₂O₃. The nonporous part of the app. may be of glass or nonvitreous refractory material, but particularly glass known as "Suprax" and "Vitrosil." Breakage between the porous and the nonporous parts does not take place as is the case when both parts are of glass.

Rotating suction filter Maschinenfabrik Buckau R. Wolf A.-G. Ger. 620,691, Oct. 25, 1935 (Cl. 12d. 16.02).

Rotary suction filter William Rausch and John H. Fedeler, Jr. (to Underpinning & Foundation Co.) U S 2,028,949, Jan 28. Various structural, mech. and operative details.

Centrifugal filtering apparatus Seitz-Werke G. m. b. H. Fr. 789,356, Oct. 28, 1935.

Air or gas filter. Ifans E. Burkholz (to American Air Filter Co.) U. S. 2,029,406, Feb. 4. Structural details.

Filters, adapted for use in drawing off liquor from barrels. Charles D. S. Appleton. Brit. 435,510, Sept. 23, 1935.

Machine for straining or filtering liquids. Seitz-Werke G. m. b. H. and Robert Adams. Brit. 436,350, Oct. 9, 1935. The app. has a no. of sieve drums to the outside of which the liquid is supplied from a passage, the filtrate being obtained from collecting vessels inside the drums. A rotary shaft carries a plate supporting the drums, each of which has an external layer of filter material. The shaft and plate are rotated rapidly and each drum is rotated slowly on its own axis.

Oil filter. Scintilla (Soc. anon.) (Ernst Schaeren, inventor). Fr. 789,682, Nov. 4, 1935.

Filter (with a rotary stack of disks and spacers) suitable for use with oils. Walter L. Chewing (to United Engineers & Constructors Inc.). U. S. 2,029,611, Feb. 4. Structural details.

Filtering device suitable for use with engine oiling systems. James A. Matney. U. S. 2,029,078, Jan. 28. Structural details.

Filter leaf construction for use in filter tanks. Matthew F. Moran. U. S. 2,028,466, Jan. 21. Various structural details.

Stand for welding glass filter plates into the funnel. V. A. Shurenkov. Russ. 37,692, July 31, 1934. Construction details.

Centrifugal separators. Herbert Schulz. Brit. 436,895, Oct. 21, 1935. A centrifuge for sepg. solids from liquids has an inner drum on a spindle arranged at right angles to the axis of the outer rotary casing.

Centrifugal separators. National Acme Co. Brit. 436,550, Oct. 14, 1935. A separator and its driving motor are arranged vertically in sep. housings and a fractional floating connection comprising a pair of horizontal surfaces is arranged between the 2 shafts. The machine is primarily intended to sep. H_2SO_4 from distillate in the refining of crude oil.

Centrifugal separator for classifying solid particles in gases. International Precipitation Co. Brit. 436,491, Oct. 11, 1935.

Centrifugal machines. Gutehoffnungshütte Oberhausen A.-G. Brit. 436,496, Oct. 11, 1935. The hollow bodies or nozzles for the discharge of liquids from sludgy material are situated at parts of the drum wall that are at a greater distance from the axis of rotation than the other parts of the wall.

Centrifugal machines. Vickers Ltd. and Charles J. Salisbury. Brit. 436,915, Oct. 21, 1935. In a centrifuge of the kind used for the treatment of paper pulp and which discharges material from an intermediate layer in the bowl, a blade not moving with the bowl extends through the free surface of the material adjacent the outlet.

Pneumatic separators of the type in which the materials are distributed in a rising air current by a rotating plate. Ernst C. Loesche and Max Benz. Brit. 436,566, Oct. 14, 1935.

Magnetic separators. Herbert H. Thompson and Alfred E. Davies. Brit. 436,138, Sept. 26, 1935. Divided on 432,431 (C. A. 30, 331).

Gravity-separation apparatus. Frederick A. F. Crawford, Wm. A. P. Challenger and Imperial Chemical Industries Ltd. Brit. 435,615, Sept. 19, 1935. Liquid nitric esters, e. g., nitroglycerine, are sepd from acids used in their manuf. or washing liquids used in their purification by passage through a vessel fitted with a continuous baffle in the form of a strip wound edgewise and with a radial inclination around a vertical axis so that the outer edges of the turns touch or are close to the wall of the vessel.

Strainer suitable for use with aqueous or oily liquids. Howard D. Phillips. U. S. 2,028,520, Jan. 21. Structural details.

Filtering gases. Società italiana Pirelli. Brit. 435,108, Sept. 16, 1935. Auxiliary neutral granular substance is introduced into a previously formed felt of fibrous material, e. g., by depositing a layer of material on the felt and shal-

ing, or by immersing the felt in a soln. or suspension of the neutral substance. Cf. C. A. 30, 909.

Separating materials of different specific gravities. Henry M. Chance. Can. 354,170, Nov. 19, 1935. Materials of different sp. grs. are suspended in comminuted form in a liquid. The heavier materials sink to the bottom and the lighter materials continually accumulate on top. The upper portion of the light materials is forced into the atm. and discharged. Cf. C. A. 29, 1255.

Separating acetylene from gaseous mixtures. Heinrich Schilling and Robert Stadler (to I. G. Farben A.-G.). U. S. 2,029,120, Jan. 24. For sepg. C_2H_2 from a gas mix. such as one contg. a large proportion of H_2 , the C_2H_2 is absorbed in a liquefied substance such as liquefied NH_3 or SO_2 , which under atm. pressure is gaseous at 15° and condensable at a temp. above -100° .

Humidifiers for bakers' ovens or other apparatus. The Gas Light and Coke Co., Wm. Dieterichs and Peter Lloyd. Brit. 436,599, Oct. 16, 1935.

Apparatus for heating and humidifying air. Kinky C. Wright. U. S. 2,029,208, Jan. 28. Structural and operative details.

Air-conditioning apparatus. George R. Goldthwaite (to B. F. Sturtevant Co.). U. S. 2,029,368, Feb. 4. Various structural and operative details.

Air-conditioning and water-heating system. Charles O. Knudsen. U. S. 2,029,574, Feb. 4. Various structural and operative details.

Air-conditioning and water-cooling apparatus. John C. Wichmann. U. S. 2,028,814, Jan. 28. Structural, mech. and operative details.

Air-conditioning and refrigerating system. Robert E. Keyes (to Cooling & Air Conditioning Corp.). U. S. 2,030,032, Feb. 4. App. and operative details are described.

Air-cooled condensers suitable for refrigerating apparatus. Delbert F. Newman (to General Elec. Co.). U. S. 2,029,890-1, Feb. 4. Structural features.

Heat exchanger suitable for use of furnace waste gases for heating water or air. Heinrich C. Trudsen (to Liesen & Co.). U. S. 2,029,450, Feb. 4. Structural details.

Tubular heat-exchange apparatus suitable for heating water, etc. Thomas L. Murray (to Metropolitan Engineering Co.). U. S. 2,029,437, Feb. 4. Structural details.

Tube and header heat-exchange apparatus suitable for reclaiming heat from waste waters. Lmule J. Parent and John L. Krieg (to Alco Products Inc.). U. S. 2,028,471, Jan. 21. Structural details.

Conveyer for heat treating furnaces. Clarence W. Spicer. U. S. 2,028,479, Jan. 21. Structural and mech. details.

Tube and header heat-exchange apparatus. Wilbur H. Armacost (to Superheater Co.). U. S. 2,029,234, Feb. 4. Structural details.

Tube and header device for cooling engine lubricants. Edwin A. Chambers. U. S. 2,029,057, Jan. 28. Structural and operative details.

Tube and header heat exchanger or cooler suitable for use with volatile liquid refrigerants. Arthur R. Hemphill. U. S. 2,028,213, Jan. 21. Structural details.

Apparatus for exchanging heat between solid and liquid or gaseous substances. Lepol Internationale Patent-verwertungs-G. m. b. H., Ger. 620,620, Oct. 24, 1935 (Cl. 80c 14-10).

Carrying out exothermic catalytic gas reactions such as oxidation of sulfur dioxide. Joseph Bayer, Alfred Halmteier and Karl Hencky (to I. G. Farben A.-G.). U. S. 2,029,604, Feb. 4. Various operative and structural details of a tube and header app. are described.

Temperature regulation of catalytic reaction chambers or converters. Walter Pohl (to Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler). U. S. 2,028,684, Jan. 21. A fluid stream such as one of C_2H_2 and steam is continuously circulated in a closed path, a minor portion of the stream being fed to the catalyst while kept in indirect heat-exchange relation with the circulating stream, and fresh reactants are supplied to the stream to compen-

state for the portion of the stream passed to the catalyst. App. is described.

Furnace suitable for heating materials for drawing or tempering. LeRoy A. Lindberg (to Lindberg Engineering Co.) U. S. 2,029,170, Jan. 28 Various structural and operative details

Condenser with pipes and headers Herbert C. Guild. U. S. 2,029,422, Feb. 4 Structural features.

Roasting furnace with alternate fixed and movable hearths X. de Spirel Belg 407,808, March 30, 1935 Mech features

Furnace and associated apparatus for melting material for "mineral wool" manufacture, etc Lee R. Campbell U. S. 2,029,307, Feb. 4 Structural and operative details

Oil-burning apparatus suitable for furnaces Arthur E. Paige U. S. 2,029,184, Jan. 28 Structural and operative details

Apparatus for supply of fluids under pressure as in supply of compressed air under a desired pressure Max H. Sussin (one-half to Frank L. Barchard) U. S. 2,029,085, Jan. 28 Various structural, mech, elec and operative details

Pump for compressed liquefied gases such as propane or butane Claude F. Tears (to Petroleum Processes Corp.) U. S. 2,028,531, Jan. 21 Structural and operative details

Pump for viscous liquids A. S. Svistunov Russ 33,922, Jan. 31, 1934. An arrangement used in the transfer of viscous liquids, such as for example heavy fuel oil transported in railroad tanks, consists of a steam pump (a portable jacketed unit of steam engine and pump), and a steam coil for heating the liquid

Hand pump for viscous fluids such as oils Rudolph D. Maulis U. S. 2,028,912, Jan. 28 Structural details

Pump and associated apparatus for taking samples of petroleum or other liquids from tanks Augustus W. Gleason and Ernest L. Moyer. U. S. 2,029,231, Jan. 28 Structural and operative details.

Pipe suitable for conveying liquids Charles A. Hill (to Mueller Brass Co.) U. S. 2,029,424, Feb. 4 The smooth inner surface of a pipe which may be formed of Cu or brass produced by piercing, drawing or extrusion is treated with an abrasive to produce irregularities throughout the entire inner surface of the pipe, for retaining a film of liquid on the interior surface of the pipe, so that the coeff. of friction between the wall of the pipe and the mass of moving liquid in the pipe is reduced. App. is described

Apparatus for dispensing liquids R. K. Galadzh Russ 34,332, Jan. 31, 1934 Construction details

Apparatus for charging containers with inflammable liquids to a given level. A. G. Lukatzki Russ 34,331, Jan. 31, 1934. Construction details of an enclosed electric mercury switch

Apparatus for drawing samples of liquids from reservoirs L. I. Fundator Russ. 34,198, Jan. 31, 1934 Construction details.

Apparatus for drawing samples of liquids F. U. Baloushev. Russ. 34,199, Jan. 31, 1934. Construction details

Dispensing gases in liquids. Allgemeine Elektrizitäts-Ges. Fr. 789,369, Oct. 28, 1935 The gas is highly diff. with the vapor of the dispersing liquid or the vapor of a liquid miscible with the dispersing liquid.

Apparatus for bringing two liquids into intimate contact. N. V. de Bataafsche Petroleum Maatschappij. Fr. 789,632, Nov. 4, 1935. The 2 liquids flow in countercurrent in a vertical column and are beaten up by a gas to produce turbulence without preventing the counter flow. Cf. C. A. 29, 81.

Bringing different liquids into contact as in treating lubricating-oil stock with selective solvents. Robert E.

Wilson (to Standard Oil Co. of Ind.) U. S. 2,029,690, Feb. 4. Various structural and operative details are described relating to the use of a horizontal inclined app. with partitions and agitating devices, with countercurrent flow of the contacting materials and having zones for vigorous agitation and zones of relative quiescence.

Apparatus for countercurrent contact of materials such as oil stocks and selective solvents Jack Robinson (to Standard Oil Co. of Ind.) U. S. 2,029,691, Feb. 4. Various details of an inclined app. with partitioning baffles and agitators.

Countercurrent contact of materials such as oils and selective solvents such as bis(chloroethyl) ether Robert E. Wilson (to Standard Oil Co. of Ind.) U. S. 2,029,687-8, Feb. 4 Various structural and operative details of a horizontal inclined app. with internal partitions and agitating devices

Distributing and treating liquids The Sharples Specialty Co. Fr. 789,450, Oct. 29, 1935. In feeding an oil mixed with a chem. reagent, means is provided to prevent obstruction of the pipes by the viscous mud formed.

Apparatus (with a rotatable drum) for pulverizing materials such as coal in an air-swept ball mill Martin Frisch (to Foster Wheeler Corp.) U. S. 2,029,917, Feb. 4 Various structural, mech and operative details.

High-pressure joints for pressure vessels Kurt Bredtschneider U. S. 2,029,606, Feb. 4 A thin elastic ferrous metal packing ring is used having a modulus of elasticity of the order of 30,000,000, various structural details being described Various alloy steels, etc., may be used

Safety device for gas lines I. N. Maizel and N. E. Zhuravle-Prokofev Russ 34,249, Jan. 31, 1934. Construction details of a pressure release valve

Apparatus for superheating steam. Heinrich Peperhorn (to Superheater Co.) U. S. 2,029,384, Feb. 4 Structural details

Vacuumizing apparatus Thomas M. Rector (to General Foods Corp.) Can 355,195, Jan. 7, 1936 Structural details are described

Apparatus for cooling effervescent liquids Leo Samel. Can 354,498, Dec. 3, 1935 Structural details

Apparatus for solidifying carbon dioxide. Maschinenfabrik Surth Zweigniederlassung der Gesellschaft für Linde's Eismaschinen A.-G. Brit. 434,999, Sept. 12, 1935 Addn. to 404,833 (C. A. 28, 5153).

Apparatus for testing the hardness of materials. Fay H. Willey. Brit. 436,565, Oct. 14, 1935.

Impact device for testing surface finishes. Robert Burns (to Bell Telephone Laboratories, Inc.) U. S. 2,028,190, Jan. 21. Various mech and operative details.

Devices for breaking up foam in washing machines and in machines for the distillation of tar or for brewing fermented liquors. Richard Burslem. Brit. 435,489, Sept. 23, 1935.

Apparatus for cleaning pipe lines Ralph W. Howe, Robert E. Love and Joseph H. Wood, Jr. (to Atlantic Pipe Line Co.) U. S. 2,028,779, Jan. 23 Mech. and operative details.

Apparatus for use of abrasives and liquids in cleaning conduits such as beer coils Elmer O. Fessler. U. S. 2,028,972, Jan. 28. Various structural and operative details

Apparatus for washing tanks such as those used for transporting oil. William Ostling (to Pyrate Corp. of Nevada). U. S. 2,029,788, Feb. 4. Various structural, mech. and operative details

Apparatus for cleaning tanks such as those used for transporting oil. Clare Richard (to Pyrate Corp. of Nevada). U. S. 2,029,795, Feb. 4. Various structural, mech. and operative details, of an app. for cleaning tanks by jets of detergent fluid.

2-GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

Bobuslav Brauner (1885-1935) His life and works
A Dorabialka *Roczniki Chem* 15, 415-21(1935)

A Hantzsch *Fr Hein Z. Elektrochem.* 42, 1-4
(1936).—Obituary with portrait

Analysis of the dust that fell on April 26, 1928 Al St Cocosinchi
Ann ses univ Jassy 20, 116-17(1935).—

A criticism and discussion of an analysis by Cernatescu
(*C A* 26, 4511). R Cernatescu *Ibid* 173-4.—Cernatescu defends his analysis

Construction of platinum thermometers and determination of their basic points W H. Keesom and B G Dammers
Physica 2, 1071-8(1935).—The construction and calibration of 5 Pt resistance thermometers for use in the range -190° to 600° are described. The optimum annealing temp was 840° to 850°. For each of the thermometers, the value of the resistance was detd at the normal b. p. of O (taken as -182.98°, in conformity with a new detn.), the ice point, the steam point and the b. p. of S. Each of the thermometers fulfilled the following conditions $R_{100}/R_0 \geq 1.39$, $R_{100}/R_0 \geq 2.645$, $R_{100}/R_0 \geq 1.02$

Comparison of some platinum thermometers with the helium thermometer between 0° and -183° W H Keesom and B G Dammers *Physica* 2, 1080-90 (1935).—Five Pt resistance thermometers (cf preceding abstr.) (I and II, wire from Hereaus, III, wire from the National Bureau of Standards, IV, wire from Johnson and Matthey, V, wire from Hereaus), satisfying the conditions stipulated in the definition of the international temp scale, were compared with the He gas thermometer between 0° and -183°. A cryostat precise to $\pm 0.002^\circ$ is described. I, II and III agree within $\pm 0.003^\circ$, IV was not compared directly with the others but agrees with them within the reading errors of the He gas thermometer. V differs from I, II and III by $\pm 0.03^\circ$ at -183°. Between 0° and -100°, the international temp scale lies below the thermodynamic temp scale, the max difference being about 0.04° at -80°. Between -120° and -183°, the international temp scale lies above the thermodynamic scale, the max difference being about 0.01° to 0.02° at -130° to -140°

A micro method for melting-point determination Martin Mezzner and Siegfried Wehrli *Helv Chim Acta* 18, 1281-3(1935).—Because the ordinary microscopic m.p. detn. is inadequate for certain substances that sublime, a sealed tube is recommended. With a diam of 0.1-0.5 mm. only a few g is required. The sample is observed by a low-powered microscope and is heated in a Thiele tube. Values agree within 1° with those by the macro method

Rotatory dispersion of aliphatic aldehydes P A Levene and Alexandre Rothen *J. Chem. Physics* 4, 48-52 (1936); cf *C A* 27, 5598, 28, 7397, 7094, 30, 4307.—Rotatory-dispersion curves of configurationally related

aldehydes of the type $\text{HMeEtC}(\text{CH}_3)_n \text{CHO}$ ($n = 0, 1, 2$ or 3) were detd in the visible and ultraviolet regions of the spectrum. Their analysis shows (1) that the band of the aldehydic group at $\lambda 2930$ is rotatory active and (2) that the sign of its contribution in the first member ($n = 0$) is opposite that of the higher members and (3) that the magnitude of that contribution varies periodically with n , the no. of C atoms between the aldehydic group and the asym. C atom.

Magnetochemical investigations XVIII $\text{K}_2(\text{B}_2\text{H}_4)$ and $\text{K}_2(\text{B}_2\text{H}_4)(\text{OH})_2$ Li Klemm and Wilhelm Klemm *Z anorg allgem Chem* 225, 258-61(1935), cf *C A* 30, 3397.—To decide whether the salt-like product formed by addn of an alkali metal to B_2H_4 , having the empirical formula KBH_4 , gives $(\text{BH}_4)^-$ or $(\text{B}_2\text{H}_4)^{2-}$ ions, magnetic measurements were made at temps from 90° to 353°K

These show that the compd is diamagnetic. Hence, according to the theoretical considerations outlined, the ions are overwhelmingly $(\text{BH}_4)^-$. Measurements at room temp indicate that the second compd is diamagnetic and hence has the formula $\text{K}_2(\text{B}_2\text{H}_4)$.

XIX The magnetic properties of potassium polyoxide and polysulfide Wilhelm Klemm and Heinrich Sodomann *Ibid* 273-80.—The susceptibilities of 3 preps of K_2O were measured at 20° , -78° and -183° . Analysis of the results indicates that it is not possible to decide from magnetic measurements whether the highest oxide of K has the formula KO_2 or K_2O_4 . Measurements were made on K_2S , K_2S_2 , K_2S_3 and K_2S_4 at room temp and at -183° . These compds were all diamagnetic at room temp. At low temps K_2S_3 showed certain peculiar effects and appeared to be ferromagnetic below -50°

Magnetochemical investigations of organic substances IV. The magnetic behavior of free radicals Eugen Muller, Ilse Muller-Rodloff and Wilhelm Bunge *Ann* 520, 235-55(1935), cf *C A* 30, 3367.—The extent and the heat of dissociation of free radicals can be calcd from their measured magnetic susceptibility. The compd of Kenyon and Banfield (*C A* 20, 2837) follows Currie's law, as do di- β -amylnitrogen oxide ($\text{MeOC}_4\text{H}_9\text{N}$) and α,α -diphenyl- β -trimethylphenylhydrazyl, $\text{Ph}_2\text{N-N-C(CH}_3)_2(\text{NO}_2)$. Tribenzylmethyl (I) forms an addn product (II) with 1 mol PhI , which decomposes at 160° . I and II show a magnetic susceptibility corresponding to complete dissociation into free radicals. V The magnetic behavior of porphyrins and porphyrindine Eugen Muller and Ilse Muller-Rodloff *Ibid* 521, 81-9.—The paramagnetic susceptibility of porphyrindine (III) was detd, from 90° to 294°K , leading to a value of $\Delta = -6 \pm 5$, as against $\Delta = -12^\circ$ reported by Kuhn, Katz and Franke (*C A* 29, 2173). The magnetic factor is constant, showing that III behaves normally. Measurements on porphyrindine from 90° to 348°K agree with the above authors' from 273° to 343° , but show at low temps a sharp deviation from Weiss' law. This deviation can be accounted for quantitatively by the assumption of an equilibrium between a paramagnetic (A) and a diamagnetic (B) form.

W W Stiller

Magnetochemical investigations of organic substances IV. The magnetic behavior of free radicals Eugen Muller, Ilse Muller-Rodloff and Wilhelm Bunge *Ann* 520, 235-55(1935), cf *C A* 30, 3367.—The extent and the heat of dissociation of free radicals can be calcd from their measured magnetic susceptibility. The compd of Kenyon and Banfield (*C A* 20, 2837) follows Currie's law, as do di- β -amylnitrogen oxide ($\text{MeOC}_4\text{H}_9\text{N}$) and α,α -diphenyl- β -trimethylphenylhydrazyl, $\text{Ph}_2\text{N-N-C(CH}_3)_2(\text{NO}_2)$. Tribenzylmethyl (I) forms an addn product (II) with 1 mol PhI , which decomposes at 160° . I and II show a magnetic susceptibility corresponding to complete dissociation into free radicals. V The magnetic behavior of porphyrins and porphyrindine Eugen Muller and Ilse Muller-Rodloff *Ibid* 521, 81-9.—The paramagnetic susceptibility of porphyrindine (III) was detd, from 90° to 294°K , leading to a value of $\Delta = -6 \pm 5$, as against $\Delta = -12^\circ$ reported by Kuhn, Katz and Franke (*C A* 29, 2173). The magnetic factor is constant, showing that III behaves normally. Measurements on porphyrindine from 90° to 348°K agree with the above authors' from 273° to 343° , but show at low temps a sharp deviation from Weiss' law. This deviation can be accounted for quantitatively by the assumption of an equilibrium between a paramagnetic (A) and a diamagnetic (B) form.

V The magnetic behavior of porphyrins and porphyrindine Eugen Muller and Ilse Muller-Rodloff *Ibid* 521, 81-9.—The paramagnetic susceptibility of porphyrindine (III) was detd, from 90° to 294°K , leading to a value of $\Delta = -6 \pm 5$, as against $\Delta = -12^\circ$ reported by Kuhn, Katz and Franke (*C A* 29, 2173). The magnetic factor is constant, showing that III behaves normally. Measurements on porphyrindine from 90° to 348°K agree with the above authors' from 273° to 343° , but show at low temps a sharp deviation from Weiss' law. This deviation can be accounted for quantitatively by the assumption of an equilibrium between a paramagnetic (A) and a diamagnetic (B) form.

W W Stiller

Magnetochemical investigations of organic substances IV. The magnetic behavior of free radicals Eugen Muller, Ilse Muller-Rodloff and Wilhelm Bunge *Ann* 520, 235-55(1935), cf *C A* 30, 3367.—The extent and the heat of dissociation of free radicals can be calcd from their measured magnetic susceptibility. The compd of Kenyon and Banfield (*C A* 20, 2837) follows Currie's law, as do di- β -amylnitrogen oxide ($\text{MeOC}_4\text{H}_9\text{N}$) and α,α -diphenyl- β -trimethylphenylhydrazyl, $\text{Ph}_2\text{N-N-C(CH}_3)_2(\text{NO}_2)$. Tribenzylmethyl (I) forms an addn product (II) with 1 mol PhI , which decomposes at 160° . I and II show a magnetic susceptibility corresponding to complete dissociation into free radicals. V The magnetic behavior of porphyrins and porphyrindine Eugen Muller and Ilse Muller-Rodloff *Ibid* 521, 81-9.—The paramagnetic susceptibility of porphyrindine (III) was detd, from 90° to 294°K , leading to a value of $\Delta = -6 \pm 5$, as against $\Delta = -12^\circ$ reported by Kuhn, Katz and Franke (*C A* 29, 2173). method of measurement of the dissociation of hexaaryl-ethanes *Ibid.* 89-94—The degree of disocn and the disocn const of hexaphenylethane are calcd from measurement of the magnetic susceptibility of its solns. The degree of disocn is slightly lower than that found by optical methods, while the heat of disocn is the same.

George Calincaert

The effect of silicic acid on the magnetic properties of dissociated mixtures with iron oxide. W. Lettkebel and K. Bockemuhl *Z. anorg. allgem. Chem.* 225, 209-12 (1935)—Eleven mixts of FeO , Fe_2O_3 and SiO_2 in varying proportions were heated to different temps (from 1000° to 1600°) and the ratio $\text{Fe}_2\text{O}_3/\text{FeO}$ in each of the end products was detd analytically. The temp at which the magnetism disappeared was also detd. To a first approximation the addn of SiO_2 produced little effect on the magnetic properties. The results are presented in both tabular and graphic form and are correlated with the work of White, Graham and Hay (*C. A.* 29, 4712*) on the disocn of the $\text{Fe}_2\text{O}_3\text{-FeO}$ system, and the magnetic investigations of Kleffner and Kohlmeier (*C. A.* 26, 4005).

W. W. Stiller

Surface magnetization and block structure of ferrite. W. C. Flmore and L. W. Keehan *Am. Inst. Mining Met. Engrs., Inst. Metals Div., Tech. Pub. No. 656*, 15 pp. (1935). cf. *C. A.* 28, 7090*.—Surface magnetization of polished ferrite crystals with or without Si was investigated, the magnetic-powder method was used. The use of a true colloid of $\gamma\text{-Fe}_2\text{O}_3$ in water improved the powder technic. The maze-like patterns, and the changes in these patterns brought about by suitably changing the magnetizing field, led to the proposal of a block model of cubes spontaneously magnetized along $\langle 100 \rangle$ or $\langle 110 \rangle$ axes. A study of patterns on various cuts of the same crystal gave addnl evidence for this structure. The size of the cubes varied from 0.5μ to 3μ , depending on the particular crystal. The stability of the secondary magnetic structure with respect to the polishing procedure adopted and to magnetic history was shown. It was suggested that the segregation of foreign atoms may account for the observed stability of the block boundaries.

C. L. Mantell

Magnetic rotatory power and dispersion of alkali mercuritetratiodides. René Lucas and Fernand Gallais *Compt. rend.* 202, 129-31 (1936); cf. *C. A.* 29, 2874*.—The exceptionally high values of Verdet's const. and of the dispersion for K_2HgI_4 are due to a very strong absorption band starting from λ 2900.

C. A. Silberrad

The magnetic susceptibility of organic liquids. Application to the additivity law. Constantin Silceanu and Dumitru Gheorghiu, *Bull. soc. roumaine phys.* 36, 77-81 (1934), cf. *C. A.* 29, 1693*.—Mixts of Me_2CO with PhNO_2 and with α -methyl-naphthalene obey the additivity law. Deviations in other cases may be accounted for by a chem. change.

R. L. DeRight

Magnetic susceptibility of alkali and alkaline earth halides. Ulrich Viel *Ann. Physik* 24, 697-713 (1935).—The susceptibilities of the alkali and alkaline earth halides, and of HCl , HBr and HI , in aq. solns were measured for various concns. at room temp and reduced to 20°. For most of the solns, χ concns up to 25% by weight were studied, and for KI the max. concn was 57%. In all cases the susceptibility is a linear function of the concn as required by the Wiedemann additive law. From the results on solns the susceptibilities of the salts and of the ions are calcd. and the results are compared with those of other investigators. The variation of the susceptibilities of NaCl and KI solns with temp. was investigated in the region 0° to 50°. Various points of theoretical interest, such as the dependence of the susceptibility of an ion on its nuclear charge no., are discussed.

W. W. Stiller

Ferromagnetic conversion and catalytic activity. IV. Hydrogenation of carbon monoxide and ethylene over nickel and carbon dioxide formation from carbon monoxide over the Heuser alloy, NiAlCu , J. Arvid Hedvall and Rune Hedlin, *Z. physik. Chem.* B30, 280-8 (1935), cf. *C. A.* 30, 360*.—The rates of the reactions change discontinuously at the Curie point when the ferromagnetic prop-

erties of the catalyst disappear. A com. thermal cond. app (cf. *C. A.* 26, 5272) was used successfully for analysis of the CO-CO_2 mixt.

G. M. Murphy

Behavior of an ion cloud about a bipolar molecule under the influence of an alternating field. Shōten Ōka, *Proc. Phys.-Math. Soc. Japan* 17, 454-66 (1935) (in German).—Math. The ionic cloud about a bipolar mol under the influence of an external alternating elec. field (of frequency ω) was studied from the standpoint of the Debye, 2 interionic theory. Because of the final relaxation time θ the ion cloud has a moment of rotation, which the central dipole decreases in its rotary path, entirely analogous to the decrease of the relaxation energy of the central ion in its path. The moment acts in the sense of a diminution of the dielec. const. of solns. of electrolytes and vanishes for high values of ω .

G. M. Petty

Dielectric loss characteristics of a chlorinated biphenyl. Willis Jackson, *Proc. Roy. Soc. (London)* A153, 158-66 (1935), cf. *C. A.* 29, 4945*.—Dielec. power factor-temp. curves are given for a chlorinated biphenyl (about 4 Cl per mol) for 8 frequencies between 50 and 10^7 cycles per sec at temps from -15° to $+80^\circ$. The temp of the max. power factor (about 21.5% in each case) increases from -5° for 50 cycles to $+40^\circ$ for 10^7 cycles and the curves are so sharp that a 20° change in temp. reduces the power factor to less than 1% so that max. dielec. const. and low dielec. loss can be attained by suitable choice of temp. and frequency. The results are discussed in terms of the Debye theory. There can no longer be doubt that the necessary conditions for the appearance of a Debye power factor max. at frequencies as low as 50 cycles can arise at normal temps.

Janet F. Austin

Electrical investigation of solutions of stearamide in paraffin wax. W. Jackson and F. C. Frank, *Trans. Faraday Soc.* 31, 1700-6 (1935), cf. *C. A.* 29, 4985*.—A series of power factor measurements was made on dil. solns of stearamide in 57-60° paraffin at frequencies 2.7×10^4 to 1.35×10^7 cycles/sec over the temp. range $0-80^\circ$. D. c. cond. measurements were made in this range. The results are interpreted by assuming the presence in soln. of polar groups of about 10 stearamide mols in a group, probably in the form of liquid crystals. The groups appear capable of adsorbing ionized impurities.

C. E. P. Jeffreys

Field strength and frequency dependence of dielectric constants of anisotropic liquids. W. Kast, *Physik Z.* 36, 809-73 (1935).—The results of Jezewski, cf. *C. A.* 23, 25, on *p*-azoxyanisole were analyzed. The decrease of dielec. const. with increasing field strength shows a sat. value well above the optical value. Only a mean moment of the large mol. groups is concerned. The dipoles inside the groups remain sufficiently movable to give only partial orientation on polarization. Increasing frequency as well as field strength must be taken into account in consideration of the decrease of dielec. const.

C. E. P. Jeffreys

Dielectric coefficients of volatile compounds of fluorine and boron. K. L. Ramaswamy, *Proc. Indian Acad. Sci.* 2A, 364-77 (1935).—The dielec. coeffs of CF_4 , NF_3 , CHF_3 , $(\text{CF}_3)_2\text{N}$, B_2H_6 and $\text{B}_2\text{N}_2\text{H}_4$ (in the vapor state) were measured at different temps. to obtain the values for their elec. moments, the values being 0, 0.21, 1.59, 0.46, 0 and 0.67×10^{-18} , resp. Compressibilities at ordinary temp. were measured accurately by refractometric studies and approx. at low temps. by studying variations of dielec. coeff. The significance of the moments is discussed.

L. L. Quill

Electric moments of *p*-quinone and related compounds. D. L. Hammick, G. C. Hampson and G. I. Jenkins, *Nature* 136, 990-1 (1935).—Elec. moments were detd for *p*-benzoquinone in C_6H_6 , CCl_4 and C_6H_5 solns., and for 2,5-dimethyl-1,4-quinone, 2,6-dichloro-1,4-quinone and tetramethylcyclobutane-1,3-dione in C_6H_6 soln. The values were all in the range $0.64-0.73 \times 10^{-18}$ e. s. u. These values are anomalous in view of the sym. structure usually assigned to these compds. and may be due to solvent effect or to an abnormally large atom polarization.

G. M. Petty

The conductivity of calcium, strontium and barium

chlorides in anhydrous glycerol. J. Szper and Z. Gajewski. *J. chim. phys.* 32, 705-14 (1935).—See C. A. 29, 6127.

The electric conductivity of metallic vapors under pressure. Werner Braunbek. *Z. Physik* 97, 482-95 (1935).—On the basis of Bloch's theory of elec. cond. the cond. of a metallic vapor and its dependence upon p can be estd approx. Vapors of Hg and K were measured. Values found for K vapor are at 1200° $10^{-10} \Omega^{-1} \text{cm}^{-1}$ at a pressure of 1 atm and $10^{-11} \Omega^{-1} \text{cm}^{-1}$ at 10 atm. Possible existence of metallic cond. at higher pressure is not completely excluded by the expts. The evidence obtained from Hg up to 35 atm and on K up to 10 atm was, however, neg. In Hg the metallic cond. amounted to less than $10^{-11} \Omega^{-1} \text{cm}^{-1}$ and in K to less than $10^{-12} \Omega^{-1} \text{cm}^{-1}$. The lower limit of measurement was detd. by thermal emission and ionization effects. S. Tolansky

Electric conductivity of alkali metal flames. Willy Kisselmann and A. Becker. *Ann. Physik* 25, 49-73 (1936).—The cond. of illuminating gas-air- N_2 flames alone, and contg. chlorides of Li, Na, K, Rb and Cs injected in soln. in known amts, was measured with precision in the range 1250-1950°K. The temp. variation of cond. of the pure flame corresponds to an av. of 2.50 v. for the formation of current carriers. For injected flames the cond. is proportional to the square root of the total metal concn. of the flame. The temp. variation of cond. does not change with concn. of metal in the range studied (10^{-4} - 10^{-2} normal). A complete theoretical explanation of the variation of cond. with the nature of the alkali metal is not possible, however, the approximation of expt. to theory is better, the higher the temp. and thus the more complete the dissociation into free metal atoms.

C. D. West
Comparative measurements of the conductivity of the Bunsen flame with direct and alternating currents. H. Ullmann. *Z. Physik* 97, 496-510 (1935).—The resistance of a condenser in the Bunsen flame is measured for an oscillation frequency $1.50 \times 10^6 \text{ sec}^{-1}$ and the cond. calcd. This is compared with the value given by d-c methods. The a-c method attains the same degree of accuracy as the d-c method. Conclusions are drawn regarding how far the disturbances produced by the electrodes reach into the condenser. Values are given for the flame cond. with a pure flame and with one contg. Na_2CO_3 .

S. Tolansky
Superconductivity in the light of accepted principles. H. Grayson Smith. *Trans. Roy. Can. Inst.* 20, 305-33 (1935). cf. C. A. 30, 666.

The Joule-Thompson effect of methane, nitrogen and mixtures of these gases. John H. Perry and Carl V. Hermann. *J. Phys. Chem.* 39, 1189-95 (1935).—The Joule-Thompson coeffs. of CH_4 and N_2 are calcd. for the temps. 200° , 250° , 300° , 350° and 400° K. and the pressures, 1, 5, 25, 50 and 100 atms, with the use of the Beattie-Bridgeman equation of state. A method is indicated for obtaining the coeffs. for mixts. of gases from those of the pure gases. Data are tabulated for 3 mixts. of CH_4 and N_2 .

L. E. Steiner
P-V-T relations of gaseous mixtures. E. R. Guldland. *Ind. Eng. Chem.* 28, 212-15 (1936).—The slope of the isometric of a mixt. can be calcd. by the molal av. of the slopes of the isometrics of the pure constituent gases, all measured at the same molal concn. This rule, together with a method for estg. the internal pressure, furnishes a means of predicting the P-V-T properties of the mixt. For the 3 gaseous mixts. given, the predicted values agree better with exptl. data than do values calcd. from Amagat's or Dalton's law, and is probably within the exptl. error of the data. The 3 mixts. were $A-C_2H_6$, H_2 -CO and CH_4 - N_2 .

F. L. Browne
Isotherms of carbon dioxide between 0° and 150° and pressures from 16 to 250 atmospheres (Amagat densities 18-206). A. Michels and Mrs. C. Michels. *Proc. Roy. Soc. (London)* A153, 201-14 (1935).—The Amagat d_s and the p_0 values for the isotherms of CO_2 between 0° and 150° , at pressures from 16 to 250 atms are tabulated and ex-

pressed mathematically. In this range the sp. heat, c_p , increases with d . L. E. Steiner

Isotherms of carbon dioxide between 70 and 3000 atmospheres (Amagat densities between 200 and 600). A. Michels, Mrs. C. Michels and H. Wouters. *Proc. Roy. Soc. (London)* A153, 214-24 (1935); cf. preceding abstr.—Tables in the previous paper are extended to include the values for pressures up to 3000 atm. The sp. heat, c_p , of CO_2 increases with d . to a max. at $d = 226.7$ Amagat units, then decreases and passes through a min. at d between 390 and 460 Amagat units.

L. E. Steiner
Theory of the equation of state. Satyendra Ray. *Kolloid-Z.* 73, 269-72 (1935); cf. C. A. 26, 1172—A modified Dieterici equation $y = k + ax$, where $y = \log(p_0/dT)$, $k = \log_e(R/M)$ and $x = 1/p_0T$ ($d = d$, $R = \text{mol. gas const.}$ and $M = \text{mol wt.}$) was applied to H_2O and HCl in the vapor phase only and to NH_3 , $EtOH$ and bromobenzene in the liquid and vapor phases. At conditions far removed from the crit. point, the $y-x$ curve is a straight line for both liquid and vapor; near the crit. point it is a hyperbola, showing that d is not const. in this region. The $y-x$ curve for water vapor shows a marked discontinuity in the region of 2.5 atm. and 115° .

Oscar T. Quimby
The theory of liquids. V. T. S. Wheeler. *Proc. Indian Acad. Sci.* 2A, 466-76, cf. C. A. 29, 6810.—The derivation and application of the principal equations of the theory are outlined together with the method of calcn. of the properties of a liquid if the temp. and the fundamental properties of the mol are known. J. E. Austin

Vapor pressure of certain glycols. O. J. Scherholts and M. L. Staples. *J. Am. Chem. Soc.* 57, 2709-11 (1935).—The vapor-pressure curves over the range 10-760 mm. were detd. for ethylene, 1,2-propylene, 1,3-propylene, 1,3-butylene and 2,3-butylene glycols. With the exception of $(CH_2(OH))_2$, all data are reported for the 1st time. The d_s and w_p are given for all compds. and in addn. the methods for the prepn. of 1,2-butylene and 2,3-butylene glycols are described. H. W. Leach

Vapor pressures of some alkyl sulfides. H. W. Thompson and J. W. Linnett. *Trans. Faraday Soc.* 31, 1743-7 (1935).—Vapor-pressure curves for $EtHS$, Me_2S , Et_2S and $EtMeS$ were detd. The $\log p$ - $1/T$ curves were satisfactory straight lines. The b ps (760 mm) and heats of vaporization were found to be Me_2S , 37° , 6910 cal; $EtMeS$, 65° , 7250 cal; Et_2S , 91.4° , 8000 cal; $EtHS$, 33° , 6860. Estn. of the Trouton const. indicates that tho ethers and thio alcs are normal unassoc. liquids.

C. E. P. Jeffreys
The accuracy of viscosity measurements by the Engler method. F. H. Garner and W. E. J. Broom. *Rev. Petroliere No.* 647, 1204-5 (1935); *J. Inst. Petroleum Tech.* 22, 27-31 (1936).—Engler viscometers are less accurate than those by Redwood and Saybolt. This is due to the unsatisfactory official German standardization methods, whereby viscometers having deviations amounting to $\pm 2\%$ are passed.

A. A. Boebling
The viscosity of deuterium oxide and its mixtures with water at 25° . Grinnell Jones and Holmes J. Fornwall. *Phys. Rev.* 44, 30-3 (1938).—The viscosity and d of H_2O - D_2O mixts. are related by the equation $\phi = 1/\eta = 1 - 2.00855(\Delta s) + 3.1122(\Delta s)^2$; ($\Delta s = d_{11}^2 - 1$). Bingham's equation for additive fluidities has the form $\phi = 111.94 + 15.611b - 36.538a$, and a and b are the vol and wt fractions of D_2O , resp. The 2 equations agree with the data to 0.006 and 0.01%, resp. The La Mer-Baker formula relating mole fraction to sp. gr. (C. A. 29, 900) is corrected for the D_2O in ordinary water. If it is assumed $w_{H_2O} = 0.8937$ centipoises, at 25° $w_{D_2O} = 1.0092$, $\phi_{H_2O} = 90.957$ rebs.

G. M. Petty
Determination of the ultrasonic velocity in fifty-two organic liquids. S. Parthasarathy. *Proc. Indian Acad. Sci.* 2A, 497-511 (1935).—The ultrasonic velocities at 7.32×10^6 cycles per sec. were detd. for 52 org. liquids and water at $23-4^\circ$ by the method of diffraction of light by ultrasonic waves. The velocity of sound in aromatic compds. is higher in general than in the corresponding al-

phatic compounds although the d_s of the aromatic compounds are higher. Cyclohexane and its derivatives come midway between the two classes. The velocity of sound in liquids of high d_s is not as low as the increased d_s would suggest. The effect of increased d_s is offset by a diminution of compressibility. Liquids with mols having high elec moment (e.g., alcs, ketones and water) have higher velocities of sound. Lengthening of the mol increases the velocity. The iso alcs show lower velocity than the normal. Adiabatic compressibilities for all the liquids are calcd.

Janet E. Austin
The stabilization of the color of fufural. N. Chetverikov and M. Lifshitz. *Maslobolno-Zhivoe Delo* 1934, No. 6, 39-40.—The addn of pyrogallol (1:1000 and 1:5000) or satd. solns of NaCl and Na_2CO_3 stabilizes the color of fufural for 6-12 months. E. Bielous.

Liquid crystals of some cholesterol compounds, and their crystalline superfusion. Paul Gaubert. *Compt. rend.* 202, 141-3 (1936), cf. *C. A.* 30, 992.—Resorcinol, pyrogallol, p -nitrophenol (but not m - or o -), salicin, erythritol, phlorizin, saccharin, isosaccharin, rhamnose and atropthalic and acetic acids also form liquid crystals when melted with cholesterol. Ordinarily on cooling such liquid crystals pass into the solid crystal form at a definite temp, but in some cases, and especially if one component is in large excess and cooling is rapid, they form a solid, sometimes as hard as gypsum, which retains the optical properties of the liquid crystal. On reheating this may either pass into the crystal form, or simply reform the liquid crystal. C. A. Silberry.

Plasticity of bismuth. W. F. Berg and L. Sandler. *Nature* 136, 915 (1935).—By use of the method of Andrade and Roscoe (*Proc. Intern. Conference on Physics* 2, 176 (1934)) crystals of Bi were grown *in vacuo*, in N, in H and in CO_2 . Under all conditions some crystals were soft and so the hypothesis of Berg (*C. A.* 29, 4933) that gas was responsible for the softness is withdrawn. The hardness of Bi crystals obtained by the Bridgman method is tentatively explained as strain hardening. The soft crystals are therefore believed to exhibit the true behavior of Bi (including plasticity). Oden E. Sheppard.

The change of electric resistance and reflecting power of metal mirrors condensed at low temperatures. R. Suhrmann and G. Barth. *Physik Z.* 36, 843-5 (1935).—The resistance of Cu, Ag, Cd, Ti and Pb mirrors prep'd by vaporization of the metals on plates kept at 20° or 80° abs decreased on warming to room temp and the light-reflecting power increased. Bi mirrors showed an increase in resistance on warming. This change in resistance indicates an increase in ordered arrangement into lattices.

C. E. P. Jefferys
The coefficient of expansion of silver iodide and of the halides of thallium. Grinnell Jones and Frederick C. Jelen. *J. Am. Chem. Soc.* 57, 2532-6 (1935).—By use of a special dilatometer the coeffs. of expansion of AgI, TlCl, TlBr and TlI were det'd at 20°, 30°, 40°, 50° and 60°. The value for AgI is -0.016×10^{-4} and is independent of temp. throughout this range. The thallous salts have pos coeffs. increasing as temp. increases. Coeffs. of Pyrex glass and toluene of 9.85×10^{-6} and 1.111×10^{-4} , resp., were also obtained. The assembly also functions as a thermostat regulator, thus simplifying temp. control.

R. H. L.
Structural changes taking place upon aging of freshly prepared crystalline precipitates. V. The thermal aging of freshly prepared lead sulfate. I. M. Kolthoff and Charles Rosenblum. *J. Am. Chem. Soc.* 57, 2573-7 (1935); cf. *C. A.* 29, 4987.4.—A sepn. of microscopic aging (sintering) from internal aging was made by following the former by adsorption of wool violet and the latter by the speed of distribution of Th B through freshly ppt'd PbSO_4 . Between 100° and 200° and for short periods at 305° there was indication of a small but definite increase of external surface. Sintering does not occur below 250°; it becomes pronounced only at 400°. Internal aging occurs at much lower temps with an incubation period. A discussion of thermal aging follows. Aging was greater at 250° than at 300° or even 400°. This was shown to be

due to H_2O . VI. Perfection and aging of lead sulfate precipitated under various conditions. *Ibid.* 2577-9 (1935).—The effect of varying the conditions of pptn. of PbSO_4 upon perfection and speed of aging of the resulting crystals was studied with the wool violet and Th B treatment. The greater the concn. of reactants the larger is the surface of the ppt. Greater perfection of crystals occurs at lower concns. of reactants. Concn. effects are greater with regard to perfection than those of temp.

R. H. Lambert
Experiments on piezoelectricity. Gilbert Greenwood. *Z. Krist.* 91, 235-42 (1935) (in English).—To test cases of doubtful piezoelectricity, especially where pyroelectricity has supposedly been found, a more delicate app. was devised, based on the method of Giebe and Scheibe (*C. A.* 19, 3207). The results were: picric acid, Na citrate , $\text{C}_2\text{H}_4\text{O}_2$, topaz, $\text{Li}_2\text{BeF}_4 \cdot \text{H}_2\text{O}$, $\text{ZnBeF}_4 \cdot 7\text{H}_2\text{O}$, $\text{C}_2\text{H}_4(\text{NH}_2)_2$, H_2SO_4 , m -bromocyananilide, wulfenite, AgNO_3 , iodoform and $\text{KAg}(\text{CN})_2$, all were neg; Li_2SO_4 , $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$, 1-chlor-2,4-dinitrobenzene, santonine, brucine, m -chlorocyananilide and methylurea were pos. Of 2 scapolites from Burma, a colorless crystal was pos, and a pink one neg.

L. S. Ramsdell
The optical anisotropy of molecular crystals as illustrated by some oxalates. Sterling B. Hendricks and W. Edwards Deming. *Z. Krist.* 91, 290-301 (1935) (in English), cf. *C. A.* 29, 7735.—The optical anisotropies of some oxalate crystals are accounted for by the anisotropy and orientation of the oxalate group in the various lattices. Mol. interaction is serious only in the presence of highly polarizable ions. L. S. Ramsdell.

Twin formation of crystals with irrational surfaces. D. B. Cogoboridze. *Physik Z. Sowjetunion* 8, 208-11 (1935).—Twin formation in crystals occurs as commonly with irrational as with rational surfaces. It is thought that the mech. deformation of the crystal governs its type of growth. Helen S. Hopfield.

Oxidation of a crystal surface studied by means of cathode-ray reflection. Tasaburo Yamaguchi. *Proc. Phys.-Math. Soc. Japan* 17, 443-53 (1935) (in English); cf. *C. A.* 29, 2842.—The effects of oxidation and of etching of cleaved surfaces of zinc blende on the reflection of cathode rays were investigated. Analysis of Laue diagrams shows that the oxidized product (ZnO) is a single crystal, so oriented that its (103) plane rests on the cleaved (110) surface of ZnS , the [010]-axis of ZnO is parallel to the [110]-axis of ZnS . By taking into consideration the temp. effect in Waller's sense (Theoretische Studien zur Interferenz- und Dispersions-theorie der Röntgenstrahlen, *Dres., Uppsala*, 1925) a new interpretation is given of the formation of the N-pattern. G. M. Pettv.

Law of corresponding states of lattice recovery. J. A. M. van Liempt. *Chem. Weekblad* 32, 546-50 (1935).—The hypothesis of lattice recovery by nucleus formation (*C. A.* 21, 3333) has been confirmed repeatedly (van Arkel, *C. A.* 24, 5007). In the recovery of a deformed crystal by heating, time as well as temp. is involved. If the increased energy of a deformed metal is taken proportional to the increased elec. resistance, R_d (the normal resistance is R_0), the degree of deformation will be $\beta = (R_d - R_0)/R_0$ at 0°. By taking a characteristic temp. t from $R_d = R_0(1 + \alpha t)$ it follows that $t = \beta/\alpha$ and the excess energy of the deformed state $\Delta E = Mc\beta/\alpha$ with c the sp. heat. Using $Mc = 8$, $\alpha = 0.005$ (Tammann value) gives $E = 1200 \beta$. The mean time for exchange of place of atoms is smaller for deformed metals than for normal ones by a factor $e^{4.33/\beta}$; for Cu with $\beta = 6$ the ratio of mean times is 1/400. This decreased time of place exchange causes the tendency to nucleus formation (Cohen, *C. A.* 29, 4714). By heating a deformed metal for a period longer than the mean time mentioned as depending on the local degree of deformation β , it will recover in the corresponding locations. For abs. temp. T , time θ secs. a relation $T \log \theta + 4.9 = \text{const.} = T(13.5 + 1.9 \log \theta)$ holds, in which ν is the period of vibration of an atom and indicates the relation between T and θ required for the recovery of the metal. Per 1% increase in abs. temp. the rate of place exchange increases 36%.

This law holds also for recrystn. if β is taken as a mean degree of deformation for the entire lattice. The equation is well borne out by data of Mathewson and Phillips (*Trans Am Inst Min Met Eng* 54, 608(1917); cf *C A* 10, 1157), of Moore and Beckinsale (*C A* 16, 324) and of Karnop (*C A* 24, 3157). In all cases the $T - \theta$ data gave a const T ($\log_{10} \theta + 13.43$), the const. decreases with increase of β . At room temp for deformed Cu the recovery requires 80,000 yrs, at 200° 1,000 secs, for deformed Al 23 yrs at 27°. Such values are of importance for structural use of alloys. B. J. C. v. d. H.

The structure and entropy of ice and of other crystals with some randomness of atomic arrangement Linus Pauling *J Am Chem Soc* 57, 2680-4(1935).—It is assumed that each mol. of ice is surrounded by 4 others, oriented so as to direct its H atoms toward 2 of the neighboring mols, forming H bonds, and that only one H atom lies near the O-O axis. There are $(\frac{1}{2})^N$ N configurations for N mols, giving a residual entropy of 0.805 e. u., agreeing well with the exptl value 0.87 e. u. The structures and entropies of the following crystals are discussed: diaspore, lepidocrocite, pyrrhotite, muscovite, formic acid, $\gamma\text{Al}_2\text{O}_3$, $\gamma\text{Fe}_2\text{O}_3$, AgI, NaBr, CaBr₂ and the cubic tungsten bronzes. Twenty-two references. Victor Hicks

The crystal structure of ice at low temperatures F. I. Burton and W. I. Oliver *Proc Roy Soc (London)* A153, 166-72(1935), cf *C A* 29, 3572¹.—X-ray diffraction patterns were prepd by the Debye-Scherrer method. When ice is formed at temps $T_1 > -80^\circ$, the usual hexagonal structure crystallizes; for $-80^\circ > T_1 > -110^\circ$, crystals grow only along certain planes, and for $T_1 < -110^\circ$, a glassy state occurs. Glassy ice formed at T_1 changes rapidly to senocryst ice when heated to T_2 . Structures formed at T_2 are maintained when cooled to T_3 . Victor Hicks

The structure of ice II Ronald L. McFarlan *J. Chem. Physics* 4, 60-4(1936).—The high pressure forms of ice discovered by Tammann and Bridgman (*C A* 29, 2040¹) have a brief period of stability at very low temps and at atm pressure. This makes it possible to obtain x-ray powder diffraction photographs of these forms. Ice II has a side-centered orthorhombic cell with $a = 7.80 \text{ \AA}$, $b = 4.50 \text{ \AA}$ and $c = 5.56 \text{ \AA}$, it contains 8 mols, has the symmetry of space group $V_6^2C_{22h}$, and $d = 1.21$. The transition I \rightarrow II breaks up the H_2O mol, ice II is an ionic crystal. The pressure of 2100 atm (used to form ice II) causes (1) a 3% decrease in the packing vol. of the O ion, (2) a breakdown of the ice I structure by a slipping of the O ion layers relative to each other, (3) a 4-coordinated structure where each O is surrounded by a badly distorted tetrahedron of O ions. G. M. Petty

Glass XII Some new heat capacity data for organic glasses The entropy and free energy of di-lactic acid Geo S. Parks, S. Benson Thomas and Donald W. Light *J. Chem. Physics* 4, 64-9(1936); cf *C A* 28, 6618¹.—Heat capacity was measured by the Nernst method upon secondary BuOH (from 102.8 to 281.7°K.) and 3 methylhexane (71.1-289.2°K.), in the glassy and liquid conditions, and upon di-lactic acid (1) in an incompletely crystd state (90-300°K.), (2) in the form of an acid glass and liquid (103.5-303.0°K.) and (3) in the form of a mixed glass and liquid (95.8-267.4°K.). The sp heats and heat of fusion of pure cryst di-lactic acid were called. The glasses and undercooled liquids show a rapid rise from the heat capacity characteristic of a cryst solid to that for the liquid state in a transition region of about 10°, the nature of this region is discussed. The molal entropy of liquid di-lactic acid at 298.1°K. is 45.9 \pm 1.0 e. u., the free energy of formation is -124,300 \pm 2300 cal. XIII Glass formation by a hydrocarbon polymer John D. Ferry and George S. Parks *Ind Eng* 70-5.—Polyisobutylene, with an av. mol wt. of 4900, is a highly viscous liquid at room temp. When cooled, it forms a glass with the transitions in thermal properties characteristic of the vitrification of substances of low mol wt. The heat capacity was detd. (from 118° to 295°K.); it increases 32% between 192° and 202°K. The thermal coeff. of expansion was detd. (160-300°K.), it increases 200%

between 185° and 205°K. The mean transition temp corresponds to a viscosity of 10^{11} poises, agreeing with a general rule for glass-forming materials. The factors on which the transition temp depends are discussed.

G. M. Petty
Application of plane groups to Weissenberg photographs M. J. Buerger, *Z. Krist* 91, 255-80(1935)(in English).—Each Weissenberg photograph is a projection of a single plane of the reciprocal lattice, which embodies both point group and translation properties. All possible Weissenberg patterns can be predicted from a study of plane point-groups and translations. The method is purely geometric and avoids analytic procedure and indexing of reflections. A few appropriately chosen photographs permit an unequivocal detn. of the centrosymmetrical class, and the unit-cell type and dimensions.

L. S. Ramsdell
X-ray measurements of diamonds M. Renninger *Physik Z* 36, 834-7(1935).—Intensity measurements of the forbidden (222) reflections from the octahedral faces of several diamonds were made. The F_{222} structure factor was estd. to lie between 2.1 and 2.6. C. E. P. Jeffreys

Formation of diamond from geologic and crystallographic points of view Elemér Veres *Bulletin Kórisz Lapok* 63, 302-9, 327-30(1935).—The different theories are presented. No definite conclusion can be drawn at present. S. S. de Finily

Graphite from diamond Paul Corrie *Compt rend* 202, 59-61(1936); cf *C A* 30, 926¹.—X-ray examn of graphite prepd by heating diamond at 1900° indicates much better developed crystallites than those in sugar C heated to 2000°. The resistivity, though less than that of the sugar C, is still much greater than that of Madagascar graphite, (relative) values averaging 0.169, 0.193 and 0.126, resp. The magnetic susceptibility approximated that of the sugar C. C. A. Silberrad

Net density and x ray investigation of carbon Yoshiaki Matsunaga *Mem Coll Sci Kyoto Imp Univ* A18, 215-20(1935).—Charcoal prepd by carbonizing pure sugar 3 hrs at 250° or 300° contains no sugar, gives an amorphous x-ray pattern and has net d 1.475. On heating above 400° the d increases and graphite is formed as shown by the x-ray pattern, the limit is pure graphite (d = 2.268). Ordinary C is a mixt. of amorphous C and graphite, the proportion depends chiefly on the temp to which it has been heated, and can be calcd from the observed d. C. D. West

The crystal structure of CdSb. Arne Ölander, *Z. Krist* 91, 243-7(1935); cf *C A* 29, 7815¹.—Powder photograph data indicate an orthorhombic unit cell for CdSb, with $a = 8.492 \text{ \AA}$, $b = 8.320 \text{ \AA}$, $c = 6.390 \text{ \AA}$, contg 8 Cd and 8 Sb. The symmetry may be either V or C . It is suggested that the arrangement may be a greatly deformed NaCl structure. L. S. Ramsdell

The crystal structure of gallium A. J. Bradley, *Z. Krist* 91, 302-16(1935)(in English).—A redtn of the structure of metallic Ga by the powder method conforms Laves' orthorhombic structure (*C A* 27, 1558¹) but photographs with $\text{Ni K}\alpha$ radiation show all 3 axes to be different: $a = 4.5167 \pm 0.0001 \text{ \AA}$, $b = 4.5107 \pm 0.0001 \text{ \AA}$, $c = 7.6448 \pm 0.0002 \text{ \AA}$. The space group is V_2^2 , and more accurate values of the parameters are $m = 0.0785$ and $p = 0.1525$ (both ± 0.0005). These were obtained from photometer measurements of the highly dispersed lines at the end of the film. This method is described and illustrated. L. S. Ramsdell

The unit of structure of telluric acid, $\text{Te}(\text{OH})_6$ Linus Pauling *Z. Krist* 91, 367-8(1935).—A rotation photograph of cubic $\text{Te}(\text{OH})_6$ shows the unit cell to contain 32 mols, as found by Kirkpatrick and Pauling (*C A* 29, 359¹) and not 4 mols, as stated by Gossner and Kraus (*C A* 28, 6604¹). L. S. Ramsdell

Crystallization of antimony anhydride Aurelio Serra *Z. Krist* 91, 371-2(1935).—Below 100° a cubic form, and above 100° an optically biaxial modification of Sb_2O_3 , are obtained by crystn from H_2O or H_2SO_4 . L. S. Ramsdell
Variation in the lattice constant of zinc oxide V. E. Cosslett *Nature* 136, 958-9(1935).—The lattice constns

of ZnO films prep'd by withdrawing a washer from the surface of molten Zn varied with age. The values for new films, and for films 12 and 18 months old, resp., were: α , 3.234, 3.262, 3.279 Å; c , 1.615, 1.628, 1.637 Å. The probable error of each measurement is 0.005 Å. The lattice consists of Au films remained constant during the same time interval. The use of such ZnO films for high-voltage calibration is inadvisable.

The structure of the electrolytic oxide layer on aluminum. I. J. W. Verwey. *Z. Krist.* 91, 317-20 (1935), cf. C A 30, 1310¹. γ -Al₂O₃, formed by electrolytic oxidation of Al, is closely related to γ -Al₂O₃, but does not give an identical x-ray pattern. The structure is described as an averaged structure of the cations. The unit cell contains 4 O-ions in face-centered positions, 2/3 Al ions are distributed statistically over all the interstices between the O ions in such a way that 70% of the Al have a coordination no. 6, and 30% a no. 4, with regard to the O.

Crystal chemical investigation of aluminum compounds with the spinel type of structure and of γ -Fe₂O₃. I. Rost Kordes. *Z. Krist.* 91, 193-228 (1935).—LiAlO₂ can be derived from Mg₂AlO₄ by the substitution of LiAl for 2 Mg. The 2 have similar hardness, d , n , and crystal structures and form solid solutions for the Li-Al spinel, $d_{100} = 7.903$ Å (or 15.806 Å). Well-crystd γ -Al₂O₃ is obtained from LiPO₄ melts, and closely resembles the Li-Al spinel, $d_{100} = 7.895$ Å (or 15.790 Å). These 2 can be referred to a face-centered cube only if the cell dimensions are doubled. Traces of Li-O or H₂O make γ -Al₂O₃ more stable. Ferromagnetic γ -Fe₂O₃ is a solid soln of 1 Fe-Fe₂O₃ and γ -Fe₂O₃. The use of fluorides in the synthesis of oxides and silicates is discussed.

The crystal system of julenite, Na₂Co(CSN)₂·8H₂O. A. Schoep and V. Billiet. *Z. Krist.* 91, 229-31 (1935).—X-ray photographs show synthetic Na₂Co(CSN)₂·5H₂O to be identical with julenite. The system is tetragonal, with $a = 9.22$ Å, and $c = 5.56$ Å. The cell contains 1 mol., and the measured d is 1.648.

The crystallography of ergine. H. Brasseur. *Z. Krist.* 91, 369-70 (1935).—Crystals of ergine, C₁₄H₁₇ON₃·ClH₂O, are orthorhombic. Oscillation photographs about the 3 axes give $a = 11.915$ Å, $b = 16.090$ Å, $c = 8.140$ Å (all ± 0.27). $Z = 4$ mols. Space group V_4 .

An x-ray study of symmetrical trimethylolamine and cyclo-trimethylenetriamino. Ralph Hultgren. *J. Chem. Physics* 4, 84 (1936).— γ -m-C₃H₆(NO₂)₃Me is orthorhombic; $a = 14.85$ Å, $b = 39.5$ Å, $c = 5.96$ Å, there are 16 mols in the unit cell, giving a calcd. d of 1.710 (the value usually given is 1.634). Trimethylenetriamino is orthorhombic; $a = 11.5$ Å, $b = 13.2$ Å, $c = 10.6$ Å, there are 8 mols in the unit cell, and the calcd. d is 1.82. The most probable space group is I^4_1 .

The crystal structure of p -dinitrobenzene. R. W. James, G. King and H. Horrocks. *Proc. Roy. Soc. (London)* A153, 225-46 (1935).— p -Dinitrobenzene crystallizes from Me₂CO in the monoclinic holohedral class. The crystallographic data of Bodewig (*Ann. Physik* 158, 239 (1876)), $\beta = 90^\circ 15'$, $a, b, c = 2.038, 1.1043$, are confirmed. The n_D^{20} is detd. as $n_D^{20} = 1.614$; $n_D^{20} = 1.72$, with $\beta = 90^\circ$ and $\gamma = 38^\circ$ to c . Two centrosym. mols occur in an elementary cell of the space group C_{2h}^2 ($P2_1/n$) with the dimensions $a_0, b_0, c_0 = 11.03, b_0 = 5.42$ and $c_0 = 6.56$ Å. Electron d projections were made by double Fourier series on the axial planes, and the 18 parameters evaluated. The C₆H₄ ring is distorted from a regular hexagon of 1.40 Å on a side by the shortening of one of each pair of sides adjacent to C-N link to 1.32 Å, the distortion being ascribed to the displacement of the C atoms linked to the NO₂ groups. Other interat. distances are: N-O, 1.10 and 1.25, and O-O, 2.14 Å. The C-N link is nearly in the plane of the ring, but lies at 25° to the plane of the NO₂ group. The mols. lie in sheets parallel to (101), and are slightly inclined to that plane. The O-H distances between adjacent mols. vary from 3.20 to 3.5 Å, and such links are probably responsible for part of the crystal binding forces. This structure does not agree with that of Hertel

and Schneider (C. A. 24, 2924) or with Banerjee's conclusions (C. A. 29, 1303¹).

X-ray analysis of the structure of lidescent shells. H. Halotidae. S. Ramaswamy. *Proc. Indian Acad. Sci.* 2A, 345-51 (1935), cf. *Ibid.* 1A, 871-9 (1934).—By use of monochromatic x-rays, the x-ray diffraction patterns of the shells of some species of *Halotis* were studied. The patterns obtained with normally incident x rays differ somewhat from those previously obtained with *Turbo* and *Trochus* in which shells there is a random orientation of the a and b axes of aragonite. In *Halotis* shells there is a preferred orientation of these axes, with a large error in orientation. The c axis is normal to the laminations as in other aragonite shells. Patterns obtained with *Nautilus pompilius* and *Margaritifer vulgaris* were measured. The type of orientation of twinned crystals of aragonite previously suggested for *Nautilus* is confirmed. The nacreous layer of *M. vulgaris* consists of single aragonite crystals with 110 planes parallel to lines of growth and c axis normal to the shell surface.

Adsorption problems. I. Traube. *Trans. Faraday Soc.* 31, 1730-9 (1935).—Many detns. of drop nos. were made and a relation between drop nos. and concn. of the solns was graphed. The results enable detns. of the capacity of adsorption of surface-active and interface-active substances by various org. substances slightly sol. or insol. in H₂O. Such substances as anthracene, naphthalene or diphenylamine added to solns of acetyl alc. or caprylic acid absorb such small quantities of adsorbate that the Langmuir theory can be applied. In some cases the adsorption is practically zero. If these substances, insol. in H₂O, are added in an emulsified state they are adsorbed to a high degree, so that there are several thousand layers on the adsorbent. The adsorbate is held so tightly that washing with H₂O removes only mol. particles if they are sol. in H₂O. The Gibbs principle is not applicable. A relation between adsorption and flocculation was found. The 2 components of adsorption, viz., the capacity and intensity factors, were discussed.

Heats of wetting and the physical significance of the constants in the equation of Rodewald. I. Adrianov. *Kolloid-Z.* 73, 328-34 (1935), cf. Rodewald, *Z. Physik.* 68, 333, 593-604 (1900).—Rodewald's equation is $c(w_1 - w_2) = \log(r_2 + 1)/(r_1 + 1)$, where r_1 and r_2 are the calorimetric heats of wetting of the solid contg. w_1 and w_2 % moisture, resp., s measures the extent to which the cohesive forces of the swelling solid are overcome and is opposite in sign to r , and c is a proportionality const. A. regards s as the absorption of energy required to disperse the water over the surface of the adsorbing solid (cf. Patzelt and Grimm, C. A. 16, 518¹). The const. c is inversely proportional to the active surface of adsorbent.

Comparison of efficiencies of activated charcoal. B. P. Denisovich. *Khim. Farm. Prom.* 1935, No. 1, 47-9.—The charcoal is kept in a buret, the standard I soln. is run through it (1 l. per hr.) and the I is detd. in the filtrate.

The diffusion of helium through fused silica. R. O. Braaten and G. F. Clark. *J. Am. Chem. Soc.* 57, 2714-17 (1935).—The rate of flow of He through SiO₂ is a linear function of pressure and thickness of SiO₂. The energy of activation depends on the temp. and the silicate content. The temp. range from 42.9° to 562° was covered.

The adsorption of hydrogen on tungsten. J. K. Roberts. *Proc. Roy. Soc. (London)* A152, 445-63 (1935); cf. C. A. 26, 2357, 3970.—A method is described for studying the adsorption of H₂ on a bare W surface which depends on the fact that the accommodation coeff. for Ne is considerably greater for a surface covered with a film of adsorbed gas than for pure W. It is shown that on a clean W surface chemisorption of H₂ occurs very rapidly at temps. as low as 79°K., satn. of the surface taking place at a partial pressure of 10⁻⁴ mm. or less. The heat of adsorption as measured on a single fine wire varies from 45,000 cal. per mol. for the first H₂ mols. to 18,000 for the

last portion becoming adsorbed. The amt of H_2 required to form a unimol. layer is consistent with the adsorption of H_2 as atoms. The film is stable for heating times of about 1 min. up to about 700°K. Calens show the dipole moment per adsorbed atom to be 1.94×10^{-18} e s u, and the change in work function resulting from covering the surface with a complete film to be 5.2 v. The rapidly occurring chemisorption of H_2 on the W surface differs from the more slowly occurring "activated adsorption." The accommodation coeff. of Ne at 79°K. is 0.32 on a W surface covered with a layer of chemisorbed H_2 compared to about 0.1 for bare W; at 295°K. the coeffs. are, resp., 0.17 and about 0.08. Some properties of adsorbed films of oxygen on tungsten. *Ibid.* 464-77.—The accommodation coeff. of Ne on a W film sat'd with O at room temp. is about 0.36. When the film is evacuated at temps. up to about 1300°K. the accommodation coeff. drops to 0.24, whereas on pure W the value is 0.08. The tightly adhering O film stable above 1300°K. is identified with the one already studied by thermionic methods (cf. C. A. 25, 1731). Its heat of adsorption is about 139,000 cal. per mol. of O_2 . It appears to be a layer of O adsorbed as atoms. The second film is new. It is interpreted as a partial layer of O_2 mols in the gaps that necessarily occur in the first film. The heat of adsorption of the second layer is about 48,000 cal. per mol. of O_2 . It is stable to about 360°K. only. Composite films of oxygen and hydrogen on tungsten. *Ibid.* 477-80.—When a film of W covered with a layer of adsorbed H_2 is exposed to a low pressure of O at room temp. the H_2 is displaced by the O, the total heat of the process being about 115,000 cal. per mol. of O_2 . The H_2 is apparently thrown off as mols. Indications are obtained of a slow disappearance of H_2 when the latter is admitted to a bulb contg. a W film partially covered with O. This observation suggests that the slow "activated adsorption" of the H_2 is connected with the presence of surface O.

P. H. Emmett
The sorption of hydrogen and deuterium by copper and palladium. I. The behavior of copper and copper oxides. H. W. Melville and Eric K. Rideal. *Proc. Roy. Soc. (London)* A153, 77-88(1935).—At. H and at. D at 20° reduce CuO with the same velocity. Mol. H reduces CuO more rapidly at 156-260° than does mol. D, the difference in energy of activation being 0.4 kcal. Mol. H and D are sorbed by and desorbed from Cu at the same velocities from 71° to 200°, except that H_2 is sorbed slightly more quickly at the higher temps. II. The sorption by palladium and diffusion through copper. *Ibid.* 89-103.—H diffuses more quickly than D through Pd, Cu and Ni at temps. from 150° to 350°, and at pressures from 1 to 200 mm., the differences in energy of activation for diffusion being 0.8 kcal. for Pd and Cu and 0.6 for Ni. In Cu, the rate-detg. step is not due to any process on the gas-Cu interface, because use of the composite films, Cu-Pd-Cu, and Pd-Cu-Pd, did not affect the results. H is more sol. than D in Pd, and the difference in velocity of diffusion is due partly to the greater sol. as well as to the greater mobility of H. A potential barrier exists for the penetration of H from the surface to the interior; the barrier has the same height for D as for H.

L. E. Steiner
Graphic representation of wetting angles for the method of maximum bubble pressure. L. Lange and K. Nagel. *Kolloid-Z.* 73, 268-9(1935); cf. Hohn and Lange, C. A. 30, 1292.—Wetting angles are sketched and described for wetting and nonwetting liquids at various stages in the formation of the bubble.

Oscar T. Quimby
Measurements of the surface tension of solutions of potassium and lithium salts of higher aliphatic acids by the ring method with exclusion of carbon dioxide and with special consideration of other disturbing effects. II. A. Lottermoser and Ernst Giese. *Kolloid-Z.* 73, 276-83(1935); cf. *Kolloid-Z.* 73, 155(1935); cf. C. A. 30, 669.—With the precautions described in the previous paper, surface tension, S , was measured at temps. of 20-70° on 0.001-1.0% solns. of K and Li salts of the following acids: caproic, caprylic, capric, lauric, myristic, palmitic, stearic, oleic and abietic. The results are reproducible to

± 1 dyne/cm. When adsorption effects are avoided S decreases with increasing temp. in many cases linearly, especially at the lower concns. c. In general the temp. coeff. of S decreases with increasing c as was previously found with Na salts, some exceptions were observed due to changes such as soln. of a ppt. with rising temp. The S -c curves show the same shape as found for Na salts, the steep portion often being linear if S is plotted against $\log c$. The surface activity is unaffected by the cation with 2 exceptions: Li oleate is more active than the Na or K salt and Na palmitate is more active than the Li or K salt. The Li salts are less sol. than the Na salts. At 0.001 to 0.01% concns. of K soaps Traube's rule is qualitatively verified.

Oscar T. Quimby
The vapor pressure of drops of S. V. Gorbachev. *Kolloid-Z.* 73, 203-7(1935); cf. C. A. 30, 141, 665.—Avoiding the assumption that Poisson's const. (product of the radius of meniscus curvature by the rise of liquid in a capillary) is independent of drop size, G. derives a math. relation based on van der Waals' equation for the vapor pressure of very small drops. For relatively large drops the new relation reduces to the Kelvin equation. The effect of dissolved substances on the vapor pressure of drops also is considered.

Oscar T. Quimby
Mechanism of the coagulation of sols by electrolytes. V. Sulfur sol. Harry B. Weiser and George R. Gray. *J. Phys. Chem.* 39, 1163-75(1935); cf. C. A. 28, 4328.—The adsorption of Th, Nd, Al, Ba, Sr and Ca during the coagulation of Raffo's S sol was detd. at and above the coagulation concn. Contrary to the observations of Bassett and Durrant (C. A. 26, 2102) the adsorption values are not equiv. at the resp. pptn. concns. The order of adsorption above the pptn. value is the same as that of the pptg. power. Th > Nd > Al > Ba > Sr > Ca. The H-ion displacement by the several cations is in the same order as the coagulating power. Equiv. amts. of H are not displaced at the pptn. values of the several cations (cf. Bolam and Bowden, C. A. 27, 649; Bolam and Mur, C. A. 28, 1910, 5311). The displacement approaches equivalence only when the pptn. values are of the same order of magnitude. With cations of the same valence the order of H-ion displacement as well as coagulating power is related to the size of the ions. A mechanism is proposed to account for the above mentioned phenomena of adsorption and H-ion displacement which accompany the processes of potential reduction and coagulation.

H. B. W.
Electrolytic coagulation of weakly solvated sols and electrolyte activity. Wolfgang Ostwald. *Kolloid-Z.* 73, 301-28(1935); cf. C. A. 14, 1775; 16, 2053.—The inadequacies of previous theories are discussed to emphasize the importance of a new guiding principle, namely, "not the micelles, but their dispersion medium should be in a corresponding (in the simplest case, identical) physico-chem. state during peptization or coagulation." Thus coagulation should take place at the same activity coeff. of the dominant ion (f_+ or f_-) regardless of the salt dissolved in the medium bathing the micelles. Numerous tables of data are presented to illustrate this principle, these are based upon data in the literature for the neutral-salt coagulation of the following hydrophobic sols: (1) negatively charged As_2S_3 , Sb_2S_3 , Au, Ag, Pt, S, MoO_3 , mastic, Congo red, (2) positively charged $Fe(OH)_3$, $Al(OH)_3$, Au. For As_2S_3 , f_+ is const. within a few % for a given investigator and varies only from 0.68 to 0.83 for different investigators, if one excludes, besides a few inaccurate results, the data for salts like $MgSO_4$ which are suspected of a tendency to form complex ions with As_2S_3 . The agreement between theory and expt. is no better in other cases (sometimes worse). The constancy of f_+ (or f_-) is best for weakly hydrated sols. Based on the above principle a new valence rule is formulated, which requires that the reciprocal of the coagulating molarities for the valence types 1-1, 1-2, 1-3, 1-4, 2-1, 2-2, 3-1, 3-2, 3-3, 4-1, 6-1, stand in the ratio 1:5:2:2:5:48:64:486:608:729:2560:27,200. That this is not in agreement with the data may be due to some neglected factor or to inaccuracy of the data. The averages for the many investigations on

As₂S₃ agree in order of magnitude with this set of ratios. In certain special cases the above valence rule reduces to the Ostwald or to the Freundlich rule. The curves obtained by Loeb for charged albumin sols suggest that the decreases in (1) swelling, (2) osmotic pressure, (3) relative viscosity and (4) membrane potential are approx. proportional to the activity coeff. of the dominant ion of the added salt.

A new method of investigating unimolecular films Irving Langmuir and Katherine B. Blodgett *Kolloid-Z.* 73, 258-63 (1935).—A lecture (cf. Langmuir, *C. A.* 28, 6606* and Blodgett, *C. A.* 29, 4649*, 5329*). O T Q

Investigation of the structures of extremely thin fatty films by means of electron diffraction H Motz and J J Trillat *Z. Krist.* 91, 248-54 (1935).—Films 2 mols thick were formed by evap. a drop of Et₂O or C₁₈H₃₆ soln. of the substance on metal foil or cellulose. With Au, Pt, Ag and Al foil there were obtained the diagrams of the metal plus characteristic ring or point diagrams from the film. Diagrams for paraffin, stearic acid, tristearin, cetyl alc. and beeswax were identical except for small intensity differences. With cellulose mounts, only the diagrams of the samples were obtained. The structures are analogous to those found for paraffin by Muller (*C. A.* 23, 30). All show the same lateral chain distances. Differences lie in the angle that the planes of the zigzag chains make with the *a* and *b* axes. The orthorhombic form of stearic acid was confirmed. L S R

Alkali films of atomic thickness on platinum Herbert Mayer. *Physik. Z.* 36, 845-8 (1935), cf. *C. A.* 29, 7811*.—A method and app. are described for deposition of alkali metal films on Pt and accurate measurement of their thickness. The change of photoelec. sensitivity of K films on Pt as a function of film thickness was followed, for both outgassed and gas-contg. films. In the former case no max. was reached, but in the latter a max. sensitivity occurs with a unimol. layer. C. E. P. Jeffreys

The preparation of colloids with ultrasonic waves Neda Marinescu. *Bull. soc. roumaine phys.* 36, 181-9 (1934).—Waves with frequencies of the order of 10⁶ are generated by piezoelec. quartz in an oscillating circuit. Such waves accelerate various chem. reactions, lower *b* p.s. as much as 10° and have profound biophys. effects. Emulsions of Hg in H₂O, kerosene and various aces were prepd. The particles were uniform spheres 0.5 μ in diam. The size depends on the amplitude and not on the frequency. Emulsions of Wood's and Rose's metals were prepd. by similar treatment at the m. p., upon cooling, these gave solid particles of the same diam. Some of these colloids have therapeutic effects. Colloids of alkali metals and their alloys in kerosene so prepd. burn spontaneously on contact with air. R. E. DeRicht

The diffusion of electrolytes through a membrane I Michimasa Kōno and Eyo Utsunomiya. *J. Chem. Soc. Japan* 56, 1475-82 (1935).—The velocities of permeability of 0.1 N alkali salts through Cellophane were measured at 25°. They are in the order KBr > KI > KCl > NH₄Cl > NaCl > LiCl and KNO₃ > NH₄NO₃ > NaNO₃ > LiNO₃. T. Katsuragi

Variations of the electrogenic property of a membrane with respect to the concentrations of the solutions that it separates M. Chanoz. *Arch. phys. biol.* 12, 251-4 (1935).—Discussion. L. E. Gilson

Dimension and cataphoretic velocity of disperse particles. J. Prosz. *Roy. Hung. Palatin-Joseph Univ. Tech. Econ. Sci., Sopron, Pub. Dept. Mining Met.* 7, 26-32 (1935).—Detns. of velocity and estimates of diam. of very many spherical particles in a paraffin oil emulsion proved that velocity depends on particle size. In the range from 1 to 10 μ velocity increases directly with diam. of particle. Theoretical explanation by means of the formulas of Debye and Huckel, and of Eucken is attempted. S. S. de Finily

Electrokinetics XVII Surface charge and ion antagonism. Laurence S. Moyer and Henry B. Bull. *J.*

Gen. Physiol. 19, 239-47 (1935).—The surface charge (neg. in sign) for cellulose in contact with solns. of 4 K salts follows the order: Cl < SO₄ < CO₃ < PO₄. For ThCl₄, the surface charge is neg. at low concns, becoming pos. with higher concns. For NaCl soln. (2 × 10⁻⁴ N) the charges plotted as logs against 1/temp. give a curve with a break at 39°. Since the sp. heat of water shows a min. at 37.5°, and the adsorption of ions probably involves the desorption of water, the break in the heat of adsorption of the charge may result from the change in desorption of water at this point. The explanation probably rests in the smaller dielec. const. at the higher temps., resulting in an increased attractive force between the ions and the charged wall. A marked ion antagonism was found between mixts. of the following pairs of compds. when surface charge was calcd. as a function of concn: NaCl-KCl, KCl-MgCl₂, NaCl-MgCl₂, NaCl-CaCl₂, KCl-CaCl₂, CaCl₂-MgCl₂. This is the first time ion antagonism has been directly traced to elec. effects. The cause of the lower charge for salt mixts. than for single salts probably lies in the tendency toward independent adsorption of the cations of the mixt. while the adsorption of the Cl ions remains much the same for both salt mixts. and single salts. This results in a smaller net neg. charge. Probably ion antagonism in biol. systems is of the same nature.

C. H. Richardson
Light scattering in gold sols in relation to particle size and shape D. S. Subbaramaya. *Proc. Indian Acad. Sci.* 2A, 358-63 (1935), cf. *C. A.* 29, 5328*.—Results of measurements of the depolarization of Tyndall scattering corresponding to the incident light *s* being (a) unpolarized, (b) plane polarized with its elec. vector perpendicular to the plane of observation, (c) plane polarized with its elec. vector parallel to the plane of observation, are reported. The results indicate that the particles in Faraday's sols are much smaller than those of other red sols prepd. from nuclear sols with H₂O₂ as the reducing agent, while those in the blue sols are the largest. In all sols studied, the shapes of the particles were far from spherical. Increased rate of growth caused by enhancing the temp. during prepn. of the sols appeared to increase the size and anisotropy of the particles. L. L. Quill

The structure of the colloidal particles of artificial atacamate A. A. Morozov. *Kolloid-Z.* 73, 288-99 (1935); cf. *C. A.* 27, 884*.—The atacamate sol (pptd. by reaction of Cu(OAc)₂ and NaCl in aq. soln., filtered and peptized with H₂O) could not be freed from chloride by dialysis without pptn. Upon diln. of a dialyzed sol with doubly distd. water, the equiv. cond. *L*, of the sol increased as did that of the ultrafiltrate from the ddd. sols. Diln. of the ultrafiltrate from the original sol scarcely increased *L* at all. Mixts. of a dialyzed sol with either Cu(OAc)₂ or NaCl or both gave less than the additive values of *L*. A sol contg. 14.56 g. dispersed phase per l. was reversibly coagulated by NaCl in concns. of 0.08 N or more, but coagulated irreversibly by Na₂SO₄ in concns. of 0.0125 N or more. All the known facts are in harmony with the particle structure

Oscar T. Quimby
The formation and constitution of crystals of lead salts containing water-soluble colloid. F. D. Miles. *Trans. Roy. Soc. (London)* A235, 125-64 (1935).—The absorption of dextrin, gum arabic or gelatin in growing crystals of PbCl₂, PbBr₂, PbI₂, PbN₃ and PbSO₄ was studied. More than 10% may be firmly bound and 5% may be present in a crystal without confusing its structure. The changes in crystal habit, and alterations in stability of various phys. forms and hydrates, induced by absorption of colloid during both slow and rapid pptn., are described. The relation between amt. absorbed and colloid soln. concn. was followed. Differences shown by the salts are discussed. Microscopic observations of the ppts. were made. The adsorption of dextrin on preformed crystals of chloride and azide was measured and compared with the estd. available surface. Results were checked with dex-

trun purified by dialysis, the osmotic pressure of which was detd. Maltose was not absorbed. Solns contg chloride and dialyzed dextrin were exam'd in the ultramicroscope and their conductivities were measured. There was no evidence of assocn of Pb ion and dextrin in soln. X-ray examn showed that the lattice spacings of the pure salts are unaffected by the introduction of colloid. The difficulties in applying the known methods of estg particle size are mentioned. An approx correction for finite size of the aperture is worked out. The results show that as colloid is taken up the av. particle width is decreased, but the 2 salts exam'd, azide and sulfate, behave differently. The ratio of coherent to incoherent radiation was measured with the conclusion that in the complexes of azide (but not sulfate) extremely fine (colloidal) Pb compd must be present. It is concluded that the constitution of the complexes is that of a connected skeletal growth of crystallites, all in nearly the same crystallographic orientation, with layers of colloid in between. These layers consist of irregular bundles of long dextrin mols anchored in the crystallites by some of their hydroxyls, but having the rest free. F. D. Rossini

Reactions of organic anions with basic thorium chloride hydrosols. Reversal of charge with salts of the hydroxy acids and with nitric acid. Arthur W. Thomas and Chester B. Kremer. *J. Am. Chem. Soc.* 57, 2539-41 (1935), cf. *C. A.* 29, 7754¹.—The relative reactivities of K salts of the carboxylic acids were studied by noting the changes in pH with concn of salt on basic Th chloride hydrosols. Conclusions: Hydroxy org. anions reverse the cationic charge to anionic thionate micelles. Conc'd HNO_3 reverses the charge. The effects of H_2SO_4 , HCl and HNO_3 are compared. Raymond H. Lambert

Simple lyotropic effects (viscosity). E. M. Bruins. *Rec. trav. chim.* 55, 13-16 (1936).—See *C. A.* 29, 6608¹.

Structure viscosity of lyophilic sols. I. Gelatin sols. Nic. Peskov and S. Averbuch. *Kolloid-Z.* 73, 182-91 (1935).—An overflow viscometer is described, it consists of 3 capillaries of equal diam. (0.0568 cm), but various lengths (7.1, 13.9 and 20.2 cm) connected to the same reservoir which communicates with a manostat. The amt. of liquid S flowing through each of the capillaries in a single overflow time Z is measured under a definite pressure P . Theoretically both PZ/S , which is proportional to the viscosity η , and S_1/S_2 (subscripts refer to two of the above capillaries) should be independent of P for liquids obeying the Hagen-Poiseuille law. With water, 20% sugar soln, EtOH and AmOH, these ratios were found to be const. within 1% over a P range of 60-900 mm H_2O . With an electrodyalized gelatin whose sols had a pH of 4.4-5, the effect of pH , P and temp. on η of 1 and 2% gelatin sols was studied. A 2% gelatin sol showed no anomalous effects at 34° or higher regardless of pH or age. At 30° deviations from the Hagen-Poiseuille law were observed only within the pH range 3.5-5.5, the effect decreasing with time if the sol was previously aged at 20° but increasing with time if the sol was freshly prepd at 30°. At 25° or lower, deviations were observed over the whole pH range (2-10). These deviations are caused by 2 factors: (1) the formation of an inner structure and (2) the orientation of the micelles. "The abs. value of η does not seem to be connected unconditionally with structure phenomena because sols with a pH far from 4.5 have simultaneously a greater viscosity and a less pronounced structure." Some measurements are also given with a Krutviscometer and with an Ostwald-Auerbach overflow viscometer. Oscar T. Qumby

Viscosity and plasticity of disperse systems. VIII. Application of the A. I. Bachinski formula to the viscosity of hydrogenated fats. M. P. Volarovich and G. B. Ravich. *Kolloid-Z.* 73, 339-42 (1935), cf. *C. A.* 30, 12¹.—The authors measured the d (Westphal balance) and viscosity (Ubbelohde capillary viscometer) at 5° temp. intervals for sunflower-seed oil (25-95°), hydrogenated fat A (50-140°) and hydrogenated fat B (55-95°). The fat acids of A had a titer of 34.2° those of B, 52.3°. The product of pressure and time of outflow was const.

within $\pm 1\%$, the limit of accuracy of the viscosity data. The viscosity-temp curves for A and B coincided. Plots of the fluidity η sp. vol. gave straight lines for all 3 substances above a fluidity of about 0.05, corresponding to the Bachinski relation (cf. *C. A.* 7, 3000¹), the break at a fluidity of 0.05 is associated with polymerization.

Oscar T. Qumby
Hydroxide gels and hydrated oxide gels and their amphoteric properties. R. Fricke. *Kolloid-Z.* 73, 300 (1935).—*See* Chemical with Krause, *C. A.* 29, 7753¹.

O. T. Q.
Mechanism and kinetics of thixotropic solidification. Wilfried Heller. *Compt. rend.* 202, 61-4 (1936), cf. *C. A.* 24, 1782¹.—The thixotropic gels formed on adding 0.03-0.06 M NaCl to a 110 micromol sol of Fe_2O_3 (2 hrs) were centrifuged for 10 to 190 min., and the percentages of solid g'd. detd. The results are explained by regarding thixotropic solidification as depending on (1) the rate of formation of germs (centers of gelation), (2) the rate of growth of these germs into elementary gels ("geloids") and (3) the rate at which these geloids associate. Thus the question whether the solid resulting from thixotropy consists of a net of gel enclosing liquid, or a uniform and homogeneous gel reduces to a question of time. C. A. S.

Coagulation of ferrocyanide sols containing varying amounts of potassium ferrocyanide. Nirmala Pada Chatterjee. *J. Indian Chem. Soc.* 12, 671-85 (1935).—An extension of previous work (cf. *C. A.* 24, 5572¹) to sols of Prussian blue (I), and of U (II), Al (III), Cu (IV), Zn (V) and Cd (VI) ferrocyanides. Concns of chlorides expressed as milliequiv./l. necessary to coagulate (1) follow the series $K > Ba > Ag(NO_3) > Al > Th$. The other sols were pptd. in presence of varying amts. (0.05-1000 ml. liq. vol.) of $K_4FeC_6N_6$. Amt. of KCl necessary increased generally with increase in amt. of $K_4FeC_6N_6$. At high concns the effect was irregular. Sols were prepd by pptn. and then alternate washing and centrifuging until peptization occurred, (I to III were acidic, IV to VI basic). Coagulating concn was detd. by finding the least concn of salt necessary to produce a clear supernatant liquid upon centrifuging for 8 min., the sol with electrolyte. Sp. cond. and cataphoretic speeds for (IV) were detd. Data and curves are given. E. R. Schierz

Dielectric constant and conductivity of gelatin sols and gels. Arkadiusz Piekara and Bruno Piekara. *Kolloid-Z.* 73, 273-6 (1935); cf. *C. A.* 28, 2594¹.—Sols and gels contg 0.5 to 1.25% electrodyalized gelatin per 100 g. soln were studied at various temps. (10-40°). The data (4 tables, 6 graphs) show: (1) the dielec. const. of gelatin dispersions (D) is greater than that of pure H_2O (D') and increases linearly with concn; (2) not only D , but also the elec. cond. of gelatin sols is greater than that of gels at the same temp. and concn; (3) although D for a given concn increases with temp., the difference $D-D'$ decreases. Two Au sols and an α -FeOOH sol had D values identical with that of H_2O . Oscar T. Qumby

Investigations of the effects of some factors on rhythmic crystallization. Mayel M. MacMasters, Julia E. Abbott and Charles A. Peters. *J. Am. Chem. Soc.* 57, 2504-8 (1935).—Several types of rhythm are differentiated, the most important ones being coarse rhythm, and fine rhythm (period 0.005 to 0.01 mm). Differences in temp. and concn do not affect the rhythmic crystn. of $K_2Cr_2O_7$ from aq. soln. Crystd. $(NH_4)_2Cr_2O_7$ and $Na_2Cr_2O_7$ also show a periodic structure. Foreign anions have a specific effect in inhibiting fine rhythm, the order of decreasing effectiveness being nitrate, sulfate, chloride. It is suggested that Liesegang rings and rhythmic crystn. from soln. or melt have a common cause. J. B. Austin

The colloid chemistry of rice starch and cooking of rice. III. Ichiro Sakurada, Toshio Kitano and Keiroku Fuchino. *Bull. Inst. Phys.-Chem. Research (Tokyo)* 14, 361-73 (1935), cf. *C. A.* 28, 3431¹.—The transformation velocity of starch from β - into α -form, generally, occurring at 60-65°, varies with the temp., 65°-16 hrs., 70°-6 hrs., or 90°-20-30 min. cooking being required for the röntgenographically complete transformation. This is also accelerated by an increase in amt. of water added, and by

dipping the rice grains in water before cooking. Grains swell rapidly with the conversion of β -starch of natural rice into α -starch of cooked rice, and decompose easily with diastase. K. Konda

Chemistry of celluloid formation II Heterogeneous transformation in the fibrous state affected by the reaction medium Motoi Wadano, Kurt Hess and Carl Trogus *Z. physik. Chem. B30*, 159-82 (1935), cf. *C. A.* 26, 3485.—The reaction between nitrocellulose and camphor to form celluloid was studied in the solvents MeOH, EtOH, PrOH, iso-PrOH, BuOH, sec-BuOH, dimethylethylcarbinol and iso-AmOH. In addition to the earlier known compd., camphor-nitrocellulose I, 2 new ones II and III were found and identified by x-ray and chem. analysis of the solid phase. The relation of the 3 compds. to each other is discussed. A few expts. were also made in CaH_2 , toluene, *m*-xylene and cyclohexene as solvents. **III Catalytic reactions in the fibrous state Heterogeneous catalysis by liquid catalysts in the solid substrate** Motoi Wadano, Carl Trogus and Kurt Hess. *Ibid.* 183-231.—The formation of camphor nitrocellulose I was studied in CaH_2 soln with the catalysts Me_2CO , MeOH, EtOH, BuOH and iso-AmOH. The effect of Me_2CO was studied by means of x-ray diagrams. A reaction mechanism is proposed. **IV Camphorization of nitrocellulose with *l*-camphor and *dl*-camphor** K. Hess, C. Trogus and M. Wadano. *Ibid.* 232-5.—The reactions of *d*-, *l*- and *dl*-camphor to form (I) are indistinguishable from x-ray analysis. G. M. Murphy

The partial molal volumes of ammonia and hydrogen in liquid ammonia hydrogen mixtures under pressure at 100° R. Wiebe and T. H. Tremearne. *J. Am. Chem. Soc.* 57, 2601-3 (1935); cf. *C. A.* 29, 981.—The vols. of NH_3 -H₂ mixts. in the liquid phase from 100 to 800 atm. were measured and the partial molal vols. of both constituents calculated. At relatively high concns. used the partial molal vol. of H in liquid NH_3 is pos. and increases with the concn. of H except at the lowest pressure. The partial molal vol. of NH_3 decreases as the concn. of H increases. W. C. Fernelius

The solubilities of *l*-proline and *l*-hydroxyproline in water, the calculated heats of solution, and the partial molal volume of *l*-hydroxyproline Tetsuo Tomiyama and Carl L. A. Schmidt. *J. Gen. Physiol.* 19, 379-82 (1935).—A curve of sol. of the 2 compds. is given, also a table of coeffs. of the soly equations. ΔH for *l*-proline is 1340, for *l*-hydroxyproline 1506. Partial molal vols. for *l*-hydroxyproline are given in a table, the calcd. molal vol. is 85.2. C. H. R.

The diffusion of ammonium salts with reference to other properties. Lars W. Ohlson. *Finska Kemistisamfundets Medd.* 44, 35-55 (1935).—The diffusion rates of NH_4Cl , NH_4NO_3 and $(\text{NH}_4)_2\text{SO}_4$ were detd. at the temps. 12°, 20° and 23-25° and for normalities ranging from 0.1 to 2.0 N . NH_4Cl gives a min. of $D = 1.368$ at 0.5 N at 20° which rises to 1.477 at 4 N and 1.440 at 0.1 N . For NH_4NO_3 , $D = 1.403$ at 0.1 N , which gradually drops to 1.228 at 7 N . For $(\text{NH}_4)_2\text{SO}_4$, $D = 1.067$ at 0.1 N , which drops to 0.787 at 6 N . Relative viscosities and d_s also were detd. The viscosity shows a min. of 0.9736 for 2 N NH_4Cl , and a min. of 0.9738 for 2 N NH_4NO_3 , but for $(\text{NH}_4)_2\text{SO}_4$ it falls steadily from a value of 1.992 at 6 N to 1.031 at 0.25 N . H. C. Duus

The mobility of ions J. J. Hermans. *Z. Physik* 97, 681-9 (1935).—Born's calcn. (*C. A.* 14, 2113) of the mobility of ions is critically discussed and the exact solution found in the case of infinite diln. This is extended to the case of noninfinite diln. and to the first approximation the mobility is proportional to the concn., not to its square root. B. Swirles

The mobility of hydrogen and hydroxyl ions in aqueous solutions II G. Wanner. *Ann. Physik.* 24, 569-90 (1935); cf. *C. A.* 30, 1286.—The theory is further treated mathematically. The theory agrees fairly well with the mobility of D_2O^+ and OD^- in D_2O . R. E. DeRicht

Estimation of transference numbers in dilute solutions from limiting ionic conductances Benton Brooks Owen

J. Am. Chem. Soc. 57, 2441 (1935); cf. *C. A.* 26, 4525.—By introducing a semiempirical relation into the equation of Jones and Dole or the Longworth parameter equation the estn. of certain transference nos. from limiting conductivities alone is facilitated. By replacing the parameter A by the quantity $-\beta\sqrt{2}(2T_c^2 - 1)/A^2$, characteristic of the whole group of electrolytes conforming to the Longworth equation, generality is gained and precision impaired only slightly. An accuracy better than one unit in the third decimal place of the transference no. is claimed for this modified equation when applied to dil. solns. of univalent electrolytes in which ionic assocn. is negligible. J. W. Shipley

Coefficient of activity of ions Marguerite Quintin. *Compt. rend.* 202, 123-5 (1936).—From detns. of E_{cell} and E_{ref} for varying values of m in the cells Cd (amalgam 2 phases) | CdCl_2 , m | KCl , satd. | KCl 0.1 N | Hg_2Cl_2 | Hg and Ag | AgCl | CdCl_2 , m | KCl , satd. | KCl 0.1 N | Hg_2Cl_2 | Hg the values of $(E_{\text{ref}})_1$ and $(E_{\text{ref}})_2$ are deduced as 0.349 v and -0.2242 v , resp., and therefrom the values of a_{\pm} and $a_{\pm 1}$, a being the parameter in Debye's theory, as 5.4 and about 2 A , resp. (cf. Gronwall, *et al.*, *C. A.* 25, 5336). This value for $a_{\pm 1}$ agrees fairly well with that, $G = 1$ A , deduced from Q 's earlier results (*C. A.* 22, 2097). C. A. Silberrad

Activity coefficients of sulfuric acid in anhydrous ethyl alcohol from electromotive-force data A. W. Scholl, A. Witt Hutcheson and G. C. Chandlee. *J. Am. Chem. Soc.* 57, 2342-4 (1935).—The activity coeffs. of H_2SO_4 in EtOH are calcd. from e m f measurements with the cell H_2 | H_2SO_4 | Hg_2SO_4 (s) | Hg . W. B. Keighton

Transition cases in the distribution of ions Raymond M. Fuoss. *J. Am. Chem. Soc.* 57, 2604-7 (1935); cf. *C. A.* 29, 2824.—By using a distribution function for the relation of free ions and ion pairs in an electrolyte a crit. point in the concn. is found above which free and assoc. ions become indistinguishable. This concn., 3.2×10^{-4} D at 25° for 1-1 electrolytes, is experimentally the concn. above which the simple laws of dil. solns. of electrolytes are no longer obeyed. At higher concns. higher types of assocn. must be considered for the cases of nonaq. solns. For aq. solns. a numerical significance is attached to the phrase "at low concns." J. W. Shipley

Calomel electrodes and Gouy's equation for diffusion potentials M. Chanoz, G. Florence and P. Perrotet. *Arch. phys. biol.* 12, 238-50 (1935), cf. *C. A.* 29, 2825.—A crit. discussion. Electrodes using satd. KCl soln. are preferred. L. E. Gilson

Volta effect of electrolytic solutions against water, and characteristics of acidity and basicity Suzanne Veil. *Compt. rend.* 202, 121-3 (1936), cf. *C. A.* 28, 4287; 29, 3896.—Two Pt wires inserted in a sheet of gelatin at different points show a p d due to heterogeneity of the gel. If one wire is inserted in a drop of pure H_2O on the gel the p d remains practically unchanged. If the second wire is inserted in a drop of soln. of some salt (lying on the gel) a p d is observed. This is termed the electrometric potential (e p) of that soln. It may be considerable, e.g., more than 0.5 v for satd. solns. of $\text{Fe}(\text{NO}_3)_3$ or Na_2S . It is pos. if the pos. pole is in the soln. in the cell Pt | H_2O | soln. | Pt, and neg. if the pos. pole is in the H_2O . The e , p , is pos. for solns. that redden litmus, neg. for those that turn it blue, i.e., acidity and basicity are correlated with the Volta effect of the soln. against H_2O . C. A. S.

Passage of current in electrolytes without electrolysis M. Vasilescu-Karpen. *Bull. soc. roumaine phys.* 36, 9-16 (1934).—Aq. solns. contg. 50% KI and concns. of 4-30% I_2 conduct c with no decompn. Since there is no polarization, solns. contg. 30% I_2 conduct 150,000 times the current for the same e m f , as those without I_2 . The reactions $\text{I} + e \rightarrow \text{I}^-$ at the cathode and $\text{I}^- - e \rightarrow \text{I}$ at the anode account for the cond., the net result being the transfer of the electricity. The only resistance is due to the increased concns. at the poles. If the electrodes are horizontal with the anode above, gravity aids the diffusion; hence the current is greater than when in the vertical position. The opposite effect is noted if the horizontal

position is reversed. Dependent on the external resistance, the relative position of the electrodes, etc., an unstable region is reached where the voltage between the plates oscillates regularly. This results in a rhythmic flow of current.

R. E. DeRicht

Determining p_H with the glass electrode. D. Wolfers *Bull soc chim. bel* 17, 1659-72 (1935).—The Morton-type glass electrode gives excellent results with all concns of HCl and HNO₃ less than 2 N. With undiluted human urine the glass electrode gives values 0.1-0.2 p_H unit lower than those obtained with the quinhydrone electrode. When urine is diluted with 3 vols of redist. water the p_H increases 0.1-0.3 unit as detd. by the glass electrode or 0.01-0.24 unit as detd. by the quinhydrone electrode.

L. E. Gilson

Exchange equilibrium between deuterium and ammonia. Karl Wirtz *Z. physik. Chem.* B30, 289-97 (1935); cf. C. A. 30, 945⁴.—Equal between NH₃ and D₂ was studied in vessels con. a Pt filament kept at 300°. The gas pressure was 40-50 mm and equil was reached in 1-5 hr. The uncatalyzed equil was studied in quartz at the same temp. Analysis was by thermal cond. The various equil involved may be reduced to 4 independent ones which were taken as $H_2 + D_2 \rightleftharpoons 2HD$, K_4 , $NH_3 + HD \rightleftharpoons NH_2D + H_2$, K_1 , $NH_3 + NHD \rightleftharpoons 2NH_2D$, K_5 ; $ND_3 + NDH_2 \rightleftharpoons 2NHD_2$, K_6 . The analytical precision was not high enough to det. all of these equil consists so A_{NH_3} , K_1 and K_5 were calcd. from spectroscopic data and used to det. K_4 from the expts. The latter was 2.0, observed and 1.82, calcd. The distribution quotient, $V = (D/H \text{ in exchange partners}) / (D/H \text{ in hydrogen})$ is about 1.5.

G. M. Murphy

Exchange reactions with deuterium. I. Deuterium and hydrogen chloride. Paul C. Cross and Philip A. Leighton. *J. Chem. Physics* 4, 28-30 (1936).—An app. for detg. exchange equil and rates of exchange of D₂ with H-contg. compds is described. The gas balance is used to analyze H₂-D₂ mixts. Results on the equil $H_2 + 2DCl \rightleftharpoons D_2 + 2HCl$ and $H_2 + DCl \rightleftharpoons HD + HCl$ agreed with theoretical values.

G. M. Petty

A useful integrated form of the equation for calculating change of equilibrium with temperature. J. B. Austin *J. Am. Chem. Soc.* 57, 2428-34 (1935).—The method is useful chiefly for plotting soly data. If soly, expressed as mol fraction, is plotted against abs temp on double logarithmic coordinates the data fall on a straight line. If the temp (T) is expressed as the ratio of T to some suitable reference temp, such as the m. p. of the solvent, the data for all solvents having the same entropy of melting fall on the same straight line.

J. B. Austin

The thermal equilibrium of the cis-trans isomers of dichloroethylene at high temperatures. William Maroney. *J. Am. Chem. Soc.* 57, 2397-8 (1935).—Earlier detns (C. A. 28, 5400¹) were extended to 875°. The av. molar heat of transition calcd. from the equil consts is 618 cal.

J. B. Austin

Constitution of liquid zinc amalgams. Herman A. Liebafsky *J. Am. Chem. Soc.* 57, 2657-62 (1935).—The e. m. f. data for Zn amalgams were reexam. and interpreted on the assumption that Zn₂ and Zn₃ are in rapid equil with monat Zn. This polymerization hypothesis is supported by the exptl. e. m. f. values obtained for the more concd. amalgams and fairly well for the more dil.

J. W. Shipley

Concentration maxima of endothermic compounds at high temperatures. Application to ozone and nitric oxide. E. Bruner, B. Suzs and E. Rad. *Helv. Chim. Acta* 18, 1468-78 (1935).—The partial pressures for the decompn. of O₃ and NO at high temps were redetd. The equil consts approximate the values of the Nernst theorem, but are lower than those previously reported by B. and S. (C. A. 25, 3570). O₃ has its max. concn. at approx. 3500°, with a corresponding partial pressure of 2.19×10^{-7} atm. NO has its max. at about 3750°, with a partial pressure of 0.0987 atm. These differences are due to more exact values for the heat of formation.

J. H. Reedy

The direct carboxylation of carbon compounds. III

The free energy of benzoic acid at 522°K. W. D. Bonner and C. R. Kluney. *J. Am. Chem. Soc.* 57, 2402-3 (1935); cf. C. A. 27, 5068-9.—The free energy of formation of C₆H₅CO₂H from C₆H₆ and CO₂ at 522°K. was calcd. to be 18,172 cal., while the equil. const., K , was 10^{-11} .

H. W. Leaby

Carbamate equilibrium. I. Equilibrium of amino acids, carbon dioxide and carbamate in aqueous solution, with a note on the Ferguson-Roughton carbamate method. Wm. C. Stadie and Helen O'Brien. *J. Biol. Chem.* 112, 723-58 (1936).—The mass-action law was applied to the equil of amino acids (I) and CO₂ (II) and equations are derived that describe these equilibria. The equilibria were experimentally detd. and the validity of the equations was tested. II and I do not combine to yield carbamates (III) at the isoelec. point of I. HCO₃ or CO₃ ions do not combine with I. Formation of III is inhibited by CH₃O.

Free II reacts only with the amphoteric I and carbamate compds. of I are dibasic salts at all p_H values greater than 7, hence the equil is expressed by $K_{Am} = (Am^+)(H^+)/(Z^-)(\alpha_{CO_2}P_{CO_2})$, where Am^+ is the concn of III, Z⁻ the amphoteric concn and $\alpha_{CO_2}P_{CO_2}$ physically dissolved II. The equil of II and I in the absence of H₂CO₃ or its ions, termed "non-carbonate equil," was experimentally measured in a special app. and is governed by $(Am^+)[(N) - (B^+) + (Am^+)] / [(B^+) - 2(Am^+)] = \alpha_{CO_2}P_{CO_2}$, K_{Am}/K_z , where N is total I, B⁺ available base, and K_z the dissociation const. of I. For glycine (IV), alanine and cysteine acid pK_{Am} at 20° is 5.54, 5.57 and 5.27, resp.

Equil in the presence of H₂CO₃ or "total equil," was measured by the usual tonometric method and is governed by a similar equation modified to take into account hydration of II, and for IV pK_{Am} is 4.81. The Ferguson-Roughton method was applied to apply to systems contg. large amts of free II by addn. of sufficient carbonic anhydrase to accelerate hydration of II 200- or 300-fold, thus excluding any mode of combination of I and II peculiar to the p_H range 5-7.

R. C. Elderfield

Esterification as a gas reaction. C. A. Winkler and C. N. Hinshelwood. *Trans. Faraday Soc.* 31, 1730-43 (1935).—The esterification reaction was chosen as a typical reaction occurring in soln. which it was hoped could be induced to take place in the gas phase. The reaction between HCl and MeOH vapor was studied at 450°. It seemed to be confined to a wall reaction. MeOH and AcOH began to react only at temps at which MeOH began to decompose. With MeOH, AcOH and HCl the results were not reproducible, but certain data were recorded. From 25 to 30% esterification occurred at 300° with the proportions MeOH 100, AcOH 50 and HCl 25 mm. Longer reaction time did not increase the amt. of reaction. The tendency to esterification was increased by increasing the partial pressure of MeOH, but was insensitive to temp. It is thought that reaction takes place in an adsorbed layer of MeOH where ionization of the catalyst can take place, and the formation of this layer depends upon various uncontrollable factors. In CCl₄ soln. the reaction velocity falls off only at very low alc. concn. When MeOH concn. is further reduced the rate becomes proportional to it and is proportional to $[AcOH]^{1/2}$. As in the gas phase the results could not be reproduced well.

C. E. P. J.

The oxidation of oxalic acid by iodic acid accompanied by a change of the stationary adjustment of the intermediate product of the reaction. Emil Abel and Leopold Blumenkranz. *Monatsh.* 66, 181-92 (1935).—Ordinarily the oxidation of (COOH)₂ by HIO₃ yields I ion as an intermediate and I₂, CO₂ and water as final products. However, when the amt. of I ion in its stationary concn. is permanently changed, as by maintaining artificially various concns. of the I ion, then a change is brought about in the character of the reaction products. I₂ becomes an intermediate and I ion a final product. The authors attempted an automatic maintenance of the I-ion concn. by the addn. of AgI + Ag₂IO₃, thereby producing a small, const. and calculable I-ion concn., $(L_{AgI}/L_{Ag_2IO_3})[IO_3^-]$, where the L's represent the relative soly products. This attempt was not successful because of the slowness in the

with 0.01 or 0.003 N $Na_2S_2O_4$. The hydrolysis of I is extremely slow in pure H_2O and in solns below 0.001 N even when $AgNO_3$ is added. The velocity becomes rapid only when $AgBr$ is present in suspension and decreases if the $AgBr$ formed in the reaction coagulates. The rate of reaction can be expressed by the equation $dx/dt = A_1(a-x)(b-x)(c+x)$ in which a , b , and c are the initial concns. of I, Ag, and $AgBr$ in suspension. The heterogeneous reaction takes place between I and Ag ions sparsely adsorbed on the surface of the $AgBr$ particles. Increasing the ratio of the concns of the reactants, other conditions remaining const, causes the velocity const to fall gradually, indicating that the relative orientation of the 2 kinds of ions in the adsorbed layer becomes less and less favorable for reaction. Janet E. Austin

Temperature dependence of the energy of activation in the deacidolization of diacetone alcohol. Victor K. La Mer and Mary L. Miller. *J. Am. Chem. Soc.* 57, 2674-80 (1935).—The velocity const, k , for the decomposition of diacetone alc. in aq. $NaOH$ was detd. at 11 temps. from 0° to 50°. At 25° k/c is independent of the concn. of $NaOH$ ($c = 0.02$ to $0.10 N$), but at 50° k/c decreases slightly as c increases from 0.008 to 0.06 N . E_{act} increases from 15,850 cal at 5° to 17,250 cal at 32.5° and then decreases by about 500 cal at 45°. The addn. of 18.5 vol % of $MeOH$ to the soln increases E_{act} by 1500 cal at 20°, about as much at lower temps., more at higher temps. Parallel results are obtained for the $B - T$ curves, the addn. of 18.5% $MeOH$ producing an increase of one logarithmic unit in B . A survey of the literature shows that dE_{act}/dT may be large for reactions involving a halogen compd (3 references), or for reactions which are a hydrolysis or a proton change (7 references). W. B. Keighton

The energies and entropies of activation of the reaction between bromoacetate and thiosulfate ions. Victor K. La Mer and Mildred E. Kammer. *J. Am. Chem. Soc.* 57, 2662-8 (1935).—The effect of ionic attraction on the activation energy, E_{act} , and on the entropy of activation, or the action const, B , was studied. For water at 25°, $E_{act}/2.3RT = E_{act}^0/2.3RT + 0.51Z_AZ_B/\sqrt{\mu}$ and $B = B^0 + 1.52Z_AZ_B/\sqrt{\mu}$. At 0 to 37.5° with $Na_2S_2O_4$ and $CH_3BrCOONa$ each 0.005 M , dE_{act}/dT is about -8.6 cal/deg mole, with 0.18 M $NaCl$ it is about -12. B also decreases with rising temp. In the presence of low-valence ions (Na^+) $\log k$ increases with $\sqrt{\mu}$ primarily owing to an increase in B . The addn. of high-valence pos. ions causes a considerable increase in E_{act} . This rate-depressing effect is more than opposed by the increase in B . The prevailing theory of catalytic action would predict a lower reaction rate on the addn. of a neutral salt, for E_{act} is shown to be increased by $684Z_AZ_B/\sqrt{\mu}$ cal/mole as a result of ionic attraction. The pos. catalytic effect of added neutral salts is due to a larger concomitant increase in B . This results from an increase in the no. of effective collisions, which in turn arises from the formation of ion clusters. Thus pos. catalysis may result from either (1) a decrease in E_{act} , which corresponds to providing a lower by-pass in the energy barrier, or (2) an increase in the entropy of activation, which is equiv. to an increase in the no. of systems crossing the energy barrier per unit of time. W. B. Keighton

The influence of nonelectrolytes upon the kinetics of the reaction between bromoacetate and thiosulfate ions. Victor K. La Mer and Mildred E. Kammer. *J. Am. Chem. Soc.* 57, 2669-73 (1935), cf. preceding abstr.—The velocity const. for the reaction between bromoacetate ions and thiosulfate ions in aq. soln at 0° and at 25° is increased by the addn. of nonelectrolytes. Urea raises the dielec. const, D , but does not affect E_{act} . Sucrose, glycerol and dioxane each lower D and decrease E_{act} . The action const, B , decreases almost linearly as a function of $D-1$ from $D = 88$ to $D = 55.7$. This may result from fewer effective collisions as D decreases because of increased electrostatic repulsion between the reacting ions. When D is about 50 this repulsive effect is exhausted and ion assocn. between the Na^+ ions and bromoacetate and thiosulfate ions becomes so great that the reaction is sub-

stantially between 2 uncharged ions. In 32% sucrose, as in water, pos. salt catalysis is due to the increase in B predominating over the simultaneous increase in E_{act} . W. B. Keighton

Electric conductivity and phase diagram of binary alloys XVII. The system lithium-aluminum G. Grube, L. Mohr and W. Breunung. *Z. Elektrochem.* 41, 880-3 (1935); cf. C. A. 29, 987.—The Li-Al alloys were investigated according to the method of thermal analysis and also by detn. of the temp. coeff. of elec. resistance of the solid alloys as previously described. From these measurements the complete phase diagram was detd. The liquid metals are not sol. in each other in all proportions. The miscibility gap in the liquid state extends at 699° from 44.5 to 60 atoms % Li. Cond. measurements fixed the appearance of a solid soln on the Al side at between 600° and room temp. LiAl forms with excess β solid soln a homogeneous region which extends at 521° from 50 to 56 atoms % Li. The existence of crystal LiAl was detected. It was formed at 521° by peritectic reaction between β solid soln and melt. O. E. S.

Structure of the zinc-cadmium eutectic M. Straumanis and N. Brakss. *Z. physik. Chem. B30*, 117-31 (1935).—The structure of the Zn-Cd eutectic obtained by slow crystn. was compared with that obtained on rapid cooling. Microscopic examn. showed only slight differences. The crystal fibers are not unit crystals but are composed of alternate layers of the Zn and Cd, growing perpendicular to the cooling surface of the melt. The no. of layers per mm. is 660 in the case of very slow cooling and becomes less with faster cooling. G. M. Murphy

The mutual solubility of aluminum, sodium, potassium and iron nitrates in water in the presence of nitric acid. II. A. I. Zaslavskii, I. L. Fttinger and E. A. Eserova. *Z. anorg. allgem. Chem.* 225, 305-11 (1935); cf. C. A. 29, 6125.—The isotherms at 0° and 20°, for the system $Al(NO_3)_3$ - $NaNO_3$ - HNO_3 - H_2O , are reported. Neither compd. formation nor mixed crystals are found. The solid phases appearing are $Al(NO_3)_3 \cdot 9H_2O$, $Al(NO_3)_3 \cdot 8H_2O$, $Al(NO_3)_3 \cdot 6H_2O$ and $NaNO_3$. L. E. Steiner

Equilibrium in the system, lithium phthalate-phthalic acid-water. Sterling B. Smith, Wm. A. Sturm and Edward C. Ely. *J. Am. Chem. Soc.* 57, 2406-8 (1935).—Soly. relations in the system $Li_2C_4H_4O_6$ - $H_2C_4H_4O_6$ - H_2O were detd. and isotherms constructed at 0°, 25°, and 50°. The 3 solid phases present at each of these temps. were $2Li_2C_4H_4O_6 \cdot 3H_2O$, $LiHC_4H_4O_6 \cdot 2H_2O$ (I) and $H_2C_4H_4O_6$. I cannot be purified by crystn. from aq. soln at temps. lower than 60°. W. B. Keighton

Binary systems of p -dichlorobenzene with biphenyl, naphthalene and triphenylmethane. Ross E. Morris and Walter A. Cook. *J. Am. Chem. Soc.* 57, 2403-6 (1935).—Solubilities, eutectic temps. and eutectic compns. of the 3 binary systems of p -dichlorobenzene (I) with biphenyl (II), with naphthalene (III) and with triphenylmethane (IV) approach closely those calcd. for ideal solns. The eutectic temp. and eutectic compn. (mole fraction of I) for the 3 systems were: I-II, 26.9°, 0.575, I-III, 39.2°, 0.606; I-IV, 35.9, 0.635. The m. p. of pure IV is 93.2°. W. B. Keighton

Purification and physical properties of organic compounds X. The freezing point diagram for the system acetaldehyde-propionanhydride. Evald L. Skau and Louis F. Rowe. *J. Am. Chem. Soc.* 57, 2437-8 (1935); cf. C. A. 29, 7770.—The binary i - p diagram for $PhNHCOEt$ and $PhNHCOEt$ was detd. by an accurate static method. The Beckmann method proved unreliable. The system shows compd. formation with incongruent melting. The compd. tends to crystallize in unstable equl. from liquid mixts. near the compd. region. XII. The lower aliphatic bromides Evald L. Skau and Rogers McCullough. *Ibid.* 2439-40.—The b. ps., ds. and i. ps. were detd. for Et, Pr, iso-Pr, Bu, iso-Bu, sec-Bu, and Am bromides. AmBr was found to be dimorphous and monotropic. The unstable form m. -94.6° while the stable form m. -87.9°. H. W. Leach

Phase equilibria in hydrocarbon systems XI Thermodynamic properties of mixtures of a crude oil and a natural gas B. H. Sage and W. N. Lacey. *Ind Eng Chem*, 28, 249-56(1936), cf. C. A. 30, 946.—Sp vols and sp heats were detd. experimentally for several mixts of a crude oil and natural gas from Dominguez Field, Calif. From these data the thermodynamic properties, heat content and entropy were calcd. Detailed tabulations and charts present the behavior of the mixts with changes of temp and pressure. F. L. Browne

The heat capacity of gadolinium sulfate from 1° to 20.5°K C. W. Clark and W. H. Keessom. *Physica* 2, 1075-9(1935).—The heat capacity of cryst. $Gd_2(SO_4)_3 \cdot 8H_2O$ was measured from 1° to 20.5°K and values are tabulated for each 0.5° in this range. The following values of C_p in cal deg⁻¹ mol⁻¹, taken from the table, illustrate the relation between C_p and T : 20.0°K, 4.50; 16.0°K, 2.50; 12.0°K, 1.152; 8.0°K, 0.310; 4.0°K, 0.103; 3.0°K, 0.140; 2.0°K, 0.284; 1.0°K, 0.88. Below 1°K, the heat-capacity curve appears to be rising to the max. theoretically expected for this paramagnetic salt. F. D. Rossini

Theory of anomalies in specific heat L. Landau. *Physik Z. Sowjetunion* 8, 113-18(1935).—Math.

Helen S. Hopfield

Heats of adsorption of gases and vapors upon crystalline adsorbents. Arthur B. Lamb and Edwin N. Ohl. *J. Am. Chem. Soc.* 57, 2154-61(1935).—The heats of adsorption of CH_4 , C_2H_6 , N_2O , H_2S , CO_2 , CH_3Cl , C_2H_5Cl , CH_3OH , CS_2 , and C_2H_5OH on chabasite, of CO_2 and CH_3OH on brucite, and of CO_2 on dehydrated thomsonite were detd. at 0°. The mol. heats of adsorption of such of these substances as are copiously adsorbed are somewhat larger than those previously observed on charcoal and SiO_2 , etc. The heat of adsorption in general increases with the percentage dehydration of the adsorbent. P. H. Emmett

Hydrates. heats of solution of hydrazonium salts at 25°. H. E. C. Gilbert and V. C. Bushnell. *J. Am. Chem. Soc.* 57, 2611-12(1935); cf. C. A. 29, 2064'.—The heats of soln. in H_2O at 25° were detd. for hydrazonium dibromide, anhyd. and hydrated and of hydrazonium sulfate, thus completing the series partially reported before. The calorimeter and procedure were as previously described. The extreme slowness with which the sulfate dissolved diminished the accuracy of the results because of the time elapsing while soln. was taking place. The molal heats of soln. of the hydrazonium salts are compared with those of the alkali and alkaline earth groups. J. W. Shipley

Sodium hydronide solutions. Heat of dilution at 68°F John W. Bertetti and Warren L. McCabe. *Ind Eng Chem*, 28, 247-8(1936).—Heats of diln. of solns. contg. 13.6 to 48% by wt. NaOH were measured and corrected to 68°F. The enthalpies at 68°F. relative to infinitely dil. soln. were calcd. F. L. Browne

Heats of organic reactions III Hydrogenation of some higher olefins G. B. Kistiakowsky, John R. Ruhoff, Hilton A. Smith and W. E. Vaughan. *J. Am. Chem. Soc.* 58, 137-45(1936), cf. C. A. 29, 4254'.—The reliability of the calorimetric measurements is discussed and some new expts. are presented. It is concluded that the earlier work in these studies is valid. The heats of hydrogenation in cal./mole of the following substances were detd. at 355°K. as: 1-heptene, -30,137 \pm 37 (60); unsym. methyl ethyl ethylene, -28,491 \pm 36 (100); 2-pentenes (cis and trans), -27,954 \pm 28 (100); unsym. methyl isopropyl ethylene, -27,997 \pm 24 (100); cyclohexene, -28,572 \pm 10 (100); trimethyl ethylene, -26,920 \pm 10 (60); tetramethyl ethylene, -26,633 \pm 19 (100). The deviations represent calorimetric precision, while the bracketed figures are a crude attempt to est. total errors. Some generalizations regarding the effects of substitution on the energetics of an ethylenic double bond are proposed. It appears that with increasing no. of substituent alkyl groups, the heat of hydrogenation is lowered

1 in a progressive manner. Monosubstitution produces a decrease of 27 Cal., disubstitution, 42 (cis) to 52 (trans), trisubstitution, 59, and tetrasubstitution, 62. Thus the differential effect grows smaller with increasing no. of substituents. The effect is independent of the chain length of the normal alkyl radical substituted, but branched groups appear to have greater effect. IV. Hydrogenation of some dienes and of benzene. *Ibid.* 146-53. The following heats of hydrogenation in cal./mole were obtained at 355°K. allene + $2H_2$, -71,280 \pm 103 (200); 1,3-butadiene + $2H_2$, -57,007 \pm 28 (100); 1,4-pentadiene + $2H_2$, -60,790 \pm 64 (150); 1,5-hexadiene + $2H_2$, -60,525 \pm 43 (150); 1,3-cyclohexadiene + $2H_2$, -55,367 \pm 56 (100); benzene + $3H_2$, -49,802 \pm 44 (150); cyclopentadiene + $2H_2$, -50,865 \pm 47 (200). The uncertainties represent calorimetric precision, while the figures in parentheses are the crudely estd. all-inclusive errors. The data are discussed and it is pointed out that 2 double bonds, when placed close together in the mol., exert an unstabilizing effect upon each other. The resonance predictions of Pauling are confirmed but qualitatively. William E. Vaughan

3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W. ALBERT NOYES, JR.

- Limits of precision in reference to atomic systems. C. G. Beddard. *Bull. soc. roumaine phys.* 36, 31-3 (1934). cf. *C. A.* 29, 2798¹.—A further discussion with reference to the effect of inequalities in the Bohr-Heisenberg theory. R. E. DeRight.
- Elements of the quantum theory. VII. Van der Waals forces. Saul Dushman. *J. Chem. Education* 12, 581-6 (1935). VIII. Perturbation theory. *Ibid.* 13, 84-92 (1936). cf. *C. A.* 30, 15¹. E. H.
- Quantized field theory and mass of the proton. Max Born. *Nature* 136, 952-3 (1935); cf. *C. A.* 29, 33¹, 1317¹.—Math. Gregg M. Evans.
- Photographic method in the investigation of the atom. Marietta Blau and Ilhertha Wambacher. *Phot. Kor. Suppl.* 70, 31-40 (1934). cf. Blau, *C. A.* 29, 3653¹.—A general account of the technique employed in the study of at structure and at processes by the aid of photography. E. R. Bullock.
- The electron configuration of superconducting metals. U. Dehlinger. *Physik Z.* 36, 892-4 (1935). cf. *C. A.* 30, 924¹.—A theoretical discussion. C. E. P. Jeffreys.
- Uses and limitations of the spectrograph for industrial control. Thomas A. Wright. *Metal Progress* 29, No. 1, 53-7 (1936). cf. *C. A.* 29, 7854¹.—Forty successful uses in different fields are mentioned. W. A. Mudge.
- The dissociation energy of carbon monoxide. R. Schmid. *Roy. Hung. Palatin-Joseph Univ. Tech. Econ. Sci., Sopron, Pub. Dept. Mining Met.* 7, 171-82 (1935).—Former papers (cf. *C. A.* 29, 779¹) gave the value of $D(\text{co})$ as 8.4 v or 194 kg.-cal. Calcs. of various quantities concerning the C atom and CO mol showed that (1) the sublimation heat for solid C equals 108 kg.-cal. and $\lambda = 205$ kg.-cal. (2) The bond energy C-C is 102 kg.-cal for solid and 99 for aliphatic C compds. The H-C bond represents 107 kg.-cal. (3) Calcs. of cyanogen yield led to the formula $\text{CN}(\text{?}) + 9.5 \text{ v} \rightarrow \text{C}(\text{?}) + \text{N}(\text{?})$, while states H and ? dissociate into $\text{C}(\text{?})$ and $\text{N}(\text{?})$, the latter lying under the former by 1.8 v. (4) The band convergence method led to the calcd. value for ionization potential $\text{CO} \rightarrow \text{CO}^+ - 13.15 \text{ v}$. (5) Crit. potentials calcd. are somewhat higher than observed. The value of $D(\text{co}) = 8.4 \text{ v}$ still needs confirmation. S. S. de Finály.
- Double excitation of helium by electron impact. H. S. W. Massey and C. B. O. Mohr. *Proc. Cambridge Phil. Soc.* 31, 601-8 (1935).—Calcd. values of the probability of excitation of He to doubly excited levels agree qualitatively with the relative intensities and distribution of observed lines. E. O. Wug.
- Collision of K ions with gas particles of inorganic and organic substances. III. Relation between effective cross section and area under mass-spectrographic distribution curve. Otto Schmidt. *Ann. Physik* 25, 92-6 (1936). cf. *C. A.* 29, 1707¹.—Irron previous measurements with about 20 mono- and poly-atomic gases it is shown that the ratio of the 2 quantities named (effective cross section by Ramsauer's method) is const. for gases in a related series. C. D. West.
- The quantity of positive ions at the cathode in an electrical discharge. T. I. Câmpian. *Bull. soc. roumaine phys.* 36, 61-8 (1934).—Although the mean energy of the pos. ions is very small, 85% of the current in H and 80% in air is carried by them. These differences are due to the secondary emissions and are diminished by evacuation. The same relative effects in H and the air are found throughout the pressure range 0.1-2.5 mm. R. E. DeRight.
- Photoelectric effect and photoconductance of crystalline semiconductors. C. Athanasu. *Bull. soc. roumaine phys.* 36, 39-50 (1934).—The 2 phenomena are identical, except that in the latter case the liberated electron must travel some distance. Thus, its effect is lost if it is absorbed within the crystal before reaching the electrode. This, in the latter case, is offset by a reduction in temp. which increases the "mean free path". The wave length of max effect on photoconductance is longer than that for the photoelec. effect. Lowering the temp. to -145° shifts the max of the former toward shorter wave lengths but has no effect on the latter; hence, at this low temp., the 2 points for argentite coincide. As abs. zero is approached the cond. falls off steadily and approaches infinite resistance. R. E. DeRight.
- Effect of pressure on the radiation of the electric discharge in cadmium vapor. V. A. Fabrikant and A. S. Kanel. *Compt. rend. acad. sci. U. R. S. S.* 3, 257-8

(1935); cf. Elenbaas, *C. A.* 29, 361—Variation of the vapor pressure in a discharge in Cd vapor produces changes in radiation as with Hg (cf. Krefitz, *C. A.* 29, 1322). Increasing the Cd pressure increases the radiation intensity and yield to a max. at about 0.1 mm., after which they fall to a min. at about 1 mm. and then rise again. A perceptible contraction of the discharge occurs simultaneously with the latter rise. The measurements were made principally on $\lambda\lambda$ 5085, 4800 and 4676 Å. The effect of added inert gases is to flatten the curve, the min. disappearing completely at higher pressures. A is more effective than Ne.

Temperature distribution and electron density in freely burning arcs. Hans Hörmann *Z. Physik* 97, 539-60 (1935).—A new detn. is made for the lengthwise field strength in freely burning and in stabilized arcs at atm. pressure. The const. of the Ayrton equation is found to be too great by a factor of 2 in the case of the C arc. The ionization in the C arc is not appreciably altered by impurities. From the intensity distribution of the spectral lines in the cross section of the arc the specific radiation density is obtained. Alkali arcs are also examd. The temp. distribution of the arc can be detd. and from this the ionization gradient is obtained. S. Tolansky.

Electron diffusion in the bulb of the mercury rectifier. D. R. Kanaskov *Fizik Z. Soejetjunion* 8, 119-35 (1935).—The discharge phenomena in the dark part of the bulb were investigated, an exploring electrode was used. A linear relation was found between the logarithm of the current of electrons of random velocities at a point on the axis of the tube, and the distance of that point from the cathode spot. There is also a linear relation between the logarithm of the electron concn. at a given point on the axis and its distance from the cathode. The change of potential along the axis of the tube is linear. Differential equations for this case are developed on the basis of Schottky's theory, and results obtained from their solution agree with expt. Helen S. Hopfield.

The radial distribution method of interpretation of electron-diffraction photographs of gas molecules. Linus Pauling and L. O. Brockway *J. Am. Chem. Soc.* 57, 2684-92 (1935); cf. *C. A.* 29, 677.—The expression for the coherent scattering is inverted, giving a radial distribution function which is the sum of a Fourier series, the coeffs. of which are the visually estd. intensities of the rings on the electron-diffraction photograph. The method leads directly to the important interat. distances with a probable error of 1 to 2%, and thus eliminates many possible models. The method was tested on Br₂, Cl₂, C₂H₄, CS₂, COS, CCl₄ and other tetrahedrals. Revised interat. distances and bond angles are given for CF₄, SiF₄, CCl₄, SiCl₄, GeCl₄, SnCl₄, PF₅, AsF₅, PCl₅, AsCl₃, CH₃Cl, CHCl₃, Cl₂O, (C₂H₅)₂O, Cl₂O and SO₂. Victor Hicks.

The electron-diffraction investigation of phosgene, the six chloroethylenes, thiophosgene, α -methylhydroxylamine and nitromethane. L. O. Brockway, J. Y. Beach and Linus Pauling. *J. Am. Chem. Soc.* 57, 2693-704 (1935).—The at. arrangements in the mols. have been detd. from electron-diffraction photographs by both the radial distribution method (cf. preceding abstr.) and the usual visual method. In phosgene, thiophosgene, and the 6 chloroethylenes, the C-Cl distance varies between 1.67 and 1.73 Å, compared with the normal single bond distance 1.76 Å. This decrease is ascribed to the partial double bond character. The bond angle Cl-C-X varies between 122° and 123°45', compared with the normal tetrahedral angle 125°16'. Other interat. distances detd. are in good agreement with previous data. Victor Hicks.

The dependence of interatomic distance on single bond-double bond resonance. Linus Pauling, L. O. Brockway and J. Y. Beach *J. Am. Chem. Soc.* 57, 2705-9 (1935).—A relation between the bond character of C to C bonds for single bond-double bond resonance and the interat. distance is plotted from certain exptl. data, and tested with other data. The electronic structures of mols. contg. various conjugated double or triple bonds (cf. preceding abstr.) or aromatic nuclei and the dependence of bond angles on single bond-double bond resonance are discussed. Some

C to C distances in polynuclear aromatic hydrocarbons are predicted and found to be in good agreement with exptl. data. Twenty references. Victor Hicks.

Diffraction of electrons by rubber films. K. I. Krulov. *Fizik Z. Soejetjunion* 8, 136-52 (1935).—The passage of a beam of electrons through a thin film of natural rubber which is not under strain gives a diffraction picture consisting of rings, showing amorphous structure. Stretching the film produces distinct points in the diffraction pattern, indicating crystal structure. Most (but not all) of these points can be explained by the model of Susich, Mark and Meyer for the unit of crystal structure of this substance. Cooling the stretched film by liquid air gives higher orders of reflection. A film of synthetic chloroprene rubber shows these points even when it is not stretched. The points indicate an orthorhombic crystal as in the case of natural rubber, but with axes of different lengths. H. S. H.

A new optical method for determining the elastic constants of crystals. C. Schaeffer and L. Bergmann. *Atti accad. Lincei* 21, 701-2 (1935).—Quartz crystals are excited to a rapid and elastic oscillation by means of a field varying between 10^5 and 10^6 oscillations/sec., by utilizing the properties of piezoelectricity. If a ray of monochromatic light is passed through this vibrating crystal, a diffraction pattern is formed which depends on the elastic properties of the crystal, but is independent of the crystal structure, and of the type of excitation. The method can be applied to nonpiezoelectric crystals by cementing the crystal onto a quartz plate of appropriate size. In this way topaz, barite, feldspar and beryl have been investigated. Illustrations of the patterns obtained are shown. A. W. Condon.

Charge potential and secondary emission of electron-irradiated substances. M. Knoll *Fizik Z.* 36, 501-9 (1935).—App. and methods for study of charge potential and electron emission of a wide variety of substances are described. C. E. P. Jeffreys.

The measurement of small light intensities by means of counters. H. Karl H. Kreuchen. *Z. Physik* 97, 625-32 (1935). cf. *C. A.* 29, 5341.—The previously described methods are used. The curves for the photoelec. yields of Zn, Cd and Cu tubes are measured in the region 400 m μ to 185 m μ for massive and evapd. counter cathodes. The massive Cd and Zn cathodes when treated with active H₂ are not different from the evapd. cathodes. Treating the evapd. cathodes does not raise the sensitivity. S. Tolansky.

An amplifier for currents of the order of 10^{-12} amperes. Hannes Allén. *Z. Physik* 97, 708-17 (1935).—A thermionic-tube amplifier is described and the theory discussed. The sensitivity is very great and the ionization from individual α -particles can be measured. S. Tolansky.

Foreign ionization and reduction in sparking potential in gases. W. Rogowski and A. Wallraff. *Z. Physik* 97, 785-91 (1935).—It is shown that the reduction in sparking potential due to foreign ionization obeys the root law of Rogowski and Fucks. With very high foreign ionization the reduction grows slowly and ultimately increases with the fourth root of the foreign gas. S. Tolansky.

Production of cosmic ray showers at a considerable depth below ground level. D. H. Pollett and J. D. Crawshaw. *Nature* 136, 1020 (1935).—Five counters in pentagonal formation at a depth corresponding to 60 m. of H₂O were used. Three particles were required for simultaneous discharge. Showers were produced in the earth above the app. Shower production was increased by a Pb shield. A thickness of 1 G cm gave the max. effect. A like result is found on the surface. The results indicate that the showers are produced by pos and neg. electrons. R. E. DeRight.

Investigation of ionization by cosmic radiation with a double chamber. W. Messerschmidt. *Fizik Z.* 36, 788-9 (1935).—The absorption of Hoffman "Stöbe" was measured by means of a double chamber. They showed a half-value thickness of 3.5 cm. Pb. The relation between shower groups studied in the Wilson chamber and the "Stöbe" was discussed. C. E. P. Jeffreys.

Theory of the β -disintegration and the allied phenom.

enon Hideki Yukawa and Shiroichi Sakata. *Proc Phys-Math. Soc. Japan* 17, 467-79(1935)(in English).—Based upon Fermi's neutrino theory of β -disintegration (C. A. 28, 5329)—it is predicted that, if the difference ΔI of proper energies of Z isotopes with at. nos Z and $Z-1$ is larger than $-mc^2 + \mu c^2$ (m and μ are the masses of the electron and of the neutrino, resp.), the isobar Z will change into the isobar $Z-1$ by absorbing one of the orbital electrons. The probability of such a process is calculated, when the electron to be absorbed is initially in one of the K states, and its bearing on the problems of the mass of the neutrino and the nuclear spin is discussed. The importance of this process in the ordinary disintegration by positron emission is considered for ΔI larger than $mc^2 + \mu c^2$. G. M. P.

Deviation of electrical charge distribution from spherical symmetry in some atomic nuclei H. Schuler. *Physik Z.* 36, 812-14(1935).—Calen shows a dissymmetry of charge distribution in the nuclei of Cu, Hg and Bi.

C. I. P. Jeffreys
The asymmetry of the electrical charge distribution of the nucleus of ^{201}Hg H. Schuler and Th. Schmidt. *Z. Physik* 98, 239-51(1935).—From very exact measurements upon the hyperfine structures of the Grp^2P_1 , P_2 , $6s7s^2\text{S}$, and Grp^2P_1 terms of the spectrum of Hg I, deviations from the Landé interval rule are found. These are attributed to an asym. distribution in the nuclear electric charge, and from this the quadrupole moment is found to be 0.5×10^{-24} . In Hg there is not a pure Russell-Saunders coupling. The relativity correction for the terms is considered. The fact that the quadrupole moment has a positive value indicates that the nucleus is lengthened in the direction of the nuclear spin axis. A new detn. is made for the fine structure of the green Hg line 5461 Å and an improved fine-structure analysis made. S. Tolansky.

Creation of positive and negative electrons by heavy charged particles. Yoshio Nishina, Shin-ichiro Tomonaga and Minoru Kobayashi. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 27, 137-78(1935).—Math. E. O. Wig.

Production of neutrons by annihilation of protons and electrons according to Fermi's theory F. Bloch and C. Møller. *Nature* 136, 987(1935).—Math-theoretical. G. M. P.

Absorption of residual neutrons Leo Szilard. *Nature* 136, 950-1(1935), cf. C. A. 29, 2441¹, 4257¹.—Neutrons which have passed a 1.5-mm. Cd sheet are only 10% absorbed by another Cd layer of 0.5 mm., yet are $1/2$ absorbed by a 0.4 mm. sheet of In. Discussion of the theory involved follows, showing that this is contrary to current theory. These residual neutrons show strongly selective absorption in certain elements such as I. G. M. E.

Resonance levels for neutron capture Hans v. Halban, Jr. and Pierre Preiswerk. *Compt. rend.* 202, 133-5 (1936), cf. C. A. 29, 19¹.—Results obtained by the authors and others (cf. Bjerge, et al., C. A. 29, 6488¹, Szilard, preceding abstr.) are summarized. It is probable that in the region of energies greater than kT there are maxima of resonance for the capture of neutrons by nuclei (cf. Perrin and Elsäasser, C. A. 29, 2837¹, Bethe, C. A. 29, 5010¹). C. A. S.

Experiments with slow neutrons P. I. Lukurskil and T. V. Zareva. *Compt. rend. acad. sci. U. R. S. S. (N. S.)*, 3, 393-6(1935).—From the fact that slowing down of neutrons is accompanied by an increase in the intensity of nuclear reactions, it may be concluded that most slowly moving neutrons possessing thermal velocities are most effective in producing reactions. This was proved by the temp. effect found with a Ag target. The neutron source was a tube contg. Rn and powd. Be. The Ag target was subjected to the action of the neutrons and the decay curve then obtained with a Geiger-Müller counter. With a 10-cm. layer of paraffin surrounding the target no increase in activity of neutrons was observed when the wax was cooled from room temp. to that of liquid air. In a series of expts. with the target surrounded by paraffin 1.7, 1.0 and 0.8 cm. thick, the increase in activity on the cooling was 13, 24 and 45%, resp. The thicknesses used were sufficient for the neutrons previously

1 slowed by H_2O and paraffin to acquire the velocity corresponding to the temp. The expts. confirm the temp. effect and show the absorption of neutrons by paraffin. With the 10-cm. layer absorption entirely compensated for the temp. effect. C. E. P. J.

Experiments with neutrons slowed down at different temperatures C. H. Westcott and H. Niewodniczański. *Proc. Cambridge Phil. Soc.* 31, 617-24(1935).—Expts. are described with neutrons slowed down by passage through a paraffin block cooled to liquid-N or liquid-H temps. and also with liquid H replacing all or part of the paraffin block. Absorption of neutrons by Cu, Ag, Rh and Cd increases as the temp. of the block is lowered. The transformations produced in these substances also increase but to a smaller extent, the effect appearing to depend on the thickness of the layer of cooled paraffin or liquid hydrogen. E. O. Wig.

Slowing down of neutrons by collision with protons Hans von Halban, Jr. and Peter Preiswerk. *Nature* 136, 951-2(1935).—Spheres with radii from 5 to 15 cm. were filled in turn with H_2O , FtOH , C_2H_6 and a liquid paraffin. With a source of neutrons at the center and an activated Ag plate in the surface the absorption by the liquids was measured and plotted against the mass of H per cc. of the liquid. Differences are found to be unexplained by differences in H d; so they must be due to differences in the structure of the compounds. Gregg M. Evans.

Disintegration by slow neutrons J. Chadwick and M. Goldhaber. *Proc. Cambridge Phil. Soc.* 31, 612-16(1935), cf. C. A. 29, 2441¹.—Bombardment of all the elements up to Al and also of Cl, A, Ca, Ni, Cu, Zn, In and U by slow neutrons results in marked disintegrations with only Li and B. N shows a small effect. The reaction with B is $\text{B}^{10} + n \rightarrow \text{Li}^7 + \text{He}^4$ rather than that previously suggested (C. A. 29, 2441¹). E. O. Wig.

Production of secondary γ rays by neutrons R. Fleischmann. *Physik Z.* 36, 806-8(1935); cf. C. A. 30, 337¹.—Paraffin, Fe, Cu, Cd and Pb emit γ -rays on the capture of a slow neutron. The yield is about 1 quantum per neutron. C. E. P. Jeffreys.

Evaluation of the exactness of Bethe and Peierls' formula, which is derived from the splitting of the deuteron by γ rays. V. I. Mamaschikov. *Physik Z. Sowjetunion* 8, 200-7(1935).—A formula for the cross section of the deuteron is given, with reference to the photoeffect on the nucleus. It is developed as a power series in r_0 , the greatest distance at which forces between the proton and neutron are manifest. The first member of the series agrees with the formula of Bethe and Peierls, which is therefore considered only an approximation. Helen S. Hoppfield.

Emission of positrons by a Th B + C source Sergio De Benedetti. *Compt. rend.* 202, 50-2(1936), cf. C. A. 29, 3907¹.—The no. of positrons resulting from the action of radiation from Th B + C on screens of Cellophane, Al and Pb, after deduction of those arising in the source and traversing the screens, is in accordance with the theory of materialization of γ -rays. Emission of positrons by radiation other than γ -rays is not detectable after such radiation has traversed a thickness of matter of 0.55 g./sq. cm. C. A. Suberrad.

Proton spectra of the elements magnesium, silicon and sulfur on bombardment with fast α rays O. Hazen. *Physik Z.* 36, 804-6(1935).—Mg, Si and S emit protons on α ray bombardment, and the yields indicate that the emission is associated with the principal isotopes. The energies of the protons allow the energies of the excited states of the nuclei produced, Al, P and Cl, to be estd. These energies are the same within the limits of error. The nuclei differ only by an α -particle. C. E. P. Jeffreys.

Chemical detection of artificial transmutation of the elements P. A. Paneth and H. Loliet. *Nature* 136, 950(1935).—Frouhge He has been obtained from bombardment of B with neutrons to be identified spectroscopically and to be measured. 2200 millieuries of radon were used and 1.3×10^{-7} cc of He was obtained. G. M. E.

Recal by β -decay. F. Bloch and C. Møller. *Nature* 136, 911-12(1935).—The probable relation between the

direction of emission of the electron and that of the neutrino in a β -decay is discussed. Oden F. Sheppard

The excitation of K-radiation from nitrogen, oxygen and neon by α particles Wolfgang Rietzel. *Ann. Physik* 24, 71-18 (1935).—Counter experiments on the excitation function for the intensity of the K-radiation excited in N_2 , O_2 and Ne α -particles (13.35 mm range in air) gave curves of the Bragg type for the total α -particle ionization in air. The N_2 curves show a flat max. at an α particle range of 30 mm. The max for O_2 lies at 35 mm while that for Ne lies beyond 35 mm. However, the Ne curve indicates an inflection point at 13 mm. Morris Muskat

The magnitude and structure of the absorption coefficients of harder γ rays W. Gentner. *Physik Z.* 36, 810-12 (1935), cf. *C. A.* 29, 2074.—The absorption coeff. of γ rays in Pb was measured as a function of wave length. The absorption coeff. of Th C' rays ($h\nu = 2.65 \times 10^6$ e.v.) was plotted against λ . The results agree with the theory and show that Compton effect, photoelectric effect, and pair formation are sufficient to account for γ ray absorption. C. I. P. Jeffreys

Recording the ionization curve of a single α -particle Hannes Alfvén. *Z. Physik* 97, 718-24 (1935). The ion column produced by a single α particle moves with constant velocity in a uniform field, so that the total ionization can be brought into a discharge chamber wherein it produces a current obeying Bragg's law. The current is of the order of 10^{-12} amp and can be measured and observed with an oscillograph. The method employed may have applications for observing individual nuclear reactions. S. Tolmnsky

The distribution of thorium C' in thallium salt solutions Johannes Zirkler. *Z. Physik* 98, 75-6 (1935), cf. *C. A.* 29, 2910.—It has been shown that the radioactive TI isotopes Th C' does not distribute itself between the TI⁺ and TI³⁺ ions according to the masses present. If the radioactive isotope is added to a mixt. of TI⁺ and TI³⁺ of equal concn., then NH₃ pptn. of the TI³⁺ shows that the TI³⁺ contains about 30% of the total γ -ray activity, and the ppt. formed with the TI⁺ and HCl contains 70% of the γ -ray activity. The relative abundances of the TI isotopes 203 and 205 are 29.6 and 70.4%. The valency change thus leads to an isotope sep., the heavier isotope tending more to go to the single-valued ion form. S. T.

Determination of the radium content of rocks Wm. D. Vry. *J. Chem. Physics* 4, 40-8 (1936).—The determination of the age of common rocks by the "He method" (*C. A.* 28, 2088) necessitates accurate detns. of Ra. The method of compensating the background by the use of two opposed ionization chambers is applied to Ra detns., and the apparatus is an observational limit of 5.5×10^{-12} α per g. Ra for n hourly readings. A summary of results for a suite of rocks from a single horizon and the present status of a geol. time scale is given. G. M. P.

Radioactivity of oil waters in Czechoslovakia I. Böhmeček, V. Santholzer and I. Ulrich. *Nature* 136, 910-11 (1935).—The Ra contents of 30 samples of water from different oil-well borings at Gibly and one sample from a boring at Jasina, Czechoslovakia, were detd. The highest Ra content was 7.25×10^{-12} g. per l. in water from a depth of 262 m. Only 8 samples had Ra contents as high as the order of 10^{-11} , the others being of the order of 10^{-12} to 10^{-11} . No correlation between depth and Ra content was found. The presence of elements of the Th series could not be proved. The Ra contents of the oil waters of Czechoslovakia are much lower than in oil waters of Russia as pointed out by Khlopina and Verndskii (*C. A.* 26, 5007).

Electrolytic separation of the oxygen isotopes Geoffrey Ogden. *Nature* 136, 912 (1935).—The electrolytic sep. coeff. for the isotopes of O is found theoretically to be between 0.8 and 1, depending on the width and height of the energy barrier, if account is taken of the possibility of "tunneling" of the barrier by the O¹⁶ or O¹⁸ complex. This sep. coeff. apparently depends on the nature of the electrode and of the electrolyte, but the above range of values is in good agreement with the available exptl. results. This means that while the concn. of D increases

from about 1/5500 to 100% by the electrolytic method the O¹⁸ isotope concn. increases from 0.15 to 0.6% when the most favorable coeff. is used. Oden F. Sheppard

Isotopes of nickel J. de Gier and P. Zeeman. *Proc. Acad. Sci. Amsterdam* 38, 810-13 (1935).—As a result of work with the parabolic mass spectrograph none but even isotopes was detected, the 61 isotope reported by Aston (*cf. C. A.* 29, 3910) being absent. The 61 isotope, about which Aston was in doubt, is confirmed. The proportions of isotopes 58, 60, 62 and 64 were 68.1, 27.2, 3.4 and 0.4%, resp. Gregg M. I. vries

Isotopic structure of iridium A. J. Dempster. *Nature* 136, 909 (1935).—Direct mass analysis of the Ir ions formed by a high frequency spark between electrodes made of Pt-Ir alloy has verified the prediction of Venkatesachar and Subbaray (*C. A.* 30, 199) relative to the existence of Ir isotopes 191 and 193. The heavier isotope is the more abundant. These two isotopes fill the only gaps in the mass no. scale in this region. Oden F. Sheppard

State of electrons in crystal lattices P. Hund and B. Mrowka. *Physik Z.* 36, 888-91 (1935)

C. I. P. Jeffreys
Artificial crystal lattices for interference with visible light Walter Kraus. *Physik Z.* 36, 841-3 (1935).—A method is described for obtaining artificial crystal lattices by the use of standing light waves. C. I. P. Jeffreys

Effect of Röntgen and γ rays upon piezoelectric crystals I. Seidl and I. Huber. *Z. Physik* 97, 671-80 (1935).—Quartz and Rochelle salt crystals are examined with x-rays and with radioactive radiations. The short waves employed produce a definite increase in the elec. cond. The piezoelectric constants are increased in some Rochelle salt crystals and in others are reduced. Quartz crystals exhibit diverse behavior. The influence upon the piezoelectric constants is attributed to a secondary effect. Radioactive radiations turn Rochelle salt crystals yellow. S. Tolmnsky

X-ray interference by contact of radiation source and crystal II Seemann. *Physik Z.* 36, 837-41 (1935).—With the single-crystal antineutrone with sep. approaching zero of the radiator and lattice, interference lines were clearer and more completely obtained. The exptl. arrangement is described and some diagrams of rock salt are shown. C. I. P. Jeffreys

Quantitative analysis of mine dusts—an x-ray diffraction method George L. Clark and Dexter H. Reynolds. *Ind. Eng. Chem., Anal. Ed.* 8, 36-40 (1936).—A known amt. of a crystal substance not present in the dust is added to it. The ratio of the photographic ds. of adjacent diffraction lines from the added and sought constituents is detd. photometrically. The amt. of the sought constituent is then read from a curve giving the relation of similar ratios to the compn. of the sample; the data for this curve are obtained from synthetic standards. For quartz, the detns. can be duplicated to within 5% of the amt. sought. Victor Hicks

New investigations on lines of helium and hydrogen with crossed electric and magnetic fields W. Stuehling. *Physik Z.* 36, 822-5 (1935), cf. *C. A.* 30, 379.—Further work on the combined Stark and Zeeman effects is described. C. I. P. Jeffreys

The influence of foreign gases upon the higher series lines of sodium Chr. Lächthauer and P. Schulz. *Z. Physik* 97, 699-707 (1935).—The broadenings produced in the lines of the ends of the Na series by He, Ne, Ar, H₂ and N₂ are measured. With all the gases the breadth falls with the series no. of the line, finally attaining a constant limiting value. The final value reached depends only upon the foreign gas used. Apart from He, the final widths and the displacements increase with the order no. The interaction of the gases differs at the beginning and end of the series. There exists an asym. effect to the red. S. Tolmnsky

The spectrum of rubidium K. W. Meissner. *J. Physik* 98, 453-4 (1935).—With reference to the results of Dutta and Bose (*cf. C. A.* 30, 379) it is pointed out that the sep. of the D term of Rb has already been measured with great accuracy by Ramb (*C. A.* 25, 5089), who fur-

ther showed, in contradiction to D. and B. that the 3D term is double

S Tolansky
Dispersion of air, krypton and xenon in the short-wave ultraviolet. Wilhelm Krongraber. *Z. Physik* 98, 17-22 (1935).—The dispersion curves are measured with a Jamin interferometer of quartz. For air the region examined is 5095-2144 Å, for Xe and Kr it is 6707-2025 Å. Dispersion formulas are obtained which give absorption frequencies of a shorter wave length than those measured by Cuthbertson (*C. A.* 5, 232). According to the quantum theory such a deviation is expected from the correspondence principle.

S. Tolansky
The spectrum of rotation-vibration of the molecule HD. G. Wick. *Atti accad. Lincei* 21, 709-14 (1935).—HD, which is not rigorously homonuclear, probably shows a faint rotation-vibration spectrum. The vibration spectrum is calculated.

A. W. Conner
The absorption spectrum of hydrogen. II. The ordering of the D level into the term scheme of hydrogen from exposures of H₂ and D₂. H. Beutler, A. Deulner and H. O. Jünger. *Z. Physik* 98, 181-97 (1935), cf. *C. A.* 30, 22.—By using the continuum of a He discharge the absorption spectra of H₂ and D₂ are taken in the region 900-600 Å with a 1-m grating. In para-H₂ the (D - A) bands are completely resolved for rotation structure, but in D₂ the resolution of the higher rotation levels is limited. The heads of the bands form the R(O) lines. Analysis of the vibration series is obtained by using the isotope effect to a 1st approximation and the empirical band formulas obtained are $H_2 v_0 = 111,819 + 2315(v' + 1/2) - 59.25(v' + 1/2)^2$, $v' = 3-10$, $D_2 v_0 = 112,428 + 1632(v' + 1/2) - 30.5(v' + 1/2)^2$, $v' = 4-11$. The series in H₂ begin at $v' = 3$ and in D₂ at $v' = 4$ as only these lie above the photochem. dissociation limit $H_2 \rightarrow H + H^+$ and their rotation terms can predissociate. The absorption lines are much broadened, being recognizable only because of the limited resolution of the spectrograph. The D level is classified as $3p^2\ ^3P_2$ and fits well into the term scheme. The following formulas are proposed: $H_2 v_0 = 111,859 + 2316(v' + 1/2) - 60.75(v' + 1/2)^2 + 0.167(v' + 1/2)^3$, $D_2 v_0 = 112,485 + 1638.5(v' + 1/2) - 30.405(v' + 1/2)^2 + 0.0591(v' + 1/2)^3$. Agreement is not exact. Richardson's recently analyzed emission bands fit this scheme badly.

S. Tolansky
The absorption spectrum of copper hydride. B. Grundstrom. *Z. Physik* 98, 129-32 (1935).—New absorption measurements are made upon CuH bands occurring at 2240 Å, the dispersion used being 2.2 Å/mm. P, Q and R branches are found for the rotation fine structure. The rotation constants for H are $B_v = 7.9$ and 7.29 for $v = 0, v = 1$, resp., and $D_v = 5.10 \times 10^{-4}$ and -5.78×10^{-4} for the same levels.

S. Tolansky
The explanation of the perturbations in the second positive nitrogen bands. D. Coster and F. Brons. *Z. Physik* 97, 570-2 (1935).—The previously examined perturbation in the 4D level of the N₂ bands is not altered by the analysis of Gerb (*C. A.* 29, 780P). The perturbations have the noteworthy properties that (1) a weakening in the perturbed lines takes place without noticeable displacement, (2) the perturbation extends only over one or very few lines, (3) no so-called superfluous lines occur.

S. Tolansky
Predissociation of the oxygen molecule. Paul J. Ilory. *J. Chem. Physics* 4, 23.7 (1936).—Data from the emission and fluorescence spectra of O₂ and from photochem. expts. are assembled to show that the O₂ mol. predissociates in the region of band absorption above 1751 Å. On the basis of this interpretation, the initial process in the photochem. reactions of O₂ caused by light in the region of Schumann-Runge band absorption is the formation of normal 3P atoms as a result of the predissociation, rather than the reaction of an optically excited mol. with a normal mol., as heretofore has been supposed.

G. M. P.
The absorption spectrum of the iodine molecule in the vacuum ultraviolet. Heinrich Cordes. *Z. Physik* 97, 603-24 (1935).—The spectrum is observed with a fluor spar vacuum spectrograph of large dispersion (2.3 Å/mm at

1700 Å) in the region 1950-1500 Å. The band heads can be arranged into 8 progressions. The individual band series and a continuous absorption band at 1505 Å are described. The absorption systems correspond to transitions in the I₂ mol. from the $^2P_{3/2}$ ground level in various excited mol. states. Two of the levels are classified as components of a 4I_2 multiplet and two others as $(^4I_2, ^4I_2)$, 4I_2 , 4I_2 and $(^4I_2, ^4I_2)$, 4I_2 . In the limit the excited mol. dissociates into a $6s^2P$ and a $5p^2P$ I atom. The extrapolation of the convergence limit of a further band system is given as 7.33 ± 0.10 eV. The upper level of this system is $^2S_{1/2}$, the atom splitting into $^2S_{1/2}$ and $^2P_{1/2}$. The ionization potential of the I atom is given as 8.9 ± 0.2 eV. The ultraviolet fluorescence spectrum is discussed.

S. Tolansky
Absorption spectra of tellurium dioxide and monoxide. Choong Shin Hw. *Compt. rend.* 202, 137-8 (1935).—The spectrum of TeO₂ consists of 3 regions: (a) from λ 2430 into the Schumann region, structureless, (b) from 2910 to 4700 with max. at 3580, and (c) with max. at 4980, b and c consist of bands, a and b appear at about 720°, c at 1250°. Two periodicities are indicated with certainty, 650 and 219 cm⁻¹, belonging, resp. to the normal and excited states of the mol. If the d of the vapor is too low the TeO spectrum (cf. *C. A.* 30, 969P) appears, together with 4 new bands on the short λ side, due to predissociation.

C. A. Silbert
The influence of heavy water of crystallization on the line like absorption spectra of chrome alums. G. Jooz and H. Böhm. *Physik. Z.* 36, 826-7 (1935).—If D₂O is substituted for H₂O in the chrome and selenate alums, a shift in the absorption lines is observed. This indicates that the lines are due to lattice and complex vibrations.

C. E. P. Jeffers
The ultraviolet absorption spectrum of water. Erwin Haas. *Biochem. Z.* 282, 224-9 (1935).—The absorption of freshly distilled water was determined with waves of a definite length. Since saturation of the water with 100% CO₂ has little effect on the light absorption of water, it is argued that the temp. effect is not due to an increase in the dissociation of the water.

S. Morgulis
Absorption spectrum of acetylene in the ultraviolet. Aurel Ionescu. *Bull. soc. roumaine phys. 36*, 151-67 (1933); cf. *C. A.* 29, 2948.—A review. R. E. DeR.

The flame spectra of some aromatic compounds. W. M. Vaidya. *Proc. Indian Acad. Sci. ZA*, 352-7 (1933), cf. *C. A.* 29, 1324.—A previous investigation by V. of a band system attributed to HCO as the emitter in the spectrum of the flame of ethylene is reviewed, and arguments for the existence of the HCO band are given. The flame spectra of C₆H₆ and C₆H₅ were also found to contain the

HCO band system, but it is less intense than in the ethylene spectrum. A similar investigation of the flames of C₆H₆, PhMe, PhOH, resorcinol, pyrogallol, BzH, BzOH, Ph₂O, PhNH₂, PhNO₂ and C₆H₅N showed the presence of the HCO bands. Their appearance in the aromatic flames was explained as due to the double bond of the benzene ring and the breaking up of the oxygenated mols. formed by the direct incorporation of the O₂ mol. A gradual

variation in the spectra of the flames of aliphatic series, and considerable uniformity for those of the aromatic series was observed. A tentative but incomplete scheme for the combustion of C₆H₆ on the hypothesis of the direct incorporation of the O₂ mol. is given. The scheme is based on spectral studies of C₆H₅N, C₆H₅NH₂ and C₆H₅NO₂.

L. L. Quill
Resonance fluorescence of benzene. H. G. R. Cuthbertson and G. B. Kistakowsky. *J. Chem. Physics* 4, 9.15 (1936), cf. *C. A.* 26, 584t.—The analysis of the resonance fluorescence of C₆H₆ given previously is amplified and corrected. Upon absorption of the 2536 Å Hg line, only the changes of the quantum no. of one ($v_1, v_2 = 990$ cm⁻¹) vibration of the nonexcited C₆H₆ mol. are unrestricted in fluorescence. In other vibrations the changes of the quantum nos. are not larger than unity (2 when required by selection rules). Five additional frequencies were tentatively identified. 432, 791, 1542, 2537 and

3174 cm.⁻¹. The fluorescence spectrum of C₄D₄ contains the frequencies 944 (as unrestricted) and 2460. The resonance fluorescence of C₄H₄ was quenched by He, H₂, N₂, CO₂ and cyclohexane; this fluorescence is quenched by being changed into high-pressure fluorescence. There is little or no loss of electronic excitation energy by C₄H₄ molecules on collisions. The quenching action is unspecific, and appears to increase as the kinetic cross section of the foreign gas mols. New high-pressure fluorescence bands were observed in C₄H₄ in the presence of foreign gases. These support Henri's analysis (C. A. 23, 1056) of the absorption spectrum as consisting of 2 close electronic levels of the excited mol. Attempts to excite resonance fluorescence in C₄H₄ derive were generally unsuccessful. PbF and PhMe, even at 0.01 mm pressure, emit nearly continuous spectra. Other derivs tried have too little fluorescence to be studied at low pressures. G. M. P.

Absorption and fluorescent spectra of certain naphthalenic hydrocarbons R. Titeica *Bull. soc. roumaine phys.* 36, 69-75(1934).—A study of the spectra of the series C₁₀H₈, α -CH₃C₁₀H₇, α -(C₆H₅)C₁₀H₇ shows that the substitution of successively heavier radicals shifts the spectra toward the visible with no alteration in their nature. The fluorescent spectra are intense but simple. Evidence is not conclusive whether they can be interpreted by the frequency 481 cm.⁻¹ or whether one of 1400 cm.⁻¹ is also necessary. R. E. DeRight.

The light absorption of porphyrin. III. A. Stern and Hans Wenderlich *Z. physik. Chem.* A174, 321-34 (1935), cf. C. A. 30, 3824.—Comparisons were made of the absorption curves of 2 chloroporphyrin- α dimethyl esters that are isomers but differ greatly in structure. The presence of a ring between γ C atom and position β in the ester produced with MeOH-HCl could be confirmed by comparing its absorption curve with that of rhodoporphyrin-XV dimethyl ester. The absorption of a porphyrin unsubstituted in the β -position and with an isocyclic ring was measured and only a small blue displacement found as compared with that corresponding to β -position in Et-substituted porphyrin. Various derivs of the chlorophyll- β series were studied and regularities found similar to those of the α -series. The effect of hydration of vinyl group in the 2-position upon light absorption in both α - and β -series is discussed. R. H. Baechler.

Infrared photography of chromium compounds J. Rzymkowski *Naturwissenschaften* 23, 610(1935).—Several Cr compounds (tri- or hexavalent Cr or perchromates) reflect light of 720-880 m μ regardless of their visible spectrum. Only a few Cr compounds form an exception, viz. CrCl₃, Cr₂S₃ and Cr₂O₃. This observation is valuable for identification of old paintings. B. J. C. v. d. H.

Structure and absorption of benzocyclopentane oximes Pauline Ramart-Lucas and Joseph Hoch *Compt. rend.* 201, 1857-90(1935).—Oximes have spectra whose form and band positions are similar to those of ethylenic hydrocarbons, whereas the isoximes have absorption bands which occupy, in the neighborhood of the visible end, the same position as those of analogous saturated hydrocarbons. The formation of the isomers may depend on the mode of splitting out H₂O from the addn complex of H₂NOH and the ketone which in turn may depend on the mobility of the O and OH groups influenced not only by the no. and nature of the radicals adjacent to the functional group but by the deformations of the valence angles. Measurement of the ultraviolet absorption of the derivs of indanone (III) and α,α -dimethylindanone (IV) and comparison of their curves with those of ethylenic, α,α -dimethylenic and hydrazidene showed them to be true oximes, although they may be regarded as derived by simple cyclization from trialkylacetophenones which have the isoxime structure. As the no. of CH₃ groups in the chain increases, the unsubstituted ketone gives a true oxime, while the disubstituted compd yields an isoxime. Thus tetralone oxime has the unsatd form and α,α -dimethyltetralone oxime shows the ring structure. Although all solns of the oximes of benzosuberone and dimethylbenzosuberone contain an equim. mixt. of the 2 forms, the main proportion of the former is in the oxime form and of

the latter in the iso modification. Similar results have been previously noted in studies of the analogous open-chain compds, MeC₆H₄CO(CH₃)₂Me and MeC₆H₄COCMe₂(CH₃)₂Me. C. R. Addmell.

The Raman effect from cholesteric points of view. Pál Szarvas *Magyar Chem. Folyóirat* 41, 95-114(1935).—A general summary of the theory of the effect based on publications of K. W. F. Kohlrausch, A. Smekal, etc.

S. S. de Finály
Polarization of Raman scattered light W. Hanle and F. Heidenreich *Physik. Z.* 36, 851-3(1935).—The polarization of the edges of Rayleigh lines and the circular polarization of Raman lines from several substances were studied. For a series of Cl compds the assocn. of Raman lines with detd. mol. vibrations are studied. C. E. P. Jeffreys.

The Raman spectrum and fundamental vibration frequencies of silane (SiH₄). Fred B. Stitt and Don M. Yost *J. Chem. Physics* 4, 82(1936).—The Raman spectrum of gaseous SiH₄ (5 atm.) contains the lines 2187 and 978 \pm 5, of liquid SiH₄ at -120°, 2175 and 907 \pm 10. A complete assignment of the Raman and infrared lines of SiH₄ is given. G. M. P.

Infrared absorption spectra of liquefied gases: methane. Constant Corin and Jacques Herry *Compt. rend.* 202, 41-4(1936).—The absorption spectrum of liquid CH₄ and of its soln in liquid N₂ between 0.8 and 2.7 μ consists of 11 bands, for which the harmonics and combinations of the 4 fundamental frequencies of the CH₄ mol., as well as the intensities are given (cf. Kohlrausch, C. A. 29, 4673). Four of the bands (A 0.88, B 1.00, C 1.15 and D 1.38) correspond closely with similar bands of C₂H₆, and are due to intra- and not inter-mol. vibrations, indicating that CH₄ groups within a mol., as in C₂H₆, absorb more strongly than when in different mols. as in CH₄.

C. A. Silberrad
Some new features in the Raman spectra of carbon and silicon tetrachlorides R. Ananthakrishnan *Proc. Indian Acad. Sci.* 24, 452-8(1935).—Two new faint lines in the Raman spectrum of CCl₄ are reported. 434 cm.⁻¹, interpreted as the harmonic of 217.9 cm.⁻¹, its appearance is probably due to its proximity to the total symmetric vibration frequency 459 cm.⁻¹, and 145 cm.⁻¹ apparently a differential tone arising from 459 and 314 cm.⁻¹. There is a well-defined wing to the red side of the line 459 cm.⁻¹. For SiCl₄, the new line 440.5 cm.⁻¹ (near the total symmetric vibration frequency 423 cm.⁻¹) is regarded as the harmonic of 221 cm.⁻¹. Janet E. Austin.

The rotation vibration spectrum of the methyl halides in the photographic infrared at 1.11 μ . H. Verleger, *Z. Physik* 98, 342-52(1935).—With the use of the new Agfa infrared plates the rotation vibration spectra of CH₃Cl, CH₃Br and CH₃I are taken with large dispersion (3-m. grating) in the region 11,100 Å. The bands show a simple set of approx. equidistant lines which show the characteristic intensity alternations exhibited by the \perp bands of a mol. with an axis of threefold symmetry. The mean sepn. of the lines for chloride, bromide and iodide, resp., are 8.47, 9.39, 9.61 cm.⁻¹. The spectra are examd. in absorption and when the pressure in the absorbing tube is raised a second band system overlaps that occurring at the lower pressure. The intensity of this system grows when the pressure is increased. The bands are classified as belonging to the vibration combination (2 ν_1 + ν_2 , 2 ν_3). S. Tolansky.

Infrared evidence for the existence of an isomeric form of hydrocyanic acid Dudley Williams *J. Chem. Physics* 4, 84(1936).—All org. cyanides have an intense infrared absorption band near 4.5 μ ; the isomer in which the C is bivalent gives more intense bands with a wave length 0.2 μ higher. The data of Nef (*J. Am. Chem. Soc.* 26, 1549(1904)) are reanalyzed; the results show that the aq. soln of HCN contains about 2% of the isomer HNC. G. M. P.

Quantitative absorption measurements on the CH harmonics of simple hydrocarbons. I. The halogen derivatives of methane, ethane and ethylene. B. Timm and R. Mecke *Z. Physik* 98, 363-81(1935).—The total absorptions of the third CH harmonic ($\nu = 4$) of the follow-

ing 18 halogen derivs of methane, ethane and ethylene are detd by photographic photometry in the region 0.8 to 0.9 μ . Chloroform, methylene chloride, Me chloride, bromoform, methylene bromide, Me bromide, pentachloroethane, tetrachloroethane, 1,1,2-trichloroethane, 1,2-dichloroethane, Et chloride, Tr chloride, tetrabromomethane, 1,2-dibromomethane, Li bromide, trichloroethylene, *cis*-dichloroethylene and vinyl chloride. A general formula is deduced for the relation between the dipole moment of any bond and the absorption strength of its bands. It is shown how the dipole moment of homopolar bonds can be estd from the measurement of the total absorption in a series of harmonics. The moment of the aliphatic CH valency is estd as 0.3 to 0.4 $\times 10^{-18}$ e.s.u. The absorption strength of the CH frequencies is to a first approximation proportional to the no of CH bonds in the mol. Deviations occur with methane and the dihydrides of ethane. The influence of the halogen is very small. In general a C=C bond reduces the absorption strength. The Br compds have stronger absorptions than the corresponding Cl compds. S. Tolansky

Raman effect of acetylenes II Duodoacetylene, liquid acetylene and deuterioacetylenes George Glocker and Charles L. Morrell *J. Chem. Physics* 4, 15-22 (1936), cf *C A* 28, 5335*, 29, 681*—An app designed for Raman work consists of 8 discharge tubes arranged concentrically around a Raman tube. Cylindrical filters may readily be used. The vibrational Raman spectra of C_2H_2 , liquid C_2H_2 and gaseous C_2H_2 , C_2HD and C_2D_2 were observed and are interpreted in the usual manner on the basis of symmetry considerations. C_2H_2 mols., which are linear in the gaseous state, are seriously distorted in the liquid state. Some lines are accompanied by faint satellites which may be due to rotation effects. The free energies of C_2HD and C_2D_2 , and the free-energy change and the equl const of the reaction $C_2H_2 + C_2D_2 = 2C_2HD$ were calcd for the temp range 273-700°K. G. M. P.

Raman spectra and molecular structure of ethane and its derivatives San-ichiro Mizushima and Yonezo Morino *J. Chem. Soc. Japan* 56, 1464-70 (1935)—As a continuation of previous work (*C A* 29, 971*, 2850*) Raman spectra of C_2H_6 and its derivs were studied in relation to free rotation. The results for CH_3X , CH_3X_2 , together with those obtained in other lines of expts (dipole moment, x-ray scattering, Kerr effect and sp heat), can best be explained by the theory of hindered rotation, but not by the assumption of *cis-trans* isomerism. T. Katsurai

Rotational Raman scattering in benzene S. Bhagavantam *Proc. Indian Acad. Sci. A*, 342 4 (1935), cf *C A* 29, 2449*, 2949*—In a study of the intensity distribution in the rotation wing accompanying the Rayleigh lines in liquid C_6H_6 , the E¹ Hilger spectrograph is used. Results agree perfectly with those obtained earlier with spectrographs of lower dispersion. L. L. Quill

Raman spectrum of benzene-*d* R. C. Lord, Jr. *J. Chem. Physics* 4, 82-3 (1936)—The shifts of 3052 and 3108 cm^{-1} reported for C_6D_6 by Wood (*C A* 29, 6505*) are believed to be due to C_6D_5H . The shifts of 3573 and 3627 cm^{-1} reported by him for C_6H_6 , which he believed to be excited by Hg-4358, are reassigned to 2 other Hg lines, giving shifts of 990 cm^{-1} . G. M. P.

Raman spectrum and molecular structure of benzene San-ichiro Mizushima and Yonezo Morino *J. Chem. Soc. Japan* 56, 1470-4 (1935)—For benzene structure hexagonal symmetry is more probable than trigonal. Calcs of the modes of vibration for C_6Cl_6 and $C_6(CH_3)_6$ are given. T. Katsurai

The infrared absorption spectra of some anthracene hydrocarbons II Applications to the analysis of hydrocarbons present in oils P. Lambert and J. Lecomte *Ann. combustibles liquides* 10, 1077-92 (1935), cf *C A* 29, 1324*—The infrared absorption curve has been detd from 6 to 20 μ for 4 substituted 9,10-dihydroanthracenes as follows 9,10-disubstituted, 9,10-di-isomyl, 9,9-disubstituted, and 9,9,10,10-tetra-substituted. The comparison of the curves with those previously obtained on frac-

tions of lubricating oil show the applicability of the method to the identification of hydrocarbons. G. C.

Raman spectra of amino acids and related compounds I Ionization of the carboxyl group John T. Edsall *J. Chem. Physics* 4, 1-8 (1936)—Raman spectra are reported for 4 amino acids, glycine, *dl*-alanine, *dl*- α -aminobutyric acid, α -amino-isobutyric acid, and for their hydrochlorides, for 3 fatty acids, $HCOOH$, $HOCH_2COOH$, and for their Na salts; and for $CH_3C(=O)OH$, $CH_3C(=O)ONa$, $MeNH_2$, HCl , $LiNH_2$, HCl , *dl*-alanine methyl ester, *dl*- α -aminobutyric acid ethyl ester, urea, $AcOMe$ and Me_2CO . The influence of the solvent water on the Raman spectra of aq solns is discussed. The "carbonyl" frequency, lying near 1670 cm^{-1} in the pure fatty acids, shifts to 1720 cm^{-1} when they are dissolved in water. No shift is found for the corresponding frequency in $AcOMe$ or Me_2CO . The presence of a charged NH_3^+ group on the C atom to the carboxyl increases this frequency by about 20 cm^{-1} . On ionization of the carboxyl group it is found that (1) the "carbonyl" frequency vanishes in all cases investigated. The behavior of the amino acids in this respect is entirely consistent with their structure as amphoterics ions. (2) A group of lines in the region 1200-1420 cm^{-1} undergoes characteristic changes in position and intensity. (3) In most cases there is a powerful line in the region 750-930 cm^{-1} whose frequency increases by 20-40 cm^{-1} on ionization. The frequency of this line is decreased by about 50 cm^{-1} for each addl Me group on the C atom adjoining the carboxyl. (4) Ionization markedly decreases the C-H frequency in $HCOOH$, and also certain strong frequencies in $MeNH_2$ and $EtNH_2$. G. M. P.

Raman spectrum of oxalic acid W. Røge Angus and Alan H. Leckie *J. Chem. Physics* 4, 83-4 (1936)—The Raman spectrum of oxalic acid is given, and is compared with spectra given by Hibben (*C A* 30, 384*) and by Rao (*C A* 29, 5350*). Hibben's results disagree with those of the other investigators, his conclusions that the 2 carboxyl groups behave differently may be invalid. G. M. P.

Raman spectrum of crystalline selenous acid C. S. Venkateswaran *Current Sci.* 4, 309-10 (1935)—At an exposure of 4 hrs. transparent crystals of H_2SeO_4 give a very intense spectrum consisting of a large no of very sharp lines. The frequency nos of these lines in cm^{-1} are 910(1), 909(2), 888(10), 862(0), 706(3), 597(8), 524(3), 364(0), 395(2), 287(3), 251(6) and 199(3). The nos within the parentheses indicate the relative intensities of these lines and a dash above some of them shows that anti-Stokes lines are also present. The lines were obtained with 4046 and 4358 radiations of the Hg arc with equal intensity. The spectrum of the solid is markedly different from that of the aq soln of this acid. W. J. Peterson

Raman spectra of glasses Th. G. Kuyumzlis *Z. Physik* 97, 561-9 (1935)—The Raman spectra of a no of the glasses made by Schott and Genossen are examd. Contrary to previous observations, an individual spectrum is observed for each glass. The spectra consist partly of sharp and partly of broad Raman lines. The frequency ~ 800 , which occurs, is of interest. It is not characteristic of SiO_2 as it is found in Si free glass. A new observation is the existence of continuous bands directly linked to the primary lines. The band structure is different for each glass. The bands exhibit sharp limits on the long wave side. S. Tolansky

Ultra-luminous spectrograph of the Pic du Midi Hubert Garrigue *Compt. rend.* 202, 44-5 (1936)—An improved form of Cabannes and Dufay's spectrograph (*C A* 28, 5332*) with F 0.55, and automatic registration, is described, giving much improved results for the night sky spectrum. The line 5577 is const. from night to night, but diminishes in intensity with increased angle of elevation. C. A. Silberrad

The sensitized decomposition of hydrogen with electrons of controlled energy Geo. Glocker and Lloyd B. Thomas *J. Am. Chem. Soc.* 57, 2352-7 (1935)—H₂

mols have been dissociated, by electrons of known speed with Hg atoms as a sensitizer (the Cario and Franck expt. in which electrons are used in place of light). From the photochem. reaction it is predicted that electrons of 4.9 e. v. should initiate the reaction. This is not confirmed. At 0.02 mm. of H₂ and 0.002 mm. Hg vapor decompn. starts at 7.7 v. J. B. A.

Photoelectric effect and photochemical sensitiveness Cécile Stora. *Compt. rend.* 202, 48-50 (1936), cf. C. A. 29, 39151.—In the course of expts. to det. the difference in the photoelec. effect of the xanthane and quinonoid groups of dyes it was shown that the pos. effect of the former increases in the order uranin, eosin, erythrosin, I e., the reverse of that of the fluorescence. The photopotential of the xanthane dyes is markedly reduced by hyposulfites, phenol, amines and TiCl₃, but K₂I while reducing that of erythrosin increases that of uranin and eosin. The action of gases (O, N and H) in this respect also differs for the 2 groups. These differences are attributed to differences in their chem. constitution.

Photochemical stability of crotonaldehyde Francis F. Blacet and Jack G. Root. *J. Am. Chem. Soc.* 58, 73-5 (1936).—Monochromatic Hg vapor radiation from 2300 to 3600 Å. covering at least 3 types of absorption was used on crotonaldehyde vapor and no decompn. or appreciable polymerization occurred. The system of conjugated double bonds seems to contribute greatly to the photochem. stability of the mol. as contrasted with the corresponding satd aldehydes. The data are discussed. A predominating reverse reaction is postulated.

Emission spectra of chemical reactions René Audubert. *Compt. rend.* 202, 131-3 (1936), cf. C. A. 29, 3238.—With counters with Al and Cu cathodes, of which the max. sensitivities are for 2400 and 2000-2250 Å., resp., the radiation emitted by 14 reactions has been exam'd. In 4 cases (oxidation of EtOH by CrO₃ and action of Br or I on Na₂CO₃ or K₂CO₃) detection was with the Al cathode only; in 3 (oxidation of glucose by KMnO₄ and of Na₂SO₃ and K₂SO₄ with O₂) with that of CuI only, and in 7 (NaOH and HNO₃ or H₂SO₄ oxidation of alk. pyrogallol or Na₂SO₃ with O₂ and action of amalgams of Na, Mg or Al on H₂O) by both.

Photochemical reaction between sodium formate and iodine and a relation between chemical reactivity and light absorption. N. R. Dhar and P. N. Bhargava. *J. Phys. Chem.* 39, 1231-44 (1935); cf. C. A. 29, 2430.—The reaction between Na formate and I₂ in the aq. soln is unimol. in the dark and semi-mol. in light. Temp. coeffs. between 15° and 25° are: dark 1.77; 8500 Å. 1.75, 6640 Å. 1.71; 5700 Å. 1.66, 4295 Å. 1.61, 3512 Å. 1.57; 3485 Å. 1.57; 3340 Å. 1.52; 3125 Å. 1.45. The velocity of the reaction is proportional to the 1/2 to 2/3 power of the incident light. The quantum yield varies from 26 to 64 and increases with temp. and frequency of incident radiation. The light absorption of the mixt. is greater than the sum of the adsorption of the reacting substances due to the activation of I₂ by the Na formate, and is proportional to the concn. of reacting substances.

Hydrolysis of glucosides and other organic compounds by ultraviolet light A. Guillaume and G. Tanret. *Compt. rend.* 201, 1037-60 (1935).—Two % solns. of glucosides (salicin, amygdalin, etc.) and of some esters were placed in *crystg.* dishes, covered with quartz plates and irradiated with ultraviolet light for 3-24 hr. periods. Ultraviolet light has a marked hydrolyzing action on glucosides and some esters.

Reduction of ferric chloride under the action of α-, β- and γ-rays. G. W. Spicer. *Trans. Faraday Soc.* 31, 1706-10 (1935).—FeCl₃ in aq. soln., in anhyd. FeCl₃ soln. and in the form of anhyd. crystals, was reduced by α rays from Rn. Reduction was incomplete in the solid, probably owing to lack of penetration. With γ- and β-rays complete reduction was effected in FeCl₃ soln., but none occurred in aq. soln.

An instance of negative photocatalysis. Jaroslav

Milbauer. *Chem. Listy* 29, 267-8 (in French 268) (1935); *Phot. Korr.* 71, 94-5.—The decompn. of an active MeOH soln. contg. 28.2 g. Na. N-chloro-*p*-toluenesulfonamide (I) per l. proceeded at a rate directly proportional to the light intensity. In the presence of 0.02, 0.2 and 1.0 mg. of the dyes Nile blue, Brilliant green, Capri blue, phos. safranin, fuchsin, primary phtol green and methylene violet per 10 cc. of I soln., the decompn. was slower than in their absence. Exposures were made to the rays of a Phillips 400-w. or of an Osram Vitalux lamp. Since simultaneous expt. with these dye mixts. made in darkness did not show a loss of the activated Cl, the process is one of negative photocatalysis. With the same range of concn. the sensitizers malachite green, primary phtol yellow and methylene blue did not show negative photocatalysis, for in the darkness they consumed activated Cl and disintegrated themselves. For following the decompn., M. added 2 cc. 2 N HCl to the dye soln., followed by 8 cc. of a 0.2 N KI soln. and then titrated the excess I with 0.05 N Na₂S₂O₃ with starch as the indicator. Frank Marech.

The yellow coloration caused by the action of ultraviolet light on mixtures of pyridine with sugars, monohydric alcohols and acetone Remy Cantieni. *Helv. Chim. Acta* 18, 1420-7 (1935), cf. C. A. 29, 5748.—The yellow color (photopyridine (I)) developed in solns. of pyridine, H₂O and fructose is more readily formed and more readily bleached than in solns. contg. glucose, galactose, sucrose or lactose. MeOH and EtOH are not very effective in the formation of I. Acetone inhibits the formation of I.

Absorption and fluorescent spectra of the coloring matter of litmus and red cabbage I. G. Popescu. *Bull. soc. roumaine phys.* 36, 33-5 (1934).—For the coloring matter of red cabbage solns. in alk. and ether have a slight yellow tint and in H₂O are violet, in acid are red and in base are green. For the litmus the colors are blue, violet, red and blue, resp. In every case the absorption bands are wide and diffuse, their position being shifted by a change of solvent. The litmus has almost continuous absorption in the ultraviolet. The fluorescent spectra are continuous with maxima between 4500 and 5000 Å. An alc. soln. of litmus has a diffuse band at 5700-6300 Å.

The influence of light on the surface tension of soap solutions II. L. D. Mahajan. *Z. Physik* 98, 348-95 (1935), cf. C. A. 26, 3164.—The total reduction in surface tension by light increases up to a max. at a concn. of 6.25 X 10⁻⁴ g. of Na oleate per cc. of soln. and diminishes when the soln. is further weakened. This limit varies with age, purity and the type of soap. The violet radiation of the visible spectrum produces a strong reduction, the greatest effect being caused by ultraviolet light. The reduction in surface tension is due to a chem. change in the soap soln. The effect is not due to heat and still occurs when heat and adsorption effects are eliminated.

The fluorescence of ruby, sapphire and emerald C. S. Venkateswaru. *Proc. Indian Acad. Sci.* 2A, 459-63 (1935).—The photoluminescence spectra of natural crystals of ruby, sapphire and emerald (beryl) at 35° are given. The fluorescence of emerald (exposure 24 hr.) shows 2 intense sharp lines at 6806 and 6827 and weak bands at 6946, 6908, 6736, 6433, 6378 Å. The fluorescence of sapphire (exposure 48 hr.) shows 2 intense and sharp lines at 6927 and 6942 and a series of bands resembling the spectrum of ruby. 7130, 7000, 6902, 6802, 6753, 6600, 6592. A 4-hr. exposure gave a very intense spectrum of ruby showing lines at 7027, 6902, 6945, 6927, 6814, 6791, bands at 7206, 7222, 7104, 7123, 7089, 7050, 6733, 6690, 6650, 6592, 6495, 6430, an unresolved blackening between 6992 and 6945, and continuous spectrum between 6100 and 6900. Since the spectra of sapphire and ruby are similar and the strong lines in that of emerald correspond to the weak doublet 6792, 6814 in ruby with diffuse bands on either side resembling the bands of ruby at 200° it is concluded that the luminescence is due in each case to the same agent, probably Cr. Janet F. Austin. "Optimum" concentration of active foreign materials

- in phosphorescent crystals Gerhard Schumann. *Z. Physik* 98, 252-61 (1935).—The crystals examd. are CaO, CaS, CaSe, SrO, SrS, SrSe, BaO, BaS, BaSe, MgS and ZnS. The active foreign materials used are Mn, Fe, Ni, Cu, Zn, Ag, Sb, Ir, Nd, Sm, Pb and Bi. In connection with the relation between the imperfection in structure and the after-glow of crystal foreign phosphorescents it is shown that the existing "optimum" concns. already detd. for foreign materials are not sufficiently definite. S T

- Coloration of compounds of different elements by cathode rays Hantaro Nagaoka and Tadao Mishima. *Ns Papers Inst. Phys. Chem. Research (Tokyo)* 28, 77-94 (1935).—The chlorides of Na, K, Pb, the fluorides of Ca, Na, Li, Mg, Al, Ti, Mn, Cr, Zn, Ce and Pb, PbBr₂, K₂S, SbOCl, PbCO₃, Pb silicate, PbO, Sb₂O₃, and K₂ alum placed in powder form in a pencil of electrons in a Coolidge tube develop colors as with x-rays, but much more readily. The intensity of light reflected from the colored spots was measured and plotted against the voltage of the cathode rays forming the spot. These curves often show breaks that correspond to x-ray voltages. The theories advanced to explain the colors arising in crystals by electron bombardment are discussed. E O Wug
- The nature of the U centers in alkali halide crystals P Tartakovsky and V. Poddubnyi *Z. Physik* 97, 765-73 (1935).—When NaCl crystals are heated to 550-600° the absorption of infrared radiation at $\approx 1.2 \mu$ strongly increases. The transition of the U into F bands under various radiations is studied. It is shown that electrons in the U levels can move to the F levels in 2 ways, namely directly involving absorption of light quanta ≈ 4 v, and indirectly requiring 6.4 v. A photoelec. current can be observed when ultraviolet radiation is used. The U centers are capable of recombining with introduced Cu ions producing a red coloration. It is considered that the U centers are electrons remaining in the place of Cl⁻ ions which have wandered away. S Tolansky
- Examination of some of the optical and electrical properties of didymium glass K. Provad, D K Bhat-tacharya and L M Chatterjee *Z. Physik* 98, 324-35 (1935).—The fluorescence bands of didymium glass irradiated by sunlight are identical with the Raman spectrum, if one considers the incident exciting radiation frequency as that of the strong absorption bands possessed by didymium glass. The infrared frequencies calcd. upon this assumption agree very well with the known values for glasses. Three new frequencies are found at 2.5, 3.1, 6.0 μ . The photoelec. cond. of the glass is examd. to try to explain the characteristic differences occurring in the fluorescence bands when filters are employed with the incident sunlight. S Tolansky
- The dust effect of Mitra Lj. Šplajt *Z. Physik* 98, 306-8 (1935), cf. Mitra, C. A. 29, 7813.—The light intensity employed by Mitra is not enough, and his exptl. precautions are insufficient. Stray light effects are suspected. The results of Mitra are criticized. S T

COLIN G. FINK

- Electric furnaces to bright anneal high-carbon steel Willard Roth *Metal Progress* 29, No. 1, 35-38 (1936).—Better temp. and atm. control are reflected in quality of product and economy of operation. Practical data are given. W A Mudge
- The manufacture of high test cast irons A. Portevin and R. Lenormand *Bull. assoc. tech. fonderie* 9, 301-4 (1935).—High-test cast iron, made in elec. furnaces and contg. 2.60 to 2.80% total C is about 50% superior to malleable iron. Most elec. furnaces for cast iron are basic-lined to facilitate desulfurization, but the basic slag has a tendency to enter the mold, the fluidity of the iron falls rapidly with the temp., and the cast-iron surface is not as uniform as that of cupola iron, whereas acid-lined furnace cast iron does not have any of these disadvantages. Cupola cast iron contg. 2.70% C and less than 2% Si has better properties than malleable iron. G T M

- Characteristics of anodized aluminum R. E. Pettit *Product Eng.* 6, 292-4 (1935).—The aluminate process is described with photographs, and also its fields of application. The oxide coating produced by the electrolytic action is 0.001 in. thick. Ann Nicholson Hurd
- Peculiarities in formation of metallic deposits Jean
- Billiter *Rev. met.* 32, 518-21 (1935).—With very low c.d.s. electrodeposition occurs only along grain boundaries of the base metal or along scratches present on it. Crystal structure of the base is reproduced in the deposit independently of the space lattice dimensions of the base. Force of attraction have a pronounced influence here and appear to be greater than of mol. order because an easily visible unoriented layer can be seen under a microscope between the base and the oriented deposit. Roughness produced with low densities persists, occasionally, when the rest of deposit is made with high densities. This can be explained by a hypothesis that a film of electrolyte which is impoverished by the current and is located next to the surface of the base is of about the same thickness as the projections originally deposited. The film does not follow the contours of the surface, maintaining the same thickness, but is reduced by the height of these projections so that they are located closer to normal electrolyte, which leads to an increased precipitation in corresponding areas. This hypothesis is supported by an expt. which is described. J D G
- Six years of observation of chromium [plate] in a job shop Wm A. Vignos *Platers' Guide* 32, 11-14 (Jan., 1936).—The Ni sub-coat should be controlled as regards Cl₂, acidity and metal content, with temp. and c.d. having an important bearing on the deposits. Arrange

ment of the work in regard to the anodes is important in Cr plating. The coating produced during the first few seconds det. the character of the final Cr plate. The size and shape of anodes, the sulfate content and the effects of trivalent Cr and of Fe are briefly reviewed. W H B

Kinetics of anode-layer formation on metals II Surface layers of lead chloride on lead. L Yu Kurtz. *Compt rend acad sci U R S S [N S]* 3, 307-8 (1935), cf. *C A* 29, 7198. —During electrolysis with a Pt cathode and a Pb anode in 0.5 N HCl, satd. with PbCl₂, with a const. c. d., the potential was const. at first, then increased suddenly, after which there was a linear increase with time. Visual observation showed that the sudden increase takes place when the surface is completely covered with a thin layer of PbCl₂, and the linear increase is due to the thickening of this layer. The thickness of the layer at this point (1.82 - 0.45 μ) decreases with the c. d. but the porosity and elec. cond. increase with the c. d., as with the Ag halides. Comparison of the porosity of the layer with that of compressed PbCl₂ showed that it is small, and the difference in the polarization curves for Pb and Ag is due to the difference in porosity of the salts. I R Rushton

The decomposition and equilibrium reaction potentials of fused potassium chloride Roy C Kirk and W I Bradt. *Trans Electrochem Soc* 69, 14 pp. (preprint) (1936). —Existing discrepancies in the literature concerning the decompn. potential of fused KCl at 500°, with graphite electrodes, were reconciled. Neumann's direct method value of 2.8 v. was verified as the decompn. potential. By means of a revised direct method, the p. d. between the anode and cathode was found to increase with increasing anodic c. d., as applied through a second cathode. A max. value of 3.37 v. was obtained with an anodic c. d. of 10 amp./sq. cm. This is quite close to the calcd. equal reaction potential and in exact agreement with the results obtained by Cambi and Devoto by the commutator method. Neumann's value of 2.8 v. should, therefore, be called the decompn. potential and 3.37 the equal reaction potential. C G I

Energy levels in electrochemistry Wilder D Bancroft and James E. Magosin. *J Am Chem Soc* 57, 2561-5 (1935). —The reduction reactions which may take place in an electrolyte depend upon the relative energy levels required for the specific reactions. That reaction requiring the lowest energy level will take place in preference to one requiring a higher energy level. It will be evolved electrolytically preferentially to reduction if the reduction requires a higher energy level to be reached than that required for the production of nascent H. In H₂SO₄ solns. lower energy levels were required for a sp. reaction where the concn. of H₂SO₄ increased or the temp. rose or the activating adsorption increased. The energy level for the production of intermediate products is also a detg. factor in the course of electrolytic reactions. Reactions are irreversible if the required energy level for the reversible process is not attained. Irreversible reactions may give a definite e. m. f., e. g., the sulfate-sulfate electrode potential may be expressed as $nFE = RT \ln P' / P_{\text{SO}_4}$. No distinction need be made between the processes of hydrogenation and reduction. J W Shipley

Dielectric properties of anodic layers in aluminum electrolytic condensers J E. Lilenfeld, L. Chandler, Jr., and S. Goldman. *Physica* 6, 416-25 (1935), cf. *C A* 26, 333. —Measurements of the dielec. properties with a new type of especially stable electrolytic capacitor showed that variations of the properties may be divided into 2 classes: lagging and nonlagging. The former are characteristic of anodic layers. Anodic layers are similar to other composite dielectrics in regard to nonlagging variations. An oscillographic study of harmonics verified the lagging nature of the changes of capacity with operating voltages (a, c, and d. c.) and demonstrated for the first time the existence of a nonlagging variation of the a. c. cond. with voltage. To minimize lagging changes most of the expts. were made with layers formed in electrolytes of low OH-ion concn. and operated in extremely viscous electrolytes of high sp. resistance and low active OH-ion concn. Where a large percentage of harmonics was de-

veloped, anodes formed and operated in decidedly amp. electrolytes were used. From the absence of evidence of changes of capacity due to pressure caused by the electrostatic field it was concluded that the layer could not be of a gaseous nature. Allen S. Smith

A study of aluminum mercury-zinc anodes in acid zinc-plating baths A K. Graham and P. G. Kolupaev. *Metals & Alloys* 7, 14 17 (1936), cf. *C A* 29, 1718.

A study of Al-Hg-Zn anodes in a ZnSO₄-Al₂(SO₄)₃-NH₄Cl bath at pH values of 2 to 4 and 3 other acid Zn baths of com. compn. at a pH of 4.0 Current efficiencies, anode polarization, sludging tendency, bath voltage, pH variations and character of deposits are reported. A comparison with com. pure Zn anodes is made. Downs Schaaf

Mercury | mercuric oxide | saturated barium hydroxide and calcium hydroxide electrodes G. J. Samuelson and D. J. Brown. *J Am Chem Soc* 57, 2711-4 (1935).

The two electrodes Hg/HgO(s), Ba(OH)₂(s) and Hg/HgO(s), Ca(OH)₂(s) were prepd. and studied from the standpoint of ease of prepn., constancy, reproducibility and effect of temp. change. The potential for the Hg/HgO(s), Ba(OH)₂(s) including a liquid junction was +0.1462 - 0.0004(t - 25°) = 0.0002 V, versus H as zero. With ordinary materials a satisfactory electrode of the same voltage was obtained. The potential of the Hg/HgO(s), Ca(OH)₂(s) was +0.1923 + 0.00010(t - 25°) = 0.0010 V, and with ordinary materials the voltage was well within ±0.002 V. of the above value. J W Shipley

An unknown property of the calomel half-cell and the estimation of bromide-chloride mixtures F. L. Hahn. *J Am Chem Soc* 57, 2537 (1935), cf. *C A* 29, 5379. Expts. indicated that small amts. of bromide in the KCl of the calomel cell influenced the e. m. f. Even the purest grades of com. KCl contained bromide up to 0.1% and the calomel will contain varying quantities of bromide.

It is suggested that it may be the presence of bromides which causes the irregular change in e. m. f. of reference calomel cells with the passage of time. The bromide effect on the e. m. f. of a calomel electrode is suggested as a method of estg. bromide in chloride. J W Shipley

Potential of the Ag(s), Ag₂CrO₄(s), CrO₄--- electrode. Jessie V. Cann and Gretchen B. Mueller. *J Am Chem Soc* 57, 2525-7 (1935). —The potential of the Ag(s), Ag₂CrO₄(s), CrO₄--- electrode was detd. by means of e. m. f. measurements in an app. similar to that used by Randall and Cann (*C A* 24, 3154). The normal electrode potential was found to be $E^\circ = -0.4163$ and $\Delta F^\circ = 20,506$ cal. J W Shipley

Study of the bismuth electrode D. N. Mehta and S. K. Kulkarni. *Jatkar J Indian Inst Sci* 18A, Pt. 14, 109-13 (1935), cf. *C A* 29, 7824. —Expts. with the Bi electrode with interference colors on the surface due to the oxide film show that it may be used to measure pH within the range 5.0 to 7.4 only. In the relation $E = E_0 + 0.00611 \text{ pH}$ (30°), the av. values of E_0 in the useful range for the half cell Bi|Bi oxide|soln. with the satd. calomel and normal H₂ reference electrodes are -0.2300 and -0.4737 v., resp. The temp. coeff. of the Bi|Bi oxide electrode is -0.0015 v./1°. Energy calcs. indicate the existence of Bi₂O in the surface film. Allen S. Smith

Polarographic studies with the dropping-mercury cathode. III. The electroreduction of benzaldehyde M. Tokunaka. *Collection Czechoslov. Chem. Communications* 7, 392-403 (1935), cf. *C A* 27, 1279. —The electroreduction of BiII at the dropping-Hg cathode was investigated by obtaining current-voltage curves polarographically. The reduction proceeds in two stages, each requiring 1 F per mol. of BiII. The first stage gives probably PhCH(OH)CH(OH)Ph, if not a free radical; the second gives PhCH(OH). The dependence of the cathode potential at which the process starts on the pH of the soln. was studied; for pH = 1, the potential is -0.9 v.; it decreases approx. 0.06 v. for each pH unit; from pH 7 both stages of electroreduction occur and the potential decreases approx. 0.025 v. for each pH unit. In neutral soln. the potential is -1.5 v.; bivalent cations make the potential more pos. In solutions of tetramethylammonium salts the electroreduction of BiOH takes place at -2.3

Storage batteries Albert Ricks. Ger 620,587, Oct. 24, 1935 (Cl 21b, 17). An active mass for Pb storage batteries is made by mixing finely powd. PbO and carbonates of Pb obtained by absorbing CO₂ by Pb oxides. The Pb carbonates are not powd., as fine as the PbO.

Electric capacitor. Frank M. Clark and Ralph A. Ruscetta (to General Elec. Co.). U S 2,028,590, Jan. 21. A film-forming armature such as one of Al foil is closely spaced to another armature and the space between the armatures contains a coned aq soln contg fine particles of salt in suspension.

Electrolytic condenser Willem C. van Geel and Hendrik Emmens (to Radio Corp. of America). U S 2,029,451, Feb. 4. A metallic electrode such as Al carrying an oxide coating is used with an electrolyte contg a soln of an acid phosphate and an alc. such as glycerol or the like for preventing attack of the oxide coating.

Electrolytic condenser Preston Robinson and Carleton Shugg (to Sprague Specialties Co.). U S 2,028,564, Jan. 21. Structural details.

Electrolytic condensers, electrolysis Siemens & Halske A.-G. Brit 435,300, Sept. 19, 1935. See Fr 785,674 (C A 30, 3034).

Film forming electrolytic paste for electrolytic condensers. Paul Hetenyi (to Solar Mfg. Corp.). U S 2,028,775, Jan. 28. Glycerol 36, NH₄ borate 56, potato starch 7 and agar-agar 1% are used together.

Electrodeposition of metal Alexander G. Russell (to Electrical Research Products, Inc.). Brit 435,694, Sept. 25, 1935. In the deposition of separable deposits on a metallized non-conducting surface, e. g., a wax master sound record, metal clips are applied to the edges of the mold to prevent curling away of the deposit.

Coating metals James H. Gravelle. Brit 435,773, Sept. 27, 1935. See Fr 783,250 (C A 29, 78331).

Electrodeposition of metals such as nickel. Paul R. Pine (to Harshaw Chemical Co.). U S 2,029,786-7, Feb. 4. Brit 436,042, Oct. 3, 1935. See Fr 781,542 (C A 29, 61507).

Electrodeposition of magnesium. P. F. Antipin. Russ. 36,019, Apr. 30, 1934. A Mg alloy is obtained by electrolysis of a hot coned aq soln of a Mg salt with a cathode of low-melting alloy such as Wood metal, Rose metal or other metal characterized by a high superpotential in the sepn. of H₂. The alloy thus obtained is then made the anode in a molten electrolyte such as carnallite.

Electrodeposition of aluminum. N. N. Tumanov. Russ. 38,327, Aug. 31, 1934. The resolin of the Al deposited from aq soln on the cathode is prevented by a diaphragm over the cathode (on the bottom) of liquids immiscible with water such as aniline or chloroform.

Bright aluminum surface. Ralph Bryant Mason and Martin Tosterud (to Aluminum Ltd.). Can 354,510, Dec. 3, 1935. An Al surface is buffed to produce a reflection factor of 74%. It is then made the anode in an electrolytic cell with a soln contg 10.0% by wt CrO₃ and 1.0% of a 48% H₂SO₄ soln. A d. c. is passed for 10 min., the electrolyte being at 40–58°. The reflecting surface then has a reflection factor of 87.2%. The article is then anodically oxidized in a 7% H₂SO₄ soln for 10 min., and the oxide coated surface treated for 10 min. with boiling H₂O and polished with soap powder. The reflection factor of the product is 85.3%.

Bright aluminum surface. Ralph B. Mason and Martin Tosterud (to Aluminum Ltd.). Can 354,511, Dec. 3, 1935. An Al article is buffed to a reflection factor of 75.9% and electrolytically treated at 60° in an electrolyte contg 25% by wt. H₂SO₄ soln and 2% of 48% HF soln. for 10 min. It is then anodically treated in a 12% H₂SO₄ soln at 24°. The oxide-coated surface obtained is heated with boiling H₂O for 10 min. and polished with soap powder; it has a reflection factor of 84.5%.

Electrolytic surface treatment of aluminum and its alloys. Ralph B. Mason and Martin Tosterud (to Aluminum Co. of America). Brit 436,154, Oct. 7, 1935. A bright surface of high reflectivity is produced on Al or Al alloy by anodic treatment in a soln. contg 1–60% of

H₂SO₄ together with HF. A current d. of 10–100 amp. per sq. ft. and temp. of 30–70° are suitable. D. c. or a c. may be used. The treated surface may be coated with clear lacquer or varnish or it may be subjected to further anodic treatment in a H₂SO₄ or (COOH)₂ bath to produce a clear, transparent oxide coating which does not appreciably impair the reflectivity. Cf. C. A. 30, 3947, 1935, 481. Oct. 7, 1935, the bright surface is produced by anodic treatment of the Al, etc., in an electrolyte contg. CrO₃ and HIF.

Coating aluminum. Siemens & Halske A.-G. Fr. 789,699, Nov. 4, 1935. Galvanic coatings are obtained on Al by subjecting the Al to a preliminary anodic treatment in an electrolyte contg H₂, HI, H₂PO₄ or H₂PO₃, and HF.

Oxide layers on aluminum. Veremigte Aluminium-Werke A.-G. Ger 620,894, Oct. 29, 1935 (Cl 48a 16). The layers are produced on Al or Al alloys by electrolysis in an (CO₂-H₂) bath contg also a small amt. of oxidizing agents such as peroxides or salts of inorg. acids, e. g., K₂MnO₄, K₂CrO₄ or K₂Cr₂O₇, and HNO₃, added to (COH)₂. Cf. C. A. 29, 17253.

Oxidation of aluminum alloys. Carlo Borgo. Fr. 789,617, Nov. 4, 1935. The surface hardness of Al alloys, particularly those contg Cu, is increased by electrolytic oxidation using as electrolyte an aq. soln of oxalic and tartaric acid, in which are dipped the pieces to be oxidized connected to the anode, while the cathode is composed of any conductor.

Oxide and colored films on aluminum. Pentall Soc. Anon. Fr 788,873, Oct. 18, 1935. Films of oxide are produced electrolytically on Al and its alloys in a bath contg an aromatic sulfonic acid, e. g., PhSO₃H, toluene-p-sulfonic acid and mono- and di-sulfonic acids of C₆H₄. Fr 788,874. The bath contains a substance having a capillary action, e. g., Na sulfocamates, Na isopropylphenylthene-sulfonate and diamyl ester of sulfophthalic acid. Fr 788,875. See Swiss 175,366 (C A 30, 759). Fr 788,876. A protective tube for elec. conductors is made of Al or an Al alloy, the surfaces of which (exterior and (or) interior) are covered with a film of oxide impregnated with insulating materials. Cf. C. A. 30, 757. Fr 788,877. See Swiss 175,365 (C A 30, 759). Fr 788,878. Paper or cardboard is covered with sheets of Al or its alloys, the surface of which has been oxidized. Fr 788,879. The film of oxide formed on Al is colored, and a design is produced by corroding a part with an alk. agent. Fr 788,880. See Swiss 176,415 (C A 30, 759).

Metallic films by cathodic disintegration. Julius von Bosse and Kurt Richter (to La Dispersion Cathodique). U S 2,028,853, Jan. 29. For accelerating the cathodic disintegration of metallic electrodes such as those of Au or Ag in a vacuum for deposition upon an article to be coated without excessive heating of the article, the size of the electrodes is so adjusted that the greatest cross sectional dimension of the electrodes is from three-tenths to approx. equal to the mean free path of the atoms formed by disintegration of the cathode. Cf. C. A. 29, 10211.

Removing electrolytic deposits. Kelsen Special Sheet Holding Soc. Anon. Brit 436,282, Oct. 9, 1935. Electrolytic deposits of metal are loosened from cathodes by dissolving the metal on particular surfaces or along particular lines as desired, the solvent selected being one that reacts with the deposit but does not attack the cathode. Thus Cr steels and steels which, in addn. to Cr, contain Ni may be used as cathodes and Cu deposited thereon is removed with dil. HNO₃ or H₂SO₄.

Electroplating apparatus. John Kronsbein and Charles F. Neale. Brit 435,631, Sept. 25, 1935. Articles are carried through the plating bath by a partially submerged rotating wheel or disk constituting an electromagnet on the periphery of which the articles are supported.

Zinc plating. Soc. d'Electrochimie, d'Electrometallurgie et des acieres Electriques d'Ugine. Fr. 789,076, Oct. 22, 1935. Electrolytic coatings of Zn are obtained by adding carbamide to solns. of neutral salts of Zn.

Chromium plating. N. D. Bryukov. Russ. 37,956, July 31, 1934. To a plating bath of H₂CrO₄, Cr₂(SO₄)₃,

$ZnCrO_4$ and $MnCrO_4$ are added hydrates of $CaCO_3$ or CaO in such proportion that the ratio by wt of the Ca , Zn and Mn is 1:1.0:0.3.

Bath for electroplating with lead. A. B. Yakulov and P. E. Borozhin. Russ. 37,957, July 31, 1934. To a bath contg. $Pb(OAc)_2$, $AcOH$ and a protective colloid is added NH_4OH .

Electrolysis. *Patent Soc. Anon. Brit.* 436,270, Oct. 8, 1935. See Swiss 170,639 (*C. A.* 30, 319).

Apparatus for the electrolysis of alkali chlorides. Charles Pouyand. Ger. 620,902, Oct. 30, 1935 (*Cl.* 121:9).

Apparatus for the agitation of the electrolyte in cells for the electrolytic etching of zinc or other metals. José G. Walling. Brit. 436,176, Oct. 7, 1935.

Heavy water and hydrogen. Albert F. Knowles. Brit. 435,450, Sept. 23, 1935. In the electrolysis of water for the concn of heavy water, the water vapor carried off by the gases is condensed before washing of the gases and is used as feed to an electrolytic cell in the next stage of concn. The feed water may serve for washing. The washed hydrogen may be brought into intimate contact with the feed water in a coke tower, the D interacting with the H_2O to form a certain amt of heavy water. The hydrogen from the later stages of concn is liquefied and the "heavy" and "light" gases are sep'd by fractional distn. The D so obtained is burnt in air to yield almost pure D_2O .

Electrolytic generation of hydrogen. Siemens & Halske A.-G. Brit. 435,710, Sept. 26, 1935. H_2 generated under pressure in an electrolytic cell is led by a pipe to a pressure-tight flask filled with H_2O or other inert and incompressible liquid, the flask being filled with H_2 by displacement and the displaced H_2O passing by a pipe to fill a fresh flask from which the displaced air escapes by a capillary.

Storage-battery electrodes. The Expanded Metal Co. Ltd. and Harry P. Salmon. Brit. 436,268, Oct. 8, 1935. The electrode in the form of a box filled with active material is made of expanded or partly expanded metal and may be made by bending a sheet of the metal into shape and welding the free edges together. *Cl. C. A.* 29, 408.

Oxide-coated cathode. Irwin F. Lowry (to Canadian Westinghouse Co. Ltd.). Can. 354,260, Nov. 19, 1935. For cathodes to be used in gas-filled tubes, such as rectifiers, for heavy duty a coating of BaO or SrO is used as the electron-emissive material.

Rotatable cathode for electrolytic cells such as those used for depositing metals in sheet form. Allen C. Jephson and Ernest B. Custer (to National Radiator Corp.). U. S. 2,029,285, Jan. 21. Various structural and mech. details.

Engine spark plug with a palladium-containing contact. Robert John and Erwin I. Spellmeyer (to Carbex Chemical Co. of Ill.). U. S. 2,028,749, Jan. 23. Pd or a Pd alloy is used on one or both electrodes.

Refining metals. Ivar Rennerfelt. Fr. 789,700, Nov. 4, 1935. The air in an induction furnace is replaced by an inert gas such as N and the metal is strongly beaten by CO , water gas or H_2 . The metal is protected against any harmful action of the inert gas by a layer of slag.

Refining auriferous material. Deutsche Gold- und Silber-Scheideanstalt vormals Roessler. Brit. 435,731, Sept. 26, 1935. See Fr. 784,928 (*C. A.* 30, 359).

Electric induction furnaces. Heraeus-Vacuum-schmelze A.-G. and Wilhelm Rohn. Brit. 436,490, Oct. 11, 1935. Add to 382,002 (*C. A.* 27, 2888). In a furnace according to 382,002, a coil for high frequency current, preferably wound about a vertical axis, is arranged between the pancake coils and the hearth, and the turns of the latter coils cross the turns of the high frequency coil to a preponderant extent.

Induction furnace for melting metals. A. I. Boldurev and N. N. Barushnikov. Russ. 37,776, July 31, 1934. Construction details.

Electric smelting furnace. Akt. Ges. Brown Boveri & Cie. Ger. 620,778, Oct. 29, 1935 (*Cl.* 31a:240).

Automatic electrolytic vulcanizer. Maurice Alléra. Fr. 789,515, Oct. 30, 1935.

Electrically heated coke ovens. Akt.-Ges. Brown, Boveri & Cie. Fr. 789,422, Oct. 29, 1935.

Electrically heated annealing furnace. Deutsche Bleckindustrie G. m. b. H. Ger. 620,820, Oct. 28, 1935 (*Cl.* 18c:801).

Charging electric metallurgical furnaces. Paul I. Mignet and Marcel P. Perron. Ger. 620,786, Oct. 30, 1935 (*Cl.* 40c:1601).

Electric resistance heater suitable for use externally of tanks or conduits. John A. Knight. U. S. 2,029,073, Jan. 28. Structural details.

Electrode steam boilers. Siemens-Schuckertwerke A.-G. (Heinrich Gelius, inventor). Ger. 620,592, Oct. 24, 1935 (*Cl.* 21b:7). A perforated float-supported sleeve for tapping off water with a high salt content is described. Thus keeps the cond. of the water from becoming too high.

Treating air electrically. Constantin P. Yagiou. Brit. 436,467, Oct. 11, 1935. Mixts of pos and neg ions in desired proportions are obtained by supplying to 1 or more sharp electrodes an alternating voltage greater than 800 v., causing an air flow over the electrodes and varying the length of the path from the electrodes to earth, whereby the rate of destruction of the neg. ions relative to that of the less mobile pos. ions can be varied. App. is described. *Cl. C. A.* 29, 3244.

Heating fluids by electricity. Gaston H. C. Roux. Brit. 436,676, Oct. 16, 1935. A fluid, e. g., a gas, is heated by passage through a refractory insulated container provided with electrodes and a resistance filling of magnetite alone or mixed with MnO_2 , wolframite, sulfides of Pb , Zn , Fe or Cu , or non-conducting materials.

Electron-discharge device. Victor O. Allen (to Hygrade Sylvania Corp.). Can. 355,060, Dec. 31, 1935. A radio tube has an electron-emissive cathode coated with alk. earth oxides and an anode consisting substantially of entirely graphitized C , substantially free from occluded gases and entrapped carbonaceous products, and from loose amorphous C . *Cl. C. A.* 29, 4633.

Photoelectric tube. George R. Stilwell (to Bell Telephone Laboratories, Inc.). U. S. 2,029,040, Jan. 23. An anode such as a Ni ring is used with a light-sensitive electrode having a base metallic layer such as Na carrying a thin film of dielec. material such as Na sulfide and an overlying thin film of light-sensitive material such as Na which in turn is covered by another thin film of dielec. material. Various structural details of associated app. are described.

Photoelectric tube. Jan H. de Boer, Johannes Bruyens and Marten C. Teves (to Radio Corp. of America). U. S. 2,029,414, Feb. 4. An anode is used with a photoelec. electrode contg. alkali metal such as Cs , and a metal such as Sn capable of alloying with the excess alkali metal of the tube is disposed outside the vicinity of the electrode. Structural details are described.

Thermionic valves, etc. The M-O Valve Co. Ltd. and Mark Benjamin. Brit. 436,527, Oct. 14, 1935. In the production of deposits of alkali and alk. earth metals within sealed vessels for photoelec. cathodes, a mixt of an oxide or carbonate of the metal and Al , the no. of atoms of Al being equal to or greater than the no. of O atoms or CO_2 radicals, is heated in H_2 at atm. pressure to about 1000°. The product is introduced into the vessel as pellets, etc., and heated in *vacuo* to 1000° or over. The process is not practically possible for Cs , and rarely so for K , Na , Co , and oxides of Ba , Sr , Ca and Li are preferable.

Colored liquids in electrical signs. Fuzo Mukasa. U. S. 2,029,183, Jan. 28. App. is described in which differently colored liquids of different sp. grs. such as water and oil are used, layers of which are caused alternately to flow through an illuminated pipe.

Metal-vapor lamp. Harvey C. Rentschler (to Canadian Westinghouse Co. Ltd.). Can. 355,173, Jan. 7, 1936. A high-pressure Hg-vapor lamp has an env. envelope contg. electrodes of the activated type and a charge of starting gas. A sufficiently small amt of Hg is inside the envelope that it can be completely vaporized in the operation of the lamp with sufficient elec. energy.

Apparatus for salvaging arc-lamp carbons by mechanical turning. Wallace E. Cross. U. S. 2,029,522, Feb. 4. Mech. and operative details.

Flashlamps. N. V. Philips' Gloeilampenfabrieken. *Brit. 436,047*, Oct. 3, 1935. In addition to the material producing the actinic light, a complex Co compound the color of which is changed by H_2O -vapor is also enclosed in the bulb to indicate the leakage of air thereinto. Co or Ni cobaltcyanide and hydroazotum cobaltcyanide are suitable compounds.

Flashlamps. N. V. Philips' Gloeilampenfabrieken. *Brit. 436,694*, Oct. 16, 1935. A lamp comprises a wire or band of Mg or Mg alloy having a periphery less than 1500μ and obtained by drawing through dies producing a comparatively small reduction of section, preferably a decrease in circumference of 6% at most per die, the zone of deformation being heated to $250-400^\circ$.

5—PHOTOGRAPHY

R. R. BULLOCK

Relation between exposure and density for x-ray exposures. J. E. de Langhe. *Z. wiss. Phot. 34*, 174-80 (1935).—On the basis of several hypotheses, a general equation is derived for the blackening on development (d) of an emulsion layer after exposure with x-rays. From the discussion of this equation, the following conclusions are drawn: (1) In its lower part, the $d-E$ curve is linear. From the equation of this linear part, it appears that the d is proportional to the expression $\Sigma a_i n_i$ [where a_i is the projected area after development, and n_i is the no. of grains per sq. cm. of the emulsion surface]. Accordingly, for a unidisperse layer, the d is proportional both to the individual, and to the total, grain surface. The d is a function of the wave length through the expression $f(\gamma) \gamma h$ [where γ is the no. of nuclei formed per quantum]. (2) The max. slope of the $d-\log E$ curve is independent of the wave length of the incident x-rays. It can be calculated from 2 of the equations for a unidisperse single-grain layer.

Author

Fine-grain chemical development. R. Namas. *Progresso fot. 41*, 97-102, 139-45 (1934). *Phot. Abstracts 15*, 194 (1935), cf. C. A. 29, 3925⁷.—Formulas for p -phenylenediamine developers are often not given with sufficient detail to det. the form in which the p -phenylenediamine is used. Many developers stated to give fine grain give very incomplete development of the image and require increased exposure. If their activity is increased by adding alkali, graininess is also increased. Some of these developers do not give better results than those obtained with a metol developer contg. just sufficient alkali to free the base; such a developer is improved by the addn. of a small amt. of safranine.

Sensitometric testing without a photometer. Th. Mendelssohn. *Phot. Ind. 32*, 886-7 (1934). *Phot. Abstracts 15*, 224; cf. C. A. 29, 3925⁷.—Both in measuring the d of an absorbing medium and in deriving characteristic curves of photographic emulsions, testing without a photometer involves the detn. of points of equal d on 2 sensitometric strips. To facilitate this, Hübl has recommended placing the 2 strips in juxtaposition under a mask contg. a narrow slit 1.5 mm. wide, and moving 1 strip with respect to the other until equality of d is obtained. By this method, a probable error of 1 mm. is claimed, and M. has checked this for 3 contrasts of printing paper. Results are quoted and discussed.

Sensitometric study of the Artigue process with two sensitive surfaces superposed. J. B. Turdy. *Photo four tous 10*, 167-70, 185-8 (1934). *Phot. Abstracts 15*, 224.—On account of rapid plates being "backed" and the impossibility of using 2 superposed plates with most plate holders, T. suggests the use of 2 emulsion-coated films placed back to back. Such "tandem-negatives" have been sensitometrically studied by developing the 2 component films separately in different developers, 1 to give a soft negative and 1 a hard negative. Three development times were used, and characteristic curves are reproduced both for the negatives separately and for the various possible combinations of them as composite negatives.

Progress and applications in infrared photography. John Eggert. *Veröff. d. wiss. Zentral-Lab. phot. Abt. 4*, 98-118 (1935).—An account is given of the further extension of sensitivity into the infrared as far as 1360μ rendered possible by the use of the cyanine dyes with 9- or 11-membered polymethenyl chains, which were

obtained in 1933, with special reference to the properties of the Agfa Infrared plates. For the later part of this article see C. A. 29, 6203¹.

E. R. Bullock

Stability of various sensitizing solutions for infrared rays. Giovanni Semerano. *Ann. chim. applicata 25*, 473-81 (1935).—A photographic film which has been sensitized to the infrared is not very stable. Aq., as well as alc., solns. of pinacyanol, rubrocyanine, neocyanine and alloxycyanine, neutral, as well as with addn. of acid or NH_3 , were used. The neutral solns. are most stable. Those compounds having a methene chain in o -position with respect to the quinoline N are more stable than those where the chain is in p -position. Heavy constituents in the methene chain also increase the stability of the mol.

A. W. Contieri

Deviation from Schwarzschild's law in the ultraviolet. Maurice Lambrey and Jean Corbière. *Compt. rend. 201*, 1351-2 (1935).—When the density, d , of a plate is plotted against $\log E_0/E$, E_0 being a fixed and E a variable illumination, for λ 4300-3230 Å, with the time of exposure, t_0 , const., the curve obtained differs materially from that obtained by plotting d against $\log t/t_0$ with const. illumination E_0 , and time of exposure, t , variable. The Schwarzschild exponent calcd. from these results varies, the variation increasing with increasing rapidly as γ (the factor of development) decreases and d increases, in approx. the same way as γ was found to do (Fabry and Buisson, C. A. 18, 2845).

C. A. Silbrad

Influence of atmospheric oxygen and of the desensitizer concentration on the sensitivity of desensitized photographic layers. Marietta Blau and Hertha Wambacher. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse, Abt. IIa*, 144, 403-8 (1935); cf. C. A. 29, 4685².—For exposures at ordinary pressure, the effect of treating Agfa Contrast plates with pinakrytol yellow soln. is to increase the steepness of the intensity-scale, and to decrease that of the time-scale, d curve. This effect is greater, the higher the concn. of the dye, but, at all the concns. used (0.001% to 0.2%), decreases with decreasing pressure (to 6 mm.). It is considered that the facts of desensitization are best explained by an oxidation theory, according to which the desensitizing dye acts as intermediary between the oxygen of the air and the development nuclei produced by light. Solarization, which is almost prevented by the highest dye concn. used at atm. pressure, is progressively less affected by lower dye concns. and at lower pressures; and the desensitizing action of KBr and of KI, and the bleaching-out action of the latter, become less pronounced under the lowest pressure.

E. R. Bullock

Modern development papers. Wandelt. *Phot. Ind. 32*, 1350-2 (1934); *Phot. Abstracts 15*, 218.—Typical characteristic curves for the 7 contrasts of Agfa "Lupece" glossy gaslight paper are reproduced, together with a table of sensitometric consts. in which are quoted the gradation—measured by the length of the projection on the abscissa of the region of the characteristic curve lying between the d_s 0.02 and 1.7—and the γ values. W. points out that neither the gradation nor the γ value alone characterizes a paper, as 2 papers may have similar gradations for very different γ values and vice versa.

Photographic diazotype layers Leonard R. Harper and Donald W. Powell. Brit. 435,874, Oct. 1, 1935. Pos. diazotype prints are produced by exposing to light under a design a surface sensitized with a diazo compd. that couples in practically neutral or acid soln., e.g., diazo-1-amino-2,5-diethoxy-4-benzoylamino benzene, diazoethyl- α -bromoglyoxylate, 2,6-dichloro-4-amino-phenylhydrazine, diazo- α -chloro- α -ketopropaldehyde-2-chloro-4-amino-phenylhydrazine, and developing the surface with a soln. that is neutral or alk. or slightly acidified with H_2BO_3 and contains a salt of an aromatic org. acid that is readily pptd. in aq. soln. by a stronger acid and has no deleterious effect on the print. Developing solns. named contain (1) phloroglucinol (I) and $BzONH_4$ (II), (2) I, II and H_2BO_3 (III), (3) I, II, Na K tartrate and III, and (4) Na phenylacetate, Na_2WO_4 and III.

Photographic diazotype processes I. G. Farbenindustrie A.-G. Brit. 436,587, Oct. 7, 1935. Light-sensitive material for the production of pictures in 1 or more colors by synthesis of 1 or more azo dyes comprises 1 or more layers, e.g., gelatin, paper, cellulose hydrate, dyed with 1 or more azo dye components substantive to the layer. Sparingly sol. components having acidic or OH groups are used in the form of salts and soly may be promoted by addn. of MeOH. The layer may be dyed with an azo coupling component, a light-sensitive diazo compd. added and a colored image produced by development after exposure. Gelatin treated with both components may be worked up into an Ag halide emulsion and the Ag image bleached in a bath tanning the gelatin at the exposed parts. Dye formation occurs at the unhardened parts on treatment with acidified $NaNO_2$ soln. Red pictures are obtained from 2,3-hydroxynaphthoic acid α -naphthalide with ureabus (p -aminobenzoyl p -phenylenediaminesulfonic acid) (I) and blue with diazotized diaminidine. The gelatin may be dyed with the azo coupling component and the Ag image converted into an anti-diazotized image as described in Brit. 387,197 (C. A. 27, 5016). Yellow pictures are obtained from di- o -sulfobenzylidene-4,4'-diaminodiphenylurea, obtained by reaction of 4,4'-diaminodiphenylurea with 2 mol. proportions of o -sulfobenzaldehyde, and the anti-diazotized β -naphthylamine. The gelatin may be dyed with the azo-coupling component, the Ag halide caused to absorb p -nitrobenzenediazonium chloride, and coupling effected. The gelatin may be dyed with both compds., the Ag image converted into an insol. nitrite compd. and diazotization effected by treatment with dil. HCl. A red picture is obtained from the urea produced by the action of $COCl_2$ on p -aminobenzoyl- p -aminobenzoyl J and acid and the I obtained by the process of Brit. 344,781 (C. A. 6, 1858).

Photographing on superposed films of different sensitivities Clyde F. Gillette (to United Research Corp.) U. S. 2,028,975, Jan. 28. Various optical and operative details.

Motion picture photography Charles B. Dreyer (one-half to Henry F. Boeger). U. S. 2,028,275, Jan. 21. Light from an object to be photographed is passed through a front emulsion sensitive to a range of light wave lengths but insensitive to a certain band of wave lengths within the first mentioned range and thence to a rear emulsion preferentially sensitive to the wave band to which the front emulsion is not sensitive, and those portions of the object being photographed which it is desired to accentuate are illuminated with light contg. wave lengths to which both emulsions are sensitive while the remainder of the

scene is illuminated with light of wave lengths mainly within the range to which one only of the emulsions is preferentially sensitive.

Colored photographs Franz Lejeune. U. S. 2,023,077, Jan. 29. A process for the production of colored photographs in natural colors on a single printing surface in which three printing images produced by tanning in a picture like manner and corresponding to a blue print image, a yellow print image and a red print image are soaked with metallic solns. involves embodying in the printing surface a ppt. in the form of a water-insol. Pb compd., such as Pb carbonate, a dimethylglyoxime ppt. and a ferric salt ppt. and afterward soaking the blue print image with a $K_4FeC_6N_6$ soln., placing the blue print in intimate contact with the printing surface to form a Prussian blue ppt. in it, stripping off the blue print image, further soaking the yellow print image with a chromatic salt soln. and placing the yellow print image in register and intimate contact with the printing surface carrying the blue image to form a yellow ppt., stripping off the yellow print image, soaking the red print image with a Ni salt soln. and placing the red print image in register and intimate contact with the printing surface provided with the blue image and yellow image to form a red ppt., and stripping the red print image.

Photographic sound records I. G. Farbenindustrie A.-G. Brit. 435,473, Sept. 23, 1935. In the photographic recording of sound by the variable d. method and in the prepn. of a pos. point from an original negative in such manner that the product of the gammas of the positive and of the negative may be 1, the neg. film is developed to a gamma greater than 1, the exposure having been such that the ds. corresponding to the max. and min. lie on the straight part of the characteristic curve; a print is then made on an undyed film, the exposure being such that the d. lies on the straight part of the curve, and the development of the positive is such that its gamma is the reciprocal of that of the negative. A detailed example is given, with formulas for metal and metal hydroquinone developers. Cf. C. A. 30, 4041.

Photographic developers I. G. Farbenindustrie A.-G. Fr. 789,616, Nov. 4, 1935. Halogen substitution products of 2-methylaminophenol (I), e.g., 5-chloro-, 4-chloro- and 4,6-dichloro I, are used for developing Ag halide emulsions with fine grain.

Photographic developers I. G. Farbenindustrie A.-G. Fr. 789,640, Nov. 4, 1935. 2-Methylaminophenols substituted in the ring by alkyl, OH or MeO groups, e.g., the 4-methyl or 5-methoxy derivs., are used for developing Ag halide emulsions. Cf. C. A. 29, 4194 and preceding abstr.

Photographic emulsion Béla Gáspár. U. S. 2,028,279, Jan. 21. A color-photographic material comprises a Ag halide emulsion having incorporated in it differently colored dyes having varying powers of resistance to the effect of an agent serving locally to discharge the dyes for the production of a color image.

Photographic emulsions Max Schmid (to Soc. pour l'ind. chim. à Bâle). U. S. 2,029,940, Feb. 4. See Brit. 428,305 (C. A. 29, 65204).

Printing papers J. Halden & Co. Ltd. and John Holden. Brit. 435,936, Sept. 30, 1935. Printing paper and cloths sensitized with ferroproussiate soln. are coated on the sensitized side with an oxidizing agent in the form of a fine, dry powder not easily sol. in H_2O so that it will exert an intensifying effect late in the development stage. Suitable agents are Sr, Mg and Ca peroxides or hypochlorites and Cl derivs. of aromatic sulfonamides. Cf. C. A. 29, 21061.

Apparatus for developing blue prints with a gaseous developer A. F. Prokin. Russ. 34,307, Jan. 31, 1934. Construction details.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

The development of the chemistry of rhenium. Ida Noddack. *1A Congr. intern. quim. pura aplicada, Madrid 3, 334-40* (1934), cf. *C. A.* 28, 723.—A review of Re and its compds. The heats of formation of Re oxides are compared graphically with data for the oxides of neighboring elements. Re is in a middle position, which accounts for the stability of its oxides. There are only small differences in the heats of formation of the oxides, and for this reason reactions in which part of the Re is reduced and part oxidized to a higher valence are possible. L. R. R.

Palladium carbide. Norbert G. Schmahl. *IX Congr. intern. quim. pura aplicada, Madrid 3, 468-74* (1934).—CH₄ or a mixt. of CH₄ with H in contact with Pd powder formed by reducing PdO with H reaches equilibrium in several hrs. The C content of the solid was 4.4%, corresponding closely to Pd₂C₃ (4.31% C). Photographs of x-ray spectra are given which show that it is a true compound. The compd. shows the same capacity to absorb H as Pd, and this is explained by assuming a double intercalated structure, according to the theory of Hagg (*C. A.* 25, 2615).

E. R. Rushton
Preparation of carbon suboxide. A. Klemenc, R. Wechsberg and G. Wagner. *Monatsh.* 66, 337-44 (1935), cf. *C. A.* 29, 6170.—A discussion of the prepn of C₃O, from Cl₂(CO₂H)₂ (I) and P₂O₅ at 140-150° (not over 20% yield) and by sublimation of (AcO)HC CH(OAc) CO O CO

(II) in CO (at 710°, 9.3% C₃O and 0.97% AcOH) and in CO₂ (21% C₃O and 60% AcOH at 650° or 810°). An app is illustrated. The carefully purified C₃O is very stable and a sample at 120 mm Hg was unchanged after 1 year. The sample from II appears to be more stable than that from I. C. J. West

Chlorous anhydride. Michel Kanter. *Compt. rend.* 202, 209-10 (1936).—By effecting the interaction of KClO₃ and H₂SO₄ in presence of undecylic acid the proportion of ClO₂ is much diminished, i. e., the reaction 2ClO₂ = Cl₂O + Cl₂O₂ is favored at the expense of 3ClO₂ = Cl₂O + 4ClO. The spectra of Cl₂O₂ and ClO₂ have been detd., that of Cl₂O (OOC₂Cl₂) showing distinct analogies to those of SO₂Cl₂ and CrO₂Cl₂. C. A. Silberrad

Arsenates of barium, a sesquiasenate. Henri Guérin. *Compt. rend.* 202, 225-7 (1936).—Ba(AsO₃)₂ begins to evolve O (and As₂O₃) at 500° and, provided it is not heated above 700°, forms the sesquiasenate Ba₂As₂O₇, which at 750-800° passes into Ba₃As₄O₁₃, and thus above 800° into Ba₄(AsO₄)₃, the only arsenate stable at high temps. C. A. Silberrad

Hydrated barium and strontium nitrites. Jean Bureau. *Compt. rend.* 202, 307-9 (1936).—The nitrites were prepd by the action of the products of catalytic oxidation of NH₃ on solns of the hydroxides and concn in vacuum, or pptn by LiOH in cold. The system Ba(NO₂)₂·H₂O has a eutectic, Ba(NO₂)₂·H₂O (hexagonal)—H₂O, at -5.8° (20.3% Ba(NO₂)₂). The hexagonal form is stable to 40°, c = 52%, above which the monohydrate assumes the rhombic form and the soly is given by c = 36 + 0.400t, the satd. soln. b. 114.8°. At 116° the anhyd. salt is formed, which m. 267° and begins to decompose at 270°. Sr(NO₂)₂·H₂O has a eutectic, Sr(NO₂)₂·4H₂O (cubic) H₂O, at -8.7° (26.4% Sr(NO₂)₂), soly c = 31.3 + 0.645t, at 15° (c = 39.55%) it changes to Sr(NO₂)₂·H₂O (hexagonal), soly. (at 15-100°) c = 36.75 + 0.1916t. The anhyd. salt decomposes before melting. C. A. S.

Hydrolytic equilibria of calcium aluminate hydrates. Frick Peter von Polheim. *Zement* 24, 643-8, 659-63, 677-83 (1935).—It is difficult to reach equilibria between the various Ca aluminates hydrates in contact with lime solns at 20-40° because of the slowness of reaction. Another difficulty arises in the variations of cry. strn. tendencies of the several aluminate hydrates, resulting in formation of intermediate products. Three distinct Ca aluminate hydrates of different lime contents are in equilibrium with their solns. at 20°. There are 3 lime water concns. with

each of which 2 solid phases occur, namely Al(OH)₃ and dicalcium aluminate hydrate, di- and tricalcium aluminate hydrate, and tri- and tetra-calcium aluminate hydrate. The concn. of solns. yielding tricalcium aluminate hydrate was found to be 56.0 mg CaO and about 80 mg Al₂O₃ per l. The values were confirmed for the di- and tetra-calcium aluminate hydrates as 300 mg CaO with 100 mg Al₂O₃ per l. and 1070 mg CaO with less than 3 mg Al₂O₃ per l., resp. All 3 hydrates form hexagonal plates at 20°. The dicalcium salt shows a characteristic glittering, even in the finest state of division. Only the tricalcium aluminate hydrate is found at 37°, with CaO concns. between 360 mg per l. and satn. H. F. Kriege

Preparation of sulfur and magnesium sulfate from sulfur dioxide and magnesia. I. Hiroshi Hagisawa. *Bull. Inst. Phys.-Chem. Research* (Tokyo) 14, 1081-90 (1935).—S and MgSO₄ are prepd by the thermal decompn. of an aq. soln of Mg(HSO₃)₂. When this soln. is heated at 130-150° in a closed tube with or without addn. of MgSO₄·6H₂O with shaking, S and MgSO₄ are formed in accordance with the following reactions: 3Mg(HSO₃)₂ = 3MgSO₄ + H₂SO₄ + 2S + 2H₂O, Mg(HSO₃)₂ + MgSO₄ = 2MgSO₄ + S + H₂O. In these reactions S acts as a catalyst, the preliminary addn. of S therefore accelerates the reactions to a great extent. Even then the 1st reaction does not proceed to completion (about 95%), while the latter comes nearly to an end in an hr. at 140° and within 20 min. at 150°. In this case a little Sr₂O₂ is found in the reaction product, the max. pressure in the reaction vessel is about 20 atm. at 140°. K. Konda

Hyposulfites. II. The reduction of sodium bisulfite by zinc amalgam. 1. Toyosaku Murooka. *Bull. Inst. Phys.-Chem. Research* (Tokyo) 14, 1091-7 (1935).—Reduction of concd. Na₂S₂O₃ soln (av. 38.76%) with Zn amalgam in liquid form gives Na₂S₂O₄ in very good yield; the rate of utilization of Zn is about 95%. The reduction velocity is greatly affected by stirring, this reaction proceeds smoothly, and comes to an end within 70 min. at 10° if the soln. is stirred sufficiently. The end point can be detd. by potentiometric titration or quantitative analysis.

III. The reduction of sodium bisulfite by zinc amalgam. 2. *Ibid.* 1154-60 (Abstracts 67-8).—The method of reduction with Zn amalgam also gives good results in the prepn. of Na₂S₂O₄ by reducing Na₂S₂O₃ soln. with addn. of H₂SO₄ and dil. H₂SO₄. Slight decompn. of free H₂SO₄ is, however, inevitable when H₂SO₄ is added, the yield of H₂S₂O₄ is somewhat lowered at temps. over 30°, the amalgam to be used is sufficient in an amt. less than 1.5 times of the theoretical based on the Na₂S₂O₃. The concn. of the solid substance remaining after the complete reduction is given approx. by 3ZnSO₄·Na₂SO₃ + Zn(OH)₂. K. K.

The action of hydrogen sulfide on chromates. H. B. Dunnichoff, G. S. Kotwani and M. A. Hamid. *J. Phys. Chem.* 39, 1217-29 (1935).—The brown solid formed in the intermediate stages of the reduction of 5% K₂Cr₂O₇ consists of Cr(OH)₃, Cr(OH)₂, a coordinated Cr₂(SO₄)₃·Cr₂(SO₄)₃ and free S while the filtrate contains K₂Cr₂O₇, K₂SO₄, and K₂SO₃. The amt. of K₂SO₄ in soln. decreases with the amt. of chromate present until the 2 disappear together and no sulfide is present as long as any chromate remains. The tetrasulfate is formed from the oxidation of the thiosulfate by the chromate and is then reduced by the alk. sulfide. No sulfate is formed if the hydroxylion concn. is above a certain value (not given). The final products of the reaction are a ppt. composed of a mixt. of Cr(OH)₃, S and a complex Cr thiosulfate in which the ratio of ionic to coordinated thiosulfate is approx. 2:1 and a soln. contg. K₂SO₄ and K₂S at ordinary temps. or K₂SO₄ and K₂S at 90°. Sulfite is the precursor of both thiosulfate and sulfate and some sulfate appears if the reaction is carried out rapidly at 90-95°, but no sulfate is formed after the reaction mixt. becomes alk. Arthur A. Vernon

The action of carbonic acid on ferrous sulfide. Y.

Kauko and P. Ilauio. *Suomen Kemistilehti* 8B, 40-50 (1935) (in German).—A preliminary report. H_2CO_3 reacts directly with FeS , forming a carbonate which goes into soln as a bicarbonate and ppts as the carbonate on removal of the H_2CO_3 .

E. E. Jukkola

The volatilization of silica and silicon as silicon sulfide. A technological study. P. Dolch. *Chem. Fabrik* 1935, 512-14.—Historical Applications to the metallurgy of Fe and to removal of Si from Al_2O_3 , etc., are discussed.

J. H. Moore

Fluorination of sulfuryl chloride—sulfuryl chlorofluoride. Harold S. Booth and Carl V. Herrmann. *J. Am. Chem. Soc.* 58, 63-69 (1936).—Sulfuryl chlorofluoride, SO_2ClF , b 7.1 \pm 0.1°, m -124.7 \pm 0.1°, was prepd. by the action of SbF_3 on SO_2Cl_2 in the presence of SbCl_3 under pressure. The latent heat of vaporization at the b. p. is 4.338 cal. At 0°, d is 1.623. Surface tension is 17.2 dynes per cm. It is hydrolyzed by H_2O and absorbed by NaOH . There is no reaction at room temp. with glass, Hg or brass.

L. R. Rushton

Chlorofluorides of germanium. Harold S. Booth and Wm. C. Morris. *J. Am. Chem. Soc.* 58, 90-93 (1936).—The fluorination of GeCl_4 by means of SbF_3 in the presence of SbCl_3 yields GeF_2Cl_2 , m 49.8°, b 37.5°, GeF_2Cl_2 , m -51.8°, b -2.8°; GeF_2Cl_2 , m -60.2°, b -20.3°, and GeF_4 . The chlorofluorides hydrolyze in air more readily than GeCl_4 . They rearrange to form GeF_4 and GeCl_4 , even at -78° and are explosively reduced by Cu to germanous salts.

L. R. Rushton

Double salts of arylidiazonium chlorides and heavy metal chlorides. Preparation of organic tin compounds by means of diazo compounds. A. N. Nesmeyanov, K. A. Kocheshkov, V. A. Klimova and N. K. Gipp. *Ber* 68B, 1877-83 (1935), cf. *C. A.* 23, 5172, 28, 1990a.—Sols of arylidiazonium chlorides were prepd. by diazotizing 1 mol. of arylamine in 300 cc. concd. HCl and 300 g. ice with solid NaNO_2 and dilg. to 1 l. The double salts were obtained by mixing a soln. of the metal chloride in HCl (d = 1.19) with a 1 l. soln. of the arylidiazonium chloride in 5 N HCl, both sols. having been cooled in a freezing mixt. The double salt was filtered off, washed with 5% HCl, then EtOH and Et_2O , and dried in the air. Double salts of the following arylidiazonium chlorides with ZnCl_2 , CdCl_2 , SnCl_4 , PbCl_2 , PbCl_2 , AuCl_3 , TiCl_4 , BiCl_3 and FeCl_3 were prepd. PhN_2Cl , o -, m - and p - $\text{MeC}_6\text{H}_4\text{N}_2\text{Cl}$, o -, m - and p - $\text{ClC}_6\text{H}_4\text{N}_2\text{Cl}$, p - $\text{IC}_6\text{H}_4\text{N}_2\text{Cl}$, and o - and p - $\text{O}_2\text{NC}_6\text{H}_4\text{N}_2\text{Cl}$ formed double salts with all of the chlorides except FeCl_3 , m - $\text{O}_2\text{NC}_6\text{H}_4\text{N}_2\text{Cl}$ with all except CdCl_2 . The compn. and decompn. temp. of each salt are given. The derivs. of AuCl_3 were golden yellow, those of PbCl_2 yellow, those of FeCl_3 bright lemon yellow, those of PbCl_2 bright orange, all the other salts (except the NO_2 and I compds. which were bright yellow) were colorless. The salts contg. Cd , Bi , Sn , Pb and Pt were relatively stable, those of Zn , Fe and Ti were easily decompd. Conversion of the double salts contg. Sn into org. Sn compds was carried out as follows: the solvent was brought to the desired temp., the metal powder was added to it with vigorous shaking, and then the double salt was sprinkled in, gradually but yet rapidly enough so that the temp. remained as const. as possible. At the end of the energetic reaction the inorg. ppt. was filtered off, the solvent evapd. from the filtrate, and the viscous residue extd. with petroleum ether. Upon concn. of this soln. the org. Sn halide crystd. In the case of low melting and difficultly crystallizable compds. the liquid obtained after removal of the petroleum ether was dild. with EtOH and then mixed with an excess of 5% NH_4OH . The diaryl tin oxide (R_2SnO) which sep'd. was filtered off, washed and dried. The yield of R_2SnCl_2 from ($\text{R}_2\text{N}_2\text{Cl}$), SnCl_4 , depends upon the conditions of the reaction and the chem. nature of R. The best reaction medium was AcOEt and the best temp. was its b. p. With (PhN_2Cl), SnCl_4 and Cu powder the yield was only 10% of Ph_2SnCl_2 (I), decompn. with Zn dust gave a better yield, with Sn powder the yield of I was 25%. Other salts of the type (RN_2Cl), SnCl_4 that were decompd. with metal were those in which R = o - MeC_6H_4 , p - ClC_6H_4 , p - BrC_6H_4 , and o -

MeOC_6H_4 ; all gave only compds. of the type R_2SnCl_2 . Decompn. of (o - MeO , $\text{CC}_6\text{H}_4\text{N}_2\text{Cl}$), SnCl_4 , m 102-4°, gave (o - MeO , $\text{CC}_6\text{H}_4\text{N}_2\text{Cl}$), SnCl_4 , m 164°. (PhN_2Cl), PbCl_2 , in Et_2O with Zn dust gave a small quantity of Ph_2PbCl_2 , m 205°. PhN_2Cl , PbCl_2 (10 g.) with Cu powder gave Ph_2PbCl_2 , which was isolated as Ph_2PbO (0.2 g.), a similar result was obtained with PhN_2Br , PbBr_2 , a yellow salt which decompd. at 85°.

Louise Kelley

System cobalt chloride-ammonium chloride-ammonia-water. Marcel Châtelet. *Compt. rend.* 202, 216-17 (1936).—Calorimetric examn. of this system shows that the first reaction is $\text{CoCl}_2 + 2\text{NH}_4\text{OH} = \text{Co(OH)}_2 + 2\text{NH}_4\text{Cl}$, but as the concn. of NH_3 increases there is first no ppt., and then formation first of the ion $[\text{Co(NH}_3)_4]^{++}$ and then of $[\text{Co(NH}_3)_5]^{++}$, the equal concns. $(\text{Co})^{++} \times (\text{NH}_3)/[\text{Co(NH}_3)_4]^{++}$ and $[\text{Co(NH}_3)_5]^{++} \times (\text{NH}_3)/[\text{Co(NH}_3)_4]^{++}$ being, resp. 3 and 95. C. A. S.

The constitution of complex metallic salts. III. The parachors of palladium and mercury in simple and complex compounds. Frederick G. Mann and Donald Purdie. *J. Chem. Soc.* 1935, 1549-63, cf. *C. A.* 28, 4330f.—In a homologous series with the formula (R_2S), PdCl_2 the parachor for Pd falls regularly from 30 when R is Me to -7 when R is Am. The same effect is noted when homologous phosphines or arsines are substituted for sulfides in the Pd compds. The m p. of the compds. also falls as the series is ascended. Since the series for Pd(SR), and Hg(SR), also show the drop in parachor for the metal, the effect cannot be due to coordinate links. The results are explained in terms of the strain const. theory of Mumford and Phillips (*C. A.* 24, 83). The parachor values for Ti, Be and Al given by Sugden ("Parachor and Valency," Chapter 7, *C. A.* 24, 546) do not take account of this effect, and so are incorrect, as are his ideas on single bonds drawn from them. The parachors of compds. of the type $\text{CR}_3(\text{SEt})_2$ are normal. When PhSH is added to a chloropalladate soln., Pd(SPh), ppts quantitatively and decomposes to Pd when heated. It can be used for the d_{rel} of Pd. The following compds. are described: AmS , b 103-9° (sulfonate, b 163-4°, m 60°); BuPhS , b 137-9°, m 103-9°; BuPhS , b 126-7°, m 67°; $\text{C}_6\text{H}_5(\text{CH}_2\text{SPh})_2$, b 264°, m 103-9°; $\text{CO}(\text{CH}_2\text{SPh})_2$, b 256-60°, m 67°; $\text{CMe}_2(\text{SEt})_2$, b 93-100°, m 69°; (MeEtS), PdCl_2 , m 67°, for the series (R_2S), PdCl_2 , when R is Pr, m 59°, Bu, m 32°, m 163°. Am, m 41°, the heptyl and octyl compds. are oils, $[(\text{CH}_2)_7\text{CH}_2\text{S}]_2\text{PdCl}_2$ decomposes *in vacuo* at room temp. (PhBuS), PdCl_2 , m 118°, (iso-BuPhS), PdCl_2 , m 96°, (PhS), PdCl_2 , m 170°, $[(\text{PhCH}_2)_2\text{S}]_2\text{PdCl}_2$, m 154°, (EtS), PdCl_2 , m 107-8° (decompn.), for the series (R_2S), $\text{Pd}(\text{NO}_2)_2$, when R is Me, m 137-8°, Et, m 161-3°, Pr, m 163-4°, Bu, m 165-6°, Am, m 163°, for the series (R_2P), PdCl_2 , when R is Pr, b 183°, m 96°, Bu, b 183°, m 96°, m 211°, m 47°, (Bu_2P), PdBr_2 , m 73°; (Bu_2P) PdI_2 , m 64-5°, (Pr_2P), $\text{Pd}(\text{NO}_2)_2$, m 167-8° (decompn.), for the series (R_2As), PdCl_2 , when R is Me, m 235°, Pr, m 55°, Bu, m 54°, Am, m 10-11°, (PrAs), PdBr_2 , m 49°; (EtAs), $\text{Pd}(\text{NO}_2)_2$, m 176-7°; for the series Pd(SR), when R is Pr, m 209-10°, Bu, m 142°, Am, m 83°, for the series Hg(SR), when R is Bu, m 85°, Am, m 66°, heptyl, m 58°, heptyl, m 75°, octyl, m 71°. The correct m p. of EtS , HgCl_2 is 77.5-8.5°. It decomposes on standing.

H. M. Leicester

The structure and configuration of certain diamminopalladium compounds. Frederick G. Mann, Dorothy Crowfoot, David C. Gattiker and Nora Wooster. *J. Chem. Soc.* 1935, 1612-52.—Besides the known yellow trans- $(\text{NH}_3)_2\text{PdCl}_2$ (I), a red compd. (II) of this formula results when formation is slow. It differs from the cis isomer I and II give the same oxalate, darkening without melting at 175-85°, which is a cis compd. and with KI gives the cis diiodide, a brown powder. I and II also give a trans dinitrate, decomp. at 231-2°. Thus the change from cis to trans and reverse occurs very easily in these compds. X-ray evidence shows that II is trans, but a different cryst. modification from I cis- $(\text{NH}_3)_2\text{Pd}(\text{NO}_2)_2$ is prep'd. from I in a large excess of NaNO_2 and NH_4OH , and darkens without melting at 234°. It easily

changes to the trans form. $[(\text{NH}_3)_2\text{Pd}][\text{Pd}(\text{NO}_2)_4]$ changes easily into the monomeric trans compd. *trans*-(NH_3) $_2\text{PdI}_2$ is prepd. from either the cis or trans dichloride and KI. It is a yellow powder, which dissolves in Me_2CO and immediately reprecipitates in the form of reddish blue octahedra. The I atoms in this modification, which is also trans, are irregularly placed between the regular layers forming the rest of the crystal in a form of polysynthetic twinning which has been predicted but not previously observed. This structure is due to the extreme rapidity of growth of the crystals, which permits an entirely haphazard orientation of the diiodide moles relative to one another. H. M. Leicester

Compounds of cyclic diamines with metallic salts zinc salts R. Cernatescu and Marg. Poni *Ann. soc. chim. Jassy* 21, 394-406 (1935), cf. *C. A.* 29, 2104⁴ Polyethylene diamine with Zn halides forms simple addn compds. contg. 1 mol. base and 1 mol. Zn salt. With naphthyl-1,4-diamine compds. are formed of the type $2\text{R}(\text{NH}_2)_2 \cdot \text{ZnCl}_2$. This is compared with the behavior of Cd, which forms compds. of the type $2\text{Ca}(\text{NH}_2)_2 \cdot \text{Cd}(\text{NO}_3)_2$. O. W. Wilcox

Complex calcium aluminates—action of organic salts J. I. Goret *IX Congr. intern. chim. pura applicada, Madrid* 3, 352-8 (1931), cf. *C. A.* 28, 577¹, 29, 2834¹—The prepn. of Ca acetate aluminate, $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 3\text{Ca}(\text{AcO})_2$, $3\text{H}_2\text{O}$ and Ca propionate aluminate, $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 3\text{Ca}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 3\text{H}_2\text{O}$, and curves showing the equal behavior of lime and $\text{Ca}(\text{AcO})_2$ and lime and $\text{Ca}(\text{C}_2\text{H}_3\text{O}_2)_2$ for the univariant systems in which the solid phases are the resp. double salts with (1) CaO and $4\text{CaO} \cdot \text{Al}_2\text{O}_3$, (2) Al_2O_3 and $3\text{CaO} \cdot \text{Al}_2\text{O}_3$, and (3) $3\text{CaO} \cdot \text{Al}_2\text{O}_3$ and $4\text{CaO} \cdot \text{Al}_2\text{O}_3$. Data on Ca formate aluminate were given in *XIII^e Congr. de chimie industrielle*. L. R. Rushton

Alkali bromine salts and bromopyridine derivatives of rhodium. Pierre Poulenc *Ann. chim.* (11), 4, 567-657 (1935).—The action of alkali bromides on Rh bromide was studied and decided differences were found between the Br and Cl derivs. The following new compds. were prepd. and analyzed and described: $\text{Na}(\text{RhBr}_4) \cdot 12\text{H}_2\text{O}$, $\text{K}(\text{RhBr}_4) \cdot 6\text{H}_2\text{O}$, $\text{K}_2(\text{Rh}_2\text{Br}_8) \cdot 6\text{H}_2\text{O}$, $\text{K}_2(\text{Rh}_2\text{Br}_8) \cdot 6\text{H}_2\text{O}$, $\text{K}_2(\text{Rh}_2\text{Br}_8) \cdot 6\text{H}_2\text{O}$, $\text{K}_2(\text{Rh}_2\text{Br}_8) \cdot 6\text{H}_2\text{O}$, $\text{K}_2(\text{Rh}_2\text{Br}_8) \cdot 6\text{H}_2\text{O}$, $\text{K}_2(\text{Rh}_2\text{Br}_8) \cdot 6\text{H}_2\text{O}$. The action of pyridine on Rh bromide is extremely

complex, a large no. of different salts being formed. Combinations of Rh bromide with pyridine hydrobromide in media more or less acidified with HBr are described: $\text{H}_2\text{Py}(\text{Rh}_2\text{Br}_8)$, $\text{H}_2\text{Py}(\text{RhBr}_4) \cdot 3\text{H}_2\text{O}$, $\text{H}_2\text{Py}(\text{Rh}_2\text{Br}_8) \cdot 9\text{H}_2\text{O}$, $\text{H}_2\text{Py}(\text{RhBr}_4\text{Py})$, $\text{H}_2\text{CsPy}(\text{RhBr}_4\text{Py})$, $[(\text{NH}_4)_2\text{RhCl}](\text{RhBr}_4\text{Py})$, $\text{H}_2\text{Py}(\text{RhBr}_4)$, $\text{H}_2\text{CsPy}(\text{RhBr}_4)$, $\text{Cs}_2[\text{RhBr}_4(\text{H}_2\text{O})]$, $[(\text{NH}_4)_2\text{RhCl}](\text{RhBr}_4(\text{H}_2\text{O}))$. A study was also made of the reaction products of increasing proportions of free pyridine on Rh bromide. The dipyrindine derivs. $\text{M}_2(\text{Py}_2\text{RhBr}_4)$, tripyridine derivs. $(\text{Py}_3\text{RhBr}_4)$ and tetrapyrindine derivs. $(\text{Py}_4\text{RhBr}_4)\text{Br}$ were prepd. and a study was made of their decompn. in aq. a. alc. and chloroform media as well as of the action of AgNO_3 on $(\text{Py}_3\text{RhBr}_4)\text{Br}$. M. McMahon

A ferric ammonium carbonate Victor Auger and Marie Gallissot *Compt. rend.* 202, 2245 (1936).—By the action of a sol. Fe^{+++} salt, e. g., FeCl_3 , on a large excess of aq. soln. of NH_4HCO_3 in presence of solid NH_4HCO_3 and in an atm. of CO_2 , a ppt. of microscopic yellow prisms is obtained, which can be washed with 1.5% soln. of NH_4HCO_3 and dried over H_2SO_4 in an atm. of CO_2 . The compn. corresponds with $\text{NH}_4\text{Fe}(\text{OH})(\text{CO}_3) \cdot \text{H}_2\text{O}$, or more probably $[\text{Fe}(\text{OH})_2\text{NH}_4(\text{H}_2\text{O})]\text{HCO}_3 \cdot \text{KHCO}_3$ and NaHCO_3 give clear liquids which soon deposit $\text{Fe}(\text{OH})_3$. C. A. Silberrad

The preparation of alkyl or phenylgermanium trihalides of the type RGeX_3 and of methylenegermanium hexachloride. Arakel Telakirian and Michel Lewinsohn *Compt. rend.* 201, 835-7 (1935).—Alkyl and phenylgermanium trichlorides were prepd. by reaction of $\text{Cs}(\text{GeCl}_4)$ (I) with alkyl or aryl halides (preferably iodides) in sealed tubes at elevated temp. in 60-80% yield. EtI and I heated 30 hrs at 110° gave $\text{I}(\text{GeCl}_3)$ (60%), PhI and I heated 30 hrs at 270° formed Ph (GeCl_3) (80%), CH_3I and I gave $\text{CH}_3(\text{GeCl}_3)$ (II), Ph_3GeI in 80% yield after 30 hrs at 200° . II was hydrolyzed by NH_4OH to germanomalonic acid, $\text{CH}_2(\text{COOH})_2$. The other trihalides reacted similarly, forming germanonic acids from which the trihalide could be regenerated by treatment with HCl. L. W. Scott

Titrimetric colorimetry P. Karsten *Pharm. Weekblad* 72, 1327-39 (1935).—The principle of titrimetric colorimetry is applied to the following detns.: Fe^{+++} by KSCN , SCN^- by FeCl_3 , Bi by $\text{KI} + \text{I}$, Cu by NH_4OH , CN by $\text{K}_2\text{Fe}(\text{CN})_6$, Cu by $\text{FeSO}_4\text{CNH}_4$, Pb by Na_2S , Cr by Na_2S , Cr by $\text{OC}(\text{NH}_2)\text{NH}_2$, Mn as HMnO_4 , phenolphthalein with 0.1 N NaOH, salicylic acid with Fe^{+++} , adrenaline with $(\text{NH}_4)_2\text{MoO}_4$, HCN as HSCN and Mn in powder. A. W. Doty

An analytic procedure for removal of phosphate, oxalate, fluoride, silicate and fluosilicate ions from group III. Selim Augusti. *Ann. chim. applicata* 25, 448-51 (1935).—The HCl soln. from the pptn. of group III is heated, and NH_4OH added until a permanent ppt. is formed. This is redissolved with just enough HCl, and excess CO_2 is then added together with a slight excess of neutral $\text{Pb}(\text{OAc})_2$ soln. This ppt. the ions PO_4^{3-} , $\text{C}_2\text{O}_4^{2-}$, F^- , SiO_4^{4-} and SiF_6^{2-} as insol. lead salts. These are filtered off, the soln. is acidified with excess HCl and the excess $\text{Pb}(\text{OAc})_2$ pptd. with H_2SO_4 . A. W. Contiers

Stability of aqueous solutions of acid potassium phthalate. James I. Hoffman *J. Research Natl. Bur. Stand.*

ards 15, 583-4 (1935) (Research Paper No. 594).—Standard aq. solns. of acid K phthalate do not change in strength during 1 yr. under av. lab. conditions. The soln. was also unaffected by direct summer sunlight. L. R. Rushton

Preservation of standard solutions of oxalic acid and sodium oxalate II Saburo Ishimaru *Science Repts. Tohoku Imp. Univ.*, First Ser. 24, 411-25 (1935), cf. *C. A.* 17, 910.—The results of numerous expts. carried out with solns. tested at intervals during a period of 7 months show that the titer of 0.5 N oxalic acid or of 0.2 N $\text{Na}_2\text{C}_2\text{O}_4$ remains const. provided the storage bottle is wrapped with black paper. With 0.01 N $\text{H}_2\text{C}_2\text{O}_4$, or solns. less than 0.2 N in $\text{Na}_2\text{C}_2\text{O}_4$, the solns. are stable in the wrapped reagent bottles provided they are 3-6 N in H_2SO_4 . W. T. H.

Micro Dumas generation of carbon dioxide Walter S. Ide *Ind. Eng. Chem., Anal. Ed.* 8, 56 (1936).— CO_2 for the microdetn. of N by an adaptation of the semimicro method of Berli and Burkhardt (*C. A.* 20, 2961) is generated from magnesium contained in the closed end of a microcombustion tube. Allen S. Smith

Volumetric extraction analysis Adolph Bolliger *Australian Chem. Inst. J. & Proc.* 2, 312-17 (1935).—A review of B's method of volumetric pptn. analysis in which the unpptd. remnants are extd. with an org. solvent immiscible with H_2O . Methylene blue is used for the detn. of certain o-polynitrophenols, especially picric acid and picrolonic acid and their compds., and some inorg.

acids and bases. Cf. C. A. 29, 1031¹, 1119², 2886³, 5380⁴, 7857⁵, 7859⁶. E. R. Rushton

Potentiometric volumetric analysis by means of three pairs of electrodes connected in series. László Szabellődy and János Jónás. *Magyar Gyógyszerésztud. Társaság Füzete* 11, 674-85 (1935).—To make possible the use of a cheap radio milliammeter for electrometric titrations a special titrating glass bottle was designed. Three pairs of electrodes connected in series are used. The p.d. is thus increased threefold and results can be visually read on cheap instruments. The 3 pairs of electrodes also make possible the use of 3 different indicators. Chiefly alkalimetry, acidimetry and pptn. titration can be conducted. The sensitivity of methods naturally cannot be increased in this way. S. S. de Tilly

Use of the iodine monochloride end point in volumetric analysis. III. Titration of thallous salts with permanganate, iodate and ceric sulfate. Ernest H. Swift and Clifford S. Garner. *J. Am. Chem. Soc.* 58, 113-15 (1936). C. A. 24, 2079.—Various modifications of the Wilm method for titrating Tl with KMnO_4 in HCl soln. (*Bull. soc. chim.* 1863, 352) were tried but the results were unsatisfactory. The use of the ICl end point gave erroneous results, because of the catalyzed oxidation of the ICl by KMnO_4 , and the use of $\text{Ce(SO}_4)_3$ for the titration was also unsatisfactory. Ti^+ salts, however, can be titrated precisely with 0.1 N KIO₃ in solns. which are 1-5 N in HCl with the ICl end point. The end point is easier to find when the HCl concn. is at least 3 N. W. T. H.

Mercaptobenzothiazole in quantitative analysis. G. Spacu and M. Kuraš. *Bul. soc. stiint. Cluj* 8, 213-4 (1935).—In this preliminary note, it is pointed out that

is an excellent reagent for Cu and Bi. An alc. soln. of the reagent gives an orange-yellow ppt. with Cu which can be filtered off and ignited to CuO. The reaction is very sensitive and can be used for detecting or detg. Cu in the presence of Ni, Co, Zn, Cd, Mg, Mn, Ca, Ba and Sr. A similar ppt. is formed with Bi and ppts. are also formed with Au, Ag, Pb and Hg. W. T. H.

β -Methylumbelliferone (fluorescent indicator). A. G. Pukirev and M. S. Maslova. *Khm. Farm. Prom.* No. 6, 11-11 (1934), cf. C. A. 29, 6166¹.—A pure product is obtained by using little more than half the H_2SO_4 recommended by Feichmann and Dinsberg, and shortening the reaction time, which cuts the purification to 1 recrystn.

L. Nasarevich
 α -Naphthoflavone as a reversible bromometric indicator. R. Uzel. *Collection Czechoslov. Chem. Communications* 7, 390-7 (1935).—See C. A. 29, 6523².

Application of x ray spectroscopic method to chemical analysis of the rarer elements V. Determination of samarium in rare earth mixtures. Sakae Shinoda. *J. Chem. Soc. Japan* 56, 1483-6 (1935), cf. C. A. 29, 2877¹.—The L_{α} line of Sm has been compared with L_{β} of Nd by the use of the wedge of cellulose plate. The intensities of the spectral lines are equal when $\frac{\text{Sm}_2\text{O}_3}{\text{Nd}_2\text{O}_3} = 0.646$.

T. Katsurai
Colorimetric method of determining aluminum with sodium alizarinsulfonate. S. N. Rozanov and G. A. Markova. *Zavodskaya Lab.* 4, 1023-31 (1935).—A critical discussion of colorimetric detn. of Al with the aid of various color reagents. The method of Atack (C. A. 9, 3186) with the use of Na alizarinsulfonate was studied in the detn. of Al in phosphorites and apatites, giving unreliable results. The intensity of coloration is a function not only of the Al alizarin lake, but also of many other factors, such as the pH medium at the time of the lake formation and after the addn. of AcOH, time of the addn. of AcOH and the amt. of alizarin. The ratio between the

color intensity and the Al content is effective within very narrow limits ($\pm 10\%$) of the correlations of the contents of the standard and tested solns. Even traces of Fe affect the detn., the effect of which cannot be eliminated by the addn. of citric acid. Sixty references. Chas. Blanc

Colorimetric estimation of arsenic. D. B. Yohelshon. *Ukrain. Khim. Zhur.* 9, No. 3-4, 341-7 (1934).—Arsenic is pptd. as As_2S_3 from dil. acid soln., dissolved in dil. NH_3 to which AgNO_3 soln. is added. The brown color produced is compared with the standard run in a similar way. L. Nasarevich

Volumetric determination of beryllium and of silicon in their complex fluorides. Yu. A. Chernikhov and E. U. Guldina. *Z. anal. Chem.* 101, 406-13 (1935).—See C. A. 29, 7856¹. W. T. H.

Separation of bismuth from lead and copper. E. A. Ostroumov. *Zavodskaya Lab.* 4, 1016-20 (1935).—Of the various methods for detg. Bi in the presence of Pb and Cu studied, the best results in sepn. of Bi were obtained with $\text{KBr} + \text{KBrO}_3$ (Moser and Maxymowicz, C. A. 20, 1041), with pyrogallol (Feigl and Ordelt, C. A. 19, 1832), and with cupferron (Pinkus and Derner, C. A. 23, 53). The Benkert and Smith method (*Chem. Zentr.* 1897, 1, 308) of hydrolytic pptn. of Bi in a HCO_2H medium gave some what inconsistent results. Chas. Blanc

New colorimetric method for determining cobalt. C. Spacu and C. G. Macarovici. *Bul. soc. stiint. Cluj* 8, 215-60 (1935).—Chiarotino, C. A. 27, 2306, has described a colorimetric test for Co using a soln. of 0.5 g. benzidine and 0.25 g. of dimethylglyoxime in 100 cc. of 95% alc. as reagent. A study of this method shows that the test is much more sensitive than claimed by C. and it is even more sensitive if the benzidine is replaced by tolidine. It can be used for detg. as little as 0.25 γ Co per cc. It is recommended to use as reagents a 1% soln. of dimethylglyoxime in alc. and a soln. of either benzidine or tolidine of the same concn. Place in the comparison tubes 10 or 15 cc. (accurately measured) of the soln. to be tested and of the standard Co soln. which is a little stronger than the unknown. To each of the tubes add, from a small pipet, 0.5 cc. of the dimethylglyoxime soln. and mix. Then add 0.2 cc. of the benzidine or the tolidine soln. Wait 15 min. for the color to develop and then compare in the colorimeter. In the 26 test detns. cited, the greatest error was about 0.9% in detg. 0.1 to 2.0 mg. of Co. Some expts. were carried out to det. the formula of the dark-brick colored compn. formed from which the following formulas were derived, in which DH_2 , Bzd and Tolid represent, resp., dimethylglyoxime, benzidine and tolidine (DH_2): $\text{BzdCo}(\text{DH})\text{NO}_3$, $2\text{H}_2\text{O}$, [DH_2], BzdCl , CoCl , Co , CoBzd , DH_2 , $6\text{H}_2\text{O}$; and [DH_2], Tolid , (H_2O) , Cl , CoCl , (H_2O) , Tolid , DH_2]. W. T. H.

Rapid determination of cuprous and total copper in cuprammonium solution. I. I. Strizhevskii. *Zavodskaya Lab.* 4, 1120 (1935).—In the control of the compn. of cuprammonium soln. used in the absorption of CO from N-H mixt. in the production of NH_3 , the following methods gave accurate results. Dil 10 cc. of the soln. to 250 cc. To det. Cu^+ introduce 25 cc. of the soln. into a mixt. of 15 cc. of 3 N H_2SO_4 with 15 cc. of the Bruhns soln. (134 g. KSCN and 20 g. KI in 1 l. H_2O), and titrate the liberated I_2 with $\text{Na}_2\text{S}_2\text{O}_3$. To det. total Cu, acidify 25 cc. of the soln. with H_2SO_4 and oxidize the mixt. with 0.1 N KMnO_4 until the pptd. Cu^+ is dissolved and an addnl. drop of KMnO_4 causes no change of color of the soln. Decompose the excess KMnO_4 with 1 drop of alk. soln. of C_2O_4 , add 15 cc. of the Bruhns soln. and titrate with $\text{Na}_2\text{S}_2\text{O}_3$. Chas. Blanc

New methods in agricultural analytical chemistry. IV. The colorimetric determination of iron. László Urbányi. *Mezőgazdasági Kutatók* 8, 279-87 (1935).—Directions are given for detg. Fe by the Prussian blue, thiocyanate and sulfosalicylic acid methods. S. S. de Tilly

Estimation of iron in phosphorites and apatites by the colorimetric method with sulfosalicylic acid. S. N. Rozanov, G. A. Markova and E. A. Fedotova. *Z. Pflanzenernähr. Dungung Bodenkn.* 41, 59-74 (1935).—See C. A. 29, 7858¹. C. J. Schollenberger

New colorimetric determination of iron with the aid of pyrogallol. A. P. Palkin. *Zashchita Lab.* 4, 1106 (1935).—Prep the reagent by dissolving 5 g pyrogallol in 100 cc. of satd. Na_2SO_3 soln. Acidify slightly a soln of Fe with pure H_2SO_4 and dil to a point where a sample of the soln will give with the reagent approx the same intensity of coloration as the standard soln. Withdraw 5 cc of the soln, add 85 cc of H_2O and then the reagent dropwise to a const color, and compare with the standard soln. A standard soln contg 0.0025 g Fe in 1 cc is prepd. from 0.1244 g $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ as above and dil to 1 l. Metals capable of giving colored solns, such as Cu, Ni, Co and Cr, must be sepd. The sensitiveness of the method is 1.7 μg . Chas Blane

Determination of small quantities of lead in tartaric acid. Sándor Ránky. *Magyar Ámpel. Évkönyv* 9, 427-9 (1935).—Dissolve 20 g tartaric acid in 50 cc distd water and add ammonia until any ppt formed dissolves. Neutralize to litmus with AcOH (litmus paper indicator). Add 2-3 drops of 50% Na_2S soln and mix with 30 cc glycerol. Compare the resulting brown color with standards. S S de Finály

Iodometric microanalysis of lead. M. N. Gapechenko. *Zashchita Lab.* 4, 1014-16 (1935). cf. Ivanov, C. A. 8, 2132—10 to 10 cc of a $\text{Pb}(\text{NO}_3)_2$ soln add 5 cc of freshly prepd. 10% NaHSO_3 and centrifuge for 10 min. Wash the PbSO_3 ppt by decanting and centrifuging with H_2O until all NaHSO_3 is removed. Dissolve the PbSO_3 in 0.5-2 cc of 2 N NaOH , add 0.001 or 0.01 N I soln (depending on the amt of PbSO_3), transfer the mixt into a flask, acidify with 20% H_2SO_4 and titrate back the excess of I with $\text{Na}_2\text{S}_2\text{O}_3$. Calc Pb from the actual amt of I consumed in the oxidation of SO_3^{2-} to SO_4^{2-} . C B

Potentiometric titration of molybdenum with silver nitrate. P. Spacu. *Bul soc. stinte Cluj* 8, 317-20 (1935).—Potentiometric titrations of MoO_4^{2-} have been described which were based on the pptn of either PbMoO_4 , Hg_2MoO_4 or BaMoO_4 . It is now shown that a similar titration can be carried out as an electrode of Ag against a calomel half cell with AgNO_3 as reagent, provided sufficient I OH is added to reduce the soly of the Ag_2MoO_4 formed. In titrating 5-cc portions of 0.4 N Na_2MoO_4 , to which 50 cc of 15-50% alc was added, the results obtained were all within 1% of the truth. W T H

New volumetric method for the determination of nickel. G. Spacu and V. Armeanu. *Bul soc. stinte Cluj* 8, 206-10 (1935).—The method resembles in principle the KCN method of Moore but the titrating KCN soln contains pyridine (Py). On adding this reagent to a Ni soln a light violet ppt. is formed according to the equation $\text{Ni}^{++} + \text{Py} + \text{H}_2\text{O} + 2\text{CN}^- \rightarrow [\text{NiPy}_2\text{H}_2\text{O}](\text{CN})_2$ and the ppt dissolves in excess KCN to form $[\text{Ni}(\text{CN})_4]^{2-}$. As reagents, an approx. 0.1 N standard soln of $\text{Ni}(\text{NO}_3)_2$ and a soln. contg 20 g KCN and 10 cc of pyridine per l are used. The titer of the latter changes slowly, it should be kept in a dark bottle and titrated against the Ni soln on the day the analysis is made. The titration can take place directly or indirectly. In the former case, take a measured vol of the KCN soln, add 1 cc. of pyridine and titrate with the neutral Ni soln until the above-mentioned ppt begins to dissolve slowly. Now add 100 cc of hot water, heat over the burner and after the soln has become clear, add more of the Ni soln dropwise until finally a faint ppt. is produced which does not dissolve in 2-3 min. Or, the unknown Ni soln can be titrated dropwise with the KCN soln until the soln becomes clear after 2-3 min. The KCN soln. must be standardized in exactly the same way. In the indirect method, add a few drops of pyridine to the solid Ni salt or to the concd and neutral soln. of the salt, and titrate in the cold, with continuous stirring, until an excess of KCN is present as is shown by the fact that the light violet ppt. has dissolved completely and the soln. has assumed a pale yellow tint. Now titrate back with the standard Ni soln. until a turbidity forms in the stirred soln. which does not dissolve after 2-3 min. The results obtained in titrating 25 portions of Ni soln. corresponding to 0.06 to 0.18 g. of Ni were all within 0.2 mg. of the truth. W. T. H.

Determination of tin in minerals and in metallurgical residues by means of 0.1 normal potassium bromate. Léopold Deutsch. *Ann. chim. anal. chim. appl.* 18, 10 (1936).—For detg Sn in minerals it is recommended to fuse the sample with Na_2O_2 ; alloys should be dissolved by heating with H_2SO_4 and Na_2SO_4 . After reducing with 5 g. of *ferrous reductum* it is recommended to filter and use an aliquot for the Sn detn. The Sn is reduced to metal by adding approx 1 g of Al and the Sn is then dissolved in 60 ml of concd. HCl by heating. After the reduction the soln is cooled out of contact with air, by allowing NaHCO_3 soln. to flow into the flask as necessary. The cold soln. is titrated with KBrO_3 in a soln. contg. ZnCl_2 , ZnI_2 , and starch as indicator. In alloy analysis, the Sn and Sb are titrated together in the above manner after the Sb has been detd. by itself with KBrO_3 in the usual manner. W. T. Hall

Spectrophotometric determination of minute quantities of zinc in organic substances. J. Dabrowski and L. Marchlewski. *Biochem. Z.* 282, 387-91 (1935); *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1935 A, 479-85.—Zn is pptd as the 8-hydroxy quinoline compd. This is decompd by HCl and the 8-hydroxy quinoline-HCl is detd by its extinction quotient. The org. matter is ashed at 500° in a quartz dish, and the ash is warmed with 1 cc concd. HCl, dild with H_2O and filtered. The filtrate is dild to bring the HCl concn to about N. Bring to a boil and pass H_2S for 2 min to ppt any Cu. Filter again, wash with HCl satd. with H_2S , and evap to 1 cc. Add 0.25 cc. 20% citric acid, neutralize with NH_4OH to methyl orange, then add 0.25 cc of a special mixt. (20 cc. HCOOH , 3 cc NH_4OH and 20 g. $(\text{NH}_4)_2\text{SO}_4$ made up to 100 cc) and 0.2 cc HCOOH . Warm to 40° and pass in H_2S , bring to a boil, then cool while passing H_2S . Collect the ppt, wash with H_2O , dissolve in a little 2 N HCl, evap partly and make alk with NH_4OH and remove the excess NH_4OH by warming. Dil the soln to 80 cc. and ppt the Zn as $\text{Zn}(\text{C}_8\text{H}_7\text{N}_2\text{O}_2)_2$ with 5 cc of the 8-hydroxy quinoline reagent (4 g 8-hydroxy quinoline and 8 cc AcOH in 100 cc) after first adding 2 cc 30% AcOH and 3 g AcONa and warming to 40°. Heat to 90° and leave overnight. Wash the ppt with H_2O , dissolve in 2 N HCl, make up to vol and exam in a spectrophotometer. From the detn. of α the concn is detd from $c = a/d$. S Morgulis

Determination of zirconium. G. A. Ampt. *Australian Chem. Ind. J. & Proc.* 2, 321-31 (1935).—A mixt. of equal parts of $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$ and Na_2CO_3 is a good flux for all Zr materials. B interferes with the detn of Al, but it can be removed by successive evapns with MeOH and H_2SO_4 . The fusion is dissolved in HCl and SiO_2 is pptd. by fuming with H_2SO_4 . The ppt. is treated with HCl , the residue is fused with $\text{K}_2\text{S}_2\text{O}_8$, dissolved in H_2SO_4 and added to the filtrate. Ti and Fe are detd. colorimetrically in aliquots. Zr can be pptd. as the phosphate from acid soln, but Ti is also pptd. partially and must be detd in the ppt and filtrate. Ti, Fe and Zr can be pptd. with cupferron ignited and weighed and Zr calcd. by subtracting Ti and Fe previously detd. E. R. Rushton

The determination of small amounts of mercury by photometric titration. Shizo Hirano. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 648-7 (1935), cf. C. A. 30, 1326¹.—A Cu_2O photoelectric cell was used with the previously described app. Gum arabic was added to the sample as protective colloid. Fxptl results are given for titration with 0.01 M and 0.001 M Na_2S soln. and good results were obtained in both cases. The presence of Cu and As had no effect. The determination of small amounts of lead by photometric titration. *Ibid.* 648-50.—The app. and method described above were used. The results reported are accurate. Pb detns in crude H_2SO_4 and in flint glass are also reported. Karl Kammermeyer

Determination of mercury in mercuric cyanide. E. Cattelan. *J. pharm. chim.* 22, 454-6 (1935).—Introduce into a 100-cc 1 phenemey flask 10 cc. $\text{Hg}(\text{CN})_2$ soln, 10 cc. distd. H_2O and 10 drops of 25% HCl. Heat until boiling starts and add, drop by drop, 2 cc. of 50% $\text{Na}_2\text{S}_2\text{O}_3$ soln. Insert a funnel into the mouth of the flask and maintain a gentle boiling for 15 min. Finally add 2 cc. of 20%

Na_2SO_4 soln and boil for 15 min, shaking 4 or 5 times. Recover the ppt. in a tared 1 G crucible with a porous bottom of Jena glass, wash with hot distd. H_2O , then dry at 100° for 1 hr. The Hg_2S ppt. is too fine to be recovered on a 1 G crucible. S. W. Goldstein

Determination of bromine. G. E. Batrak *Mid. Exptl. (Ukraine)* No. 2, 109-4 (1935).—The method of Bernhardt and Uco (cf. C. A. 19, 2965) was modified by burning the mixt. on a sand bath, decolorizing with animal charcoal (in acidified medium) and subsequent filtering through an ordinary filter (instead of Hugo's filter), thus obtaining a clear soln and preventing loss of Br by eliminating the repeated burning. The sensitivity of Schiff's reagent was detd. not by the diffuse violet color but by the appearance of typical lilac rings with a pink tinge and a yellow layer on the top after placing carefully along the sides of the test tube a few drops of Cl_2 water. In the absence of Br the rings are just yellow. After some training B could det. even 10% of Br (the original method was only sensitive up to 5%). S. A. Corson

Determination of active chlorine in chlorinated lime, Labarraque's and Dakin's solutions. Carl Staimer *J. pharm. Belg.* 17, 775-7 (1935).—The active Cl content is not only the Cl present as hypochlorite, but all the Cl liberated when the sample is treated with an acid. If enough chloride is present, the active Cl will be twice the amt. present as hypochlorite. S. W. Goldstein

Determination of iodine with iodides R. L. Ralgorodskaya and E. S. Binova *Farm. Zhur.* 1935, No. 1, 23-5.—Free I is titrated with $\text{Na}_2\text{S}_2\text{O}_4$, the iodides are then titrated with AgNO_3 and the free I equiv. is subtracted from total iodides. L. Nasarevich

Determination of iodine in extracts from brine. I. Orlov and T. Kapanova *Khim. Farm. Prom.* 1935, No. 1, 44-6.—Iodine liberated with the nitrite from the acidified brine is extd. with activated charcoal, ground and extd. with Na_2SO_4 , filtered, made up to the mark and titrated with the standard As_2O_3 in the presence of $(\text{NH}_4)_2\text{CO}_3$, eosin as indicator. To det. I in the waste liquors it is oxidized to iodate with Br_2 , excess Br removed with phenol and the I liberated from the added KI is titrated with 0.001 N $\text{Na}_2\text{S}_2\text{O}_4$. To det. the Cl the I is removed by boiling with HNO_3 and then titrated according to Volhard. The acids in the crude I are extd. with petr. ether, shaken with standard alc. NaOH , and the excess is titrated back. L. Nasarevich

Determination of iodine in kelp. J. B. McKean *Analyst* 61, 11-13 (1936).—Dry 25 g. of the crude sample to const. wt. in a water oven. Grind the dry sample to pass through a 20-mesh sieve and dry again. Boil 20 g. with 200 ml. of water for 30 min.; filter and make up to 500 ml. Mix and take 50 ml. for the I detn. Dil. to about 400 ml., add 10 cc. of 20% AcOH and 1 ml. of Br_2 . Boil until only a slight yellow color remains, cool and add about 0.5 g. of phenol dissolved in a little glacial AcOH . After 2 min. or more, add an excess of KI soln and titrate with 0.05 N $\text{Na}_2\text{S}_2\text{O}_4$ soln. W. T. H.

Selenium as the catalyst in Kjeldahl digestions. K. Scharer *Z. Pflanzenenergie, Dungk. Bodenkd.* 41, 203-7 (1935).—Powd. Se (pure red pptd. Se, Merck) and CuO were compared as catalysts for Kjeldahl digestions and the former proved the better. C. J. Schellenberger

New titrimetric method for the determination of nitrogen in ammonium salts and in foodstuffs. N. V. Shirokov and V. Volovinskaya *Z. Unterzuch. Lebensmittel.* 70, 249-4 (1935).—The principle for the detn. of NH_3 in NH_4 salts depends on the treatment of a soln with Na_2CO_3 in the presence of a Ag salt. The NH_3 set free by the Na_2CO_3 combines with the Ag to form the complex cation $\text{Ag}(\text{NH}_3)_2^+$, while the excess Ag is filtered from the soln as Ag_2CO_3 . The Ag in the complex is detd. by the Volhard titration or alim. The NH_3 is then calcd. from the formula of the Ag complex. In the estn. of total N in foodstuffs, the Kjeldahl method is first employed, with H_2SO_4 , CuSO_4 , and K_2SO_4 . After the digestion, a soln of NaOH is added until a permanent ppt. of $\text{Cu}(\text{OH})_2$ remains. This soln is then filtered, made up to the mark and an aliquot taken for the detn. of NH_3 as described above for NH_4 salts.

The results obtained by these methods show no variations which are of practical significance. P. L. Dunlap

Determination of moisture in sulfidic copper ores. L. M. Tol'son and P. O. Ferstater. *Zarodskaya Lab.* 4, 1031-8 (1935).—The nature of various forms of moisture contents in S-bearing Cu ores and methods of their detn. were studied with a view of developing better methods of lab. control of ore treatment. Sulfidic Cu ores contain 4 forms of moisture: water adsorbed on the surface, mechanically occluded (intercryst.) water, water of crystn. ($\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$, etc.), and water of constitution (CuCO_3 , $\text{Cu}(\text{OH})_2$, $\text{CuCl}_2 \cdot 3\text{Cu}(\text{OH})_2$, $\text{CuSO}_4 \cdot 2\text{Ca}(\text{OH})_2$, etc.). The detns. are made with 5 g. samples (not less) powdered to 120 mesh. Det. adsorbed water by the difference in wts. of a sample dried in a vacuum desiccator over CaCl_2 for 24 hrs. and following exposure to air for 2 hrs. Det. the intercryst. water by deducting the value of adsorbed water from the detn. of the sum of the 2 forms of water by the CaCl_2 method (cf. C. A. 29, 7854). Det. the water of crystn. by the increment in wt. obtained by drying a sample in an elec. oven at 250° for 2 hrs. and following exposure to water vapor in a desiccator for 3 hrs. and drying over CaCl_2 for 24 hrs. All forms of moisture, except that of intercryst. water, are const. for the ores of the same origin, the detn. of which is required only in the complete analysis of the ore. The results of detn. of intercryst. water by the usual methods of drying are misleading because of the partial loss of water of crystn. Intercryst. water can be detd. with an accuracy to 0.03% for air-dry ore and 0.2% for damp ore by drying a 5-10 g. sample in an elec. oven at 70° for 3 hrs. or in a vacuum desiccator at 60° . The intercryst. water is rapidly evapd. in the air, hence the detns. of moisture contents in prep. lab. samples are not representative of the ore in the bulk. The true contents of intercryst. moisture can only be detd. at the supply base by drying several kg. of crushed (not powd.) sample at 70° . Chas. Blanc

Determination of aluminum oxide in aluminum and its alloys. S. I. Sukkov and B. M. Korotkevskaya. *Zarodskaya Lab.* 4, 1104 (1935).—The detn. depends on the soln. of metals and usually of Al_2O_3 in $\text{CuCl}_2 + \text{KCl}$ in H_2O and on the soln. of ignited Fe_2O_3 and usually of Al_2O_3 in $\text{HCl} + \text{HNO}_3$. Treat a 3 g. sample with 100 cc. of the reagent (1 mole of CuCl_2 and 2 moles of KCl in 1 l. H_2O) first in the cold and then on a hot plate until all metals are dissolved. Dil. the soln. with hot water and filter through a triple filter. Wash the ppt. with hot 20% HNO_3 and then with water, and ignite in a Pt crucible. Evap. the SiO_2 in the residue with HF as usual, digest the residue with concd. HCl on a hot plate, transfer the mixt. into a beaker, treat it with aqua regia, dil., filter, ignite and weigh Al_2O_3 . The accuracy of the detn. is equal to that obtained by the method of alk. fusion. Chas. Blanc

Determination of gallium in aluminum. J. A. Scherzer. *J. Research Natl. Bur. Standards* 15, 585-9 (1935) (Research Paper No. 833).—Ga is present in most faunites and is, therefore, in most samples of Al. wares. In analysis, it can be sep'd. from Al by taking advantage of the fact that Ga can be pptd. by cupferron in solns. which are 0.6 N in H_2SO_4 , provided an excess of 15-20 ml. of 6% cupferron soln is added. In the analysis of a sample of Al weighing 10 g. and contg. 0.01% Ga, a vol. of 450 ml. is sufficient to prevent contamination with Al. The ignited cupferron ppt. should be dissolved in 1.2 N HCl and exam'd. for Sn, Cu, V, Ti and Zr which will likewise be pptd. by cupferron. After detg. the wts. of these 5 elements, the Ga can be obtained by difference. If, on the other hand, Ga alone is to be detd., it is better to make use of the fact that GaCl_3 , like FeCl_3 , can be extd. by ether from a soln. in 6 N HCl . The vol. of the acid soln. should be about 400 ml. prior to the extn. and 3 extns. with 100 ml. of ether are necessary and sufficient. From the ether ext. the Ga is obtained eventually after pptn. with cupferron. Analysis of numerous samples of Al showed values ranging from 0.0005 to 0.016% Ga and the 2 methods of analysis gave uniform results. The Ga in the small ppts. was identified spectrochemically and found to be practically pure. W. T. H.

Volumetric determination of nickel in steels. A. L. Vorob'ev. *Zavodskaya Lab* 4, 1105 (1935).— $\text{Ni}_2\text{P}_2\text{O}_7$ for the titration of Ni by the method of Gel'band (C A 29, 75²) is prep'd by dehydrating $\text{Ni}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O}$ at 200–50° and heating the residue in an elec oven at 600° for 1 hr.

Standard methods of chemical analysis of manganese bronze. *Am Soc Testing Materials, A S T M Designation* B27–35, *Am Standards Assoc, A S A No. K3–1935*, 11 pp.

Testing for sea-water damage. W. M. Deaber. *Analyst* 61, 14–22 (1936).—Samples of galvanized ware, Cu-coated wire, bristles, sugar, corn meal, cacao beans, gum arabic, Gruyère cheese, prunes, dates, walnuts, sheep's wool and carpets have been exam'd. A sample of wool damaged by sea water showed a reduction of the K_2O from 2–3 to 0.16% and an increase of Cl[–] from 0.02–0.3 to over 1%, showing that K salts had been washed out and NaCl absorbed. In the search for a test which would be more sp than the test for Cl[–], the following method for Br was devised. Soak the suspected sample for some time to remove sol halides. To the aq ext add 0.5 g of Ca(OH)₂ and evap to dryness. Treat the residue with 2 ml of water, add 2 ml of a soln prep'd by dissolving 150 g of CrO_3 in 80 ml of water and pass a stream of CO_2 through the soln to expel liberated Br, and cause the vapors to come in contact with filter paper which has been impregnated with 0.2% soln of fluorescein in alc. If Br is present in the vapors, red eosin is formed. The quantity of Br present can be est'd by comparison with standard stains but it is best, after an orienting expt., to base the estn on a stain produced by about 1.7 g of Br. Since sea water contains 3–3.4% of NaCl and the ratio of Cl:Br ≈ approx 2:1 it is possible to prove contamination with sea water if the aq ext from damaged goods shows about this ratio.

Analyzing the "carbon" deposits in tractor engines. I. G. Semendo and B. B. Kroll. *Neftekhim Khorozhovo* 29, No. 10, 75–76 (1935).—1- $\frac{1}{2}$ lb the sample with a suitable solvent for grease, etc., under a reflux condenser, weigh the residue and subtract the wt. of its ash.

Standard methods of routine analysis of dry red lead. *Am Soc Testing Materials, A S T M Designation* D19–35; *Am Standards Assoc, A S A No. K16–1–1935*, 5 pp.

Determination of fumigants. II. An improved vacuum apparatus for the measurement of gas concentrations. A. B. P. Page. *J Soc Chem Ind* 54, 421–427 (1935); cf. C A 27, 792³. III. Microdetermination of ethylene oxide and hydrogen cyanide. O. F. Lubatti. *Ind* 421–6T, cf. C A 27, 245³.—The methods described are suitable for use with Page's improved vacuum app for measurement of gas concn (cf. above). Absorption of ethylene oxide in a 0.025 to 0.1 N H_2SO_4 soln contg. 49–53 g/100 cc. MgH_2 gives 100% recovery. The excess acid is titrated with 0.025 N NaOH. The cyanide is absorbed in 0.2 N NaOH soln and titrated iodometrically. Details of technic are given. P. S. R.

Rapid detection of ozone. M. Shlesinger-Konstantinova. *Sotzialist Rekonstruktsiya i Nauka* 1935, No. 6, 167.—The intensity of soln luminescence of a specially selected substance after having reacted with O_3 is proportional to its quantity. Notwithstanding the fact that O_3 itself does not fluoresce, its quantity is det'd. by the quantity of the fluorescing substance formed from it and the special substance by a photometric method of visual estimation.

Determination of the total oxidizing power, of nitrite, of ozone and of the total chlorine content of fresh and of poisoned air. II. H. Cauer. *Z anal Chem* 103, 385–416 (1935), cf. C A 30, 1324³.—The nitrite is det'd in the same way as the total oxidizing power, by its action on KI in the presence of dil. H_2SO_4 , after the removal of ozone by heating the air to 200°. The introduction of the necessary furnace causes more complication in the app, with resulting loss in accuracy, so that in biol. and hygienic expts it is usually best to rely upon the value obtained for the total oxidizing power. O_3 is det'd. by the loss of I

caused by passing the air through a neutral KI soln.; this method is useless in the presence of Cl_2 . The total Cl content, or all substances that form water-sol. chlorides, is det'd. by passing a measured vol. of the air through KOH soln. and eventually detg the Cl[–] content of the KOH soln. by titration with AgNO_3 according to either Mohr or Volhard. Since about $\frac{1}{4}$ of the free Cl_2 forms ClO_2 in the absorbent, this method does not give accurate results in the analysis of Cl_2 gas.

Colorimetric determination of nitric acid and of nitrates. R. Cernitescu and F. Gheller. *Z anal Chem* 101, 402–6 (1935).—Buznea and Cernitescu (C A 22, 1297²) proposed a sensitive colorimetric test for nitrate which depends upon the red coloration produced by the reaction with a soln. of *m*-diaminophenol in conc'd H_2SO_4 or HCl . This test can be used as a basis for the colorimetric detn of small quantities of nitrate. 1st test to make sure that no interfering substances are present, if they are found, they must be removed by a suitable method, e. g., halide with Ag_2SO_4 . Make an orienting expt. to find the approx quantity present and then take a suitable amt of the sample for the colorimetric comparison.

Determination of hydrobromic acid in hydrochloric acid. 1. Chelle. *Bull. soc. pharm. Bordeaux* 73, 188–90 (1935).—0.005 mg HBr can be detected in 10 cc. HCl by using the Demégné-Chelle reaction (C A 7, 740, 2231).

Determination of butyric acid in commercial acetic acid. Ladislav Klinc. *Ann. chim. anal. chim. appl.* 18, 6–9 (1936), cf. C A 29, 705², 7574².—Butyric acid is oxidized by H_2O_2 and AcMe is formed. Scott-Wilson's reagent (10 g. HgCN in 600 cc. of water added to an equal vol. of 30% NaOH soln. and the next added slowly to 100 cc. of 0.725% AgNO_3 soln.) will detect AcMe equiv. to as little as 0.01 mg. of butyric acid. By applying this test to numerous samples of AcOH the conclusions drawn are:

(1) Synthetic AcOH contains no butyric acid. (2) Pyroigneous acid can be obtained pure but most samples contain some butyric acid, sometimes as much as 9–10%. (3) AcOH obtained by fermentation is likely to contain 0.25–0.28% butyric acid.

Electrometric titration of carbonic acid and of sodium bicarbonate in dilute solutions. Holvard Llander. *Inv* 1935, 75–83.—The pH values of solns. of CO_2 and of NaHCO_3 were det'd. for various dilns by means of a glass electrode against a standard calomel cell and the curves det'd. for the titration of such solns. with NaOH or with Na_2CO_3 . The results appear to agree satisfactorily with values expected from the ionization consts. of H_2CO_3 .

Field method of determining phosphoric acid in phosphates. M. I. Zagorskii. *Zavodskaya Lab* 4, 1039–42 (1935).—The colorimetric detn gives accurate results without the use of heat. Add to 5 g. of powd. sample 50 cc. of 5% HCl and shake in a Wagner app. for 30 min. Dil. the filtrate to 250 cc., withdraw 5 cc. of the soln. and dil. to 240 cc. To 5 cc. of this soln. add 5 cc. of the soln. (25 g. of NH_4 molybdate in 100 cc. H_2O mixed with 75 cc. H_2SO_4 in 125 cc. H_2O) and 5 cc. of the soln. (5 g. hydroquinone in 250 cc. H_2O mixed with 0.25 cc. of conc'd. H_2SO_4). After 5 min. of shaking, add 25 cc. of 20% AcONa (cryst.) soln. dil. the soln. to 250 cc., and compare with the standard solns. prep'd by treating KH_2PO_4 as above. A portable set for field analysis of phosphates is illustrated and described.

The determination of sodium chloride in salt. C. W. Foulk and John R. Caldwell. *J. Am. Water Works Assoc.* 27, 1712–16 (1935).—The procedure consists in pptn. of about 94% NaCl by conc'd. HCl and then the balance, after excess acid has been removed, with a Mg uranyl acetate reagent—as Na Mg uranyl acetate. Full details of operation are given and from the results shown the method is quite accurate.

Spectrophotometric determination of potassium chloride in sylvinite. R. Romann and C. Spatel. *Bull. soc. chim.* [5] 2, 2168–70 (1935).—The common ion effect of KCl on the soly. of a less sol. colored salt of K, such as the picrate,

is followed in the instrument. This method agrees within 0.2% with the perchlorate method. Gregg M. Evans

Potentiometric determination of metavanadate with silver nitrate. P. Spacu. *Z. anal. Chem.* 103, 422-4 (1935).—The titration of 0.1 N NH_4VO_3 with 0.2 N AgNO_3 is described. The soln to be titrated contained 20% of LiOH in a total vol of approx 90 ml. As indicator electrode a wire of Ag was used against a normal calomel cell. The ppt formed is orange-yellow AgVO_3 .

W. T. H

Microalkalimetric studies. III. Microdetermination of ammonium. J. Mika. *Rev. Hung. Pakin-Joseph Univ. Tech. Econ. Sci., Sopron, Pub. Dept. Mining Met.* 7, 92-110 (1935). cf. C A 29, 5773.—Details for carrying out a micro distn are given. S. S. de la Peña

Determination of chlorate and perchlorate in the presence of considerable nitrate. F. S. Tomula. *Z. anal. Chem.* 103, 427-30 (1935).—Dissolve about 10 g. of conc. alkali nitrate in a little water, add 3-5 ml of 40% HCHO soln, 1 ml of 0.5 N FeCl_3 soln and 2 cc of 2 N HNO_3 . Allow to stand on the water bath for 0.5 hr., add 20 ml of concd HCl and evaporate to dryness. Dissolve the residue in a little water, evaporate again with the same vol of HCl and repeat twice more. Finally treat the residue with 50 ml of concd HCl , filter through sintered glass and wash with a little concd HCl . Evaporate the filtrate to dryness. It will weigh about 0.5 g. in the analysis of NaNO_3 samples. Dissolve the residue containing chloride and unchanged perchlorate in a little water, make up to exactly 100 ml., mix and determine the Cl^- content in an aliquot part of the soln by the argentometric method of Volhard. Then, in the remainder of the soln add a corresponding quantity of AgNO_3 and filter off the AgCl ppt. Evaporate the filtrate to about 40 ml and determine perchlorate by the method of Tomula and Pelkonen. C A 28, 3027.—In another portion, reduce the chlorate with Zn and dil. H_2SO_4 , determine the Cl^- by the Volhard method and correct for the original Cl^- content. W. T. H

Potentiometric titrations of sulfite and sulfoxylate alone and in the presence of hyposulfite. J. Lobering. *Z. anal. Chem.* 101, 392-8 (1935).—Chromic acid in the presence of dil. acid oxidizes sulfite and sulfoxylate to sulfate and is itself reduced to Cr^{++} in accordance with these equations:

The end point is best determined potentiometrically with a Pt gauze electrode balanced against a calomel cell. The soln should contain 1-2% of H_2SO_4 or HCl . It is possible to oxidize both sulfite and sulfoxylate in dil. acid soln without oxidizing any hyposulfite, but the temp must be kept below 40° to prevent decomposition of hyposulfite. Frisch Muller. *Ibid.* 340. A. Mutschkin. *Ibid.* 342. S. Polheim. W. T. H

Detection of ferrocyanide in the presence of ferrocyanide. I. M. Korenman. *Z. anal. Chem.* 101, 417-19 (1935).—Indigo carmine in Na_2CO_3 soln is oxidized by ferrocyanide to form pale yellow disulfo-dihydroindigo. The reaction is very sensitive. To 3 cc of the soln to be tested and to 3 cc of pure water in another vessel, add 10 drops of satd. Na_2CO_3 soln. Now if 2-3 drops of 0.02% indigocarmine soln is added to the pure water sample, the liquid assumes a blue tint. The same vol of indigocarmine soln added to the sample containing ferrocyanide will soon lose its color. As little as 3-5 of $\text{K}_4\text{Fe}(\text{CN})_6$ can be detected in 3 cc of soln. W. T. H

Microchemical determination of some cations with the aid of hexamitrophenylamine. O. G. Shelintz. *Zarodskaya Lab.* 4, 1047-52 (1935).—The Na salt of $(\text{O}_2\text{N})_6\text{C}_6\text{H}_2\text{N}_6$ ($\text{H}_2\text{NHC}_6\text{H}_2(\text{NO}_2)_6$) reacts with K, Ca, Sb, Ti, Be, Zr, Pb and Hg^{++} , giving characteristically shaped and colored crystals. K can be detected in the presence of Na, Li, Mg, Ba, Sr and Ca. NH_4^+ gives a similar crystal ppt and therefore must be removed. Al, Fe, Cr, Ni, Co, Cu, Bi, V, Th, and Hg^+ form amorphous ppts. Other cations do not affect the reaction. Photomicrographs and description of various crystals are given. Chas. Blanc

1. Rapid determination of sulfate and the sum of iron and aluminum ions in commercial hydrochloric acid. V. K. Gontarik. *Zarodskaya Lab.* 4, 1043-6 (1935).—The Ind. son method of detn. of sulfate in conc. HCl was modified by evapn. HCl to dryness and titrating the residue in H_2O with 0.1 N $\text{Ba}(\text{OH})_2$ in the presence of phenolphthalein as indicator to a pink and thereafter to a point when a small fraction of the soln after filtration gives no turbidity on the addn of BaCl_2 . By this procedure all sulfates, except $\text{Al}_2(\text{SO}_4)_3$ and $\text{Fe}_2(\text{SO}_4)_3$, can be detd with accurate results. The latter are detd by the difference between the titration results in the presence of phenolphthalein and methyl orange as indicators. Similar results, with a considerable saving in time in evapn. of HCl , can be obtained by microanalysis based on the same procedure. Chas. Blanc

Analysis of methylene blue. K. D. Shestrebacher. *Khim. Farm. Prom.* 1935, No. 2, 117-18.—A small sample of the dye is treated with excess of standard SnCl_2 , heated and titrated in CO_2 with standard $\text{K}_2\text{Cr}_2\text{O}_7$. The appearance of permanent blue indicates the end point. L. N.

Spectrophotometric determination of chlorophyll a chlorophyll b, carotene and xanthophyll. A. Sprecher von Bernegg, E. Heierle and F. Almasi. *Biochem. Z.* 233, 45-52 (1935).—A method is described for detg. all 4 pigments in a small leaf with an accuracy of 5%. S. M.

4. Principle of formaldehyde, alcohol and acetone titations. George M. Richardson. *Proc. Roy. Soc. (London)* B119, 65-6 (1936). cf. C A 28, 5007.—In titrations of this type, the initial point and the end point must be defined clearly in statements of analytical results. Joseph S. Hepburn

Analysis of formaldehyde. I. Determination of formaldehyde. A. Mantegazza. *Materie plastiche* 2, 54-6 (1935). II. Determination of methanol in formaldehyde. *Ibid.* 117-22.—A complete review of the chem. methods of analysis, together with the more rapid gravimetric and phys.-chem. methods (detn. of d or n) for the analysis of mixts of MeOH and HCHO . G. A. Brown

Acid base titrations in alcohol-water mixtures. III. Titration of alkaloids and alkaloid salts. H. Baeggaard-Rasmussen and F. Reimers. *Dansk Tidsskr.* 9, 3-8 (1935) (summary in English). cf. C A 28, 5367.—The p_n values of dil. HCl and NaOH in alc. solns, detd with a H electrode at 23°, were in 50% alc. 1.32 and 2.20 vs. 0.1 and 0.01 N HCl , resp., 13.5 and 13.07 for 0.1 and 0.01 N NaOH , resp., and in 75% alc. 1.58 and 2.74 vs. 0.1 and 0.01 N HCl , resp., 14.3 and 13.70 for 0.1 and 0.01 N NaOH , resp. The end points of the reaction scale, which according to Bjerrum (C A 26, 3716), are the max and the min p_n obtainable in dil. solns (max. p_n were approx. 0.3 and 15 in 50% alc. and approx. 0.3 and 15 in 75% alc.)

7. The acidity constants of the alc. solns of the alkaloids investigated were detd, partly colorimetrically and partly electrometrically. In addition to the previously described buffers, mixts of solns of codeine and codeine HCl were also used, their p_n values were detd with H and quinhydrone electrodes. The value of $p_n = (p_0/0.072)$ at 23° of cells of the type Pt | quinhydrone, alc. soln | aq. KCl | aq. N KCl , HCl , Hg , detd. by measurement against buffer solns of known p_n was 7.41 = 0.02 in 50% alc. and 7.58 = 0.02 in 75% alc. (cf. Conant and Fisher C A 14, 3866; Michaelis and Mizutani, C A 19, 255). 20, 561, 2108). In the majority of cases p_n was detd in mixts of solns of alkaloid base and alkaloid salt containing sufficient KCl to make the salt concn 0.05 N. From the results obtained p_n is calculated from the equation $p_n = p_0 - \log (\text{Calculated base}/\text{Calculated salt})$. The variation of p_n with the alc. concn for various alkaloids is shown in a diagram in comparison with the variations of p_n for the most important indicators used in the titration of the alkaloids and their salts. From an approx. detn. of the limits of error in the titration of a basic alkaloid (i.e., the distance of the p_n of the titration end point to the nearest end point of the reaction scale and to the p_n of the alkali), it can be told which alkaloid can be titrated in alc.-w. mixts and which indicator should be used (cf. Linderstrom-Lang, C A 22, 4726). Solns. contg. 50% alc. are

preferable because the accuracy of the titration decreases with increasing concns. of alc. The majority of the alkalooids could be titrated satisfactorily in 50% alc with bromophenol blue as indicator. In many cases it is advantageous to dissolve the alkalooid in alc, add methyl red and titrate to the color change which in alc occurs too soon, then the soln may be dild with water without risk of pptn and the titration finished in aq soln where methyl red in most cases is very suitable. The changes in the pH of the alkalooids and the position of the basic end point of the reaction scale in alc-water mixts as compared with that for water, render the titration of alkalooid salts with a base more accurate in alc-water media than in pure water, the accuracy increasing with the concn of alc. It is shown that most of the alkalooids studied can be titrated in 75% alc with phenolphthalein, or better with Porriar blue (cf. Ol-en and Reimers, *C A* 26, 5848) as indicator. The following alkalooids were used in the investigation: cocaine, morphine, narcotine, papaverine, quinine, cincholine, strychnine, brucine, atropine, procaine, metimephedrine and cocaine. D Thuesen

Estimation of acetone in methyl and ethyl alcohols S D. Sumwalt and M C T Katti *J Indian Inst Sci* 18A, 115-22(1935).—Messinger's method for detg AcMe depends upon treating the sample with NaOH and I_2 , which causes the AcMe to be oxidized to AcONa and CHI₃. After the reaction is over, the soln is made acid and the excess I_2 titrated with $Na_2S_2O_3$. This method gives accurate results for detg AcMe in aq solns even when as little as 0.5 mg of AcMe is present in 100 cc. In the presence of MeOH Messinger's method gives results which are erratic and correspond to values which are too high. The reason for this is that MeOH is oxidized by NaIO and the principal product is HCO₂H. If it is assumed that the rate of oxidation of MeOH is proportional to the concn of NaIO at any time, a logarithmic equation can be derived for the total quantity oxidized and the calcd. results then agree with those obtained experimentally. Other methods for detg AcMe were tested and that of Scott-Wilson, as modified by Marriott is the most suitable. By this method it is possible to detect 0.1 mg of AcMe in 100 cc. of soln even when EtOH and MeOH are present. The method should not be used, however, for pptg. more than 8 mg of AcMe at a time and in the titration, 1 cc. of N NII.CNS corresponds to 0.12 mg of AcMe rather than the theoretical value of 0.80 mg. The ppt. must be allowed to stand at least 20 min., and 8-9 times the theoretical amt. of reagent must be used.

W T II

Grouping of organic solvents and organic compounds with Magdala red. Hermann Eichler *Z anal Chem* 103, 425-7(1935).—Magdala red has a yellowish red color in solns of pH 2 or lower but becomes red at pH 4 and fluorescent. In basic solns there is no fluorescence. With respect to their behavior toward this dyestuff, org compds can be classified as follows: (1) Compds which dissolve Magdala red with fluorescence at room temp and which in their original condition reddens gray Magdala red paper and color it throughout. To this class belong alcs, lower ketones, fatty acids, aldehydes, Turkey-red oil and phenols; nitrobenzene dissolves the dyestuff with very weak fluorescence. By the addn of compds. of group 3, the fluorescence usually disappears. Aq solns of the above substances do not as a rule give the Magdala red reaction. (2) Substances which do not dissolve Magdala red at ordinary or higher temps and do not act upon Magdala red paper. Hydrocarbons of the aliphatic and aromatic series, their halogen derivs, fats, C₆H₆, ethers, fatty and ethereal oils belong to this class. Mixts of these substances with sufficient EtOH dissolve Magdala red with red fluorescence, if the substance does not mix with EtOH, only the alc. layer is colored. (3) Compds which dissolve Magdala red without fluorescence and color Magdala red paper red. Upon the addn. of a suitable quantity of AcOH or of concd. HClO₂, fluorescence results as soon as the pH is lowered to about 4. Besides these classes, there are solns, in which Magdala red dissolves only at an elevated temp. with fluorescence; these

are water, aq solns. of fatty acids and dil. mineral acids of pH about 4. W. T. II.

Sulfonation of naphthalene. I Determination of the relative proportions of α - and β -naphthalenesulfonic acids. Robert Lantz *Bull. soc chim* [5] 2, 1913-32(1935); cf. *C A* 29, 6593⁷.—A procedure for the detn. of the relative amts of α - and β -naphthalenesulfonic acids (I and II) has been worked out for use in a future publication on the monosulfonation of naphthalene. Under definite conditions, I is desulfonated and pptd quantitatively as an insol polybromonaphthalene leaving II entirely in soln. as a sol polybromonaphthalenesulfonic acid. The amt. of I in a mixt of I and II can be detd either by estg. the H₂SO₄ resulting from the elimination of the HSO₃ group or better by detg the insol bromonaphthalene by CrO₃ oxidation. I from the results of detailed investigation a method of carrying out the bromination either in the presence or absence of H₂SO₄ has been formulated. About 0.17 g. of the Na salts of I and II in powder or in H₂SO₄ soln. is sealed into a bomb tube with stated amts. of 65% HBr and Br. The tube is heated in boiling H₂O for 3-5-6 hrs. according to the method adopted. The cooled brominated product is taken up in 100 cc H₂O and, after boiling off the excess Br, is filtered. The washed residue is taken up in 50 cc concd H₂SO₄ and the detn is completed by oxidation with concd CrO₃ soln (*C A* 26, 3691). The results are calcd on the basis of a bromonaphthalene contg 4 atoms of Br (if H₂SO₄ is not used) or 4.5 (with H₂SO₄). It has been shown that naphthalene brominates more slowly than I under the given conditions and that the above procedure can be used for mixts contg a small amt. of naphthalene which should be calcd as I in the estn.

C R Addinall

Analysis of commercial xanthates C A Shcherbakova *Zarodskaya Lab* 4, 1053-61(1935).—The simplified method of analysis of xanthate flotation reagents depends on the difference of the results obtained by iodometric titration of aq soln of xanthate together with the impurities (thiosulfates, sulfides and thiocarbonates) and that of the impurities alone by a preliminary decompn of the xanthate with HCl. The products of xanthate decompn (CS₂ and the alcs), incapable of reacting with I_2 , do not affect the titration of impurities. Considerable advantages of the aq iodometric detn. are claimed over the 2 of the best known methods of acidimetric and alc. iodometric detns. For the analysis of xanthates contg thiosulfates and no sulfides and thiocarbonates, dissolve 4-5 g. of a xanthate in a little cold water, ppt. carbonates and sulfates with an excess of 20% BaCl₂ (not more than 50 cc), dil the soln to 500 cc., let settle, filter (discarding the first 50 cc of the filtrate), and use the filtrate in the following detns. If the soln. is alk., neutralize 25 cc. of the filtrate with NaOH in the presence of phenolphthalein, add a starch soln and excess of I_2 soln., and titrate back with $Na_2S_2O_3$. Treat 25 cc. of the filtrate in a glass-stoppered flask with HCl (25 cc of 0.1 N for Et xanthate, 10 cc of 0.5 N for Pr and Bu xanthates, and 10 cc of 1 N for iso-Am xanthate, allowing the mixts. to stand for 10, 30 and 45 min., resp.). Neutralize the soln. with a small excess of CaCO₃, and proceed with the iodometric titration as above. In the analysis of xanthates contg contaminating sulfides and thiocarbonates, any loss of H₂S, formed in the decompn. of xanthate with HCl, is avoided by following the above procedure in the manner given. Introduce 25 cc of xanthate soln contg 2-3 drops of phenolphthalein soln into a filtering flask fitted at the top with a dropping funnel (1) contg. HCl, and at the side neck with a long rubber tubing connected with a dropping funnel (2) contg NaOH soln. Move the funnel (2) to the lowest possible level and open the cock, decompose the xanthate soln in the flask by introducing HCl from the funnel (1). Pour in the NaOH soln. in the funnel (2). Neutralize the excess of NaOH with a few drops of HCl in the funnel (1). Disconnect the app. and proceed with the iodometric detn. Chas. Blanc

Rapid methods for determining trinitrophenol in commercial picric acid. N. Ya. Ugnaychev and D. A. Rikhter. *Zarodskaya Lab* 4, 1062-6(1935).—The resp.

basis of the 2 methods of detn. of $\text{HOC}_4\text{H}_7(\text{NO}_2)_2$ (I) in picric acid by titration with HgNO_3 and by pptn. with ammoniated CuSO_4 and iodometric back titration of excess CuSO_4 in the filtrate are: $2\text{I} + \text{Hg}_2(\text{NO}_3)_2 = 2\text{HNO}_3 + [\text{C}_4\text{H}_7(\text{NO}_2)_2\text{OH}]_2\text{Hg}_2 + \text{H}_2\text{O}$ and $2\text{I} + [\text{Cu}(\text{NH}_3)_4]\text{SO}_4 + 2\text{NH}_4\text{OH} = [\text{C}_4\text{H}_7(\text{NO}_2)_2\text{O}]_2\text{Cu}(\text{NH}_3)_4 + \text{H}_2\text{O} + (\text{NH}_4)_2\text{SO}_4$. Any dinitrophenol present is not pptd. Prep a standard soln of HgNO_3 by digesting 20.5 g $\text{Hg}_2(\text{NO}_3)_2$ with 300–500 cc H_2O acidified with HNO_3 (1–2 cc of 10% HNO_3 for each 100 cc H_2O) at 50–60°. Decant from the undissolved residue, dissolve it in a little HNO_3 , mix the 2 solns., dil. to 1000 cc. and standardize the soln. by titrating 0.5% soln. of picric acid until a drop of the supernatant soln. fails to give a dark spot on the test paper. Prep. the test paper by adding dropwise 1% AgNO_3 to 10% $\text{Na}_2\text{S}_2\text{O}_3$ to a brown discoloration of the soln., followed by satg. filter paper with this soln. and drying. Prep a standard soln. of ammoniated CuSO_4 by adding 200 cc of 10% NH_4OH to 6–7 g CuSO_4 in 300–500 cc H_2O and dilg. to 1000 cc. For the standardization of the soln., introduce an excess of the soln. (25 cc.) into 50 cc. of 0.2–0.3% of picric acid contg. 2 cc. of 10% NH_4OH , shake well, filter and wash the ppt. with 0.5% NH_4OH . Make the filtrate slightly acid with H_2SO_4 (10 cc. of 10% H_2SO_4), add 5–8 cc. of 20% KI and titrate with 0.5 N $\text{Na}_2\text{S}_2\text{O}_3$. Equally accurate results are obtained by dissolving the ppt. in 5–10 cc. of dil. H_2SO_4 and titrating as above. Similar procedures are used in the detn. of I in com. picric acid.

Chas. Blanc
Microcrystalline reaction of glyccoll. *Geo. Deniges, Bull. soc. pharm. Bordeaux* 73, 168–72 (1935).—Place a few particles of the sample on a slide and add a drop of phosphotungstic acid soln. with the aid of a fine rod. If the solid does not become entirely moistened, a very small droplet of the reagent may be added or the mixt. may be stirred gently with a very fine rod. Examine without a cover-slip under a magnification of 130–50×. If the glyccoll. sample is a soln., a drop should be carefully evapd. on a slide and the reagent added to the residue.

S. W. Goldstein
Identification and colorimetric determination of glyccoll. by means of alloxanic reagent. *Georges Deniges, Bull. soc. pharm. Bordeaux* 73, 161–8 (1935).—Place a little (less than 0.5 mg.) of glyccoll. in a round-bottomed porcelain dish (2–3 cm. diam.) and dissolve with agitation in 1 drop of D.'s alloxanic reagent (*Bull. soc. pharm. Bordeaux* 1901, 161). Allow to stand at room temp. A pink color is apparent after 15 min., and becomes more pronounced on standing, being very strong after 2 hrs. After 4 hrs. the color has changed to an intense reddish violet. Addn. of 1 cc. of water to the residue forms a violet-red soln. One part of the soln. is treated with 1–2 drops of NaOH soln. to give a violet color, while the other half of the soln. is treated with 1–2 drops of 5% (AcO) $_2\text{Zn}$ soln. contg. 2 cc. of glacial AcOH in 100 cc. of soln. to give a yellow-orange color. A set of standard tubes can be prepd. with known amts. of glyccoll. treated as above.

S. W. Goldstein
A colorimetric method for the determination of glucose and levulose by their osazones. *V. S. Butkevich and M. S. Gaevskaya, Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 3, 113–16 (1935).—Hertzfeld's method, *C. A.* 27, 1374, of detg. glucose in the presence of other reducing substances gives correct values (precision $\pm 2.5\%$), only when the time of heating for osazone formation is 1.5 hrs. and not 1 hr. as prescribed by H. The formation of glucosazone is about 0.5 complete in 1.5 hrs. Heating a longer or shorter period gives results that are high or low, resp. Formation of levulosazone is complete in 1.5 hrs., hence, it can be detd. by the same method, but the value obtained is twice the true value. Glucose and levulose can be detd. in the same soln., if the time of heating is prolonged to 5 hrs. In this case the precision is somewhat lower, exceeding 10%, if the concn. of glucose is 4 times that of levulose.

W. Gordon Rose
Volumetric determination of the sodium salt of glycerophosphoric acid and notes on the behavior of the calcium salt. *S. Babich, Z. anal. Chem.* 101, 398–401 (1935).—

1 Dissolve 0.1–0.2 g. of the salt in 25 cc. of water, add 5–10 cc. of 0.5 N $\text{Pb}(\text{NO}_3)_2$ and boil 5–10 min. Cool, dil. to 50 cc., stir carefully and filter. To an aliquot part of the filtrate, add phenolphthalein and titrate with 0.1 N Na_2CO_3 soln. until a distinct pink color prevails. Heat to boiling to see if the color fades, if it does add a drop or 2 more of the soda soln. From the vol. required of Na_2CO_3 , the excess $\text{Pb}(\text{NO}_3)_2$ is known and when this is subtracted from the original vol. used, the difference is a measure of the quantity of glycerophosphoric acid present. Residue obtained in this way with the Na salt agree well with those obtained by acidimetric titration. The procedure also gives good results when Na cacodylate is present, which is not true of the acidimetric method of analysis. The behavior of the Ca salt of glycerophosphoric acid is interesting. Analysis by the above procedure shows that about 7.3 cc. of $\text{Pb}(\text{NO}_3)_2$ is required when the theory demands 8.76 cc. Similarly when it is attempted to det. the Ca present, only a corresponding quantity of Ca can be pptd. as CaC_2O_4 . In the filtrate from the CaC_2O_4 ppt., more Ca can be found after destroying all org. matter with hot HNO_3 . Possibly part of the Ca in the glycerophosphate has replaced an OH group and is present as glycerate.

W. T. H.
Microdetermination of protein nitrogen in the presence of ammonium salts. *André Roche and Francis Marquet, Bull. soc. chim. bel. 17, 1630–2 (1935).*—The protein is pptd. as the tannate by Hédin's reagent (tannin 70, NaCl 100 and AcOH 50 g. per l.) and washed free from NH_4 salts with a mixt. of Hédin's reagent 1, satd. K_2SO_4 5 and water 94 parts. The usual Kjeldahl detn. is then made. The method is adapted from that of Kossel. *L. E. G.*

A sensitive reaction for the detection of nitrogen bases. *H. Wachsmuth, J. pharm. Belg.* 17, 705–8 (1935).—To 10 cc. of a very dil. soln. of the alkaloidal base add 0.5 cc. of 15% CuSO_4 and a trace of KCN (or 1–2 drops of a 1% soln.). The coloration appears immediately without heating. A turbidity may form if the soln. of the base is too concd. An excess of KCN is undesirable as it hastens the decoloration. The reaction is not specific for the CN ion. Morphine produces a yellow-green, but the result is doubtful with concns. below 1.15,000–1.20,000. Pyramidone produces a violet, which is definite with concns. below 1.700,000. Apomorphine produces a red, which passes through rose to brown to gray and finally to a stable green. The color can be removed by shaking with org. solvents. The coloration was observed with concns. about 1.2,000,000. Adrenaline produces a red, and a rose color is still perceptible with concns. of 1.5,500,000.

S. W. Goldstein
Color tests for distinguishing between tetrahydronaphthalin and decahydronaphthalin. *A. Castiglioni, Z. anal. Chem.* 101, 414–17 (1935).—Mix 1 cc. of the hydrocarbon, or mixt. of hydrocarbons, with 50 cc. of 50% alc. and of this mixt. take 1 cc. for the test. To it add 1 cc. of HCHO in 30% aq. soln. and 10 cc. of concd. HCl or 2 cc. of H_2SO_4 . If HCl is used, heat to boiling and allow to cool but with H_2SO_4 do not heat. With the HCl , decalin gives an orange color with as little as 0.05 g. of hydrocarbon and tetralin gives no color when as much as 0.2 g. is used. With H_2SO_4 , on the other hand, 0.01 g. of tetralin suffices to give a distinct pink coloration and 0.1 g. of decalin is required to give a yellow color. If HCHO is replaced by furfural, a more sensitive test is obtained but both hydrocarbons give the same color.

Forensic chemistry in the service of the state. *Gualermo Q. Quibilan, Rev. filipina med. farm.* 26, 307–16 (1935). Pitfalls in medicolegal toxicology. *Pablo Anzuarez and Guillermino Q. Quibilan, Ibid.* 361–7.

E. J. C.
A new crystalline derivative of blood pigment. *M. Wagenaar, Z. anal. Chem.* 103, 417–18 (1935).—In previous papers, *C. A.* 24, 1402, 3258, a summary of all the known cryst. derivs. suitable for the identification of blood pigment has been given. In this connection, it may be mentioned that the hemin crystals of Teichmann are of particular importance. Some difficulties that occur in applying this important test are not encountered with a

new test which is even more conclusive. If a trace of blood fluid, such as can be obtained from particles of blood or from blood stains on clothing, is covered carefully with a cover glass, so that no small objects such as particles of hair or sand will prevent the direct contact of the cover glass with the object glass, and then a few drops of acetone is allowed to flow upon it, the particles of blood pigment will be surrounded by acetone. The cover glass presents too rapid evaporation. Finally if 1 drop of dilute mineral acid is added, soon crystals of a crystal compound of acetone and blood pigment develop even in the cold. Photomicrographs of the characteristic crystals are shown.

P S Roller The crystallization of orthorhombic and monoclinic pyroxenes from synthetic silicate melts D P Grigor'ev. *Zentr Mineral. Geol* 1935A, 353-7; cf C A 29, 6542 — Mixts corresponding to $3\text{MgO} \cdot \text{CaO} \cdot 3\text{SiO}_2$, to which CaF_2 had been added, were heated at 1400° for 4 1/2 hrs and cooled slowly The material obtained consisted chiefly of enstatite, often bordered by monoclinic diopside which was apparently formed by the reaction enstatite + liquid

= diopside Enstatite does not crystallize from melts if F_2 is absent (cf. Bowen and Scharrer, *C. A.* 29, 4250), probably because of the fact that the inversion temp enstatite-clinoenstatite is lower than the temp. at which complete crystn occurs in the absence of F_2 . M F

The refraction and birefringence of a zircon K. Chudoba *Zentr. Mineral. Geol.* 1935A, 362-7, cf. Epler, *C. A.* 22, 3823, 4120—A green a -zircon, $d_{10} = 4.150$, had n_x 1.8560, 1.8629, 1.8701 and n_z 1.8671, 1.8739, 1.8809 for Li, Na and Ti light, resp. Another zircon with the same d was found on optical examn to be largely δ zircon (uniaxial, high birefringence) with some c -zircon (biaxial) and with a border zone of a -zircon (uniaxial, low birefringence). Michael Fleischer

Minerals of lead slags Petrological methods of investigating slags W. I. Lober *Chem. Erde* 10, 67-115 (1935)—Existing information is summarized (120 references), and in many cases recast, e.g., into diagrams for the systems CaO - FeO - SiO_2 and Ca - SiO_2 - Na_2SiO_3 - Zn - SiO_2 - Fe_2SiO_4 , with their comps., ds., optical properties and miscibility limits. Suitable petrological methods are described, in particular pulverization followed by sepn by d , optical examn, and chem. analysis of the sepd portions, with full details, and numerous micrographs. In this way the constituents of various slags were detd. In those from "mixed ore" (Lower Harz) were identified fayalite, willemite, α -celadon, sphalerite, wurtzite and magnetite. In lead slags were found various orthosilicates: fayalite, willemite and monticellite (between the first 2 of which a gap of immiscibility from above 17% fayalite to 36% willemite was found), melilite and justite, several feldspars in small amt., pyroxene (near hedenbergite), magnetite and (often ferruginous) zinc spinel, and various sulfides: galena, chalcocopyrite, chalcocite, bornite, pyrrhotite, with sphalerite and wurtzite, the Zn occurring as sulfide and silicate being in approx. equal amts. C. A. Silberrad

Investigation of minerals containing rarer elements Allantite found in Kanbe village, Mara Prefecture J. I. sutaro Takubo and Heihachiro Ukwai *J. Chem. Soc. Japan* 56, 1523-5 (1935), cf. *C. A.* 28, 3892—The compn. of this mineral is believed to be $Ca_2(AlOH)(Al, Ce, Fe)_3(SiO_4)_2$. T. Katsuragi

Sorption of gas by minerals V. Jitsusaburo Same-shima and Noriyoshi Morita *Bull. Chem. Soc. Japan* 10, 487-90 (1935), cf. *C. A.* 28, 2646—The partially or wholly dehydrated minerals, mordenite, thomsonite, scolecite, epistilbite and phillipsite were tested with NH_3 and CO_2 . Dehydration was carried out by heating 2.5 hrs. at 200° *in vacuo*. Mordenite was heated to 350° for 30 min without effect, while heating thomsonite to 350° for 1 hr. caused complete dehydration. Mordenite sorbed considerable amts. of both gases and is a sorbent of the chabazite type. The other minerals sorbed little CO_2 , but did sorb considerable amts. of NH_3 , with which they appeared to combine chemically. Completely dehydrated thomsonite sorbed but little NH_3 . *VI. Ibid.* 490-4—Dried or dehydrated sepiolite, talc, serpentine, asbestos, acid clay, bentonite and vivianite were tested with NH_3 and CO_2 . Sepiolite sorbed considerable amts. of both gases and is a sorbent of the silica gel type. Acid clay and bentonite sorbed NH_3 , as did asbestos to a slight extent, but no CO_2 . Talc, serpentine and vivianite sorbed neither gas. John E. Mubery

Chemical and physico-optic relations in the brittle mica group G. Koch *Chem. Erde* 9, 453-63 (1935)—Numerous analyses with values of d , α , β , γ and $2E$, many new, are given of the brittle micas. These lead to the formula $H_2(Ca, Na)_2Al_2[Al_2Si_2O_{10}]_2$ for margarite, increase in Na being accompanied linearly by decrease in α , β , γ and E , and increase in γ - α , and $H_2CaMg_2[Al_2Si_2O_{10}]_2$ for clintonite, with which are included zanthophyllite and brandisite. Ca and Na are interchangeable in the margarites, and Mg and Al between them and the clintonites, all being intermiscible. Chloritoid is $H_2[Si_2Al_2Al_2Fe_2O_{10}]_2$ and otterite $H_2[Si_2Al_2Al_2Fe_2O_{10}]_2$ with Mn replacing part of the Fe (with proportionate decrease

in d). Analyses of paragonite confirm the formula $H_2NaAl_2Si_2O_{10}$. C. A. Silberrad

Synthesis of pyrophyllite Robert Schwarz and Georg Trageser, *Z. anorg. allgem. Chem.* 225, 142-50 (1935), cf. *C. A.* 29, 7873—Pyrophyllite has the compn. $Al_2O_3 \cdot 4SiO_2 \cdot H_2O$ and does not lose H_2O below 690°. By heating feldspar, plagioclase or kaolin with 0.5 N HCl at temps. above 320°, pyrophyllite can be obtained, but it is accompanied always by some of the initial substance. The material is heated in a Ta crucible in a steel autoclave. H. Stoertz

Thermal decomposition of talc R. H. Ewell, E. N. Bunting and R. F. Geller *J. Research Natl. Bur. Standards* 15, 551-6 (1935) (Research Paper No. 848)—Water in excess of 1 mol was mostly driven off between 390° and 500°. This water loss was accompanied by a small endothermic heat effect, but not by any change in crystal structure or optical properties. The one mol of combined water was driven off between 800° and 840°. This water loss was accompanied by a large endothermic heat effect and an increase in true sp. gr. from 2.83 to 2.91, and by breakdown of the talc into enstatite and amorphous silica. Inversion of the enstatite to clinoenstatite took place gradually, both phases being observed in material heated at 1200°, and only clinoenstatite in material heated at 1300°. The latter also showed conversion of the amorphous silica to cristobalite. The data support the hypothesis of Foshag and Wherry (*C. A.* 17, 513) that water in talc in excess of 1 mol is not constitutional and may be held electrostatically between basal cleavage planes. P. S. Roller

Constitution of the clay minerals C. E. Marshall *Science Progress* 30, 422-31 (1935); cf. *C. A.* 29, 7850—A review with bibliography. Joseph S. Hebrum

Chemical structure of clay minerals and corresponding silicates of bi- and tri-valent metals Julius Holzer *Chem. Erde* 9, 464-85 (1935)—Of 28 such minerals 132 old analyses have been selected as trustworthy and recalcd. to show the at. content of di-(except Ca) and tri-valent metals, Si, O, OH (detd. by amt. of H_2O), Ca, Na⁺, K and H_3O^+ . The ratio Si/O is very near 2.5 in a large no. of cases. In 45 where the divergence is considerable it has been made exactly 2.5 by a suitable transfer of H_3O^+ to H_2O , in many cases definitely supported by consideration of the dehydration results. On the basis of these revised analyses the structures of the minerals are discussed in the light of recent x-ray results, such as those on chlorite, muscovite, kaolin, pyrophyllite, etc. Eighty-four references. C. A. Silberrad

Composition of halloysite and powdery dolomite from Buda Gabor Vavrinec *Magyar Chem. Folyoirat* 41, 70-7 (1935)—Analysis of halloysite gave SiO_2 37.82, Al_2O_3 31.15, FeO 0.12, CaO 0.45, MgO 0.25, P_2O_5 0.17, SO_3 traces, CO_2 0.26, H_2O 29.93, org. matter traces, sum 100.15%. Drying expts. showed that water content of halloysite behaved similarly to that of hydrogels of pure SiO_2 or Al_2O_3 . Curves showing H_2O content of halloysite according to lowering tensions would be like the dehydration curves of van Bemmelen. Also soly expts. with concd. H_2SO_4 , dil. HCl and concd. HF were made. A special calorimeter was constructed to det. reaction heat of pure SiO_2 , silica earths, $Al(OH)_3$, Al_2O_3 and various halloysites. The latter gave 602 and 530 cal., resp., the theoretical values calcd. from their analyses were 607.6 and 521.1 cal., resp. The components of halloysite (SiO_2 and $Al(OH)_3$) are probably united not chemically but as a phys., eventually colloidal, mixt. This statement affirms that of Mehmel (*C. A.* 29, 4799) about the crystal structure of halloysite. A new analysis of a dolomite flour from Martonföld, Budapest, gave CaO 39.92, MgO 21.44, FeO 0.13, CO_2 46.60, P_2O_5 0.08, SO_3 0.05, SiO_2 0.22, HCl insol. SiO_2 0.13, HCl insol. 0.15, H_2O at 150° 0.06, loss on ignition 0.20, sum 100.08%. S. S. de Finily

The rare earth content of European and Japanese clay shales. E. Minami *Nachr. Ges. Wiss., Göttingen, Math. physik. Klasse*, Pachtgrupp IV, 1, 155-70 (1935); cf. *C. A.* 28, 4001, 30, 1335—The rare earth content of

all the clays, detd. gravimetrically, was close to 0.02%. The amts. of each element present were detd by x-ray spectrographic methods. Ce, Y, Nd, La and Th predominated.

Lias clay from Dobbertin, Mecklenburg-Schwerin F K Schlunz, *Chem Erde* 10, 116-25 (1935), cf. C. A. 27, 5689, 28, 1960.—This clay was examd by similar methods to those used for clays from the neighboring localities, Papendorf and Mallus. Quartz and feldspar increased, muscovite and kaolin decreased as particle size increased; the only clay mineral found by means of x-rays was halloysite; of heavy minerals the proportion therein of pyrite (78.4%) was very much greater than in either of the other 2 clays above mentioned (28.0 and 34.2%, resp.), while that of hornblende was small. Of electrolytes Ca and Cl ions were low, SO₄ high. C. A. Silberrad.

Spectro-analytical investigation of tectites E Preuss, *Chem. Erde* 9, 305-418 (1935).—By use of the Mannkopf and Peters' spectral method (cf. C. A. 25, 5110), analyses of a large number of tectites and analogous materials have been made, with results shown in the annexed table, in which the mol. totals of the oxides of Al, Fe, Mg, Ca, Na and K are made up to 100, and SiO₂ stated in proportion (figures in col. 1 indicate the number of samples of which the analysis is the average)

	d	SiO ₂	Al ₂ O ₃	FeO	MgO	CaO	Na ₂ O	K ₂ O
Moldavites (14)	2	354	14828	515	38	12	7	17
Andalites (2)	2	448	1	5111	378	36	18	5
Indochina (8)								
Bilitonites (5)	2	477	1	5178	380	37	21	5
Average (36)								
Norwegian loam								
Lithosphere								

There were also found Li, Be, B, Sr, Ba, Ti, Zr, V, Cr, Mn, Ni, Cu, Ga, Ge, Sn, Pb and Se in amts comparable with those in the lithosphere, the chief differences being the relatively smaller content of the more volatile elements, e. g., Cu, Ge, Sn and Pb in the tectites, the most variable amts were those of Cr and Ni. Glasses were also analyzed.

	FeO	CaO	NaO	MnO	TiO ₂
Darwin glass	2	3	0	035	0
SiO ₂ glass (Henbury)	6	0	007	0	12
SiO ₂ glass (Wabar)	5	0	0093	0	13
SiO ₂ glass (Libyan desert)	0	3	0	0006	0
Moldavites, av.	2	5	0	006	0
Australites, av.	4	7	0	013	0
Bilitonites, av.	5	6	0	055	0

The results are not in favor of Spencer's theory (C. A. 27, 2911), nor does the general resemblance between the compns. of the tectites and that of the lithosphere favor a cosmic origin. Analyses were also made of Paucurambo glass (Linc, C. A. 28, 2301), and of glass spheres from Colombia (Stutzer, C. A. 21, 41), showing compns. resp. differing markedly from that of the tectites, and identical with that of obsidian. C. A. S.

Deposits of mixed minerals in Sardinia L. Gerbella, *Ricerche assoc. mineraria sarda* 40, No. 7, 4-8 (1935), cf. C. A. 29, 2888.

Hills of Shah Abdul Azim (Persia) A. Riviere, *Compt. rend. soc. géol. France* 1935, 60-2.—A stratum, a few in thick, of much crushed quartz and limestone is impregnated with Fe and galena, which extend into the limestones above and below it. C. A. Silberrad.

Outline of the geochemistry of the Urals E. C. Zakharov and S. A. Yushko, *Trans. All-Union Sci. Research Inst. Econ. Mineral.* (U. S. S. R.) No. 75, 4-42 (in English 43-6) (1935).—Late Paleozoic igneous activity in the Urals gave origin to bodies of (1) gabbro, diorite and plagiogranite with associated pyrite and Cu-Zn deposits and (2) K granites with high-temp. Au deposits and meso-epithermal Hg-Sb-Au deposits. The amts. of As, Sn, Sb, Se, Te, Cd and Tl associated with various types of

deposits and mineralization and their areal distribution are summarized. Ge and In were detected spectroscopically in Zn ores, one of which contd. 0.02% In₂O₃.

R. H. Beckwith

Notes on the Balumbing mine, west coast of Sumatra D. W. J. Grey, *Bull. Inst. Mining Met.* No. 375, 1-18 (1935).—Subsequent to propylitization and silicification of the rhyolites and tuffs by hydrothermal solns., faulting occurred mineralization by ascending solns. followed and was at first confined to the fissures. The original filling was probably calcite and Mn with which latter the Au and Ag were associated. Descending surface waters, charged with H₂SO₄ derived from oxidation of the pyrite in the propylite, attacked and leached the fractured surfaces of the chloritized and sericitized rocks in the elastic zone and yielded kaolin and hydrous SiO₂, mostly colloidal. These waters also attacked the Au and Ag. At the surface Ag was only slightly attacked, but in depth, in the path of increasingly acid solns. as oxidation proceeded downward, the Ag went into soln. as sulfate. The soln. descended through the shattered rock where Ag was partly pptd. by unaltered orthoclase and in neutral soln. partly abstracted by colloidal kaolin. The H₂SO₄ reacted with NaCl in the mine waters to form HCl, which with the Mn in the ore generated Cl which dissolved Au. Four possible precipitants, each of which probably had something to do with it, are considered.

The evolution of the present metallurgical flow sheet is described in detail. An old tabling and cyaniding plant was scrapped in favor of flotation. Use of a blanket strike before the classifier reduced reagent consumption to Pb(OAc)₂ 0.93, Na₂S 0.31, Bu xanthate 0.19, Aerofloat 15.0 14 soda ash 0.90 lb per ton. In Aug. 1934, in treating an ore averaging 2.79 dwt per ton, 32.6% of the Au was recovered on blankets, flotation recovered 93.6% of the Au from an impoverished head (1.88 dwt) for an over-all recovery of 95.7%.

Microscopical study of copper ores from Nieder-Marsberg (Westphalia) Friedrich Schwacke, *Chem. Erde* 9, 480-525 (1935).—A detailed account with photomicrographs, of the manner in which the various minerals, primarily chalcocite, covellite, bornite, chalcopryrite, galena, sphalerite, pyrite, marcasite, tetrahedrite, farnatite, quartz and calcite, and secondarily malachite, azurite, cuprite, tili ore, melanoconite, limonite, gypsum and native Cu and Ag, occur, with their relations to the country rock, and discussion as to their origin.

C. A. Silberrad

Geology of the iron deposits in the lower Yangtze region C. Y. Hsieh, C. C. Sun, Y. C. Cheng and K. Chern, *Mem. Geol. Survey China*, Ser. A, No. 13, 191 pp. (1935).—Six types of occurrence of Fe in Tangtu district are described. All are genetically related to the diorite and were formed as an after-effect of the igneous intrusion. In the first stage of mineralization apatite, magnetite and actinolite with perhaps a small amt. of hematite were deposited under high temp. and partly pneumatolytic conditions. Not long after this, a soln. forming large bodies of hematite emanated from the same magmatic source. Almost simultaneously the veins were altered, the actinolite to nontronite, while the country rocks were silicified, sericitized and partly aluminized or kaolinized.

At first the soln. was very rich in Fe and SiO₂; subsequently it became alk. and locally sulfurous. In the third stage of mineralization specularite, hematite, quartz, chalcocite, a little apatite and barite deposited under epithermal conditions. Next Fe was deposited in the interstices of quartz and barite crystals under cold-water conditions. In the final stage, atm. agencies altered the Fe to limonite. The Fe deposit of Tungkuangshan is of contact metamorphic origin. The ore, magnetite with a small amt. of hematite, is in close assoc. with garnet. Garnet, diopside, wollastonite and forsterite have been formed in the calcareous rocks, and sericite, andalusite and cordierite in the argillaceous and siliceous rocks. The Changlungshan Fe veins were deposited by solns. from granitic rocks at great depth and under high temps. The Sanshan deposits are of the contact pyrometamorphic type similar to those of Tungkuangshan. The Cheng-

menshan deposit is of hydrothermal origin and of the mesothermal type. In the Nanking Hills, 3 fields occur. The ore was formed as an igneous after-effect of the intrusive rock, probably as a replacement under mesothermal to epithermal conditions. Alden H Emery

Ferrous deposits of Berry. André Vatan. *Compt. rend. soc. géol. France* 1935, 64-5.—The origin of these deposits, consisting of an intimate assoc. of CaCO_3 and limonite, is attributed to transport of $\text{Fe}(\text{OH})_3$ from laterite in pseudo-sols in H_2O of pH less than 7, i. e., rich in CO_2 , into a lake with limestone bottom. Here CaCO_3 dissolved as bicarbonate and the alkyl of the H_2O increased until at pH 10 the colloidal sols of $\text{Fe}(\text{OH})_3$ became unstable, and limonite deposited in intimate assoc. with CaCO_3 . C A Silberrad

Sudbury nickel field restudied. A G Burrows and H C Rickaby. *Ann. Rept. Ontario Dept. Mines* 43, Pt. II, 1934, 49 pp (1935).—The rocks of the area are described and the theories for the origin of the ore reviewed. Alden H Emery

Description of the Umshunskii tungsten ore deposit. T G Tikhova. *Razvedka Nedr. (Subterranean Prospecting)* 5, No. 3, 15-23 (1935).—A wolframite ore contg. WO_3 74.62, FeO 17.43, MnO 7.60, CaO 0.30 and SiO_2 0.20% was found in Umshunsk, located about 207 km from Sretensk, Siberia. A A Boehlingk

The Khaidarkan mercury-antimony fluoite deposit. A I Suloev and A L Ponomarev. *Trans. All Union Sci. Research Inst. Econ. Mineral. (U. S. S. R.)* No. 71, 5-76 (in English 77-8) (1935).—The deposit, in the northern Alai foothills southwest of Fergana, occupies an area of 10.9 sq. km. A belt of limestones is tightly interfolded and interfaulted with sandstones and shales, and all are cut by diabases, probably of Variscan age. Granites, granodiorites and pyroxenites in the vicinity are probably of the same age. Extensive areas of breccias along faults and along the contacts between limestones and shales are cemented and replaced by fine-grained quartz, fluorite, stibnite and cinnabar and are cut by veins of the same material. The ores are of disseminated epithermal type and of hypogene origin. Estimates of tonnage of fluorite, Sb and Hg are given. The deposits are believed to merit exploitation on a large scale. Densities of rocks calculated from their chemical analyses. Reginald A Daly. *Proc. Nat. Acad. Sci.* 21, 657-63 (1935).—The method of calcn. of liddings (C. A. 14, 2457) which assumes the material to be completely crystd., nonvesicular and at room temp. was tested. The water-corrected normative ρ of the more abundant holocryst. rocks may be regarded as the actual ρ . The calcd. ρ was too low when the combined water was much in excess of 1%, and also in general for peridotites. Applications of the calcns. to extrusive and porous rocks are made. P S Roller

Viscosity of melted rocks. Michel P. Volarovich. *Compt. rend.* 202, 78-80 (1936). *cf. C. A.* 29, 4922, 7744.—The viscosities at several temps. between 1100° and 1400°, detd. by V's method, and complete analyses of the following rocks are given (figures after each indicate the percentage of SiO_2 and the viscosities in poises at 1400°): basalt 43.03, 55, teschenite 50.58 (with 23.41 Al_2O_3 + Fe_2O_3), 851; andesite 63.76, 1175, olivine basalt (erupted 1932) 52.4, 126; diabase 48.14, 60, obsidian 73.79, 170,000, and artificial glass 72.8 (with 15.8 Na_2O), 123. The increase in viscosity with increased SiO_2 is obvious, unless modified by a large amt. of Na_2O as in glass, the high viscosity of teschenite is attributed to the large amt. of Al_2O_3 + Fe_2O_3 . C A Silberrad

Mixing or separation into components of silicate rock magmas. G Linck. *Chem. Erde* 10, 126-8 (1935).—Grignov's expts. (*cf. C. A.* 29, 6542) are unsatisfactory, as he has based the compn. of his melts on the constituents charged without allowing for possible volatilization. There is no evidence of silicate magmas ever sepg. into 2 phases, either as 2 layers, or as an emulsion (such as NaCl may form in a magma). On slow cooling sepn. may occur of a mineral with which the magma is satd. at a temp. slightly below its m. p. e. g., of leucite. Any differentiation must consist of a wandering of those components which crystallize out first, e. g., by gravitation (*cf. Vogt, C. A.* 18, 805). C A Silberrad

Geochemical characteristics of protocrystallization. A E Fersman. *Compt. rend. acad. sci. U. R. S. S. (N. S.)* 3, 216-20 (1935).—In the crystn. of basic and ultrabasic rocks, the minerals crystg. earliest are those of sym. crystal structures, highest coeffs. of thermal stability and highest values of lattice energy. The elements predominating in these minerals are those of even at no and esp. those with max. values of packing energy, of shortest ionic radii and of lowest at. vols. and ionization potentials, i. e., elements with the most stable nuclei and with the greatest mech., thermal and electrostatic strength of the electronic shells. Michael Fleischer

Geochemical investigations of volcanoes in Japan. I. Studies on the gases and the spring waters of the volcano Asama. I Kimio Noguchi. *J. Chem. Soc. Japan* 56, 1495-510 (1935).—Results of analyses of the various volcanic products are given. II. Chemical compositions of the lavas of the volcano Oshima, Izu. Iwaki. *Ibid.* 1511-22.—The compn. of the lavas are similar. T. Katsura

Petrology of Alaid volcano, North Kurile. Hisashi Kuno. *Japan J. Geol.* 12, 153-62 (1935) (in English).—The lavas of Alaid Island are of several kinds of olivine-basalt, while those of Taketomi Island consist of a single kind of olivine-anorthite-basalt. These basalts differ markedly from those from the volcanoes of Huzi zone, central Japan. Among other differences they are more alk. and less siliceous, and the groundmass contains olivine and alkali-feldspar with silica absent. In the Alaid basalts, the olivine and augite crystd. out side by side. The olivine in the effusive stage was more ferrierous than that crystd. in the intratelluric. The early olivine and

augite reacted with residual magma to form more ferriferous zones successively around the r.p. crystals

The andesitic rocks of Ditréu, C. A. Department, Transylvania Virgil Ivanovici *Ann. sci. univ. Jassy* 20, 80-97 (1935)—The mineral descriptions of several samples of rock are given, with chemical analyses. They are composed mainly of plagioclase, augite and olivine

John I. Milberry

A shallow intrusion of the bysmalith of Cavallo L. Glaueaud *Bull. soc. géol. France* [5], 4, 515-22 (1935)

The bysmalith at Cavallo (Constantine, Algeria) consists of vitreous and microgranular rocks, the latter a quartziferous hornblende microgranodiorite containing phenocrysts of strongly zoned plagioclase (30-40% an), green pleochroic hornblende and occasionally of orthoclase and biotite embedded in a paste of minute crystals of plagioclase with orthoclase and quartz (often poikilitic). Contact with the surrounding Eocene marls is marked in the bysmalith by the crystals being much smaller, while the marls have been metamorphosed in places to depths of a few cm to 4 m, with formation of sericite and spotted schists, chlorite, hornfels, garnet, rutile, sphene, etc. in 2 zones, one the result of mere heat, the other of pneumatolytic and hydrothermal action. Elsewhere the contact is marked only by a brecciated zone cemented by a paste of the comminuted materials or of calcite

C. A. Silberrad

Glasses and nephelite accumulations from Steinberg near Fiedbach Karl Scholitsch *Zentr. Mineral. Geol.* 1935A, 3-8-82—The nephelite basalts were probably formed by accumulation of crystals following differentiation. They show evidences of having been transported through the melt during the period of de-gassing. The composition of the glasses agrees qualitatively with the composition to be expected after separation of olivine and pyroxene, which are present as phenocrysts. Four new rock analyses

Michael Fleischer

The catamorphism of igneous rocks under humid tropical conditions John B. Harrison *Brochure publ. by Imp. Bur. of Soil Sci., Harpenden, Eng.*, 79 pp.—An extensive treatise is given on the chemical, microscopical and petrological aspects of the tropical catamorphism of igneous rocks. The SiO_2 , Fe, Al, Mn, Mg, Ca, Ti and alkali analyses of the catamorphic products are made on a soln. obtained by treating the rock with a mixt. of 40 cc H_2SO_4 (sp. gr. 1.84), 20 cc HCl (sp. gr. 1.19) and 10 cc HNO_3 (sp. gr. 1.40). The Fe^{3+} is determined on a soln. of a separate part of the material dissolved in HCl and dil. H_2SO_4 . Under tropical and temperate conditions, surficial weathering of igneous rocks results in the catamorphism of the rock minerals by processes of hydration and oxidation with the production of hydrated silicates of Al_2O_3 or silicoaluminic acids, hydrated silicates of Fe, hydrated oxides of Fe, with residual quartz and other resistant minerals. II. Catamorphism of basic igneous rocks under humid tropical conditions. The action of primary lateritization is due to the action of carbonated ground waters on its surface and is the setting free from combination in the rock minerals of the SiO_2 , Ca, Mg, Na and K, while leaving most or all of the Al as gibbsite and the greater part of the Fe as limonite. While this primary process is the same on high and low levels, the after-processes differ materially. During the formation of primary laterite at low altitudes from basic igneous rocks containing small quantities of quartz, a proportion of the SiO_2 set free by catamorphism becomes crystalline during similar formation at high altitudes no change in crystalline SiO_2 is indicated. On the contrary, it appears that some loss of quartz may take place at high levels. During the lateritization at low levels of similar, but quartz-free basic rocks, there is apparently little or no formation of crystalline SiO_2 . Primary laterite is composed of the residue from the catamorphism of basic rock; laterite

earth consists of these residues with varying proportions of SiO_2 taken up from the ground-water from rocks undergoing active lateritization; the surficial ironstones and bauxites are composed of constituents leached from the primary laterite during its conversion into lateritic earth, as well as lateritic earth after its desiccation. Primary lateritization is followed by desiccation which gradually results in vast masses of lateritic earths or argillaceous laterite. Exceptionally deposits of secondary quartz occur. Under temperate conditions, catamorphism of basic rocks is not a lateritic action, but a more gradual and less complete degradation and decomposition, accompanied by oxidation, hydration and leaching with the formation of various more or less complex hydrated silicates. III. Catamorphism of intermediate igneous rocks under humid tropical conditions. There are 5 fairly well marked zones of alteration between an epidote-quartz-diorite and its final degradation products lateritic earth and surficial bauxite. There is (a) a gradual increase in the proportions of Al_2O_3 present in the catamorphic products, (b) a gradual change from FeO to Fe_2O_3 , (c) marked diminution in the proportions of CaO and MgO, and (d) very great diminution of the alkalis. IV. Catamorphism of acidic igneous rocks under humid tropical conditions. Under tropical conditions, acidic rocks, such as aplites, pegmatites or granites and granitic gneisses, do not undergo primary lateritization, but gradually change through catamorphism into pipe- or pot-clays, or more or less quartziferous and impure kaolins. Lateritic earths, and even pot-clays, may undergo desiccation, with the formation of concretionary and surficial masses of bauxite

J. R. Adams

Some differentiate and endomorphism contact rocks from Szarvasko Zsigmond Szentpétery and Kálmán Emzst *Földtan. Közlem.* 65, 305-14 (1935)—Chemical analyses and detailed petrographic description of 7 rock samples, consisting of quartz-plagioclase-pegmatite, quartz-plagioclase, lamprophyre, titanomagnetite-gabbro-peridotite and some accumulative metamorphic rocks are presented and discussed

S. S. de la Foy

The contact metamorphism of the Onawa pluton, Piscataquis County, Maine Shaler S. Philbrick. *Am. J. Sci.* 31, 1-40 (1933)—The Onawa pluton was formed by intrusion of a quartz-rich subalkali intermediate magma. Differentiation occurred with production of a basic border. Metamorphism of the slate series was begun during the intrusion of the pluton and continued through the associated igneous activity during which intermediate dikes were intruded accompanied or followed by injection of aplite veins of several compositions. Acid dikes with assimilated aluminous material were next intruded. Quartz veins carrying black tourmaline are the last phase of igneous activity. The degree and character of metamorphism were independent of the type of equigranular holocryst. igneous rock at the contact of the pluton but was much less intense in the vicinity of an apophysis of porphyritic microcryst igneous rocks. Both intensity and character produced were governed by the conditions of crystallization of the igneous rock. The aplite veins show in their modes of occurrence certain features that suggest that the rock reached a semimolten condition. The wide aureole and extensive recrystallization indicate that the superheat of the pluton was large and slow in dissipation. The lack of high-temperature minerals in the metamorphics shows that the temperature was not much above that of the country rock prior to and during intrusion. The highest degree of metamorphism is in a xenolith of plagioclase-cordierite-pleonaste-hypersthene hornfels

Alden H. Emery

Metamorphic rocks of southern Abukuma plateau. Kenichi Sugi *Japan J. Geol.* 12, 115-51 (1935) (in English)—The petrography of the following types of rocks is described: metamorphic rocks (a) from igneous and pyroclastic, (b) from sedimentaries and (c) due to retrogression. Metamorphic facies and causes of metamorphism are considered. Under (a) the rocks are divided into 2 main groups, one characterized by mineral assemblage of green schists including hornblende-bearing varieties, and the other by amphibolites. The retrogressive

rocks are widely distributed among low-grade metamorphic members of the eastern zone but are derived also from high-grade rocks of the western zone P S Roller

Metamorphic rocks of neighborhood of Viviers, Pyrénées-Orientales I Ragun *Compt rend soc géol France* 1935, 58-60 —The calcareous strata in this neighborhood show 2 distinct forms of metamorphism (a) cryst limestones and marbles contg considerable amts of silicates which often form visible crystals of scapolite, pyroxene, garnet, amphibole, quartz and sphene, and (b) less metamorphosed, contg smaller amts of quartz, feldspar and biotite, and considerable mizzonite C A S

Metamorphism on border of lustrous schists of Cerrières, Hautes Alpes Ch Pussenot *Compt rend soc géol France* 1935, 144-6 —Several strata of Rhætic and Liassic siliceous limestone in this neighborhood are characterized by a metamorphism that has produced large quantities of albite crystals C A S

Peculiar recrystallization of limestone Jean Goguel *Compt rend soc géol France* 1935, 152-3 —Near Vauluse and elsewhere in the department of that name the calcite of the Urgonian limestone has recrystd in yellow spherulites, usually about 1 mm diam, made up of cryst fibers, slightly cemented together and showing slight pleochroism Analysis gives the compn as approx $75\text{CaCO}_3 + 1\text{MgCO}_3$. The bed of spherulites rests on and penetrates into unaltered limestone C A S

Petrogenesis of Franconian ripple limestone Ph Schmitt *Chem Erde* 9, 321-64 (1935) —The methods of deposition of the ripple limestones of the area southeast of Homburg are examd, as also their chem compn (which throws no light on them) Sixty complete analyses are given, as a result of which the limestones are classified in 3 divisions according to the amt of clay present The bad smell on breaking the limestone is attributed to a polymerized form of H_2S C A S

Comparison of the spectroscopic analyses of Cryptozoön profluerum and the mineral waters of Saratoga Springs, New York Oskar Baudisch *Arkiv Kemi, Mineral Geol* 12B, No 9, 5 pp (1935) —Cryptozoön from the Saratoga Springs region contain Ca, Na, K, Li, Mg, Sr, Si, B, Fe, Mn, Cu and Ag All Ag lines were definite The quantities of Sr, Mn, Cu and Li contained in waters from Hathorn, Coesa, Geyser and Lincoln Springs are tabulated All the Cryptozoön contained B and much larger amts of Mn than the springs, while neither contained Ba The springs contained no B Since B is found in sea sediments and formations (Cryptozoön are of algal origin) while only traces have been found in igneous rocks and residual clays, its absence from the spring waters suggests that they are of magmatic origin A W D

Chemical weathering and soil formation in Siam E Blanck, W Credner and E v Oldershausen *Chem Erde* 9, 419-52 (1935) —A considerable no of analyses of surface soils, including laterites and "red earths," and of the immediately underlying rock in various places in Siam are given The essential differences between soils formed by rock decompn *in situ*, and those of the level areas resulting from sedimentation is emphasized, and the effects of climate are discussed C A S

Weathering of rocks under varying climatic conditions E Blanck and R Thernitz *Chem Erde* 9, 529-39 (1935) —Pieces of Muschelkalk and Bunter sandstone were exposed to the weather on the Brocken (1142 m) and at Göttingen (140 m) in 1922, and examd in 1927 and 1934, as to the extent of weathering In 1927 (cf C A 22, 4423) no definite inferences could be drawn In 1934 detailed comparison of appearances and complete analyses show that there was little difference between the weathering in the 2 places as regards the sandstone, but that the Muschelkalk suffered more in Göttingen than on the Brocken, a difference attributed mainly to the higher temp prevailing at the former place C A S

Recent and fossil Terra rossa formation in southern Franconian Alps E Blanck and E v Oldershausen *Chem Erde* 10, 1-66 (1935) —Mainly of geological interest, but the paper contains a considerable no of complete analyses of surface soils, underlying rocks, limestones, etc., and of terra rossa mainly from the valley of the Altmühl and neighborhood (30 m N. of Augsburg), showing the relations between the surface soil and mother rock, and effects of weathering and solvent action of water C A S

The chemistry of the weathering process R Schwarz *IX Congr. intern. quim pura aplicada, Madrid* 3, 329-8 (1934); cf C A 29, 78737 —Hydrolysis of alkali or alk earth aluminosilicates under mild conditions will not produce kaolin, because the soln becomes alk SiO_2 sol is quite stable in alk soln, but $\text{Al}(\text{OH})_3$ and $\text{Fe}(\text{OH})_3$ are pptd, and laterite is formed The formation of kaolin must be due to pneumatolytic action It could not be produced from amorphous material, without hydrothermal action, by using salts or inorg or org acids in a measurable length of time C R Rushton

The distribution of the chemical elements in the universe Walter Noddack *IX Congr. intern. quim pura aplicada, Madrid* 3, 327-33 (1934); cf C A 29, 7071 —There is greater uniformity in the compn of meteorites than anywhere on the earth The mineral structure of the meteorites and the fact that even very small ones contain nearly all of the elements in approx the same proportions indicate that they condensed from the gas phase The smaller meteorites, because of their lesser gravitational fields, could not hold the more volatile elements, so there is very little Hg, N or rare gases in them, and the same elements are lacking in the spectra of the fixed stars C R Rushton

Determination of the thorium content of rocks Wm D Urry *J Chem Physics* 4, 34-40 (1936) —A new method for the detn of 10^{-4} to 10^{-2} g Th is described It is used to complete the data necessary for the calcn of the age of geological material The α -particle activity of Th in a streaming gas is measured with a counter this procedure is more accurate than the usual ionization measurements on the Th deposit Simultaneously the Pa/Ra ratio in common rocks can be detd G M P

9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, OSCAR E. HARDER AND RICHARD RIMBACH

Geochemistry and the theory of metallurgy. A. F. Kapustin, *Sotsialist Rekonstruktsiya i Nauka* 1935, No. 5, 22-43.—An analogy is drawn between Tamman and Goldschmidt's theory of the structure of the earth's crust and conditions in a metallurgical furnace in regard to disson equal and the affinity of metals toward S and O. The equal between ZnS and gaseous HCl was at const. pressure, and curves of concn.-temp. for different isobars were obtained. It should be possible to fortify the behavior of a compd. in metallurgical treatment from its behavior in soln. B. V. Shvartzberg.

A note on the use of ultraviolet lamps in mines for rapid detection of scheelite in ores by fluorescence. Wm. O. Vandenberg, *Bur. Mines, Information Circ. No. 6873*, 3 pp. (1935). Alden H. Emery.

The San Antonio mine and mill. Anon. *Trans. Can. Inst. Mining Met.*, 1936 (in *Can. Mining Met. Bull. No. 285*) 1-9.—The cyanide mill is described. A. H. E.

Nickel progress during the last decade. John F. Thompson, *Rev. Met.* 32, 509-17 (1935).—A survey of recent advances. At the Frood mine in the Sudbury district the ore is ground and subjected to flotation. Gang is eliminated and Cu-rich and Ni-rich portions are sepd. from each other. The Ni-rich portion is roasted in Herreshoff furnaces placed above reverberatories into which hot calcines are fed. Reverberatories are run to produce a 25% mat and a slag with 35% SiO₂. The mat is blown in Pierce-Smith converters to a compn. of Cu 42%, Ni 37% and S 20%. Converter slags return to the reverberatories. The "tops and bottoms process" (Orford method) depends on the soln. of CuS in Na₂S, which is obtained by roasting Na₂SO₄ with C and mat. After melting, the dissolved CuS floats on the top of the Na₂S and is sepd. from it after cooling. Bottoms are crushed, washed and sintered. This sinter is melted with C and is cast into anodes. Anodes are placed in electrolytic cells inserted in cloth bags which serve as membranes. Pure Ni soln. contg. only Ni-SO₄ and boric acid is pumped into them. On leaving the cells the soln. is free from Cu by addn. of Ni powder and Fe is removed by converting it into Fe(OH)₃ and filtering off. At Clydach (Wales) the Mond process is applied to roasted and reduced bottoms furnishing 99.9% Ni free from Co. Statistical data on the uses of Ni are given. Forty-seven references. J. D. G.

Modern uses of nonferrous metals. C. H. Mathewson, *Am. Inst. Mining Met. Engrs.*, 1935. The new industrial development and exploitation of metals and alloys. Zay Jeffries, 1-15, cf. C. A. 29, 429. A study of the occurrence and amenability to leaching of the phosphorus compounds in some red iron ores of Alabama. Ill. S. Hertzog, *Bur. Mines, Rept. of Investigations No. 3294*, 9 pp. (1935).—Most of the P in these ores occurs as Ca₃(PO₄)₂ mixed with small quantities of ferrous, ferric and Al phosphate. Thoroughly leached outcrop ores usually are low in P compared with unleached ores. Acid solns. are the best solvents for Ca₃(PO₄)₂. The acid

consumption increases with increased CaCO₃ content. The P in ores in which the CaCO₃ content is small is not removed by weak acid solns. FePO₄ is removed by strong acid solns., which also dissolve appreciable amts. of the Fe ore. A cheap reagent is essential. It must not introduce any objectionable element into the ore. The removal of P from the red Fe ores of Ala. by leaching does not appear to be commercially feasible. A. H. E.

Historical notes on the Paho process. T. A. Rickard, *Trans. Can. Inst. Mining Met.* 1936 (in *Can. Mining Met. Bull. No. 285*) 23-48.—NaCl, CuSO₄, and Hg are added at widely separated intervals to Ag ore, the whole process takes 24 to 30 days. Ag extn. is 80-85%. A. H. E.

Flotation at Government Gold Mining Areas. Anon. *S. African Mining Eng. J.* 46, 339 (1935).—Fagergren flotation machines following corduroy tables are to be used to sep. the pyrite for sep. grinding and cyanidation. Alden H. Emery.

Metallurgy of gold and platinum among the pre-Columbian Indians. Paul Bergsøe, *Nature* 137, 29 (1936). E. H.

Metallurgical stoppers and nozzles. A. M. Trahtenberg and I. A. Tatarskii, *Ogneuporus* 3, 648-54 (1935).—Nozzles with magnesite inserts must be used for casting boiling metal and without them for quiet metal. The latter nozzles must be fired at over 1400° and must have a max. porosity of 23% and an alumina content of 34%. Nozzles with inserts can be produced from a batch contg. less alumina, but not under 31-2%. The porosity can attain 28%, the firing is satisfactory at 1300°. Stoppers must be fired at about 1350° and possess a max. porosity of 23%. It is recommended to connect the stopper with the shank with the aid of a bolt turning round 90°. E. F. Stefanowsky.

Qualities of pig iron. Round table. Ralph H. Sweetser, *et al.* *Am. Inst. Mining Met. Engrs., Tech. Pub. No. 669*, 16 pp. (1935). Alden H. Emery.

The influence of low-graphite and low-silicon pig iron on the mechanical properties of gray cast iron at elevated temperatures. Max Paschke and Friedrich Bischof, *Gieserei* 22, 625-7 (1935), cf. C. A. 30, 1004.—Four exptl. melts were prepd. from the following materials: a special pig iron with high C and low graphite and Si, hematite pig iron, steel scrap, FeSi and FeMn. As the special iron was increased in the mix, the hematite pig iron was decreased and the steel scrap was kept practically const. so that the resulting analyses of the 4 melts were similar. Any noticeable changes in properties therefore measures the influence of the low-graphite low-Si pig iron. Results show that with an increasing amt. of the special pig iron the strength increased at elevated temps. C. B. Jeun.

Various phases of activity in iron and steel reviewed. Introduction. A. B. Kinzel, *Mining Met.* 17, 49 (1936); cf. C. A. 29, 3956. Development and use of alloy steels rapidly expanding. *Ibid.* 49-50.—In the Cr steels, Si or Mn is used as the modifying agent; in the Ni steels, Mo is used, in the Mn steels, V. In engineering steels, the development of modified types of the S. A. E. group is notable. Grain-size control specifications are being accepted; this control is achieved through use of Al, Zr or V. More attention given to the product of the iron blast furnace. Ralph H. Sweetser, *Ibid.* 50-1. Temperature problems engage open-hearth operators—bureaucracy only fear of steelmen. L. F. Renartz, *Ibid.* 51-2.—Thermocouples are being installed in the roofs of open-hearth furnaces. Increased roof life and more tons per hr. have been reported. Further development of open-hearth efficiency depends on high temps. in the hearth obtainable only if better refractory brick are produced. Pros and cons of furnace insulation are discussed. Pressures at which natural gas is burned are being increased; a small amt. of fuel oil may be used to increase luminosity and thus speed heat transfer. Bessemer steelmaking is reviving. G. B.

Waterhouse *Ibid* 52-3—Improvements have been made in the properties of free-machining steel used for screw stock and for use in automatic or semi-automatic machines. Great progress in x-ray examination for non-destructive testing. A. V. de Forest *Ibid* 53-4—Developments in nondestructive testing are reviewed, including x-rays, radiography, Sperry test, magnetic analysis, sonic testing, Magnallux. Grain-size control an important development in steel metallurgy. F. B. Foley, *Ibid* 54-5—Recent studies in control and effect of grain size are reviewed. Casting of camshafts and crankshafts an interesting development. James T. MacKenzie *Ibid* 55—The most outstanding development in Fe and steel foundries has been the casting of camshafts from cast Fe and crankshafts from graphitic steel. Cu seems slated to replace Ni to a considerable extent in castings. Hot- and cold rolling of wide thin sheets greatly advanced. Anon. 55-6 Alden H. Emery

Steelmaking in 1935. Emil Gathmann. *Blast Furnace Steel Plant* 24, 91, 99(1936). E. H. Some problems of steel melting. Earl C. Smith. *Trans Am Inst Mining Met Engrs* 116, 13-25(1935)—Chief attention is given to refractories and slags.

Oil fired assay furnace—experience shows improvement possible. G. Spencer Compton and C. McHarty. *Chem Eng. Mining Rev* 28, 53-81(1935)—Three oil-fired furnaces employed, resp. at the Kalgurli School of Mines, the North Kalgurli United Mines and the lab. of the Western Mining Corp. are described. At the North Kalgurli mines the furnace is a combination cupelling and fusion one with low-pressure burner using crude oil. The usual slot in the back of the muffle is blocked up and a piece of refractory Carbolux piping cemented over a circular hole $1\frac{1}{4}$ in. in diam. in the top of the muffle and placed as far back as possible. This pipe projects to the outside (top) of the furnace a height of 6 in. The improvement is effected by fitting a piece of seamed black-iron piping over the vertical refractory pipe. This black-iron pipe is 6 ft. long and has fitted to it a simple butterfly throttle by which the upcast draft can be regulated. This lowers cupellation time about 20 min. W. H. B.

The open hearth in 1935. K. C. McCutcheon. *Blast Furnace Steel Plant* 24, 47, 50(1936). E. H.

Steel-melting furnaces—automatic control in the open hearth. A. J. Boynton. *Iron Steel Engr* 13, 25-6 (Jan., 1936), cf. *C. A.* 29, 3271⁸—Automatic control results in a decrease in fuel consumption ranging from 7 to 11%, and a notable increase in rate of production.

W. H. Boynton. Open hearth furnace operation—four million B. t. u. per ton. L. H. Schwartz and G. E. Rose. *Iron Steel Engr* 13, 18 (Jan. 1936)—A large no. of runs and a careful study of results indicate the great advantage to be gained in open hearth practice by the transfer of heat by radiation from the flame, and conduction and convection are relatively ineffective as compared with radiation from the flame under these conditions. In the second place, in regenerated mixed gas (coke-oven and blast-furnace gas) there is a continuous supply of open hearth fuel that is borne down heavily with C particles and that can be regulated as to richness in an ideal manner as required for the different periods of the open hearth heat. Thirdly, since open hearth furnaces must be built of refractory materials, they are necessarily more or less porous and, hence, if air infiltration is to be kept at a min. the subatm. conditions must be kept at a min. in an open-hearth furnace just as in a battery of by-product coke ovens. The transfer of heat by radiation requires a more or less static situation and shows greater effectiveness upon the bath when it is under cover of the slag.

W. H. Boynton. Waste-heat boilers in open hearth practice. R. Percival Smith, et al. *J. Iron Steel Inst. (London)* Special report No. 10, 73 pp (1935). *Blast Furnace Steel Plant* 23,

7 108-10, 719, 780-3, 800, 850-60, 862, 876(1935), 24 87-9 (1936)—See *C. A.* 30, 412⁷. A discussion on the report on "Waste-heat boilers in open-hearth practice." A. F. Webber, et al. *J. West Scot. Iron Steel Inst.* 43, 3 12 (1935).—The construction and advantages of the Spenser thimble tube boiler and of the Smaullo fire tube boiler are given. The use of a water tube boiler is compared to that of a fire tube boiler. A properly designed economizer will lower the temp. 55° to 80°. The results of the Park C test are not representative of ideal conditions because the gas temp. and flow were less than the boiler was designed for and because the producer gas was not of the most desirable composition especially with respect to moisture content (38.7 grains per cu ft.). The results are representative of general experience, however, because frequently the heat available, the steam generated, and the draft-control requirements are less than estd. before the installation. F. G. N.

Service of silica brick in open hearth furnaces of the Petrovskii plant (at Dnepropetrovsk). V. Trubnikov. *Ozgonpur* 3, 492-8(1935).—Silica brick in the roofs of open-hearth furnaces were more durable in 1934 than in 1933 (up to 366 smeltings against 248 in a 100-ton furnace). This is due principally to improvements in the work of the furnace. The repairs undertaken in this furnace and phys. and chem. changes in silica brick from its roof are described. E. B. Stefanovsky

Suspended, unfired, reinforced roofs for open hearth and electric furnaces. I. S. Kainarskii, B. Ya. Pines and S. Ya. Kozlov. *Ozgonpur* 3, 661-6(1935).—Roofs of metal-cased magnesite-chromite blocks, after a run of 62 hrs., were in satisfactory condition, thus it is possible to select appropriate basic and neutral materials for the purpose. E. E. Stefanovsky

Progress at the blast furnace in '35. A. J. Boynton. *Blast Furnace Steel Plant* 24, 55-6(1936); cf. *C. A.* 29, 780⁷. E. H.

Some engineering aspects of the first report of the blast furnace practice sub-committee. Thomas B. Mackenzie. *J. West Scot. Iron Steel Inst.* 43, Pt. 2, 19-49 (1935)—Pertinent data concerning the output and furnace dimensions are presented for each of 15 basic practice furnaces, 13 hematite practice furnaces, and 14 foundry practice furnaces. One furnace is operated by each practice. When making foundry iron its output is 95% and when making hematite Fe is 93.3% of the output when making basic Fe. The coke consumption for foundry Fe is 110.1% and for hematite Fe is 115.5% of that for basic Fe. The coke consumption per sq ft. of hearth is 25-0.06D² for basic practice, 25-0.067D² for hematite practice, and 25-0.032D² for foundry practice. D is the hearth diam. in ft. Description of the equipment of the basic furnaces includes hot blast stoves, means of cooling the bosh wall, of charging the furnace, of providing the blast, and the vol. of blast. Formulas that represent British practice relate the important furnace dimensions to the hearth diam. and to the tons per hr. production. F. G. Norris

Production and preparation of blast furnace flux. F. C. Hodges. *Am Inst Mining Met Engrs Tech Pub* No. 668, 11 pp (1935). Alden H. Emery

Metals and alloys in the chemical industry. I. Introduction and theory. Frederick A. Rohrmann. *J. Chem. Education* 13, 53 5(1936). II. Ferrous metals and alloys. *Ibid* 53-9. E. H.

Uncommon metals and their practical use. R. Freitag. *Warme* 58, 662-3(1935)—F. discusses Be, Li, Ba, Ca, Re, massium, W, Na, Cd, Ti, Hg and the uses to which they have been put. W. H. Bruckner

Atomic arrangement in metals and alloys. W. L. Bragg. *J. Inst Metals* 56, 275-9(1935)—The theory of rearrangement in the cryst. structure of an alloy is discussed. This arrangement consists of 2 features: (1) the pattern of sites characteristic to each phase, and (2) the method of distribution of the constituent atoms among the phase-sites. X-ray analysis has made possible definite progress in this study. C. B. Jenni. Thermomagnetic analysis of metallurgical products and

its recent applications P. Chevenard. *Mitteil* 10, 104-20(1935).—A recording thermomagnetometer has been developed in France at the Imphy Steel Works. The principles of thermomagnetic analyses are given. The magnetization field cycle characteristics, magnetization in a max. field, remanence and coercive force, are modified with rise in temp. the hysteresis falls and the magnetization decreases following the Langevin-Weiss law and becomes very weak at the Curie transformation point, at which the metal becomes paramagnetic. In a series of alloys, the variations of these characteristics with the compn. depend to a great extent on the constitution. With solid solns, the magnetic hysteresis is generally weak. The magnetization and temp. of the Curie point vary with the concn., following a definite law. In solid solns, formed by Ni only 5% Cu is required to render the alloy paramagnetic at ordinary temps. In aggregates, the Curie point remains at a const temp. Thus for aggregates iron-cementite, steels and white iron, the thermomagnetometer registers the magnetic transformation of cementite at 210°. At 750° the reaction $\alpha\text{-Fe} + \text{Fe}_3\text{C} \rightleftharpoons \text{austenite}$ is manifested by an almost vertical drop in magnetization; the ferromagnetic $\alpha\text{-Fe}$ disappears, with formation of paramagnetic austenite. This reaction of 3 phases is invariant, i.e., isothermal. The Faraday-Curie thermomagnetic method was employed, i.e., the magnetization produced by a force which attracts a specimen placed in a nonuniform magnetic field. The thermomagnetometer consists of an expansion pyrometer attached to a magnetic balance. The test specimen in a silica tube is placed parallel to a standard sample (paramagnetic alloy of Ni-Cr-W) which has a regular and reversible expansion. These samples are heated in an elec. furnace and the expansion pyrometer records the change in vol., and with the application of a magnetic field it registers the temp.-magnetization curve. The temp. in the test should not rise more than 300° per hr. Isothermal tests can also be made. Thermomagnetic analysis has been applied in the following cases: (1) Magnetic transformation of a 0.57% C steel. In the annealed state this steel consists of an aggregate of two ferromagnetic phases, $\alpha\text{-Fe}$ and cementite. (2) Magnetic transformation of Fe-alloys contg. 0.20% N at 480°. This alloy consists of a mixt. of a Fe-N solid soln and Fe₃N. (3) Reheating of quenched austenitic steels. A steel contg. 1.5% C and 2.25% Cr is in a state of homogeneous austenite. This unstable austenite is destroyed on heating. By means of thermomagnetic and dilatometric methods, the complicated reactions occurring during reheating are identified. Heating to 300° does not change the state of the austenite but when held for 7 hrs. at 360° the alloy becomes partially ferromagnetic. This partial magnetization can be explained by the partial transformation of $\gamma\text{-Fe}$ into $\alpha\text{-Fe}$. (4) Transformation of a Hadfield steel by cold working. After a quench from 1100° the Hadfield steel consists of homogeneous paramagnetic austenite. Cold working renders this steel weakly magnetic, owing to the change austenite \rightarrow complex carbide + austenite poor in C and Mn. (5) Stabilization by heating a high Ni-Cr steel. (6) Heterogeneity of complex austenites. G. T. Motok.

Dynamic elasticity of metals A. Leblanc. *Mitteil* 10, 20-13(1935).—The elastic deformation which is produced in a metal subjected to dynamic forces is given the name of dynamic elasticity. Elastic deformation by impact is given by $\epsilon = 1000 E^2 / 2M = 500 E^2 / M$, where ϵ is the absorption capacity of impact work per cu. dm. of metal, M is the coeff. of elasticity longitudinal to the metal, and E is the elastic limit of the metal, all terms expressed in kg./sq. mm. G. T. Motok.

Methods of mechanical testing of metals at low temperatures A. S. Ialkevich. *Zavodskaya Lab.* 4, 1007-110(1935), cf. C. A. 29, 1302.—The existing methods of mech. testing of steels, brass, bronze and Al alloys in the lab. at temps. below 0° are discussed. Chas. Blanc.

Actual problems in testing methods for light metals. M. Roß. *Aluminium* 17, 631-7(1935).—The present status of technological testing of light metals, the various

methods and their particular purposes are discussed and classified; terms are defined and the prepn. of test specimens is described; their dimensions are given in sketches. It is emphasized that material testing and experience are one indivisible unit; testing of materials in the lab., supervision during production and manu. and experience, made on the finished structure must always be correlated to obtain the greatest benefit for the progress of industry. M. Hartenheim.

Effect of test conditions on shrinkage determination O. Bauer and H. Siegerschmidt. *Metallwirtschaft* 14, 854-8(1935).—The usual method for detg. shrinkage was used, but the length and width of the test pieces, the rate of pouring, and the temp. of the mold were varied. The alloy was 16% Sb, 0.21% graphite and the balance Pb. With equal width the short pieces shrank more than the long ones. With equal length the narrow pieces shrank more than the wide ones. With slow pouring rate the size of the test piece had less influence on the shrinkage than with fast pouring rate. At 210° mold temp. the quickly poured test pieces had higher shrinkage than the slowly poured ones, but at 130° the conditions were reversed. The results are explained by the effect of the test conditions on the α temp. of the metal in the mold which controls the shrinkage. Photomicrographs of slowly cooled and quenched test pieces showed segregation in the upper part of the mold, especially in the slowly cooled pieces. C. E. Macfarlane.

Untenability of the conception of an upper and lower yield point and of the breaking load of soft steel and other metals G. Welter. *Metallwirtschaft* 14, 1043-7(1935).—The stress-strain curves of soft steel produced automatically by the conventional types of testing machines are not correct, as they show a drop in load when the test piece starts to stretch at the yield point, and another drop in load after the max. has been reached and before the test piece breaks. These drops do not actually take place, but are due to the construction of the testing machines. This contention is illustrated by curves obtained by the use of a testing machine loaded with dead weight, lead shot. These curves show a deviation from the straight line at the yield point for annealed 0.15 C steel, an increase in the rate of elongation, but a slight increased instead of a reduction in the required load. The load approaches a horizontal line at the breaking point, but does not drop. C. E. Macfarlane.

Use of x-ray and microscopic analysis as an aid in rational thermal treatment of brass A. I. F. Nikov and M. M. Umanskii. *Zavodskaya Lab.* 4, 1043-6(1935).—The results of x-ray and microscopic exams of the effect of thermal treatment on the microstructure of 2 samples of brass are illustrated and described. Chas. Blanc.

Magnetic investigations of precipitation hardening Hermann Auer. *Physik. Z.* 36, 880-2(1935).—Magnetic measurements are of use in measuring the influence of various thermal treatments of temperable alloys, as the susceptibility of such alloys drop during transformation, and the fall is linear with log time. The dependence of the discontinuity in the final susceptibility on temp. of quenching allows a magnetic formulation of phase diagrams. From quant. measurements of susceptibility the stoichiometric proportions of elements in stable phases may be detd. The influence of quenching velocity on Al-Cu alloys was studied. C. E. F. Jeffreys.

Methods of hardening cast iron by heat treatment J. S. Vanick. *Metal Progress* 29, No. 1, 40-3(1936).—Chem. compn. must be such as to allow the casting, as cast, to possess fine distribution of graphite, complete freedom from massive carbides or carbide clusters, a tendency to harden evenly and deeply and be relatively easily machinable. Illustrations are given for heat treating typical cast irons. W. A. Mudge.

The use of catalysts in the pickling of metals. M. Peernaux. *Verre silicates ind.* 7, 50-1(1936). H. S. W.

Progress in the knowledge and application of plastic forming processes. E. Seibel. *Metallwirtschaft* 14, 893-7(1935).—A review of cold drawing of rods and wire, deep-drawing, and drawing tubes, covering power requirements,

distribution of forces, effect of die angles and lubrication
Thirty-eight references C. E. McFarlane

The influence of pressure on the electric resistance of hard drawn gold wire in different stages of annealing and of soft gold wire A. Michels and M. Lennssee *Physica* 2, 591-6 (1935) —The expts were conducted in the manner previously described (C. A. 24, 2649). C. A. 29, 342 —The Au wire at 25° decreased in resistance steadily for 4 months after drawing, after annealing to 50°, 75°, 100°, 150° or 450° the relative resistance at 25° decreased from 1.03712 to 1.00000 Pressure produced a hysteresis effect, the 450° wire after application of 2000 atm at 75° had a permanent resistance increase of 1/42 000, generally, however, the change is much lower For pressures up to 1942 kg per sq cm the pressure coeff. $(1/R_0)(\Delta R/\Delta p)$ is about 2700 to 2900 depending on temp; tabulated data are given The av temp coeff $(d/R/dT)(1/R_0 \times \Delta R/\Delta p)$ is -1.3×10^{-4} sq cm per kg per deg abs, the pressure coeff. $(d/dp)(1/R_0 \times \Delta R/\Delta p) = 3 \times 10^{-11}$ cm 4 /kg 3 B. J. C. van der Hoeven

Special methods of gas firing to avoid scale and soft skin Winfield Foster *Metal Progress* 29, No 1, 51-2 (1935) —A comparison of results obtained from heating by coal and by gas W. A. Mudge

Rhodium surfaces for metal reflectors Blausius Bart *Product Eng* 6, 308-9 (1935) —By electrolytically depositing Rh metal on a master mold high optical accuracy (in the order of millionths of an in.) can be obtained in metal reflectors Rh has a high specular reflection over a wider color range than any other reflector material It is harder than Ag, non-oxidizing, resistant to heat, unaffected by industrial and chem fumes, easy to deposit, requires no polishing and is not color selective A. N. H.

Elasticity of aluminum at high temperatures J. Vero *Roy Hong Palatin—Joseph Univ Tech Econ Sci, Sopron, Pub Dept Mining* 17, 163 70 (1935) —A modification of the method of Schwinning and Strobel (C. A. 26, 5524-5) was worked in which the elongations caused by the creeping phenomenon are determined more precisely The values are 5480-5750 at 150°, 4650-4775 at 240° and 3700 at 340° for the elasticity modulus in kg/sq mm S. S. de Finily

Iron of high purity Frank Adcock and Charles A. Bristow *Proc Roy Soc (London)* A153, 172 200 (1935) —Measurements of phys properties, made on specimens of pure Fe from 5 batches with known analysis, gave: length of side of body-centered cube, 2.8700 ± 0.0005 Å at 17°, d_1 , 7.871 ± 0.002 , coeff of expansion $(\times 10^6)$ at the temps, 50°, 75°, 100°, 125° and 150°, resp, 11.2, 11.6, 12.0, 12.4 and 12.8, sp elec resistivity, R_l for the temp range, 0-200°, $R_l = (8.9 + 0.051 t + 0.00006 t^2) \times 10^{-4}$ thermal cond (in cgs units) at the temps, 0°, 25°, 50°, 75°, 100°, 125°, 150°, 175° and 200°, resp, (0.14) , 0.18 , 0.18 , 0.18 , 0.17 , 0.17 , 0.16 , (0.16) and (0.16) The elec resistivity of 2 earlier (less pure) batches was slightly lower than for the higher purity batch given above The values for the thermal cond are higher than those usually attributed to Fe Other factors than purity cause variation in magnetic properties, the purest Fe did not possess the highest magnetic permeability The α - γ transformation did not occur at a definite temp but occupied a definite temp range, difficult to explain in terms of possible impurities present The transformation is apparently not a simple phase change L. E. Steiner

The orientation of crystals in silicon iron Richard M. Bozorth *Trans Am Soc Metals* 23, 1107-11 (1935) —X-ray examn of Si iron prep'd by Goss (cf C. A. 29, 5793), shows that the component crystals are oriented so that a [100] direction is parallel to the direction of rolling and a (110) plane lies in the rolling plane The differences in magnetic properties in different directions in the sheet are explained in terms of the properties of the single crystals W. A. Mudge

Graphitization of cast iron A. Le Thomas *Rev universelle mines* 11, 553-4 (1935) —Tests made by Le T. agree with results published by Portevin (C. A. 24, 1828), 300° must be assumed as that practical temp be-

low which castings do not undergo any further measurable change by slow graphitization Eleven references

M. Hartenhom
The diagram iron-carbon silicon A. Dawans *Rev universelle mines* 11, 541-32 (1935) —The binary diagrams I-Fe, Fe-Si and Si-C are explained and from these the ternary diagram Fe-C-Si is derived and discussed from the particular point of the practical foundry and steel worker. Twelve references M. Hartenhom

Gases in steel T. Swinden *Iron & Steel Ind*, 9, 100-6 (1935) —A review P. G. Norris
The structure method of examination of steel heterogeneity V. D. Sadovskii *Zavodskaya Lab* 4, 103-4 (1935), cf C. A. 28, 3698 Chas. Blane

The detection of oxide inclusions in steels by imprint R. Mitsche *Berg- und Hütten-männisches Jahrbuch* 11, 127 33 (1935) —The practical importance of determining nonmetallic inclusions in steel is explained and the method of Niessner (cf C. A. 26, 5871) described which permits making photographic prints on gelatin paper of oxide inclusions The paper is impregnated with a sol of 1 HCl in 20 H₂O, the polished section is then pressed onto the paper and the latter developed in a ferrocyanide soln (20 g in 1 l water). The influence of the kind of gelatin paper, developing conditions and least magnitude of inclusions which can be detected are discussed For references M. Hartenhom

Snow flakes in forged steel Leon Gullet and Marc Ballay *Rev met* 32, 522-30 (1935) —A crit survey of the contemporary views on the nature of snow flakes in steel and on the methods for their elimination Nineteen references J. D. G.

Formation of flakes in chromium nickel molybdenum steels I. Musatti and A. Reggioni *Rev met* 3, 531-52 (1935) —Steels contg 0.30-0.40% C, 0.40-0.6% Mn, 0.30 Si, 0.6-0.8 Cr, 2.7-3.2 Ni and 0.30-0.40% Mo have a strong tendency toward flake formation Max heats of this analysis investigated showed independence of the defect from nonmetallic inclusions, liquation segregations in ingots and dendritic segregations Theory concerning flake formation with internal stresses caused by austenite transformations was refuted by application of heat treatments preventing this change and the failure to cure the trouble Expts of H. Benek, I. Schenck and H. Mueller, C. A. 29, 3957, showing the relation between flake formation and H were amplified by heating flake free specimens in H₂ After heating 5-25 hrs at 1150° all samples contained flakes located radially around their periphery at a certain distance from the surface Similar heating in N did not produce any flake Amt and size of the flakes after the same treatment increased in the following order: C steels had the least amt of them, then Ni-Cr steels and the worst flaking was observed in Ni-Cr-Mo alloys Heating in H₂ at lower temp decreases the intensity of the action Under 800° no flake formation was observed Thirty-nine references J. D. G.

The aging of steel L. S. Davenport and E. C. Bain *Trans Am Soc Metals* 23, 1047-93 (1935) —Two kinds of aging are described, (A) C aging and (B) strain-aging (A) is caused by pptn of 1 c carbide from ferrite super-satd with C, pptn is in a random manner throughout the grains (B) is caused by the rejection of an Fe-C compd, from ferrite seemingly supersatd with C, in the slip bands of cold worked grains W. A. Mudge

Grain size and its influence on the manufacture of steel wire B. L. McCarthy *Iron Age* 136, No 15, 14-19, No 16, 23 7, 80-2 (1935) —Choice of steel for making wire begins at the open hearth and includes consideration of the compn of the charge, the C content at melt, the rate of C elimination from the bath, the compn and character of the slag and the final deoxidation of the metal In absence of an Al addn, the McQuaid-Chen test (C. A. 16, 1730) indicates the amt of oxides dissolved in the metal The grain size of fine-grained steel is controlled by the judicious addn of Al in the ladle to steel that has been deoxidized in the furnace with Mn and Si The grain size of coarse-grained steel is not subject to such close

control. The distribution of cold work depends on the microstructure and should be as nearly uniform as possible. The microstructure is developed during patenting. Coarse-grained steels have a slow rate of the decompn of austenite at Ar₁ and fine-grained steels a fast reaction rate. Dissolved oxides and fine grains may retard the rate of soln of the constituents. Coarse-grained steel is desirable for the manu of high-C wire because of the resulting coarse patented grain size. McQuaid-Tin tests were made on 3 samples from the same heat. The coarse-grained steel to which no Al was added in the mold has no 4 grain after carburizing at 870° and no 3 and 1 at 925° and 985°, resp. The fine-grained steel to which 6.5 oz Al per ton was added in the mold had no 6, 4 and 2 grain after carburizing at 925°, 985° and 1040°, resp. The fine-grained steel to which 13 oz Al per ton was added in the molds had no 7, 6 and 5 grain size after carburizing at 925°, 985° and 1040°, resp.

F. G. Norris. **Contributory effects of furnace atmospheres on the grain size of molybdenum high-speed steel.** Arthur Phillips and M. J. Weldon *Trans Am Soc Metals*, 23, 880-401(1935).—A steel contg Mo 7.03, Cr 3.33, V 2.05 and C 0.77% was heated in oxidizing, reducing and neutral atms and the resulting effect upon grain-size, temp of incipient melting and extent of decarburization detd. The most pronounced structural alterations are produced by oxidizing atms., particularly those contg appreciable amts of H₂O vapor. W. A. Mudge.

Correlation of failures from embrittlement of 4 to 6% chromium steel with the notched-bar impact test. H. M. Wilten. *Trans Am Soc Metals*, 23, 915-38(1935).—Lab. temper brittleness tests can be used to predict service failures in refinery cracking stills. W. A. Mudge. **Construction steels.** L. Persoz *Mémoires*, 10, 216-42 (1935).—A survey is given of phys. testing, constitution of steels, heat treatments and classifications of steels. All the common phys. testing and examn. methods employed in control of construction steels are discussed.

G. T. Motok. **Endurance limit of welded boiler plate in the unannealed and annealed condition.** C. Appaly and F. Sauerwald. *Metallwirtschaft*, 14, 858-61(1935).—The welded 0.09 C boiler plate was tested as welded, after annealing at 930° and after stress relieving at 650°. The endurance tests were made at 400°. The unannealed welded steel had an endurance limit of 10 to 11 kg./sq. mm. compared with 9 for the parent metal. The endurance limit and microstructure of the parent metal were not affected by the annealing and stress-relieving treatments. The 930° treatment reduced the endurance limit of the welded steel to that of the parent metal, and increased the grain size to approx. that of the parent metal. The 650° treatment reduced the endurance limit to a point half way between the welded and parent metal, while the grain size remained unchanged. The higher endurance limit of welded boiler plate is due partly to finer grain size and partly to internal strains. Some of the tests were made both by the usual long-time method and by the shortened method of Juretzek and Sauerwald (C. A. 29, 2592). Good agreement was obtained by the 2 methods. Six references. C. E. Macfarlane.

Experience with higher-pressure steam installations. Otto Schöne. *Warme*, 58, 765-74(1935).—Part of the paper deals with the use of welded alloy steels suitable for superheater tubes above 400°. Micrographs are shown of structure of weld and transition zone of the various steels discussed. The corrosion attack on and scale deposits on steam turbine blades are discussed and shown in photographs. W. H. Bruckner.

Modern materials for high-pressure vessels. L. P. McAllister. *Welding Engng*, 20, No. 5, 30-2(1935).—Tables are shown giving the chem. and phys. properties of Ni steels, Mn-V steels and Cromansil steel. A. N. H.

Materials for high temperature steam piping. Wilhelm Paul. *Warme*, 58, 839-43(1935).—A discussion of C steels as compared with alloy steels with respect to tensile strength, ductility and creep limit at 400-500°. Tables are given of tensile strength, ductility and endurance limit

at intervals of temp. from 20° to 600° and charts of tensile strength, creep, endurance and improvement factor as compared with C steel, for 0.5% addns of Ni, Co, Mn, Ti, Si, Cr, Cu, W, Mo and V. The latter charts are for 400° and 500°. The increase in cost of each steel due to the 0.5% alloy addn. is tabulated in comparison with the 0.1% C steel. Another table gives the endurance limit of various steels with 1 to 3 alloy addns. of up to 1% each and compares the improvement of the alloy steels with a 0.1 C-0.5 Mn steel. W. H. B.

Chromium steels of high nitrogen content. Russell Franks. *Trans Am Soc Metals*, 23, 968-87(1935).—Grain refinement is due to Cr nitride functioning to promote austenite formation, or similar to that of carbides in ordinary steel. Addns of N₂ are preferably recommended for low-C steels because N₂ will not correct the harmful effect of C in high-Cr steels. W. A. Mudge.

Improved fabrication of 18-8 chromium steels. Donald R. Pratt. *Welding J* (N. Y.), 14, No. 12, 16-19(1935).—Discussion of fabrication by gas welding with Cb stabilized plate and rod. Ti and Cb are considered equally effective in plate in overcoming intergranular attack, but Cb for welding rod does not burn out as readily as Ti and welds therefore have greater corrosion resistance because of larger stabilizer recovery. Cb is recommended also for welding ordinary unstabilized steels because of counteracting effect of Cb or C pickup. Where it is necessary to cross welds, the Cb bearing rod deposit is protected against heat effect of the crossing weld. In welding stabilized 18-8 use of neutral flame with flux painted on rod or seam and use of flux point on underside of weld are recommended. The weld should not be puddled because of excessive loss of Cb from such procedure. Other precautions in welding technique are given. W. H. Bruckner.

The importance of aluminum additions in modern commercial steels. Harry W. McQuaid. *Trans Am Soc Metals*, 23, 797-838(1935).—See C. A. 30, 65°. W. A. Mudge.

Hardening characteristics of one percent carbon tool steels. T. G. Digges and Louis Jordan. *Trans Am Soc Metals*, 23, 839-56(1935).—Com. 1% C tool steels of foreign and domestic manufacturers were prepd with 3 different initial structures, viz., spheroidized cementite, coarse pearlite and sorbite. The effect of these initial conditions upon the austenitic grain-size and grain-growth characteristics was detd. between 1425° and 1775°F. For quenching temps. below that at which all C is completely dissolved in the austenite the initial structure exerts a definite effect. Above this temp. each steel approached both a grain size and crit. cooling rate which was characteristic of the steel regardless of its initial structure. W. A. Mudge.

Interpretation of torsion impact properties of carbon tool steel. G. V. Luerssen and O. V. Greene. *Trans Am Soc Metals*, 23, 801-77(1935).—By use of a 1.08% C steel and correlating torsion impact with other phys. properties it is shown that the 3 stages in the impact curve coincide with the 3 universally recognized structural changes traversed in tempering. These are (1) stress relief in the martensite, (2) the transformation of retained austenite to martensite and (3) the decompn. of martensite to the softer, more ductile constituents. W. A. Mudge.

Influence of carbon content on high-temperature properties of steels. A. F. White, C. L. Clark and R. L. Wilson. *Trans Am Soc Metals*, 23, 995-1015(1935).—Short time tensile, creep and impact tests at temps. from 85° to 1400°F. with supplementary microscopic examn., show that the behavior of steel at elevated temps. is sometimes independent of the C content and may be affected by initial heat treatments or the addn. of alloying elements that would change the character of the carbides in the structure. W. A. Mudge.

Influence of common alloying elements on properties of steel. Edgar C. Bam. *Rev. mét.*, 32, 553-61(1935).—Alloying elements change only speed and intensity of the reactions found in common C steel and their temp. Factors defining the final properties of C steel are the same as

those for alloy steel, but the latter has certain limitations which are eliminated by the addn. of alloys. They dissolve in austenite and affect profoundly speed and type of transformations occurring during the final cooling. The lower the temp. at which transformations actually occur, the finer is the dispersion of carbide particles and the harder is the metal. Steel must have a certain crit. speed of cooling to carry it through higher temp. ranges of transformation to the temp. of about 150° at which martensite is formed. All alloying elements which dissolved in austenite, with a possible exception of Co, reduce this speed and permit quenching to penetrate deeper in the metal. Alloying elements refine austenitic grain either by forming fine oxides in melting and deoxidation or by forming carbides which are insol. in the matrix. Size of austenitic grain inversely affects phys. properties of steel. Deep quenching is produced here either by adding other alloys or by dissolving some of the pptd. carbides such as Mo. Stability of these carbides at higher temp. has a pronounced effect on grain size and speed of transformation. J. D. G.

Alloy steels and ferro alloys in 1935. James C. Vignos. *Blast Furnace Steel Plant* 24, 57-8 (1936), cf. *C. A.* 29, 1702. E. H.

Laboratory methods of preparation and testing of high-melting alloys. L. I. Kramp and M. A. Yur'ev. *Zavodskaya Lab.* 4, 1090-2 (1935).—The literature on the prepn. and examn. of various carbides, nitrides and borides is discussed. About 15 references. Chas. Blanc.

Special apparatus used for testing aluminum alloys. E. John Pike. *Metallurgia* 13, 35-7 (1935).—Special testing equipment is described and results of tests on several Al alloys are given. J. L. Gregg.

Fatigue strength of aluminum alloys. R. Immann. *Aluminium* 17, 639-43 (1935).—The usual defn. of fatigue strength is made on the Schenck machine with polished specimens. The fatigue strength is influenced by the structure of the alloy (heterogeneous or homogeneous), by the mfg. process (casting, rolling, heat treatment) and by notch effects (due to casting skin, inclusions, segregations, lesions of the surface, oxidation). These effects are discussed for different Al alloys, and shown in diagrams and photographs of structures. The fatigue strength is defined as that load in kg./sq. mm. which the material will stand under an alternating load of 100×10^6 alternations for Al wrought alloys, and 20×10^6 alternations for Al cast alloys. M. Hartenheum.

Hot shortness of aluminum alloys in die castings. J. Vero. *Roy. Hung. Palatin Joseph Univ. Tech. Econ. Sci., Sopron, Pub. Dept. Mining Met.* 7, 138-42 (1935).—Hot-shortness is defined as the tendency of an alloy to form cracks during cooling in the mold. It is proposed that the extent of hot-shortness be expressed numerically by the frequency of cracks occurring in castings of simple shape, given as a percentage of the cracked samples to all castings. In alloys contg. more than 12-13% of liquid at the temp. of the critical paste state possible cracks can be prevented. Data on strength and load are not always sufficient to est. hot-shortness of an alloy. The influence of temp., wt. and cooling factor of the mold and of pouring temp., etc., is discussed and possibilities of avoiding cracks are shown. S. S. de Fmily.

Crystal structure of AuBe₂ and PdBe₂ and its relation to the cubic AB₂ structure. Lore Misch. *Metallwirtschaft* 14, 897-9 (1935).—The intermetallic compds. AuBe₂ and PdBe₂ were prep'd by melting in an elec. furnace, and were exam'd by x-rays. Both have a face-centered cubic lattice with 24 atoms in the elementary cell. The lattice const. for AuBe₂ is 6.085 Å and for PdBe₂ is 5.982 Å. The lattice structure is not quite the same as the typical cubic AB₂ structure, such as that of MgCu₂, but corresponds to that of ZnS. C. E. M.

Beryllium iron alloys. W. Kroll. *Metals & Alloys* 7, 24-7 (1936). D. S.

Beryllium-copper—established properties and proved applications. Robert W. Carson. *Product Eng.* 6, 175-7 (1935).—Photographs indicate a variety of applications. Hardness, fatigue strength, cond., ductility and stability

are controlled by heat treatment and cold work in fabrication. Ann. Nicholson. Hurd.

Copper-lead bearings. D. E. Anderson. *Product Eng.* 6, 363-4 (1935).—A discussion with micrographs. Ann. Nicholson. Hurd.

The transformation in the copper-gold alloy Cu₃Au. C. Sykes and H. Evans. *J. Inst. Metals* 58, Advance copy No. 716, 29 pp. (1935).—The effect of the transformation in the alloy Cu₃Au on the elec. resistance, x-ray structure and α heat was investigated experimentally. It is shown that the general character of the transformation is satisfactorily predicted by the Bragg-Williams theory of the formation of superlattices by rearrangement. This process involves first the formation of small nuclei which grow to a size approximating that of the individual crystals, if const. temp. is maintained. If the alloy is continuously cooled before it attains equil., nuclei tend to grow and at the same time the degree of order in the nuclei increases because of the reduction of temp. C. B. Jenni.

Röntgenographic and electrical investigations of the Cu-Au system. C. H. Johansson and J. O. Lind. *Ann. Physik* 25, 1-48 (1936), cf. *C. A.* 20, 1154, 21, 2204.—In the compn. range 47-53 atoms % Au there is formed ordinarily the known tetragonal compd. CuAu (I). Under specified conditions in the ranges 36-47, and 53-65, and even 47-53% Au, there may be formed an ordered orthorhombic phase CuAu (II), as shown by superstructure lines on x-ray powder photographs. II is closely related to I and can be derived from I by increasing the b-period of I by an integral factor such as 10, the a- and c-periods remaining unchanged. The detailed structure analysis of II is given. Lattice const. and specific resistances of Cu-Au alloys over the whole compn. range and after varying heat treatments are reported. Complete literature index of recent work on this system. C. D. West.

The various copper-nickel alloys. Joseph Dhavarnas. *Culture et l'atlon* 8, 541-3 (1935).—The alloys of Ni with Cu, Zn, bronzes and light metals are briefly reviewed. Cu-Ni alloys are now widely used as fire tubes and condenser tubes, the alloy with 20-30% Ni possesses a particularly high resistance to corrosion by seawater. The alloy with 45% Ni, "constantan," has a high thermoelec. force and a fairly const. elec. resistance at varying temps. Alloys of Cu-Ni 7n are the so-called German silvers with 15 or less % Ni and 45-55% Cu. Ni added to Sn bronzes gives a much finer grain and improves the tensile strength. All alloys with up to 4% Ni addn. show increased hardness and strength. A heat-resistant alloy ("V") is composed of Al 92.5, Cu 4.0, Mg 1.5 and Ni 2%. Another light metal used for engine parts in combustion motors is a complex Al alloy contg. Ni, Cu, Mg, Fe, Ti and Si. M. Hartenheum.

The copper-zinc diagram. J. Schramm. *Metallwirtschaft* 14, 995-1001, 1047-50 (1935).—A no. of disputed points in the Cu-Zn constitutional diagram were investigated by thermal and microscopic analysis of samples melted in an evacuated porcelain tube. An improved method for obtaining heating and cooling curves with a mirror galvanometer was used which produced extremely accurate results. The transformation which takes place at about 900° was found to be a peritectic reaction, $\alpha + \text{melt} \rightleftharpoons \beta$. The compn. of these phases is $\alpha = 67.7\% \text{ Cu}$, $\beta = 63.5\% \text{ Cu}$ and melt = 62.5% Cu. At 834° there is transformation between the phases β , γ and melt which consists of solidification or melting, melt $\rightleftharpoons \gamma$. The compn. of β is 43.6% Cu, and γ and melt 40.25% Cu. The point H in the diagram does not correspond to a compd. Cu₂Zn, as claimed by Bauer and Hansen (*C. A.* 22, 567), as it solidifies over a temp. interval. The point B on the peritectic line UVW has the compn. 1.70% Cu. The improved Cu-Zn diagram is given. Twenty-nine references. C. E. Macfarlane.

High chromium alloys—centrifugal castings and tubes. R. J. Wilcox. *Metal Progress* 29, No. 1, 44-8 (1936).—The machinery does not differ essentially from that used for cast pipe or gray I. Operations must be highly

coordinated and tuned, and metal temps. carefully controlled to overcome the inherent sluggishness of the alloys. Details are given for alloys contg. 3 to 65% Ni, 9 to 20% Cr with and without addns of Mo. W. A. Mudge

Tests on the determination of creep limit of lead alloys H. Hanemann and W. Hofman *Metallwirtschaft* 14, 915-17(1935)—Pure soft Pb and hard Pb contg. 1.11% Sb, in the form of strips 35.8 sq mm, were used. The elongation in tension under constant loading was measured by means of a microscope, over a gage length of 400 mm. Loads from 10 to 55 kg/sq mm were used and elongation-time curves were plotted. The creep limit for hard Pb at 20° was found to be approx. 22 kg/sq mm, but soft Pb continued to stretch even with the lowest loads used. The time required to produce 1% elongation was also plotted against load and the results were compared with those of Moore, Betty and Dollins (*C. A. 29, 3280*). The discrepancy between the 2 may be due to different test methods or difference in materials. Preliminary tests on hard and soft Pb of the same comp. but from another source indicated considerably lower results. C. E. Macfarlane

The solid-solution series MgCu, MgNiZn and MgZn-MgCuAl. Werner Döring *Metallwirtschaft* 14, 918-19 (1935)—Since MgCu₂ and MgNiZn are both cubic, and MgZn₂ and MgCuAl are both hexagonal, a series of alloys in steps of 10% was made of these groups to det. whether they formed continuous solid solns. The alloys were melted and homogenized, and their lattice const. detd. by x-ray examn. In both cases the solid solns. were found. In the MgCu-MgNiZn series the lattice const. remain the same, while in the MgZn-MgCuAl series a continuous decrease takes place. C. E. M.

Recent uses of molybdenum in the ferrous metal industry. Jean Cournot *Rev. met.* 32, 562-76(1935)—An extended list of alloy compns. contg. Mo and covering steels, steel casting and cast iron uses. Most of the items are illustrated with figures giving their phys. properties and optimum uses. J. D. G.

Nickel-alloy gear materials and their heat treatments J. W. Sands and F. J. Walls *Product Eng.* 6, 370-3 (1935)—Gears made of Ni alloys, heat-treated steel, cast-iron and bronze alloys are compared as to compn. and phys. properties. Graphs, charts and photographs are shown. Ann Nicholson Hurd

The system nickel-manganese H. S. Valentiner *Z. Physik* 97, 745-57(1935), cf. *C. A. 29, 3967*—Data are given for the changes in resistance for Mn-Ni alloys subjected to magnetic fields. Alloys with up to 20% Mn have a normal behavior, while 25-30% alloys show neg. values for $\Delta R/R_0$ far below the Curie point even with moderate intensities. S. Tolansky

Cadmium nickel bearing alloys A. J. Phillips *Product Eng.* 6, 365(1935)—Photographs and charts of their properties are given. Ann Nicholson Hurd

Cadmium-silver-copper bearing alloy L. C. Blomstrom *Product Eng.* 6, 364-5(1935)—A discussion with a micrograph and photographs. A. N. Hurd

Properties of solum containing magnesium (solum gamma) G. Sachs and E. Scheuer *Metallwirtschaft* 14, 937-41, 972-5(1935)—This alloy, contg. 12% Si, 0.4% Mg, 0.5% Mn, balance Al, is especially suitable for large and complicated castings which require high strength. Large castings can be quenched in water during heat treating without danger of cracking, as in other Al alloys. Slight warping can be overcome by straightening after quenching, but after aging this alloy is too stiff to straighten. It was found that in castings quenched under ordinary conditions the hardness of thin sections was less than that of heavy sections. This was due to cooling of the thin sections during the transfer from furnace to quench. Uniform results were obtained when this interval was reduced to 10 seconds by unproved equipment. It is essential to use cold water for quenching solum gamma. The highest possible quenching temp. should be used, usually 525° after heating for 3 hrs. At about 530° the Al-Si-Mg-Si eutectic melts and leaves voids at the grain boundaries. Very large castings are

apt to be too soft because of the relatively large interval between Mg-Si dendrites and resulting slow diffusion. This is overcome by increasing the heating time and by the use of chills. The use of salt as a flux should be avoided as it lowers the Mg content and results in low phys. properties. The aging treatment is not crit., 20 hrs. is required at 150° and 4 hrs. at 180°. The endurance limit is quite high in the quenched state, but is not increased by aging. The endurance limit is not lowered by running water over the test piece. Test bars cut from 14 production castings averaged 31.3 kg/sq mm tensile strength, 2% elongation, 109 Brinell hardness, and 7 kg/sq mm endurance limit. Still better properties are obtained in permanent mold castings. Solum gamma is not recommended for castings which are subjected continuously to temps. higher than 150° to 170°. Twelve references. C. Bearing requirements in automotive engines V. Skillman *Product Eng.* 6, 362-3(1935)—The evolution of the different bearing alloys is discussed. A. N. Hurd

A new heat-resistant alloy S. L. Hoyt and M. A. Scheel *Trans. Am. Soc. Metals* 23, 1022-38(1935)—The alloy contains 37.5% Cr, 7.5% Al and balance Fe and is malleable both hot and cold. The alloy is suitable for operation at 2300-2400°F in resistor elec. furnaces. Details are given. W. A. Mudge

Which alloy for die castings? Herbert Chase *Product Eng.* 6, 379-82(1935), cf. *C. A. 29, 437*—A large table gives the compn. and properties of die casting alloys. Photographs are shown. Ann Nicholson Hurd

A new metal mallet K. Wisemann *Aluminium*, 17, 644(1935)—An alloy of Al-Zn with 7-15% Zn was found to be a very suitable substitute for Pb, as it keeps its shape much longer and is sufficiently deformable not to damage the metal parts on which it is used. M. H.

Summary and outlook [corrosion]. Fritz Todt *Chem. Fabrik* 1936, 1-2, cf. *C. A. 29, 4316*—The closing address before the convention on corrosion, Berlin, Nov. 18-19, 1935. J. H. Moore

The anodic behavior of corrosion- and heat-resistant iron alloys L. Harant Berg and Hulten-mannisches *Jahrbuch* 83, 122-7(1935)—The process of soln. of anodes of different corrosion resistant alloys in H₂SO₄ and HNO₃ was studied. Steels of approx. similar compn. and structure showed also a great similarity in the dissolving process. After the passive state has been reached the soly. depends on the c d applied, at an av. c d there exists a sharply defined zone of perfect soly. where all constituents of the steel dissolve in the same proportion in which they are contained in the steel. The carbide carbon is oxidized in the passive state of the steel and at the higher c ds so that the carbides also dissolve. Curves show the anode potentials as a function of c d. Eight references. M. Hartenheum

Comparison between the effect of hydrogen-ion concentration on the rate of corrosion of steel in pure oxygen and air at 25° J. M. Bryan *Trans. Faraday Soc.* 31, 1714-18(1935), cf. *C. A. 29, 1043*—The main effect of high O₂ concn. is to mask the H-ion concn. effect, and to equalize the corrosion rate over the greater part of the pH range. H₂ evolution is inhibited at high acidity by O₂. Ferric Fe is similar in action to high concn. of O₂. Ferrous Fe promotes oxidation type corrosion over the whole pH range. C. I. P. Jeffreys

Laboratory study of the atmospheric corrosion of metals II. Iron—primary oxide film W. H. J. Vernon *Trans. Faraday Soc.* 31, 1068-76(1935), cf.

C A 26, 285—Marked differences in properties of oxide film on Fe are observed according to whether the film is produced below or above a crit temp 200°. The equation $d \log W/dt = -Q/RT$ expresses the relation between rate of oxidation and temp, but there is a change of const at 200° giving 2 intersecting straight lines with the greater slope above the crit temp when log oxidation rate is plotted against $1/T$. At higher temp a parabolic relation ($w^2 = kt$) holds between oxidation rate and time. Below 200° the expression deviates ($w^2 = kt$ approx). Above 200° the colors produced are consistent with interference of light in a continuous transparent sheath, and any given color may be obtained at different temp by calcn of the time required to give appropriate thickness. Below 200° the relation between color and film thickness does not hold. The ill-defined colors ultimately obtained suggest a granular film. At 25° a point of inflection in the time-oxidation curve below which deviation from the quadratic parabola is in the reverse direction, at 15 days, is believed to imply completion of unit lattice of oxide over the whole surface. A secondary inflection where ($w^2 = kt$) changes to ($w^3 = kt$) marks the breakdown of this primary film. Electron diffraction expts show a difference in structure of the film above and below 200°. The diffraction patterns for a sample oxidized at 135° indicates a cubic structure of side 8.4 Å. This may be due to $\gamma\text{-Fe}_2\text{O}_3$ or Fe_3O_4 . At higher temps a rhombohedral structure ascribed to $\alpha\text{-Fe}_2\text{O}_3$ is obtained. Evidence indicates that the crystals were oriented on the surface with a 211 plane parallel to the metal surface. III Secondary product or rust (influence of sulfur dioxide, carbon dioxide and suspended particles on the rusting of iron) *Ibid* 1678-1700—In purified air of high relative humidity (RH) rusting of mild steel is reduced if the high RH is approached from zero. This is ascribed to the strengthening of the primary film in the early stages. At const RH just below satn time-corrosion curves are convex about the corrosion axis, under supersatn conditions they are concave for 70 days then nearly linear. This is ascribed to changes in primary film. In the presence of SO_2 at approx 50% RH (primary crit humidity) there is a marked weight increase followed at a little higher RH with rust formation. At approx 80% RH (secondary crit humidity) there is a great increase in rate of attack. The primary crit humidity depends upon a relation between concns of H_2O , O_2 and SO_2 for rusting to begin. Secondary crit humidity depends upon the properties of the initially formed rust. Differences in the behavior of Fe and Zn depend upon secondary crit humidity phenomena. The influence of suspended solid particles depends upon whether (1) they are intrinsically active, e.g. $(\text{NH}_4)_2\text{SO}_4$, (2) neutral, but capable of adsorbing active gases, e.g. charcoal, (3) neutral with little adsorptive capacity, e.g. SiO_2 . Under supersatd conditions $(\text{NH}_4)_2\text{SO}_4$ particles greatly increase the rate of attack. SiO_2 and charcoal in purified air have little effect, but charcoal has an enormous effect in presence of traces of SO_2 , because of local concn of the gas. SO_2 has a definite repressive effect on the corrosion of Fe under all conditions investigated, especially marked in the presence of $(\text{NH}_4)_2\text{SO}_4$ particles. C E P Jeffers

Testing metals for their chemical resistance to fluosilicic acid. M A Filippenko and I I Zarnig. *Mineralnue Udobreniya Insektitsionnyy I*, No 5, 90-81(1935).—Among a great variety of metals and alloys investigated a cast iron contg Cu 0.99, S 0.008, Cr 40.68 and P 0.05% was most resistant, next was a steel contg C 0.15, Ni 8, Cr 18 and Ti 0.4%. The metal samples were kept under agitation in a thermostat charged with a mixt of H_2SiF_6 & 5, Fe_2O_3 0.5 and SiO_2 about 1.5% (corresponding to conditions existing during manu) for 5-6 days at a temp of 45°. A A Boetlingk

And corrosion of structural iron in the presence of sulfur dioxide and hydrogen sulfide. V A. Karnitzkii and N A Golubev. *J Applied Chem (U S S R)* 8, 84/4 (in German 871)(1935).—The corrosion of structural iron in H_2SO_4 and HCl is accelerated in the presence

of dissolved SO_2 and H_2S gases. This acceleration is identical for both gases when dissolved in HCl , while a soln of SO_2 in H_2SO_4 is more active. Corrosion by H_2SO_4 and HCl in the presence of dissolved SO_2 is proportional to the concn of the SO_2 . The highest corrosive effect by SO_2 and H_2S depends upon the concn of the H ions; it is highest in 30% H_2SO_4 . This accelerating action is probably due to the formation of FeS films in various parts of the metal which create a great no of local elements. A. A. Boetlingk

The effect of air velocity on the scaling of iron. W. Baukloh and O. Reil. *Metallwirtschaft* 14, 1055-7 (1935).—Samples of Armco iron were heated in a quartz tube at 600°, 700° and 800° in a stream of air which was preheated in another furnace. The velocity of the air was varied from 0.05 to 0.7 m/sec. At each temp the loss in weight due to scaling rose sharply at first with increase in air velocity, then dropped after reaching a max, and finally became const. The maxima and horizontals in terms of weight loss were higher the higher the temp, and the maxima occurred at higher velocities the higher the temp. A theoretical explanation is given. C E. Macfarlane

Testing steels for their resistance to corrosion and erosion in contact with phosphoric acid extracts from Vyatka phosphates. M A Filippenko and I I Zarnig. *Mineralnue Udobreniya Insektitsionnyy I*, No 4, 95-6(1935).—Strips of various alloys were placed in a thermostat (73-6°) and immersed in a suspension contg Fe_2O_3 24.10, SO_3 3.4 and P 0.91% (liquid phase) and gypsum and undecomposed solid particles of Vyatka phosphorite (solid phase). For 100-114 hrs. the following alloys resisted the corrosion and erosion completely: (a) C 0.10, Si 0.39, Cr 19.50, Ni 8.64 and Mn 0.54%; (b) C 0.10, Si 0.94, Cr 15.48, Ni 8.77, Mn 8.77 and Ti 0.6%; (c) C 0.25, Si 0.40, Cr 17.00, Ni 9.00 and Mn 0.50%. Steel contg C 0.10, Si 0.78, P 0.011, Cr 27.29 and Mn 0.24% was slightly attacked and that contg C 0.35, Si 2.50, Cr 18.00 and Ni 25.00% was badly corroded. A. A. Boetlingk

Corrosion-resisting materials for gas appliances. A. L. Ward and W. H. Fulweiler. *Western Gas* 11, No 11, 26(1935).—Parts of pilot valve and thermostats made of brass with less than 63% Cu or if made with Al do not corrode. Brass with more than this percentage of Cu corrodes by forming CuS. W. H. Bruckner

Rust damage in hot-water systems. Alex. Marx. *Gesundh.-Ing* 58, 705-8(1935).—Theories to account for rust formation are critically discussed. The fact that such troubles are much more prevalent and serious in recently developed high-pressure systems is held to be due not to the properties of the water, the type of system (high- or low-pressure), or primarily to the presence of Cu parts in the system, but rather to the fact that the ingot steel commonly used for the more recent high-pressure systems since the war is less resistant to corrosion than the weld Fe formerly used in the older low-pressure systems. M. G. Moore

Automatic apparatus for corrosion tests of metals by intermittent action of moving liquid and its vapor in the presence of air or other gases. P. Ivitzkii and N. Arnshtam. *Zavodskaya Lab* 4, 1113-15(1935).—A metal plate is immersed in a liquid contained in the top chamber of a superimposed 2-chamber unit. A no. of such units is set in a box-like thermostat heater. The top chambers of each unit are fitted with top tubes connected by means of rubber tubing to a common outlet provided with a 1-way valve. The bottom chambers are similarly connected through the side tubes and with an elec. piston pump through a system of safety flasks. By means of a circuit-breaker regulated by a clock mechanism, the liquid is intermittently forced into the top chamber and then returned by gravity to the bottom chamber. The construction and operation of the app are described in detail and illustrated. Chas. Blanc

Longer life for galvanizing furnaces. Wallace G. Imhoff. *Am. Machinist* 80, 18 20(1934).—Discussion of factors of corrosion from molten Zn on the inside and chem.

destruction of furnace on the outside by combustion atm. Forcing production by increasing the temp. of the galvanizing pot is shown to decrease the life of the pot and ultimately to decrease production due to high rate of formation of galvanizing dross at higher temps. The dross sinks to the bottom of the pot and becomes tightly packed, this increases temp. of furnace bottom and aggravates drossing because of the high temp. differential between the bottom and the liquid Zn.

W H Bruckner

Coloring metals H Krause *Metallwirtschaft* 14, 1015-17(1935). Cf C A 29, 5403¹—Cd can be colored black by dipping in cold soln of 60 g KClO₃, 35-40 g Cu(NO₃)₂, 1 l H₂O, brushing, redipping, rinsing, drying and polishing. Another soln contains 30 g Cu(NO₃)₂, 2.5 KMnO₄, 1 l H₂O, used at 60-80°. Cd is colored brown by 160 g KMnO₄, 60-250 g Cd(NO₃)₂ and 1 l H₂O. Cu and Cu alloys are colored brown by repeated dipping in a hot soln of 5 g KMnO₄, 50 g CuSO₄, 1 l H₂O, and brushing. Addn of a little FeSO₄ produces a more greenish color. A soln of 50-60 g KClO₃, 100-125 g CuSO₄ or Cu(NO₃)₂, 1 l H₂O colors Cu and its alloys a reddish brown. Various shades can be produced by addn of Ni or Fe salts. Cu is colored red by dipping in molten KNO₃ or NaNO₃. A violet color is obtained by adding 1% KMnO₄. Fe is colored black by a mixt. of molten NaNO₃ and NaNO₂. Addn of 5-25% NaOH produces a flat black. For some purposes it is better to color Fe in a soln of 1.5 g NaOH, 25-50 g NaNO₂, 5 g tannic acid, 1 l H₂O at about 160°. Al is colored gray by a electrolytic bath of 100 g As₂O₃, 30 g NaCO₃, 10 g KCN, 1 l H₂O, and black by 10-20 g (NH₄)₂MoO₄, 5-15 g NH₄Cl, 1 l H₂O. The latter can also be used for Zn, Fe, Pb Sn and Cd.

Stainless Steels Treated with Columbium. New York: Electro Metallurgical Co.

Sulfidic ores. R. Englert & F. Becker, Chem. Fabrik and Galina Finanz A.-G. (Antor Michels, inventor). Ger. 620,710, Oct. 25, 1935 (Cl. 40a. 12.70). Sulfidic ores contg. Pb, Cu, Zn, etc., are worked up by fusing with carbonates of alkali or alk. earth metals and blowing

gases contg. O onto the fused mass. Thus, rock salt, galena and soda are powd. and fused in a reverberatory furnace and O blown in until half the PbS is oxidized. Metallic Pb seps. at the bottom of the furnace and can be tapped off below the fused salt. A 95% yield of metallic Pb is obtained. By shortening the O treatment, PbCl₂ is produced. Other examples describing the similar treatment of Cu pyrites and Zn blende are given.

Iron ores. Fried. Krupp Grusonwerk A.-G. Fr.

789,379, Oct. 28, 1935. The reduction and fritting of ores of Fe are carried out in a rotary tubular furnace, solid fuel being added in the proportion of 20-30% of the ore, and oxidizing gases being introduced but little external heat being added so that the reduction, preceding the fritting, takes place in a long zone of the furnace.

Apparatus for distillation of magnesium Fritz Hansgig (to American Magnesium Metals Corp.) U. S. 2,029,921, Feb. 4 Various structural and operative details

Purification of magnesium Fritz Hansgig and Konrad Erdmann (to American Magnesium Metals Corp.) Can. 354,354, Nov. 26, 1935 Finely divided Mg is mixed with a hydrocarbon oil and heated to carbonize the oil and bond the powder into aggregates. The Mg is vaporized from the aggregates and condensed to coherent form, the impurities remaining in the carbonized matrix of the aggregates. Cl. C. A. 29, 6874¹

Purifying magnesium Walther Schmidt and Adolf Beck (to Magnesium Development Corp.) U. S. 2,029,898, Feb. 4 For removing "iron impurities" from Mg, there is dissolved in the molten metal, by heating to above 700°, sufficient Mn, Si or Mn chloride to form primary crystals on cooling of the melt while simultaneously combining with the impurities, and the melt is cooled to a temp. not exceeding about 700° and the crystals contg. the purifying substance and impurities are removed from the melt.

Magnesium Frank R. Kemmer (to Magnesium Products Inc.), Can. 354,952, Dec. 24, 1935 A charge of MgO and carbonaceous material is subjected to at least a partial vacuum to remove the gases. These gases are replaced by a protective liquid and the charge is fed into a reaction chamber and heated.

Metallurgy Hendrik J. Janssen (to Shell Development Co.) Can. 354,308, Nov. 19, 1935 Finely divided ore is mixed with liquid fuel and air is blown through the mixt. in the presence of an oxidizing catalyst to obtain fatty acids. A lye is added to the mixt. to form soaps. The fuel slurry is atomized and burned with such quantity of air that incomplete combustion takes place and the metal ore is reduced.

Refining metals and alloys Vereinigte deutsche Metallwerke A-G and Henry Lepp (to Compagnie générale d'Electrometallurgie) Brit. 436,204, Oct. 4, 1935 The mech. properties of metals, e. g., Cu, Ni and their alloys, particularly those produced by melting scrap metal, are improved by creating neutral or reducing conditions in the bath by means of a neutral or reducing atm. when the metals are melted and then rendering the atm. oxidizing and adding to the bath 1 or more oxidizing agents in quantity substantially equal to that necessary to oxidize the gaseous impurities, e. g., H, SO_2 , CO, N, etc., in the bath, the oxidation taking place in the presence of a slag contg. 1 or more compds. of Ba or Sr and in the presence of a substance or substances e. g., Zn, Cd, Fe, Mn, Na, Pb, less noble than the principal metal of the bath. The oxidizing agent must not be decomposed at the temp. of the bath and is preferably a metal oxide. Cl. C. A. 29, 3643¹

Metals Tréfileries et laminours du Havre Fr. 789,436, Oct. 29, 1935 Metals such as Al, Mg, Ca and Si, generally obtained by electrolysis, are obtained by first forming an alloy or a mixt. contg. at least 1 metal in the metallic state and subliming the metals 1 at a time at suitable temps. The alloy may be formed by heating together oxides and carbides of the metals to be alloyed or oxides and reducing metals.

Deoxidizing metals Société d'Electrochimie d'Electrometallurgie des acieries électriques d'Ugine Brit. 436,450, Oct. 7, 1935. The metals are treated with a very fluid slag contg. not less than 5 or more than 90% TiO_2 , and acid, neutral or basic oxides usually contained in metallurgical slags and in such proportions that the slag has an acid character and is capable of extg. oxide from the metal. In an example, a slag contains TiO_2 35, SiO_2 25, Al_2O_3 30, CaO 5 and Mn oxide 5%. Cl. C. A. 30, 73¹

Extracting iron Lucien P. Basset. Brit. 436,443, Oct. 3, 1935 In the simultaneous manuf. of Fe or steel and portland cement or hydraulic lime, the charge consisting of ore, chalk, coal for reducing the ore and the CO_2 from the chalk, carburizing coal and a quantity of addnl. coal approx. 5% of the reducing coal for combatting the oxidizing effects of the reducing flame used is heated in a rotary furnace by a flame obtained by the combustion of pulverized coal with air sufficient to produce chiefly CO_2 and little or no CO . H_2O -vapor may be supplied to assist in removal of S from the clinker produced and air may be introduced into the furnace to burn the combustible gases therein. A cement produced by the process contains SiO_2 21, Al_2O_3 6-7, CaO 68 and other ingredients 5%, a hydraulic lime, SiO_2 16-17, Al_2O_3 6-7, CaO 72 and other ingredients 5%.

Lead Ernst J. Kohlmeier and Henry Hocking Ger. 620,943, Oct. 30, 1935 (Cl. 40a. 18 01). Pb and other metals are obtained from flue dust, mixts. of oxides or other starting materials by mixing them with powd. C and introducing the mixt. into fused salt or other neutral flux. A foam is maintained in the fused mass during the addn. of the mixt. Carbonates may be added to the fused mass to produce this foam. The reaction may take place in a short rotating-drum furnace. Examples are given.

Metallurgical furnace of the suspended-arch type suitable for treating lead and its alloys Karl A. Landner

(to American Smelting and Refining Co.). U. S. 2,029,492, Feb. 4. Structural details.

Melting and holding furnace for metals. John G. G. Frost (to National Smelting Co.). Can 351,204, Nov. 19, 1915. Structural details are described. The furnace is adapted to be used for metals in which a low Fe content is desired.

Furnace construction and operation for heating soaking pits. Gustav A. Merkt (to Morgan Construction Co.). U. S. 2,029,580, Feb. 4. Various details.

Charging apparatus for the Siemens-Martin furnace. N. N. Gergel. Russ 204,660, May 31, 1931. Addn. Russ 21,576, Feb. 23, 1935. Mechanical features.

Mouth lock for blast furnaces. P. D. Zaitsev. Russ 14,971, April 30, 1920. Construction details. Addn. Russ 33,981, Jan. 31, 1934.

Apparatus for passing metal plates, sheets or bars through pickling baths, furnaces, etc. The Milnergriffith Co. Ltd. Ir 749,283, Oct. 25, 1935.

Degasifying liquid slag. Dortmund-Hoerder Huttenverein A-G. Brit 447,095, Nov. 4, 1935. See Fr 781,653 (C A 29, 619F).

Granular blast furnace slag. L. Gothot. Belg 400,970, Jan. 31, 1935. The slag is molded and screened directly as it leaves the blast furnace, so as to obtain grains of 0.7-0.8 mm.

Preparing metal stock such as aluminum stock for working. Richard L. Templin (to Aluminum Co. of America). U. S. 2,029,800, Feb. 4. Mech. features.

Apparatus for tempering iron objects. The Linde Air Products Co. Ir 789,132, Oct. 21, 1935.

Cyanide cementation. Deutsche Gold und Silber-Scheidanstalt vorm. Roessler (Walter Beck and Klaus Bonath, inventors). Ger 620,978, Oct. 31, 1935 (Cl. 18c. 317). The cementation process is regulated in fused cyanide baths for Fe and steel by adding nonalkali or less-alk. substances whose cyanides are more readily decomposed under the reaction conditions than the cyanide comprising the bath. Thus, a bath contg. increased BaCl₂, NaCl, KCl and NaCN is given an addn. of SrCl₂ to increase the efficiency of the cementation process when Fe or steel is immersed in the bath. Other examples are given.

Cementation of steels. Louis Renault. Fr 788,736, Oct. 15, 1935. Gas from a producer blown with air and steam is treated so as to convert the H₂ therein to CH₄ by reaction with the CO or CO₂, water formed is removed and the resulting gas is used for cementation of steel.

Pickling iron and its alloys. Oscar Fakler. Fr 789,099, Oct. 22, 1935. The bath of H₂SO₄ used contains such a proportion of FeSO₄ and is carried to such a temp. that the FeSO₄ activates the pickling action of the free H₂SO₄, the temp. and concn. of the free H₂SO₄ being such that the FeSO₄ crystallizes with 7 mols. of water. Thus, a bath is used contg. 170-220 g. of anhyd FeSO₄ per l. and the H₂SO₄ is maintained between 120 and 60 g. per l., the temp. being about 50° F. Ir 789,100. Residual waters from HCl pickling baths are recovered by transforming the metal chlorides therein to alk. earth chlorides by adding an alk. earth base and regenerating the HCl by treating these chlorides with H₂SO₄.

Apparatus for pickling, scrubbing and swilling metal plates. Saml. Davies. Alexander Engineering Works and Samuel Davies. Brit 476,222, Oct. 3, 1935.

Nitriding articles of alloy steel. K. M. Boroditzkil. Russ 37,724, July 31, 1934. After the usual thermal treatment articles are nitrided with NaCN or KCN at temps. not exceeding the annealing temp., i.e., 520-650°.

Nitrided steel. Wilhelm Kroll. U. S. 2,029,724, Feb. 4. For improving the hardness of a steel contg. Be 0.1-5.0%, the steel is chilled from a temp. above that of aging and is subsequently superficially nitrided while heating it to 400-600°.

Annealing steel. Soc. anon. des établissements Marrel Frères. Ir 789,601, Nov. 4, 1935. A piece of steel hardened by tempering is annealed locally by heating to 650° by a bath of molten Al or other substance or max. m. at about 650°, kept near its solidification point.

Processing material such as in annealing strip metal for

1 springs by electric heating and treatment with a liquid such as water or oil for quenching. De Hart G. Serantom (to Western Elec. Co.). U. S. 2,029,937, Jan. 28, App. and various operative details are described.

Furnace suitable for bright annealing. Patrick J. McIntyre. U. S. 2,028,941, Jan. 28. Structural, mech. and operative details of a furnace to which gases such as non-oxidizing gas and superheated steam may be supplied.

2 Heat-treating ferrous alloy articles. Frederick R. Bonte. Brit. 476,202, Oct. 1, 1935. Addn. to 406,131 (C A 28, 47652). In making articles as described in 406,131, the articles, after heating to above the crit. point, are cooled from that temp. and then subjected to further heat treatment to harden their surfaces. The heat treatment involves heating to 900-1800°F. and quenching, and may be applied to a selected part of the article. The alloy may contain C 1.5-2.5 and Si 0.6-0.9% but, if it contains 1.5-2.0 C and up to 1% Mn, the Si may be increased to 1.3%. The alloy may also contain Ni 0.75-2.0, Mo 0.2-0.5, Al 0.5-15.0, Cr and W 0.5-18.0 and V up to 1%.

Heat-treating steel wheels or tires. Christer P. Sandberg and Oscar F. A. Sandberg (also legal representatives of Nils P. P. Sandberg, deceased). Brit 436,530, Oct. 14, 1935. In treating the wheels at above the crit. range, the surface or surfaces are cooled very rapidly by means of jets of atomized H₂O so that sufficient evapn. of the H₂O particles is assured, and the amt. of H₂O is reduced as the surface cools. The cooling is stopped when the heat retained corresponds to an av. temp. above 500° but below the crit. temp. and the wheel is then placed in a heat-insulated container or furnace until the retained heat has evened out to produce said av. temp., the wheel being finally cooled slowly.

Heat treatment of rails. Quincy Bent and Edward F. Kenney (to Bethlehem Steel Co.). U. S. 2,029,286, Feb. 4. App. and various operative details are described.

Heat-treating electric-arc-welded chrome-alloy-steel containers such as those used in oil cracking. Harry S. Blumberg (to M. W. Kellogg Co.). U. S. 2,029,897, Feb. 4. A welded container the base metal of which is a Cr steel contg. 4-6% of Cr (the remainder being Fe and C except for incidental impurities) and the weld metal of which is an austenitic Cr-Ni-Fe alloy of low-C content contg. about 0.42% or more of a metal such as Ti, Nb or Ta, of greater carbide-forming tendency than Cr, proportioned to combine with substantially all the C in the weld metal is heated to effect recrystn. in the base metal and soln. of carbides in the weld metal, then slowly cooled to below the crit. range of the base metal so as to effect annealing of the base metal and pptn. of harmless carbides in the weld metal, then reheated to below but near to the crit. range of the base metal to effect approx. attainment of equil. and cooled.

Special steels. Cimmar Molybdenum Co. Fr 788,889, Oct. 18, 1935. Mo steels contain C 0.1-0.7, Mn 0.1-2, Si 0.5-2.5, Cr 0.01-11 and Mo 1-8%. Ni 0.01-2.5 and V 0.01-2% may also be present. An example contains C 0.45, Mn 0.55, Si 1.25, Cr 8, Mo 4.25, Ni 1.8, V 1% and Fe the rest, S and P being present in the usual amts.

Steel ingots. L'auxiliaire de l'industrie. Fr 789,895, Sept. 10, 1935. A compn. contg. C 2b, SiO₂ 62, Al₂O₃ 1, Fe₂O₃ 0.5, MgO 0.5, alkali 6 and water 4%, is introduced into fused steel immediately after its casting in the ingot mold, to improve the texture of the ingot and particularly to reduce the cavity therein.

Cast steel car wheels. Alfred W. Gregg and Raymond H. Frank (to Bonney-Floyd Co.). U. S. 2,029,819, Feb. 4. Wheels possessing differentially hardened tread and axle regions are formed from iron contg. incidental impurities such as S and P together with C 0.25-0.40, Mn 0.90-1.50, Mo 0.20-0.40, Cr 0.10-1.00 and Si 0.20-0.50%.

Steel alloys. Frederick M. Becket and Russell Franks (to Electro Metallurgical Co.). Brit. 436,184, Oct. 7, 1935. Addn. to 414,211 (C A 29, 1099). Seamless tubes and other articles are made of austenitic steel alloys

of the compn given in 414,211, particularly those contg. Cr 15-25, Ni 6-12, C up to about 0.2 and Cb and Ta up to about 4%, the Cb being present in greater amt. than the Ta

Composite metal bodies Frederick F. Gordon Brit. 436,401, Oct. 10, 1935 See Ger. 622,484 (C. A. 30, 1351)

Aluminum alloys I G Farbenund. A-G. Fr. 788,952, Oct. 21, 1935 Alloys which are useful where resistance to pressure of liquids or gases is desired contain Mg 3-7, Si 0.8-1.5, Mn 2-5% and Al the rest

Beryllium and its alloys Compagnie de produits chimiques et électrometallurgiques Alais, Fropes & Camargue Fr. 789,244, Oct. 25, 1935 See Brit. 435,747 (C. A. 30, 1353)

Copper alloys Leonard C Bannister and Imperial Chemical Industries Ltd Brit. 436,662, Oct. 16, 1935 Pipes, vessels, etc., for use in mfg., conveying and storing beer are made of Cu alloys contg. up to 10% Al. The alloys may also contain Zn 0-30, Si or Mn about 1% and Ni a small amt. The interior of the pipes, etc., may be cleaned before use by pickling in a soln. contg. H_2SO_4 10 and $Na_2Cr_2O_7$ 10%.

Iron alloys Electro Metallurgical Co. Fr. 788,947, Oct. 19, 1935 Alloys contain Cr 50-80, N 0.35-1.8, C 1-5%, and Fe the rest. The ratio of N to Cr is preferably 1/100. The alloys may be made by melting Fe and adding a Fe-Cr-N alloy contg. Cr 60-80 and N 0.35-1%.

Nickel-cobalt alloy Westinghouse Electric & Mfg. Co. Ger. 620,897, Oct. 29, 1935 (Cl. 405 14) The sum of the Ni and Co contents is 80-95% and the sum of the Fe and Ti content is 5-20%. As an example, the alloy comprises Ni 73, Co 18, Fe 7 and Ti 2%.

Alloys Stahlwerke Röchling Buderus A-G and Alfred Kropf Ger. 620,712, Oct. 29, 1935 (Cl. 404 1 65) Addn to 616,558 (C. A. 30, 424) Alloys contg. Cr 10-40, Ta 3-50, C 0.1-1.0 and Ni 40-60% are cold-molded or shaped in stages. The alloy is heated to 950-1050° before each cold shaping stage, and is cooled to 300-600° after each stage.

Alloy of high strength George P. Halliwell (to Canadian Westinghouse Co. Ltd.) Can. 354,247, Nov. 19, 1935 An alloy contg. Ni 40-60, Co 20-35, Fe 5-20, Ti 0.5-10 and Cr up to 20% is quenched from approx. 900° and aged at 500-800° for approx. 1/2 hr. It has an elastic limit of 52,000-66,200 lbs. per sq. in. and a tensile strength of 105,000-120,200 lbs. per sq. in. at approx. 600° Cl. C. A. 30 74

Hard alloys A A Abinder Russ. 38,325, Aug. 31, 1934 Cementing metals or alloys are atomized into liquid low boiling organic substances (e.g., alc., gasoline, acetone) to which is added not over 20% of their weight of rubber, tar or guita-percha. The finely divided metal thus formed is mixed with carbides, shaped, pressed and ignited.

Hard alloys V D Romanov, V S Rakovskii, V I Tret'yakov, R A Trubnikov, V P L'vovskaya, N E Levina and E M Belostotskaya Russ. 37,534, July 31, 1934 Tungsten carbide or other hard compds in powder form are introduced into a chamber in which a cementing metal is being reduced and vaporized.

Hard alloys Firth-Sterling Steel Co. Brit. 436,255, Oct. 8, 1935 See Can. 350,602 (C. A. 29, 5063) Part of the Al may be replaced by Mg and (or) Be. Up to 5% of Fe, Ni and Co may be present.

Improving the ductility of magnesium alloys Robert D Lowry and Fred L Reynolds (to Dow Chemical Co.) U. S. 2,029,728, Feb. 4 A relatively non-ductile annealed rolled Mg base alloy material such as one contg. Mg together with Al 4 and Mn 0.3% is alternately bent and straightened at a temp. between about 5° and 135° so as to stress the metal without substantially changing its thickness, and is then annealed.

Tools for cutting glass, etc. The General Elec. Co. Ltd. and John H. Partridge Brit. 436,017, Oct. 3, 1935 The tools are made by sintering at a high temp. a mixt. of finely divided Al_2O_3 and a material which is,

or which becomes after sintering, softer and more ductile than cryst. Al_2O_3 . Thus a mixt. of Al_2O_3 with 10% Fe_2O_3 (rouge) is pressed into a coherent bar of square section with sharp edges and the bar is sintered at about 1700° in an elec. furnace that has resistance elements of Mo and is filled with H_2 , the Fe_2O_3 being reduced to Fe.

Alloys for bearings General Motors Corp. Brit. 436,633, Oct. 15, 1935 An alloy consists of at least 95% Cd and 0.5-5% Ag, preferably with 0.25-1% of a hardening metal, e.g., Cu and (or) Ni. Up to 0.25% Zn may be present.

Composite bearings Degenhart Baron von Loe Brit. 436,705, Oct. 16, 1935 A Cu-coated bearing-shell of Fe that is not hardenable by chilling is heated in borax to 1050-1085° and inserted into a mold which is then filled with molten Cu-Pb alloy and plunged into cold H_2O .

Permanent magnet Robert Bosch A-G Fr. 789,426, Oct. 29, 1935 The magnets are made of an alloy contg. Ni 7-30, Al 3-20, Cu 20-40% and Fe the rest.

Permanent magnets Robert Bosch A-G Fr. 789,157, Oct. 24, 1935 Alloys contg. Ni 7-40, Al 3-20, Cu up to 40% and Fe the rest are used, the Ni and Cu being introduced into the molten bath in the form of com. alloys of Ni and Cu. Cf. C. A. 29, 7430 and preceding abstrs.

Composite metal products The Mond Nickel Co. Ltd. Brit. 436,329, Oct. 9, 1935 A protective metallic film is applied to the surface of a metal or alloy contg. Cr, the film is placed in contact with the cleaned surface of a foundation or base metal and the composite unit is heated to form a bond between the base metal and the film, which is preferably of Ni or Ni alloy and preferably applied to the Cr alloy by electrodeposition. The outer layer may consist of an alloy contg. Cr 14, Fe 6 and Ni 80% or of stainless steel preferably contg. Cr 15 and Ni 8%.

Removing aluminum from copper and copper alloys V. A. Dubinkin, S. A. Dubinkin and I. V. Molvanov Russ. 38,324, Aug. 31, 1934 Al is removed by melting the metals in an oxidizing atm. with the introduction of Ba salts except those contg. S in the acid radical.

Removing oxide coatings from ferrous metals Harry S. George (to Electro Metallurgical Co. of Canada, Ltd.) Can. 354,406, Nov. 26, 1935 A surface-oxidized article contg. Fe and at least 8% Cr is cleaned by providing a box-annealed scale theoron, treating in a hot bath contg. about 20% NaOH in which Cl has been bubbled until O is liberated, and then subjecting to a hot acid bath contg. 50 g. per l. of HNO_3 and 10-100 g. per l. of HCl.

Coating with metals Cyril H. Walker, Charles Sykes and Associated Electrical Industries Ltd. Brit. 436,792, Oct. 14, 1935 Surfaces are coated by distn. of metals in a vacuum by placing the coating metal as a thin uniform layer on the surface of a heater, preferably an electrically heated strip of W or Mo, raising the temp. until the coating metal melts to form a thin uniform coating on the heater and then raising the temp. to distil the coating metal onto the surface to be coated. App. is described.

Machine for coating metal plates with tin, tenné or other metal or alloy Saml. Davies Alexander Engineering Works Ltd. and Samuel Davies Brit. 436,007, Oct. 3, 1935

Machines for applying a layer of tin or other metals or alloys to metal plates Saml. Davies Alexander Engineering Works, Ltd. and Samuel Davies Fr. 788,440, Oct. 10, 1935

Mold materials International de Levant Masu facturing Corp. Ltd. Brit. 436,196, Oct. 7, 1935 A centrifugal metal mold is lined, prior to casting Fe therein, with ferrosilicon powder of such fineness that not more than 5% is retained on a 150-mesh sieve, Tyler series, and not less than 10% on a 200-mesh sieve.

Tungsten carbide castings Orrin F. Marvin (to Mills Alloys, Inc.) U. S. 2,028,911, Jan. 28 In making thin castings such as rotary saw blades, the fluid material from which the casting is to be made is poured into a mold, which may be formed of graphite and is also poured around the outside of the mold. App. is described.

Casting aluminum magnesium alloys Aluminum Ltd.

Fr. 788,835, Oct. 18, 1935. To avoid unfavorable reaction between the alloy and the atm. or the constituents of the mold, the mold of green sand is treated with NH_4F , or NH_4F is incorporated with the sand before molding.

Welding rod. Aubrey T. Roberts and John H. Pater-son (to American Murex Corp.) Can. 354,513, Dec. 3, 1935. An electrically conductive coating is provided on the rod comprising a bonded mixt of powd Fe and Fe-Mn in the proportion of 6% Mn to the powdered Fe. The Fe-Mn mixt comprises not less than 10% of the welding rod. Cf. C. A. 29, 6506¹.

Electrode for welding hard alloys. N. I. Mushitzkil. Russ. 37,778, July 31, 1934. A tubular electrode con-

granular hard alloys contains also 3-20% B and 2-4% molasses to improve the hardness of the welded spot.

Paste for welding electrodes. A. A. Alov. Russ. 37,779, July 31, 1934. In a welding paste contg. coal, graphite, Ni, Cr, V, Mo, Mn, etc., is incorporated the basic component Na acetate or K acetate together with NaOH or Ca(OH)_2 or soda-lime to the amount of at least 50% of the amount acetate.

Apparatus for measuring the hardness of metals. Felix Eugene. Brit. 436,155, Oct. 7, 1935.

Apparatus for degreasing metal and other articles. Joseph A. M. W. Mitchell and Imperial Chemical Industries Ltd. Brit. 436,155, Oct. 7, 1935.

10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

Activation of specific bonds in complex molecules at catalytic surfaces. Hugh S. Taylor, Kiyoshi Morikawa and W. S. Benedict. *J. Am. Chem. Soc.* 57, 2735 (1935).—The activation of the C—C and C—H bonds have been followed on an active Ni surface by the study of the 2 reactions (a) the exchange reaction $\text{C}_x\text{H}_y + m\text{D} \rightarrow \text{C}_x\text{H}_y\text{D}_m$, where $x + y = 6$ and m may be varied arbitrarily, (b) $\text{C}_x\text{H}_y + \text{H}_2 \rightarrow 2\text{CH}_4$. The former involves only the C—H, the latter the C—C bond, the other reactant in each case being H or D adsorbed on the surface in the activated form. On this catalyst the exchange reaction proceeds quantitatively at 115° under conditions in which reaction (b) is quite negligible. The production of CH_4 sets in about 150° and is sensibly complete around 200°. This defines the temp., catalyst and reactant concn. conditions necessary to activated adsorption of C_xH_y molecules, producing either the C—H or the C—C bond split or both. The work is being continued. C. J. West

Method of comparison and critical analysis of the physical properties of homologs and isomers. The molecular volume of alkanes. Geo. Calingairt and John W. Mulky. *J. Am. Chem. Soc.* 58, 154-7 (1936).—A graphical method is described for the crit. comparison of data on any one of the phys. properties of large groups of homologs and isomers. The illustration chosen covers the d. (mol. vol.) of the alkanes and suggests the necessity of obtaining more and better data in the range C_5 to C_{10} . The effect of structure is discussed. C. J. West

Isomerization of normal heptane. Geo. Calingairt and Harold A. Beatty. *J. Am. Chem. Soc.* 58, 51-4 (1936); cf. C. A. 29, 4325¹.—On heating C_7H_{16} with AlCl_3 at 90° (90° in the still-head) there were obtained, on the basis of 100 parts C_7H_{16} reacted, the following products: pentanes and below, 64.6, 2-methylpentane, 3.4, 3-methylpentane, 2; hexane, 0.4, 2,1-dimethylpentane, 1.5; 2,2,3-trimethylbutane, 0.5, 3,3-dimethylpentane, 0.4; 2-methylhexane, 1.2, 3-methylhexane, 1.0; polymerization products, 2.1. Phys. properties used for the identification of the products are given. The results in general suggest that naphthenes are not formed. C. J. West

Induced substitution of pentene by chlorine. T. D. Stewart and Bernhard Weidenbaum. *J. Am. Chem. Soc.* 58, 98-100 (1936).—Cl and 2-pentene react in CCl_4 to yield 1-chloro-2-pentene as well as the normal addn. product. Substitution is favored by increasing the pentene concn., addn. by increasing the relative concn. of Cl. The same effect is observed in 1-phenyl-2-propene to a smaller extent but not at all in the slowly reacting 2-chloropentene. A tentative explanation is suggested, based upon competitive reactions involving a common intermediate. The substitution product was identified by its reaction rate with Me_2N , the pseudo 1st order sp. reaction rate const. in mols. per l. at 25° being: the chlorinated 2-pentene 0.10; 1-chloro 2-propene 0.015, CCl_4 and 2-chloropentene no reaction in 9 hrs.

Influence of substituents on the additive reactivity of ethylene derivatives. III. Further experiments on the

addition of bromine in solution. S. V. Anantakrishnan and Christopher K. Ingold. *J. Chem. Soc.* 1935, 1396-8, cf. C. A. 29, 6566¹.—The work on the relative rates of addn. of simple C_4H_8 derivatives toward the electrophilic reagent Br^+ (C. A. 26, 78) has been extended to a study of the systems $\text{C}_4\text{H}_8 + \text{PhCH CH}_2$, $\text{PhCH CH}_2 + \text{MeCH CH}_2$, $\text{Me}_2\text{C CH}_2 + \text{MeCH CH}_2$, $\text{C}_4\text{H}_8 + \text{Me}_2\text{C CH}_2$, $\text{C}_4\text{H}_8 + \text{Me}_2\text{C CHMe}$, $\text{C}_4\text{H}_8 + \text{OHCH CH}_2$, $\text{C}_4\text{H}_8 + \text{OHCH CHMe}$. The expts. were carried out at -70° in CH_2Cl_2 with exclusion of light. The "reduced rates," i. e., rates of reaction for C_4H_8 derived expressed as multiples or fractions of the rate for C_4H_8 itself, are given. An accumulation of Me groups causes an increase in the "reduced rate" of addn.: C_4H_8 1.0, MeCH CH_2 2.0, $\text{Me}_2\text{C CH}_2$ 5, $\text{Me}_2\text{C CHMe}$ 10.1, $\text{Me}_2\text{C CMe}$ 11. The CHO group, instead of deactivating more powerfully than CO_2H , actually increases the reaction rate quite appreciably. OHCH CH_2 1.5, OHCH CHMe 3.0. C. J. West

Mechanism of the addition of halogens to ethylenic linkages. Richard A. Ogg, Jr. *J. Am. Chem. Soc.* 57, 2727-8 (1935).—The following mechanism is suggested for the addn. of halogens to ethylenes: $\text{Br}^+ + \text{RCH=CH}_2 \rightarrow \text{RCHBr}-\text{C}^+\text{H}_2$, $\text{RCHBr}-\text{C}^+\text{H}_2 + \text{Br}^- \rightarrow \text{RCHBr}-\text{CH}_2\text{Br}$; i. e., the addn. is catalyzed by the halide ion and the intermediate is a carbocation. The first reaction is to be regarded as a substitution reaction of the halide ion with 1 of the electron pair bonds of the ethylenic linkage and hence as attended by optical inversion of the intermediate C atom. The carbocation thus has a *trans*-configuration and since no configuration change attends the 2nd reaction, the final addn. product should be *trans*. A very similar mechanism probably obtains for addn. of HX to ethylenic linkages, the 2nd step being replaced by addn. of a H ion to the carbocation. Acetylenic linkages should behave similarly. C. J. W.

Photolodination of the ethylenic bond at low temperatures. Geo. S. Forbes and Arthur F. Nelson. *J. Am. Chem. Soc.* 58, 182-3 (1936).—When an equimol. quantity of I was added to 1-butene (0.01 M) in CH_2Cl_2 or CHCl_3 and the solns. illuminated, 90% of the I disappeared in CH_2Cl_2 at -60 to -90° in 3 hrs. and 95% in CHCl_3 at -60 to -70°, the solns. illuminated in quartz by a spark between high W steel electrodes evolved the I quantitatively within 1 hr., in 3 stages; at 20° for 100 hrs. 81% of the I was evolved, also in stages.

Peroxide effect in the addition of reagents to unsaturated compounds. X. The addition of hydrogen bromide to methylacetylene (allene). M. S. Kharasch, J. G. McNab and M. C. McNab. *J. Am. Chem. Soc.* 57, 1663-5 (1935); cf. C. A. 30, 718¹; 28, 5037¹.—The "normal" addn. of HBr to methylacetylene (I) produces exclusively 2,2-dibromopropane; under the influence of added peroxides, HBr adds to I to give the 1,2-isomer. The HBr must be passed into the I, contr. the added peroxide, at a temp. of -33° to -40° in order to effect a complete reversal of the "normal" addn. XI. The solvent effect in the addition of hydrogen bromide to isobutylene.

M. S. Kharasch and W. M. Potts. *Ibid.* 58, 57-60 (1936).
 —Pure *tert*-BuBr is formed by the addn of HBr to *vacuo* to isobutylene (I) in the presence of solvents and antioxidants. *iso*-BuBr is formed in amts varying from 100 to 75% by the addn of HBr to I in the presence of solvents, air and peroxides. The conclusion is reached that, under rigidly maintained antioxidant conditions, solvents *per se* have no effect upon the direction of addn of HBr to I but affect markedly the rate of addn. This is interpreted as indicating that the apparent directive solvent effect observed under other than antioxidant conditions is in reality an effect of the solvent upon the relative rates of the 'normal' and peroxide-catalyzed addn reactions.
 C. J. West

Reaction of butylacetylene with oxygen. Charles A. Young, R. R. Vogt and J. A. Nieuwland. *J. Am. Chem. Soc.* 58, 55-61 (1936). cf. *C. A.* 29, 1771.
 —Butylacetylene (I), which has been carefully purified to remove olefin impurities, forms a peroxide readily. Evidence is presented which indicates that the peroxide is not formed by a polymer or allene form of I. $C_4H_5CO_2H$ has been identified as 1 of the decompn. products of the peroxide of I. This peroxide is quite unstable in a coned form, decomps to an acidic, viscous, dark brown, strongly lachrymatory liquid.
 C. J. West

Alkyl acetylenes and their addition compounds. VII. Preparation of some ketals of alkyl acetylenes with the higher alcohols. D. B. Killion, G. F. Hennon and J. A. Nieuwland. *J. Am. Chem. Soc.* 58, 80-1 (1936). cf. *C. A.* 29, 7939.
 —The action of butylacetylene or amylacetylene on a soln. of an alc. and Cl_2CCO_2H in the presence of a catalyst from red HgO , Et_2O , BF_3 and $MeOH$ gives the following 2,2-dialkyl alkanes: 2,2-diethoxyhexane, b_p 68-69°, d 0.835, n_D^{20} 1.4087; dipropoxy homolog, b_p 95-96°, d 0.836, n_D^{20} 1.4160; dibutoxy homolog, b_p 115-117°, d 0.837, n_D^{20} 1.4240; dipentoxo homolog, b_p 141-143°, d 0.839, n_D^{20} 1.4285; dihexoxy homolog, b_p 143-145°, d 0.839, n_D^{20} 1.4322; 2,2-diethoxyheptane, b_p 81-83°, d 0.834, n_D^{20} 1.4132; dipropoxy homolog, b_p 107-109°, d 0.836, n_D^{20} 1.4191; dibutoxy homolog, b_p 134-136°, d 0.837, n_D^{20} 1.4252; dipentoxo homolog, b_p 148-150°, d 0.839, n_D^{20} 1.4310. With branched-chain monohydric alcs. Ketals have not been isolated by this method. *iso*-PrOH, *tert*-BuOH and *tert*-AmOH show no evidence of reaction.
 C. J. West

The reaction of acetylene upon acetyl chloride. André Cornillot and René Alquier. *Compt. rend.* 201, 837-8 (1935).
 —Acetylene reacted with $AcCl$ at 15° in the presence of $AlCl_3$ to form *Me* β -chlorovinyl ketone (I), b_p 135°, b_d 40°, in 25% yield. I polymerized to a resin on standing. The semicarbazone of I m. 180°. The oxime and phenylhydrazones were not formed. I in boiling alc. NaOH gave 50% triacetylbenzene.
 E. W. Scott

Chlorination of methane. I. Preparation of carbon tetrachloride. A. I. Kiprianov and T. S. Kusner. *J. Appl. Chem. (U. S. S. R.)* 8, 673-84 (1935).
 —Up to 90% of CCl_4 was obtained when passing a mixt. of CH_4 , HCl and Cl_2 through an activated C catalyst, at a reaction temp. of 525-80°. The ratio of the ingredients was $Cl/HCl = 1/2$. 160 l. Cl_2 can be handled hourly by 100 g. activated C, and the approx. ratio, depending upon the purity, of $Cl_2/HCl = 16/64$. 80-100 l. A detailed description of the exptl. procedure is presented.
 A. A. Bochtchug

Allylic rearrangements. I. Crotyl and methylvinylcarbinyl bromides. Saul Winstein and Wm. G. Young. *J. Am. Chem. Soc.* 58, 104-7 (1936).
 —Details are given of results reported in *C. A.* 29, 7939.
 C. J. West

Initial formation of methyl alcohol in the oxidation of methane. William A. Bone. *Nature* 136, 910 (1935). cf. Newitt and Srego. *C. A.* 29, 1770.
 —Explosions of $5CH_4 + 2O_2$ mixts. yielded among the suddenly cooled products 0.13% $MeOH$ and 0.03% $HCHO$. Not the faintest trace of peroxide formation could be detected. The $MeOH$ is formed before the $HCHO$.
 O. E. S.

Action of sulfuric acid on 2-butanol. Nathan L. Drake and Fletcher P. Veitch, Jr. *J. Am. Chem. Soc.* 57,

2623-5 (1935).
 —The action of 75% H_2SO_4 on 2-butanol at 80° for 48 hrs. in an autoclave gives, among other products, 3,4-dimethyl-2-hexene (I) and di-*sec*-butyl ether (II). I was identified by the action of O_3 , giving *Me* *sec*-Bu ketone (III) (2,4-dimethylphenylhydrazones, m. 71.2°), alk. HOBr transforms III into $Me(CH_2CO_2H)(p$ -phenylphenyl) ester, m. 70.6°. II b. 121°, d_4^{20} 0.79, n_D^{20} 1.3930, HBr gives *sec*-BuBr. The theory of the mechanism of polymerization by acids suggested by Whitmore (C. A. 28, 1327) explains the observed facts better than that of Kline (C. A. 29, 1057).
 C. J. West

Synthesis of several octadecyl alcohols with branched chains. Otto Brunner and Gertrud Wiedmann. *Monatsh.* 66, 438-42 (1935).
 —*Li* α -ethylpalmitate, b. 198-203° (95% yield), amide, m. 111-12°, reduction of the ester with Na in $EtOH$ -BuOH gives 70% of α -ethylhexadecyl alc., b. (high vacuum) 100-101°, m. 15°, the phenylurethan is an oil, the 4'-chlorophenylcarbamate m. 105-6°. Di-*Et* butyldodecylmalonate, b. 224-6° (70% yield). α Butylmyristic acid, b. 214-19° (77%), *Et* ester, b. 184-192°; amide, m. 10-10°; α -butyltridecyl alc., b. 125-30° (high vacuum), m. 1°; 4'-chlorophenylcarbamate, m. 102-3°. Di-*Et* hexyldodecylmalonate, b. 222-5° (70%), α -hexylstearic acid, b. 218-20°, *Et* ester, b. 195-8°; amide, m. 110-11°; α -hexyldodecyl alc., b. 120° (high vacuum), m. -7.5°; 4'-chlorophenylcarbamate, m. 77-8°. Di-*Et* dodecylmalonate, b. 220-3° (60%), α -octylstearic acid, b. 212-18°, *Et* ester, b. 195-7°; amide, m. 122.5-3.5°; α -octyldodecyl alc., b. 110-20° (high vacuum), m. -8°; 4'-chlorophenylcarbamate, m. 90°.
 C. J. West

Formation of amides from nitriles by the action of hydrogen peroxide. L. McMaster and C. R. Noller. *J. Indian Chem. Soc.* 12, 652-3 (1935).
 —Data for optimum conditions for the Radziszewski reaction as ded. from 2-8 expts. for 13 nitriles, using 3, 6, 12 and 30% H_2O_2 in the presence or absence of $EtOH$ are summarized. In general, the H_2O_2 was added to a weighed amt. of the nitrile and sufficient 95% alc. to effect soln. was added (cf. Murray and Cloke, C. A. 29, 729). The soln. was made alk. with 6 N NaOH and was kept at 60° for 4 hrs. The alk. mixt. was cooled, neutralized with H_2SO_4 , evapd and extrd. with $CHCl_3$ or crystd. from H_2O . Conditions for the conversion of *Li*, *Pr*, *Bu*, *iso*-*Bu*, *Ph* CH_2 , *Ph* CH , CH_3 , *C* Ph , α - $O_2NC_6H_5$, p - $O_2NC_6H_5$, m - MeC_6H_4 , $(CH_3O)_2C_6H_3CH_2$ and α - $O_2NC_6H_4C_6H_4CH_3$ nitriles into 49.6, 64.9, 62.5, 56.5, 59.5, 61.0, 83.0, 50.4, 91.2, 93.0, 84.8, 97.4 and 85.4% yields of the corresponding amides, m. 80-1°, 114.6°, 104.1°, 135.4°, 153°, 166.5°, 202-6°, 176.5°, 201.6°, 141.5°, 93.8°, 168.6° and 199.6° (all m. ps. cor.) are given (cf. Org. Synthesis, XIII, 94). H_2O_2 in concns. up to 30% has no effect on neutral solns. of $EtCN$ or α - $O_2NC_6H_4CN$ at temps. up to 100° when decomposed catalytically by MnO_2 , $Co(OH)_2$, Co_2O_3 or Ni_2O_3 . The OH ion is evidently necessary as a catalyst in this reaction. C. R. Addinall

Vinylidiazomethane. Charles D. Hurd and S. C. Lu. *J. Am. Chem. Soc.* 57, 2076-7 (1935).
 —Vinylidiazomethane (I) results in 22-5% yields by the method of Nurdlinger and Acree (C. A. 4, 1616). *Allyl*nitrosourea in red oil, decomps. on attempted distn. at 3 mm., d_4^{20} 1.051, d_4^{25} 1.047 (94% yield). I and $BrOH$ in Et_2O give, after 2 days, 65.7% of allyl benzoate. I (0.33 g.) in 100 cc. Li_2O gives, after 2 days, 0.72 g. pyrazole (cf. Adamson and Kenner, C. A. 29, 2910), 5413°.
 C. J. West

New method for the preparation of alkory boron halides and their reaction with metals. Corlies R. Kinney, H. Theron Thompson and Lee C. Cheney. *J. Am. Chem. Soc.* 58, 2396-7 (1935).
 —Dissomethylboron chloride (I), b. 110-15°, results in 15% yield from *iso*-AmOH and BCl_3 in dry $CHCl_3$ at -20° but in 45% yield from (*iso*-AmOH) B and BCl_3 after standing 24 hrs. (EtO) B reacts readily with Na and Zn dust on warming slightly, gases being evolved and (EtO) B being isolated in about 75% yield. I does not react with "mol. Ag" but reacts readily with Na or Zn on warming, the reaction is exothermic and becomes violent unless cooled. The gases evolved at 70°

contain HCl and probably II and iso-C₁₁H₂₂; the liquid product contains only (iso-AmO)₂B and B₂O₃.

C. J. West
Preparation of dichlorodiethyllead A. I. Yakubovich and I. Petrov. *J. prakt. Khim.* 144, 67 8(1935).—Repetition of Gilman and Robinson's exp't (*C. A.* 24, 2981) on the action of HCl on I in PhMe gave about 50% Ph₂Cl₂, 30% Ph₂PhCl and 20% Ph₂Ph₂Cl. Pure Ph₂Ph₂Cl results from the action of Cl upon Ph₂Ph at -60° to -20° (Krause and Gruttner, *C. A.* 11, 976).

C. J. West
Constitution of the bisulfite addition compounds of aldehydes and ketones. Walter M. Lauer and Carl M. Langhammer. *J. Am. Chem. Soc.* 57, 2360-2 (1935). The H₂SO₄ addn comp'd of HCHO and presumably of all aldehyde and ketone bisulfites are salts of R₂C(OH)SO₃Me. The prep'n of IC₁H₂SO₃K from CH₃I and K₂SO₃ is described (73% yield). Fusion with AcOK gives AcOCH₂SO₃K (I) (20.5% yield), also prep'd from HOCH₂SO₃K, AcO and AcOH, both decompose 211.6°, both form plates and flattened prisms from 95% 1:10H₂O, the index of refraction corresponding to light vibrating parallel to the long direction of the prism is 1.491 ± 0.002. IC₁H₂SO₃K and K₂SO₃ give CH₃(SO₃)₂K, reduction of IC₁H₂SO₃K gives MeSO₃K, identified by the amide and amide I and K₂SO₃ give AcOCH₂SO₃K, while PhNH₂ gives 85% of PhNHCH₂SO₃K.

C. J. West
Reduction of aldehydes with aluminum isopropoxides. Wm. G. Young, Walter H. Hartung and Frank S. Crossley. *J. Am. Chem. Soc.* 58, 100 2(1936).—Al(iso-PrO)₃ is effective for the reduction of aldehydes to the corresponding alcs., other products are esters, aldol derivs and resinous material. Details are given of the prep'n of crotyl alc. in about 51% yield in iso-PrOH or in 40-56% yield in C₁₁H₁₆, citronellol was obtained in 32% yield and cinnamyl alc. in 68% yield. Reduction of PhCHO with Al(Oi-Pr)₃ in PhOH at 25° and in refluxing C₁₁H₁₆ gave 0 and 6% BuOH, while Al(iso-PrO)₃ gave 30 and 28% BuOH. With CMe₂OPr only 14% crude crotyl alc. was obtained. The reaction mechanism is more complicated than previously reported.

C. J. West
Synthesis of deuterioacetaldehyde. J. F. Ziegler and Darrell V. Sackman. *J. Am. Chem. Soc.* 57, 2735 (1935).—C₂D₂ in an acid soln of Hg salts in D₂O gives deuterioacetaldehyde, with a vapor pressure of 327 mm at 0°; it shows the usual aldehyde reactions.

C. J. West
β-Chloropropionaldehyde and several of its derivatives. A. Kirmann, M. Goudard and M. Chaludard. *Bull. soc. chim.* [5], 2, 2147-52(1935).—The acetal and several other derivs of ClCH₂CH₂CHO (I) have been prep'd and the comparative mobility of the Cl atom in the presence of the various groups has been studied. Distn at 19 mm of the product formed by the action of dry HCl on CH₂ClCH₂CHO at -10° gave I and its trimer, which on distn yielded I, b. 170-1°, d₄ 1.40°, d₂₀ 1.175, M. R. 20 55 (calcd 20.94). The mixt. formed by the passage of 2 mols. of dry HCl into CH₂ClCH₂CHO in a large excess of MeOH was decanted from the aq. HCl layer, dist'd and dried over CaCl₂. The crude product was freed from the di-Cl deriv by the addn of a large excess of MeOH and, on distn, gave ClCH₂CH₂CH(OMe) (II), b. 51°, d₄ 1.061, n_D 1.427, M. R. 33 42 (calcd. 33.45). Treatment of II with dry HCl and distn of the product yielded ClCH₂CH₂CH(OMe)Cl (III), b. 55°, d₄ 1.180, n_D 1.450, M. R. 32 19 (calcd. 32.05). Similar treatment with dry HBr and rectification gave 3 fractions: trimethoxypropane, b. 45.6°, b. 140°, d₄ 0.942, n_D 1.400, M. R. 34 49 (calcd. 34.60). Cl₂BrCH₂CH(OMe)Br, b. 75°, d₄ 1.806, and BrCH₂CH₂CH(OMe), (IV), b. 58 60°, d₄ 1.311, n_D 1.475, M. R. 36 49 (calcd. 36.35). The enhanced activity of the Cl atom does not show itself in double decomp. reactions but by favoring the elimination of H with the consequent reestablishment of the double link of CH₂ClCH₂CHO. On refluxing with AcONa in AcOH, I regenerates CH₂ClCH₂CHO. Treatment with Ac₂O converted I into the diacetate, ClCH₂CH₂CH(OAc)₂, m. 47°, and gave also a mixt. of CH₂ClCH₂OAc and CH₂ClCH₂ClOAc, identified

by their Raman spectra. A further fraction consisting of a polymer of I, b. 170-75°, was also isolated. The extreme instability of the Cl group was also manifested in the attempts to prep. I by decarboxylation or by hydrolysis of the hemiacetal. A NaHSO₄ complex can be isolated but the aldehyde loses the hydroxide on sapon. of the complex with either dil. H₂SO₄ or NaHCO₃. Treatment of I with RMgX compds leaves the Cl atom intact and the trimer, in 36%, is totally inert to these reagents. II and IV also contain a very mobile halogen atom and, on treatment with PrONa, AcONa or even Ag₂O in the cold, split off HCl or HBr. However, the action of KCN on IV gave NCCl₂CH₂CH(OMe)Ph, b. 91°, d₄ 0.992, n_D 1.416, M. R. 32 67 (calcd. 33.02), converted by treatment with MeMgBr into isonic acid, AcCH₂CH₂CH(OMe)₂, b. 85°, d₄ 0.983, n_D 1.421, M. R. 37 66 (calcd. 37.83). semicarbazone, m. 126°. Boiling IV with NH₃ in Me₂CO produced L₁NCH₂CH₂CH(OMe)₂, b. 85°, d₄ 0.888, n_D 1.415, M. R. 50 34 (calcd. 51.0). IV was unreactive to refluxing with MeMgBr for 8 hrs. Agitation of II with a 4-fold excess of benzene in the presence of AlCl₃, distn of the product and recrystn from 95% alc. yielded PhCH₂CH₂CH(OMe)Ph, C₁₄H₁₈O, m. 31°. III reacted vigorously with MeMgBr in the cold to give ClCH₂CH₂CH(OMe)Me, b. 125°, d₄ 0.964, n_D 1.515, M. R. 31.82 (calcd. 31.81), and with PhMgBr to form the analogous ClCH₂CH₂CH(OMe)Ph, b. 113 4°, d₄ 1.075, n_D 1.516, M. R. 51 76 (calcd. 51.31), which reacted with benzene in the presence of AlCl₃ to give a crude fraction, b. 170-40°, contg. PhCH₂CH₂CH(OMe)Ph, m. 31°. Attempts to cyclize III by boiling with Mg turnings in Et₂O and in Bu₂O failed. The results are discussed from the viewpoint of induced polarities, and the conclusion is drawn that the notion of the mobility of a group as a function of the structure of a mol. has little validity except in the surroundings of a well-defined reaction medium.

C. R. Addinall
Enolization as directed by acid and basic catalysts. III. The acid-catalyzed enolization of some secondary butyl ketones. Paul D. Bartlett and Charles H. Stauffer. *J. Am. Chem. Soc.* 57, 2580-94(1935), cf. *C. A.* 28, 3051f. —The competitive rates of enolization in the 2-EtMe-CHCOR, where R is Me, Et, cyclohexyl and benzyl, in glacial AcOH with HNO₃ as catalyst. The method has been checked with the observation that under these same conditions the rates of iodination and racemization of d-MeEtCHCOR are identical. The relationship between alkyl substitution and competitive enolization rate of an active II does not bear out any simple hypothesis of enolization mechanism previously advanced; it is opposite in menthone to what it is in the acyclic sec. Bu ketones.

C. J. West
Chemistry of the lipides of tubercle bacilli. XLII. The composition of the timothy bacillus wax. The isolation of d-2-eicosanol and d-2-octadecanol from the unsaponifiable matter of the timothy bacillus wax. Mary C. Pangborn and R. J. Anderson. *J. Am. Chem. Soc.* 58, 10-14(1936); cf. *C. A.* 30, 501f. —The wax of the timothy bacillus (*C. A.* 23, 941) was purified by pptn. with Me₂CO from Et₂O (8 times), it contains 0.29% P, 0.41% N, 1.7% ash, m. 45°, 1 no. 20.6, sapon. no. 60.0, [α]_D 15.1° (CHCl₃). Sapon. of 50 g. wax gave 10.9 g. fatty acids giving alc-sol K salts, 1.7 g. fatty acids giving H₂O-sol K salts, 8.5 g. acids giving alc-insol but Cl₂-sol K salts, 12.0 g. diacid alc., C₁₈H₃₄O₄ (I), 0.5 g. higher optically active alcs., 1.5 g. crude glycerol and 2.3 g. crude trihalole. I is obtained from the Cl₂-insol portion of the K salt and m. 60-7°, [α]_D 6.1°, mol wt 518, 1 no 15.2, the presence of a H₂O group is shown by the formation of the Ac deriv., m. 41°, [α]_D 8.1° (CHCl₃). Me ester, amorphous, m. 49°, [α]_D 6° (CHCl₃). Crystn of the optically active alc. fraction from MeOH (9 times) gives d-2-eicosanol, m. 62.6-3°, [α]_D 4.2° (CHCl₃). Ac deriv., m. 37-7°, [α]_D 1.5° (CHCl₃). Me deriv., m. 39-40°, acid phthalate, m. 60-1°, oxidation of the alc. gives 2-eicosanone (II), m. 58 9°, semi-

carbazone, m 128°, oxime, m 73-4°. The mother liquors give *d*-2-octadecanol, m 66°, $[\alpha]_D^{25}$ 5.7° (CHCl₃), 7.3° (C₆H₆), phenylurethan, m 72-3°, solidifies 66° and then m 70-7°, $[\alpha]_D^{25}$ 7.9° (CHCl₃), oxidation gives 2-octadecanone (III), m 52°. II and III are identical with the products prepd. by Morgan and Holmes (C. A. 19, 2807).

C. J. West
The saponins as a source of high molecular carboxylic acids. D. A. Shvedov, S. A. Kuzin and A. I. Andreeva. *Mosk. gos. univ. izvestiya* 1934, No. 5, 30-2, cf. C. A. 28, 59611. The saponins can be readily oxidized with HNO₃ to high-mol. carboxylic acids with a yield of 30-60%.

L. Bielous
Isotopic exchange reactions of organic compounds. I. The intermolecular nature of three-carbon tautomerism. D. J. G. Ives and H. N. Rydon. *J. Chem. Soc.* 1935, 1735-42, cf. C. A. 29, 432. The "equilibration" of vinylacetic (I) and crotonic acids (II) in the presence of 1.05 mols. of NaOH in dil. D₂O at 100° has been studied, as a check, the behavior of PrCO₂H (III) under the same conditions has also been examined. A method of isotopic analysis depending on d. dectms accurate to 1 part per million, applicable to small samples of H₂O and involving no loss, is described. The exptl. results show that, although there is no detectable interchange with II and III, substantial interchange occurs in the case of I, on the basis of the necessarily tentative assumption that no isotopic discrimination occurs, the results indicate that 1 of the propene H atoms of I undergoes isotopic interchange with the solvent. It is concluded that purely intramolecular mechanisms for this type of 3-C tautomerism are unacceptable.

C. J. West
Relative rates of ozonation of unsaturated compounds. C. R. Noller, J. I. Carson, H. Martin and K. S. Hawkins. *J. Am. Chem. Soc.* 58, 24-6 (1936).—Curves are given showing the relative rates of ozonation of a no. of unsatd. compds. Whereas a double bond, unaffected by the presence of other groups, adds O₃ extremely rapidly, the rate is markedly decreased when the double bond is conjugated with CO groups, 3 or more Ph groups or 2 Cl atoms attached to the doubly bound C atoms also decrease the rate of addn. Where 2 or 3 double bonds are conjugated with each other, 1 bond adds O₃ rapidly while the others add only slowly. In the case of *cis-trans* isomers, where the rate of addn. is decreased by other groups, the *trans*- is found to add more rapidly than the *cis* form. The procedure should prove valuable in the investigation of unsatd. compds. of unknown structure. Compds. studied include oleic acid, Me oleate, elaidic acid, 1-phenyl-1-cyclohexene, (CICH₂)₂, (PhC)₂, PhC₂CHPh, stilbene, vinylacetic acid, crotonic acid, cinnamic acid, crotonic aldehyde, itaconic acid, diphenylbutadiene, eleostearic acid, sorbic acid, citraconic acid, Me maleate, maleic acid, mesaconic acid and Me fumarate.

C. J. West
Decenoic acid, C₁₀H₁₈O₂, in sperm head oil. Yoshiyuki Toyama and Tomotaro Tsuchiya. *J. Chem. Soc. Japan* 56, 1313-15 (1935), cf. C. A. 30, 315, 316. Decenoic acid (I) is sepd. from sperm-head oil. Consts. bp. 143-8°, d₄²⁰ 0.9238, n_D²⁰ 1.4507, n_D²⁵ 1.4488, M. R. 49.56 (theory 49.45). Me decenoate in acetone is oxidized with KMnO₄ and the acid esters are saponified. The free acids liberated by sapon. are azelaic and formic acid. Therefore, the structure of I is Δ⁹-decenoic acid. Also in *Bull. Chem. Soc. Japan* 11, 26-9 (1936). K. Kutsuta.

Highly unsaturated alcohols in sperm-blubber oil. Yoshiyuki Toyama and Goroku Akiyama. *J. Chem. Soc. Japan* 56, 1316-19 (1935).—From the higher-boiling fraction of unsaponifiable substances of sperm blubber oil, an ether-insol. bromide (I) is prepd. Dehydrobromination of I gave a mixt. of highly unsatd. alcs (II). II was converted into an acetate, analysis of which indicated that it consisted of C₂₆H₄₄O and C₂₈H₄₆O. Also in *Bull. Chem. Soc. Japan* 11, 29-34 (1936). K. Kutsuta.

Catalysis in organic chemistry. V. Decomposition of esters and acids by anhydrous zinc chloride. H. W. Underwood, Jr., and O. L. Baril. *J. Am. Chem. Soc.* 57, 2720-30 (1935), cf. C. A. 25, 3619.—The Me, Et,

Pr and Bu esters of monobasic aliphatic acids were not affected by the catalyst; Am esters decomposed very slowly into an unsatd. hydrocarbon and the aliphatic acid, the rate of decompn. increases with the no. of C atoms in the alc. group. The aliphatic monobasic acids themselves are not affected by the catalyst. Esters of aliphatic acids are all decomposed, the dibasic acid reacting with the ZnCl₂ to form the Zn salt with evolution of HCl; the HCl forms the alkyl halide with the unsatd. hydrocarbon. Esters of aromatic acids decompose into an unsatd. hydrocarbon and the aromatic acid, which decomposes into CO₂ and a satd. hydrocarbon (if the acid is monobasic), dibasic acids form the anhydride; benzyl esters decompose into the acid and the PhCH₂ groups polymerize. All unsatd. hydrocarbons evolved, whether aliphatic or aromatic, polymerize. Esters and acids which did not dissolve the ZnCl₂ were not themselves decomposed.

C. J. West
Constitution of dimeric ketene. W. R. Angus, A. H. Leckie, C. G. Le Ièvre, R. J. W. Le Ièvre and A. Wassermann. *J. Chem. Soc.* 1935, 1751-5.—This study is an attempt to distinguish between the 3 possible formulas CH₂ CO CH₂ CO (I) = C(OH) CH CO CH₂ (II) = C(OH) CH C(OH) CH (III). The observed dipole

moment (3.16 in C₆H₆, 3.30 in CCl₄, both × 10¹⁹) and the mol. refraction ($[R]_D^{20} = 20.14$) are incompatible with I and III is excluded by the heat of combustion (5321 = 1.5 cal./g. (const. vol.)). The dimeric ketene must therefore exist predominantly in the keto-enol form (II). Forms I and III could nevertheless be present in comparatively small concns. Dissoln. of the ketene has no great effect on the Raman spectrum and, therefore, presumably, on the constitution. Raman spectra are given for the pure liquid and the soln. in CCl₄.

C. J. West
New method of preparation of acetic anhydride and homologs. V. M. Rodionov, A. I. Smirnov and T. A. Aleksova. *Khim. Farm. Prom.* 1935, No. 2, 102-6.—The method is based on the following scheme. 2AcONa + N₂O → Ac₂O + NaNO₂ + NaNO, L. N. Stability of pinacولات in liquid ammonia solution. Charles B. Wooster and Donald S. Latham. *J. Am. Chem. Soc.* 58, 76-8 (1936), cf. C. A. 29, 707.—The di-Na derivs. of pinacol (I) and acetophenone pinacol (II) may be prepd. by the action of NaNH₂ on these glycols in liquid NH₃. These pinacولات give no evidence of dissociation into metal alkyls. Na in liquid NH₃ replaces only 1 of the H atoms of I, it reacts extensively with II, not only replacing H but also cleaving the C—C bond.

C. J. West
1,4- and 1,5-Oxido compounds. Synthesis of 1,5-oxidodecane. Adolf Franke, Alfred Kroupa and Otto Schmid. *Monatsh.* 66, 400-32 (1935); cf. C. A. 26, 4031.—Details are given of the prepn. of Me(CH₂)₉COCH₂CO₂Et in 80% yield, it bp. 109-12°. The Na deriv. with (CH₃)₂Br₂ gives Me(CH₂)₉COCH₂[(CH₃)₂Br]CO₂Et, hydrolyzed by dil. HCl to Me(CH₂)₉CO(CH₂)₂OH (II), which is difficult to isolate at this stage and is converted to anhydride 1,5-ol-5-one (II), bp. 190-202°. With H₂O II readily gives pure decan-1-ol-5-one (I), bp. 144-8°, m. 24-5-3°, the mol. refraction corresponds to the open-chain formula. Oxidation of 1.254 g. I with CrO₃ in AcOH gives 0.5 g. δ-ketocaproic acid (III), m. 56-4° and 0.27 g. of a neutral product, in 52°, an ester of I and III. Reduction of I with Na-Hg in LiOH yields 43% of decan-1,5-diol (IV), bp. 155-5-7°, m. 23-4°. Catalytic reduction of II with Pt gives 1,5-oxidodecane (V), bp. 198-5-200-5°, Br in CHCl₃ gives 1,5-dibromodecane, bp. 150-1-5°, which was transformed into the dinitrile and then to α-amylpimelic acid, whose diamide m. 161-5°. IV and 30% H₂SO₄ give some V but largely the unsatd. alc., C₁₀H₁₈O, b. 228-31°, which yields 40% V with 57% H₂SO₄ at 133° (CH₃)₂Br₂ (70 g.) and BrONa, heated 9 hrs. at 200°, give 25 g. 6-bromohexan-1-yl benzoate (VI), bp. 187-9°, and 10 g. hexamethyleneglycolbenzoate, m. 55-5-6°. VI and AcCHNaCO₂Et, followed by hydrolysis, give nonan-1-ol-8-one, m. 23-3-5°, this does not yield an oxide with

H_2PO_4 but a high-mol. compd. of unknown constitution.

C. J. West

Reduction of organic compounds by ethanalamines. M. Meltner, C. Wohlbeg and M. J. Kleiner. *J. Am. Chem. Soc.* 57, 2554 (1935).—The ethanalamines (preferably the diethanalamine) reduce anthraquinone to anthranol, Me_2CO to Me_2CHOH , azobenzene to $PhNH_2$, chrysoidin to 1,2,4- $C_6H_3(NH_2)_3$, $PhNO_2$ and o - ONC_6H_4Me to azo, azoxy and amino compds. The yields from the last 2 compds. under various conditions are given. The reaction depends on the decomposition of the NH_2 alc into NH_3 and an aldehyde.

C. J. West

Some derivatives of β -sulfolpropionic acid. Lucius A. Bigelow, Hugh W. Sigmon and David H. Wilcox, Jr. *J. Am. Chem. Soc.* 57, 2521-4 (1935).—The Ag salt of $HO_2SCH_2CH_2CO_2H$ (I), from I and Ag_2O , is anhyd., contrary to Rosenthal (*Ann.* 233, 15 (1889)), heating with MeI at 100° for 6.5 hrs gives 78% of the *Me ester*, b_p 172-3°, m 17°, *Et ester*, m 4° (78%), *Pr ester*, m -7° (86%), *Bu ester*, m -25° (96%), *phenylethyl ester*, m 80° (64%). $PhCH_2Br$, $PhCH_2I$ or phenacyl bromide did not react. The acid chloride (92% pure) m -9° ($\pm 1^\circ$). $PhNH_2$ gives the diamide, $PhNHCOCH_2CH_2SO_2NHPh$, m 161°. NH_3 in C_2H_5 gives 53% of *NH*, β -sulfolpropionamide, m 164-8°. $Ba(OH)_2$ gives the *Ba salt* in a quant. yield, with dil. H_2SO_4 it appears to give the di-*NH*, salt of I, pyrolysis of which at 111° and 3-4 mm gives a quant. yield of the acid *NH*, salt of I.

C. J. West

Preparation of some of the lower alkyl sulfonic acids. D. L. Vivian and E. Emmet Reid. *J. Am. Chem. Soc.* 57, 2559-60 (1935).—*Propylsulfonic acid*, b_p 136°, m 7.5°, d_4^{25} 1.2516, *Bu homolog*, b_p 147°, m -15.2°, d 1.1909, *Am homolog*, b_p 163°, m 15.9°, d 1.226, *hexyl homolog*, b_p 174°, m 16.1°, d 1.1047. The *Bu* compd was prep'd by oxidation of $BuSH$ with conc'd HNO_3 , the others were obtained from *Ba* salts with H_2SO_4 . The *m* ps are compared with those of RCO_2H . *Butanesulfonyl chloride*, b_p 90°, d_4^{25} 1.2140, d_4^{25} 1.2404. The *Bu* acid did not react with C_2H_5 at 80° ; the $PhNH_2$ salt of the acid, m 162°, did not undergo any change at 130° in several hrs.

C. J. West

Preparation and properties of β -alkylcholone chlorides and their acetyl esters. Randolph T. Major and Howard T. Bonnett. *J. Am. Chem. Soc.* 58, 22-4 (1936).—1-*Chlorononan-2-ol*, b_p 114.5-6.5°. 1-*Dimethylammonioalkan-2-ols* were prep'd from the appropriate chlorohydrin with 2 mols. Me_2NH in C_2H_5 at $115-20^\circ$ for 15 hrs. *Mer-NCH_2CH(OH)R*, where *R* is *Et*, b_p 142-4°, *Pr*, b_p 73-4°, *Bu*, b_p 89-90°, C_6H_{13} , b_p 99-101°, C_6H_{15} , b_p 104-6°. The methiodides were prep'd in the usual manner. *Me-NCH_2CH(OH)R*, where *R* is *Et*, m 162-3°, *Pr*, m 193-200°, *Bu*, m 90-2°, *Am*, m 98-100°, C_6H_{13} , m 109-10°, C_6H_{15} , m 122.5-3.5°. The corresponding chlorides: *Et*, m 174-6°, *Pr*, m 115-17°, *Bu*, m 100.5-2°, *Am*, m 72-4°, C_6H_{13} , m 69-71°, C_6H_{15} , m 97-9°. *Ac derivs* of the chlorides *Et*, m 144-6°; *Pr*, m 163-9°; *Bu*, m 188-7°; *Am*, m 182-4°, C_6H_{13} , m 169-71°; C_6H_{15} , m 178-7°. A preliminary report upon the pharmacol. action of these compds is presented.

C. J. West

Experiments on the direct esterification of higher fatty acids with glycerol and with ethylene glycol. T. P. Hilditch and J. G. Rigg. *J. Chem. Soc.* 1935, 1774-8.—In the direct esterification of higher fatty acids with $C_2H_5(OH)$ or $C_2H_4(OH)_2$, the yield of monoglycerides can be very much increased by employing a medium in which both the alc and acid are freely sol., such as $PhOH$ or MeC_6H_4OH . In expts using a wt. of $PhOH$ equal to the wt. of acid much higher yields of monoglyceride are obtainable, according to the temp., time of reaction and the ratio of $C_2H_5(OH)$ to acid in the reaction mixt.; in the most favorable circumstances the product may contain about 90% of monoglyceride. The presence of β - $C_6H_5SO_3H$ considerably increases the total yield of esters but causes some diminution of the proportion of monoglyceride. Reichler's camphor- β -sulfonic acid is a more efficient catalyst but it also lowers somewhat the percentage of monoglyceride. The higher the temp. the

greater the total yield but the percentage of monoglyceride again falls. The variations in the conditions of reaction have less effect on the yield of monoglycerides in the case of stearic and oleic acids than in the case of acids of lower mol. wt. With $C_2H_5(OH)$, the total yield of esters and the proportion of monoacylated glycol therein were larger than in expts with $C_2H_4(OH)_2$, under the same conditions. Pure monolaurin or monopalmitin may be prep'd by crystn from Et_2O at 0° . Almost exclusive formation of a monoglyceride takes place in this reaction. Details of many expts are given.

C. J. West

A new methylxethyl. Joseph Wiemann. *Compt. rend.* 201, 1399-4 (1935). cf. *C. A.* 29, 3651^r.—Treatment of crude vinylpropenyl glycol (I) with $PhNCO$ gave a phenylurethane which, on sapon with $Ba(OH)_2$, yielded a liquid (II), b_p 111°, d_4^{25} 0.9344, n_D^{25} 1.4800, *M* 36.57 (calcd. 36.64) corresponding to that of a vinylpropenyl glycol. Treatment of 1.8 g of II with 1.7 g of $AgClO_4$ in 250 cc. of H_2O in the presence of 0.05 g of O_2O_2 gave 0.5 g of a methylxethyl (III), $Me[CH(OH)]_2CH_2OH$, m 127°, which formed a mixt. of dibenzoz and tribenzoz acetals, m 151°, on heating with BzH . I is evidently a mixt. of 2 diastereoisomers which yields 2 phenylurethanes and 2 methylxethyls, m 190° and 127°. III is the more fusible and is derived from the glycol forming the least sol. phenylurethane, and it is concluded that it has the steric formula $MeCH(OH)[CH(HO)]_2CH_2OH$ identical from the 3rd C atom with that of allitol.

C. R. Addinall

The preparation of pure sorbitol and sorbose and the influence of this ketose on the conductivity of boric acid. J. Boeseken and J. L. Leefers. *Rec. trav. chim.* 54, 851-5 (1935).—With a special catalyst (Ni , Co and Cr on $Ca_3(PO_4)_2$), glucose (100 g) in 500 cc. of $EtOH$ was reduced completely to sorbitol (I) in 1-2 hrs. at 150° with 150 atm of H_2 . I was purified by prep'd monobenzoxy-sorbitol, m 163-8°, from which I was obtained by hydrolysis. I in the presence of a culture of *Acetobacter suboxydans* was oxidized to sorbose (II) under carefully controlled conditions. The sp. cond of II (0.1 M) was 4.2×10^{-4} mho, changing to 6.1×10^{-4} mho in 21 min. The sp. cond of II (0.1 M) in H_2BO_3 (0.1 M) soln was 229×10^{-4} mho, a change which can be observed to a lesser extent with fructose.

E. W. Scott

α -Caprolactone. F. J. Van Natta, J. W. Hill and W. H. Carothers. *J. Am. Chem. Soc.* 58, 183 (1936).—A reply to Stoll and Rouve's criticisms (*C. A.* 30, 1361^r) of recent work (*C. A.* 28, 1603^r).

C. J. West

Odor and constitution. Some γ -substituted γ -butyrolactones. B. Rothstein. *Bull. soc. chim.* [5], 2, 1936-44 (1935), cf. *C. A.* 29, 3308^r.—The condensation of a series of monoalkyl-substituted ethylene oxides with $NaCH_3CO_2Et$ (I) has provided a new method of synthesis of γ -substituted γ -butyrolactones, of which several are already known and used in perfumery. A series of chlorohydrins, $RC[CH_2(OH)]CH_2Cl$, was prep'd by the method of Detoeuf (*C. A.* 16, 2113), which gave 40-60% yields contaminated with the difficultly separable *di-Cl* derivs., and in which the rate of reaction diminished with increasing mol. wt. of the ethylene hydrocarbon. The following phys. data are tabulated for the designated *R* substituent: *Bu*, b_p 73-5°, n_D^{25} 1.4478, d_4^{25} 0.9139, *M* 36.02 (calcd. 36.30), *iso-Am*, b_p 85-7°, n_D^{25} 1.4475, d_4^{25} 0.9310, *M* 40.62 (calcd. 40.91), *Am*, b_p 91-2°, n_D^{25} 1.4489, d_4^{25} 0.9316, *M* 40.70 (calcd. 40.91); Me_2CH- (CH_3), b_p 99-100°, n_D^{25} 1.4508, d_4^{25} 0.9774, *M* 45.30 (calcd. 45.53). The ethylene oxides, $RC[CH_2O]$

where *R* is *Bu* (II), *iso-Am* (III), *Am* (IV) and Me_2CH- (CH_3) (V) were prep'd by heating the corresponding chlorohydrins with $NaOH$ (36% *Bz*) at 40° for 2 hrs with stirring. Theoretical yields of oxides where *R* is $Me(CH_2)_4$ (VI), $Me(CH_2)_3$ (VII), $Me(CH_2)_2$ (VIII), $Me(CH_2)$ (IX) and $Me(CH_3)$ (X) were obtained by the action of Bz_2O_2H on a 50% excess of 1,2-ethylenes in $CHCl_3$. The following consts are tabulated: II, b_p 123-4°, n_D^{25} 1.4093, d_4^{25} 0.8456, *M* 29.25 (calcd. 29.32); III, b_p 54-5°, n_D^{25} 1.4135, d_4^{25} 0.8339, *M* 33.97 (calcd. 33.97); IV, b_p 43-4°, n_D^{25} 1.4148, d_4^{25} 0.8362, *M* 33.97 (calcd. 33.97); V, b_p 43-4°, n_D^{25} 1.4148, d_4^{25} 0.8362, *M* 33.97 (calcd. 33.97).

34.12 (calcd 33.97), V, b_{11} 62-3°, n_D^{20} 1.4230, d_4^{20} 0.8481, M R 38.43 (calcd 38.58), VI, b_{11} 75°, n_D^{20} 1.4250, d_4^{20} 0.8374, M R 43.36 (calcd 43.20); VII, b_{11} 64°, n_D^{20} 1.4296, d_4^{20} 0.8401, M R 47.93 (calcd 47.82), VIII, b_{11} 105°, n_D^{20} 1.4330, d_4^{20} 0.8415, M R 52.62 (calcd 52.44), IX, b_{11} 124-5°, n_D^{20} 1.4355, d_4^{20} 0.8402, M R 57.20 (calcd 57.04), X, b_{11} 139-9°, n_D^{20} 1.4380, d_4^{20} 0.8414, M R 61.77 (calcd 61.68). A soln of 1 mol of ethylene oxide in an abs alc soln of 1 mol of I was kept at room temp for 2 hrs and was then boiled for several hrs. After the addn of the necessary NaOH the reaction mixt was saponified by boiling for several hrs longer. The alc was removed and after diln and extrn with Et₂O the soln was acidified with dil H₂SO₄. The acid was extrd with Et₂O and the washed and dried ext was evapd and distd *in vacuo*, giving 70% yields of the lactones, 1,4-octanolide, b_{11} 127°, n_D^{20} 1.4511, d_4^{20} 0.9796, M R 38.58 (calcd 38.79), 1,1-nonanolide, b_{11} 136°, n_D^{20} 1.4462, d_4^{20} 0.9672, M R 43.02 (calcd 43.23) (hydroxynolactone, m 84°), odor of coco faintly tinged with amineol, 7-methyl-1,4-octanolide, b_{11} 136°, n_D^{20} 1.4452, d_4^{20} 0.9620, M R 43.17 (calcd 43.21), odor of essence of angelica seed, 8-methyl-1,4-octanolide, b_{11} 145°, n_D^{20} 1.4462, d_4^{20} 0.9513, M R 47.63 (calcd 47.83), peach odor, 1,4-undecanolide, b_{11} 162°, n_D^{20} 1.4512, d_4^{20} 0.9494, M R 52.21 (calcd 52.44) (hydroxynolactone, m 94-5°), strong peach-like odor, on which account and its relatively low price it is used as a base in many perfumes, 1,4-dodecanolide, b_{11} 130°, n_D^{20} 1.4522, d_4^{20} 0.9393, M R 56.95 (calcd 57.07), slightly musk, peach like odor but heavier than the previous lactone, 1,4-tridecanolide, b_{11} 142-3°, n_D^{20} 1.4532, d_4^{20} 0.9312, M R 61.57 (calcd 61.68), 1,4-tetradecanolide, m 29°, b_{11} 140°, b_{12} 193°, 1,4-pentadecanolide, m 32°, b_{12} 159°. Sapon of the corresponding lactones gave hydroxydodecanic and hydroxytridecanic acids, m 63° and 66°, resp. I opens the O-bridge of the substituted ethylene oxides and fixes the HC(CO₂Et)₂ group on the least substituted C atom. The above series shows that in a homologous series there are about 3 members which have fundamentally the same odor, modified by slight nuances. The branched-chain isomer has generally the same odor as the straight-chain compd but with a decided note of fresh green leaf. The γ -substituted butyrolactones from C₁₁ to C₁₄ are similar to their α isomers in possessing an odor of musk and pear though the latter are stronger and more lasting. C R A

Multivalent amino acids and peptides V. Cystine
 cyamidine Jesse P Greenstein *J Biol Chem* 112, 75-8 (1935), cf. C A 29, 7761¹.—The cyamidine deriv of cystine, anhydro- α,α' -disulfanodisulfide (β -thiopropionic acid) is easily prepd by heating diguanidocystine with concd HCl, then adding ice-cold 3 N NH₄OH to the soln of the HCl salt, it darkens above 240°. HCl salt, m 160°, half m 188°. It is extremely sensitive to alkali like all ring compds involving the disulfide linkage, and yields Na₂S, pyruvic acid and guanidine, the latter substance being destroyed during the reaction with evolution of NH₃. VI The action of proteolytic enzymes on certain synthetic substrates *Ibid* 57 22 (1936).—The diketopiperazine, anhydro-1-lysyl-1-glutamic amide, is completely resistant to pepsin, trypsin and papain-HCN and anhydrominotricarballylic tetramide is not attacked by papain HCN. While these results are not sufficient in themselves to discredit the diketopiperazine hypothesis, they do imply that considerable caution should be exercised in applying the anhydride structure to the proteins 1-Lysyl-1-glutamic acid and 1-lysyl-1-histidine are hydrolyzed by yeast peptidase, the latter more slowly than the former. Glycyl- β - α -aminocarballylic acid is slowly split by yeast and intestinal erepsin but is resistant to carboxy peptidase. A P Lothrop

Synthesis of fumaric acid A M Bulligina *Maifobolno Zhivoe Delo* 1934, No 4, 43—The prepn of C₄H₂(CO₂H)₂ by oxidation of furaluril with NaClO₂, with V₂O₅ as catalyst, was carried out on a semi-com scale. Yield 74%. F Bielowski

Amino acids and related compounds X. Electrolytic oxidation of aspartic acid and malonic acid Yoshitane

Takayama and Saburo Miduno. *J. Chem. Soc. Japan* 56, 1490-3 (1935); cf. C. A. 29, 7973¹.—Use of a PtO₂ anode and aspartic acid (I) in dil H₂SO₄ at 35° gives 10.8 mol % of HCO₂H, 1.4 mol % malonic acid (II) and a small amt. of succinic acid (III), NH₃ and CO₂. The same treatment on II gives HCO₂H and CO₂. The course of decompn. of I is the first oxidation product is malonic semialdehyde which decomposes to give II, and II gives HCO₂H through HCHO. It is possible that 2 mols of II give a mol. of III. K Kutsuta

Allomucic acid and a new tetrahydroxydicarboxylic acid
 Théodore Posternak. *Helv Chim Acta* 18, 1233-7 (1935), cf. C. A. 29, 5817¹.—The m p of synthetic *dl*-talomucic acid (I) is not lowered on mixing with *dl*-talomucic acid prepd by epimerization of mucic acid with pyridine (Fischer's allomucic acid). 0.7 g I dissolves in 100 cc H₂O, the antipodes are sol. in 3-4 parts H₂O. Di Et ester of I, prepd by each of the above methods, m 133-141°, mixed m p 138-140°. *d*-Allomucic acid (II) (cf. Levene and Jacobs, C. A. 5, 507) was prepd by the method of Austin and Hummoller (C. A. 28, 4383²). The new tetrahydroxydicarboxylic acid (III) was obtained in 0.6 g yield by HNO₃ (d 1.15) oxidation of 1 g of the lactone of II. III, m 197-8° (decompn) (heating slowly), is slightly sol. in H₂O, insol in alc and ether. The Na salt of III is quite sol. in H₂O, this soln is optically inactive. III forms a di Et ester, m 153-4°, a monolactone, m 200-1° (decompn), sol in H₂O, slightly sol. in alc. and EtOAc, and a diphenylhydrazide, m 227-229° (decompn). W. Gordon Rose

The formation of hydrocyanic acid from organic compounds, in the presence of ammoniacal cupric sulfate
 Jacques Parrot. *Compt rend* 201, 993-5 (1935).—Several compds were studied by use of the method previously described (C. A. 29, 5818¹). The following nos express the no of mols HCN obtained from 100 C atoms in the substance, in 8 hrs (1) at 58-62°, α -glucoheptose 2.6, *d*-fructose 17.5, *d*-sorbitose 15.6, *d*-glucose 5.0, *d*-mannose 3.1, *d*-galactose 0.3, glucosamine-HCl salt 12.7, *l*-arabinose 3.0, *l*-xylose 3.3, mesoxalic acid 16.6, tartaric acid 13.0, glyoxal 3.5, glyoxylic acid 18.4, lactose, maltose, sucrose, rhamnose, gluconic acid, tartaric acid, oxalic acid, formaldehyde and pyrogallol 0.0, (2) at 80-85°, lactose 2.5, maltose 2.6, rhamnose 8.5, glyoxylic acid 20.2, sucrose, gluconic acid, pyruvic acid, oxalic acid, formic acid, glycerol, alanine, formaldehyde, pyrogallol and hydroquinone 0.0. HCN is formed by the action of NH₃-CuSO₄ on reducing sugars, and similar substances. W. Gordon Rose

Mechanism and heat of polymerization of fulmic acid V Fulmic acid
 Kurt Sennewald and Lothar Breckenbach. *Ann* 520, 201-34 (1935), cf. C. A. 29, 123¹.—S and B measure the rate and heat of polymerization of fulmic acid (I) at room temp in H₂O solns and with various concns of H₂SO₄. I polymerizes by a *see order* reaction to dicyanodiamide (II), and II reacts further, mostly with I to give a trimer (HONC), (III), and partly with itself to give isocyanamic acid (IV). With decreasing concns of mineral acids, the rate of formation of II and III increases, but more in the case of III, thus decreasing the amt of IV formed. In the total absence of mineral acid, only III is formed, and the reaction appears to be trimol. The formation of II instead of isomutroacetonitrile oxide, as postulated by Wieland (C. A. 19, 2807¹) is demonstrated by the addn of halogen acids. AgONC in H₂O is treated with HCl, the soln filtered, extrd with Et₂O, and after distn the residue is washed with H₂O, and dried, giving chloroglyoxime, m 152.5°. Similarly, bromoglyoxime, m 158° (anti-diacetate, m 100°), and iodoglyoxime, m 163°, are prepd. G. Calmgaert

Dicyanodiamide
 F Chastelain. *Helv Chim Acta* 18, 1237-1302 (1935).—A crit. review is given of the literature on dicyanodiamide (I). Alk hydrolysis of I is believed to be a bimol reaction, since the rate of liberation of NH₃ is the same when the mol proportions of NaOH and I are reversed. C believes that I exists in a tautomeric equl between the forms HN C NH C (NH) NH

(II) and $\text{H}_2\text{NC}(\cdot\text{NH})\text{NHCN}$ (III). Only II is present in alk. solns., and this is the preferred mode of representing I in the solid state and in neutral solns. III exists in acid solns.

Several derivatives formed by the action of phosgene, chloroformates and chloromethyl carbonates on cholesterol. André Kling and Maurice Rouilly *Compt. rend.* 201, 782-4 (1935).—Cholesterol (I) with COCl_2 gave only cholesterol chloroformate, in 114% CICO_2Me did not react with I. The ester formed by treating I with $\text{CICO}_2\text{CH}_2\text{Cl}$ was unstable. I with $\text{CICO}_2\text{CH}_2\text{Cl}$ and with $\text{CICO}_2\text{CCl}_3$ gave dichloromethyl cholesterol carbonate, in 85%, and trichloromethyl cholesterol carbonate, in 107%. The facility of reaction of the chlorinated Me chloroformates with I increased as the no. of Cl atoms was increased. $\text{CO}(\text{OCCl}_3)_2$ was still more active. These results confirmed the explanation offered by K. (C. A. 28, 1793) for pulmonary effects caused by inhalation of suffocating gases.

E. W. Scott
Application of xanthate reaction to dehydration of binary α -glycols. V. A. Fomin *J. Gen. Chem.* (U. S. S. R.) 5, 1192-4 (1935).—The absence of isomerization in the dehydration of secondary and tertiary alcs. by the thermal decarboxylation of the corresponding ethers of xanthic acid (cf. Chugaev, *Ber.* 34, 2276 (1901), 35, 2470, 2012 (1902)) made the use of this method of dehydration of α -glycols interesting, because all other methods result in a radical change of the hydrocarbon skeleton. The pinacol deriv. of Me xanthate, $\text{Me}_2\text{C}(\text{OCS}_2\text{Me})\text{C}(\text{OH})\text{Me}$, is decomposed in the process of formation without α -pin of COS and with the formation of MeS and the heterocyclic

stable compd. $\text{S} \cdot \text{C} \cdot \text{O} \cdot \text{CMe}_2 \cdot \text{CMe}_2 \cdot \text{O}$ (I), in 176% (Me_2CO) (sealed tube) I, heated with concd. KOH, gives pinacol hydrate, K_2CO_3 and K_2S . The hydrate and I, heated with H_2SO_4 , give pinacolone. A mixt. of 50 g. of dry pinacol in 500 g. xylene with 20 g. K. is refluxed for 25 hrs. The cold soln. of K pinacolate is treated with 85 g. of CS_2 with shaking and then heated on a water bath for 4 hrs. After addition of 80 g. of MeI and refluxing for 6 hrs., the reaction mixt. is steam-distd. to expel the xylene and the I in the distn. flask is boiled with C. Chas. Blanc.

Reduction of nitroguanidine. II. Preparation and properties of nitroguanidine. V. J. Sabetta, David Hummelford and G. B. L. Smith *J. Am. Chem. Soc.* 57, 2478-9 (1935); cf. C. A. 26, 2442.—Reduction of nitroguanidine with Zn in 1.5% NH_4Cl gives 40-60% of the NO deriv. (I). Soln. of I in g. per 100 g. H_2O : 5°, 0.093; 15°, 0.118; 20°, 0.154; 25°, 0.185; 30°, 0.216; 40°, 0.305; 50°, 0.527; 72°, 1.23; 73°, 1.41. The intensity of the yellow color of an soln. is proportional to the concn. at const. temp. and p_H between 6 and 10; at 10° the color intensity is 70% of that at 40° and at p_H 2 and 12 it is 80% of that at p_H 7. I detonates at 161°, it may be detonated on the hand without injury. The isoelec. point of I is near p_H 7. The decomposition in acid, neutral and basic soln. is monomol or pseudo-monomol. The energy of activation in acid and basic solns. is about 19,000 cal. per mol. and is probably somewhat higher in neutral solns. I may be analyzed by titration with KMnO_4 ; 4 other analytical methods are indicated. III. Synthesis of aminoguanidine. G. B. L. Smith and Edward Anzelmi *Ibid.* 2730.—Me isothiourea sulfate and $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ in H_2O at 10° give 90% of aminoguanidine sulfate, with 1 mol. H_2O , in 206% (decompn.), it is a strong base, A_9 estimated as 1×10^{-4} . IV. Preparation of nitroguanidine by catalytic hydrogenation. Eugene Lieber and G. B. L. Smith. *Ibid.* 2749-80.—Catalytic reduction of nitroguanidine with Adams' Pt oxide catalyst gives 55-60% NO deriv. and with Raney Ni catalyst 36-44%. H_2O is the most satisfactory for the Pt catalyst and is suitable for the Ni catalyst, though MeOH gives somewhat higher absorption rates with the latter. The optimum temp. is 25-35° and a decrease or increase of 10° results in a lowering of the rate of H_2 absorption of 40-70%. With the Ni catalyst the optm. ratio is 0.5 g. of catalyst mass to 1 g. NO_2 compd.

C. J. West

Colored compound formed in the Sullivan reaction for guanidine. M. X. Sullivan and W. C. Hess. *J. Am. Chem. Soc.* 58, 47-8 (1936).—The N detn. and the products of acid hydrolysis indicate that the colored compd. formed in the Sullivan reaction for guanidine is 4-guanidino-1,2-naphthoquinone. Hydrolysis yields guanidine and hydroxy-naphthoquinone. The guanidine deriv. of β -naphthoquinone, $\text{C}_{11}\text{H}_7\text{N}_3\text{O}$, m. 263-7° (decompn.), and on hydrolysis yields more or less α - $\text{C}_{11}\text{H}_7\text{O}$.

C. J. West

Barbituric acid derivatives. II. A comparison of 2-mercapto compounds of 4-amino-5-methylthio-barbituric acid and 5-methylthio-barbituric acid. Takeichi Nishikawa *J. Chem. Soc. Japan* 56, 1497-04 (1935); cf. C. A. 29, 7947.—Compds. are prep'd by replacing the 2-H of 4-amino-5-methylthio- and 5-methylthio-barbituric acid by Me, Et, Pr, Bu and iso-Bu groups and their m. ps., d, soly., cond., p_H and the extent of exfoliation are estd. The differences in these properties are explained by the fact that the imino group gives stronger basicity and has larger space to be occupied than the keto group when the corresponding 4-imino and 4-keto compds. are compared. In a similar manner, the change in properties of the homologous series of 4-imino and 4-keto compds. are explained from the facts that the pos. character and the vol. to be occupied by the alkyl group in the 2-position are increased with an increase in the no. of C atoms.

K. Kutsuta

Synthesis of 1-d-glucosidocytosine. Guido E. Hilbert and Eugene J. Jansen *J. Am. Chem. Soc.* 58, 60-2 (1936).—2,4-Diethoxypyrimidine (50 g.) and 50 g. acetobromoglucose, heated at 65° overnight, give 28 g. of 1,2-dihydro-2-keto-4-ethoxy-1-tetraacetyl-d-glucosidopyrimidine (I), in 206% (cor), $[\alpha]_D^{25}$ 36.1° (c 12 in CHCl_3); EtOH-HCl and I form 1-d-glucosidouracil, heating I (3 g.) with EtOH-NH_3 (satd. at 0°) at 80° for 96 hrs. gives 2.06 g. 1-d-glucosidocytosine (II), with $\frac{1}{2}$ EtOH , in 197-9% (decompn.), the hydrate m. about 128° and readily loses H_2O at 100° and 1 mm., anhyd. II is extremely hygroscopic and in 24 hrs. gains 0.6% of its wt. in H_2O , crystn. from 80-5% EtOH gives a product with both EtOH and H_2O , m. 194-5° (decompn.), $[\alpha]_D^{25}$ 23.7° (H_2O , c 2.8), anhyd., $[\alpha]_D^{25}$ 25.6° (H_2O , c 1.8); picrate, m. 216-8° (decompn.), nitrate, with 1 mol. H_2O , m. 143° (decompn.), $[\alpha]_D^{25}$ 21.3° (H_2O , c 2.3). II hydrate and Ac_2O with $\text{C}_6\text{H}_5\text{N}$ give 1-tetraacetyl-d-glucoside-7-acetylcytosine, m. 225°, $[\alpha]_D^{25}$ 38.1° (CHCl_3 , c 1.7). The chem. properties of II are in general quite similar to those of cytidine.

C. J. West

Cardiac glucosides. XII. Empirical formulas of scillardin A and its derivatives. A. Stoll, A. Hofmann and J. Feyer *Helv. Chim. Acta* 18, 1247-51 (1935).—From mol. wt. detns., by titrimetric methods, of various acids of the bile and scillardin groups it is concluded that scillardin A (I), the aglucon of scillaren A, contains only 24 C atoms and is in agreement with the simple bile acids. The formula, $\text{C}_{24}\text{H}_{40}\text{O}_7$, formerly proposed for I is, accordingly, altered to $\text{C}_{24}\text{H}_{40}\text{O}_7$. The titrations were carried out by dissolving the compd. in 95% alc. and titrating with 0.1 N NaOH in the presence of phenolphthalein, allowance being made for the alkyl. of the solvent (0.1-0.3 cc. of 0.1 N NaOH). Details of exptl. results for allocholanolic, isoscillardinic (A), cholanic, dehydrocholanic and hyodehydrodesoxycholic acids are given. Values agreeing for mol. wts. corresponding to $\text{C}_{24}\text{H}_{40}\text{O}_7$, $\text{C}_{24}\text{H}_{40}\text{O}_8$, $\text{C}_{24}\text{H}_{40}\text{O}_9$, $\text{C}_{24}\text{H}_{40}\text{O}_{10}$, $\text{C}_{24}\text{H}_{40}\text{O}_{11}$ and $\text{C}_{24}\text{H}_{40}\text{O}_{12}$ were found. New formulas for the following compds. previously described in this series of investigations during the years 1933-5 are: scillaren A, $\text{C}_{24}\text{H}_{40}\text{O}_8$, proscillardin A, $\text{C}_{24}\text{H}_{40}\text{O}_9$; anhydroscillardin A, $\text{C}_{24}\text{H}_{40}\text{O}_7$, isoscillardinic acid A, $\text{C}_{24}\text{H}_{40}\text{O}_8$, methyl-scillardinic acid A, $\text{C}_{24}\text{H}_{40}\text{O}_9$, scillanic acid A, $\text{C}_{24}\text{H}_{40}\text{O}_{10}$; octahydrodesoxy-scillardinic acid A, $\text{C}_{24}\text{H}_{40}\text{O}_{11}$, methyl-scillarenic acid A, $\text{C}_{24}\text{H}_{40}\text{O}_{12}$, isoscillarenic acid A, $\text{C}_{24}\text{H}_{40}\text{O}_{13}$, hexahydrodesoxy-scillarenic acid A, $\text{C}_{24}\text{H}_{40}\text{O}_{14}$, hexahydrodesoxy-proscillardinic acid A, $\text{C}_{24}\text{H}_{40}\text{O}_{15}$.

C. R. Addinall

Ring-closure studies in the sugar benzoates. M. L. Wolfson and Clarence C. Christman. *J. Am. Chem. Soc.*

58, 39-43 (1936).—This work is a continuation of the ring closure studies in acylated sugar derivs (C. A. 29, 744⁹, 3313⁹). *l*-Arabinose (10 g) and 35 cc BzCl in 75 cc $\text{C}_6\text{H}_5\text{N}$ (the soln of the sugar in the $\text{C}_6\text{H}_5\text{N}$ is allowed to stand 24 hrs at room temp before the BzCl is added) give α -*l*-arabinose tetraacetate (I), m 160-1°, $[\alpha]_D^{25}$ 112.5° (CHCl_3 , c 4), the β -isomer in 173-4°, $[\alpha]_D^{25}$ 125° (CHCl_3 , c 4). A mixt of 25 g I and 100 g HBr in 200 cc AcOH , allowed to stand overnight, gives 10.5 g benzobromo-*l*-arabinose (II), m 114-5°, $[\alpha]_D^{25}$ 204° (CHCl_3 , c 2). *l*-Arabinose di-Me mercaptal (17 g) and Ph_2CCl in $\text{C}_6\text{H}_5\text{N}$, allowed to stand at room temp for 30 hrs and then treated with BzCl and $\text{C}_6\text{H}_5\text{N}$, give 35 g of trityl-*l*-arabinose di-*l*-*l* mercaptal triacetate, m 111-12°, $[\alpha]_D^{25}$ -25° (CHCl_3 , c 4), hydrolysis with HBr-AcOH followed by the action of HgCl_2 , CdCl_2 in Me_2CO gives *l*-arabinose triacetate, m 162-3°, $[\alpha]_D^{25}$ 236° (CHCl_3 , c 4), in $\text{C}_6\text{H}_5\text{N}$ (c 4) the value changes from 143° to 196° in 12 hrs, the same compd results by hydrolysis of the Br atom in II the action of BzCl gives I. *d*-Galactose di-*l*-*l* mercaptal triacetate, m 127-8°, $[\alpha]_D^{25}$ -16.5° (CHCl_3 , c 4), results in 13 g yield from 25 g of the trityl deriv, HBr in CHCl_3 gives the 6-*Br* deriv, m 103-4°, $[\alpha]_D^{25}$ -1.4° (CHCl_3 , c 4), *d*-galactose tetraacetate methyl alcoholate, m 112-13°, $[\alpha]_D^{25}$ 6.5° (CHCl_3 , c 4), α -*d*-galactose pentaacetate, m 124-0°, $[\alpha]_D^{25}$ 187° (CHCl_3 , c 4). Trityl-*d*-mannose di-*l*-*l* mercaptal triacetate, m 105-6°, $[\alpha]_D^{25}$ 0°, $[\alpha]_D^{25}$ -10.5° (CHCl_3 , c 3.5), the corresponding triacetate, m 133.5-4.5°, $[\alpha]_D^{25}$ 36° (CHCl_3 , c 4). *d*-Mannose di-*l*-*l* mercaptal triacetate, m 110-17°, $[\alpha]_D^{25}$ -5° (CHCl_3 , c 2), *d*-mannose tetraacetate, amorphous, $[\alpha]_D^{25}$ -115° (CHCl_3 , c 2.3). The prepn of aldehyde-*d*-glucose pentaacetate, m 81-2°, $[\alpha]_D^{25}$ 40° (EtOH , c 1), from the di-*Ph* mercaptal is described. C. J. West.

Constitution of osazones. Lewis L. Fingel. *J. Am. Chem. Soc.* 57, 2419-23 (1935).—The spectral absorption characteristics of the sugar osazones are practically identical and in concert with the structures originally suggested by Fischer. The bisphenylhydrazones of methylglyoxal and dimethylglyoxal have practically coincident absorption curves, the differences from those of the sugar osazones are ascribable to the presence in the latter of an O atom on the neighboring C atom. Osazones are readily susceptible to hydrolysis under mild conditions, the mutarotation of sugar osazones appears to depend upon the establishment of an equilibrium between them and their hydrolysis products. It was hoped that the question of the ring could be settled by a study of the methylation products of glucose phenylsazone but in no case was it possible to obtain homogeneous cryst products, Me_2SO , and alkali in dioxane yielded sirupy products with MeO contents from 16.3 to 22.6% and cryst mixts having 14 to 20.7% MeO , basic products, comprising *N*-methylated osazones and PhNHNHMe , were always formed. Methylation of partially methylated material with MeI and Ag_2O or Ag_2CO_3 caused considerable decomposition. Neither methylation of partially acetylated glucose phenylsazone with Me_2SO , and alkali nor treatment of a partially methylated sirup with Na K alloy followed by Me_2SO , led to satisfactory results. Methylation of fructose methylphenylsazone (I) by the liquid NH_3 method led to cleavage of the *N-N* linkage instead of methylation of the NH groups I and PhNHNHMe in MeOH after 1 week give glucose methylphenylsazone, m 192-1°, β - $\text{O}_2\text{NC}_6\text{H}_5$, NHNHMe gave the methylphenyl-*p*-nitrophenylsazone, orange, m 223.5-4.5° (m ps cor). Galactose phenylsazone yields a monoacetate deriv, yellow, m 183.5-4.5°, on standing with P_2O_5 in Me_2CO at 0° for 1 hr. Glucose phenylsazone and Ac_2O in $\text{C}_6\text{H}_5\text{N}$ give a tetra-*Ac* deriv, m 102-4°, $[\alpha]_D^{25}$ -58.5° (97% tOH , c 0.431). The tetra-*Ac* deriv of I, orange-yellow, m 126-7°, $[\alpha]_D^{25}$ -184.8° (tOH , c 0.403). C. J. West.

The structure of *d*-xylofomethylose. P. A. Levene and Jack Compton. *J. Biol. Chem.* 112, 775-83 (1936), cf. C. A. 29, 2923⁹.—Acetone-*d*-xylofomethylose on methylation by Purdie's method gave the 3-*Me* deriv (I), b_p 58.40°, n_D^{20} 1.4777, $[\alpha]_D^{25}$ -49.4° (H_2O). Removal of the Me_2CO residu from I by 1% H_2SO_4 gave

3-methyl-*d*-xylofomethylose (II), b_p 100.2°, $[\alpha]_D^{25}$ 81° (H_2O), phenylsazone, m 128-30°. II (2.4 g), refluxed with 1% MeOH-HCl (50 cc) for 1 hr, gave on distn 3-methyl- α -methylxylofomethyloside (III) (0.9 g), b_p 58-62°, n_D^{20} 1.4410, $[\alpha]_D^{25}$ 121.5° (H_2O), and 3-methyl- β -methylxylofomethyloside (IV) (1.0 g), m. 45-60°, b_p 72-5°, $[\alpha]_D^{25}$ -127.0° (H_2O). III with Purdie's reagents gave 2,3-dimethyl- α -methylxylofomethyloside, b_p 33-41°, m. 31-5°, $[\alpha]_D^{25}$ 151.0° (H_2O). Thus, on oxidation with concd HNO_3 for 7 hrs, during which the temp was raised to 100° in the 1st 30 min, gave *d*- $\text{H}_2\text{O}_2\text{CCH}(\text{OMe})_2\text{CO}_2\text{H}$ (V). Similarly from IV 2,3-dimethyl- β -methylxylofomethyloside, b_p 38-40°, n_D^{20} 1.4201, $[\alpha]_D^{25}$ -102.4°. This with HNO_3 also gave V. *d*-Xylofomethylose (VI) (1 g) in H_2O (50 cc) and Ag_2O (12 g) were heated at 80° for 8 hrs and gave AcOH . Polarimetric data for the rate of lactonization of *d*-gulonemethyloside are given and indicate the formation of both γ - and δ -lactones. These observations confirm the structure previously assigned to VI with the deoxy group at position 5 (C. A. 30, 84⁹).

The action of phosphate on hexoses. II. Ryuzaburo Nodzu and Kiyotada Matsui. *Bull. Chem. Soc. Japan* 10, 467-71 (1935); cf. C. A. 29, 4737⁹.—In the previous paper it was shown that when glucose was distd with 40% $\text{K}_2\text{HPO}_4\text{-K}_2\text{H}_2\text{PO}_4$ soln about 5% of the glucose was converted into acetol. To see if other salts had the same action 5 g of glucose was distd in the same way with 50 cc $\text{Na}_2\text{HPO}_4\text{-NaH}_2\text{PO}_4$ soln, p_H 6.2-6.5, b_p 106-0°. Acetol and a trace of Ac_2O were isolated as semicarbazones. Glucose (3 g), distd with an arsenate soln (40 g KH_2AsO_4 + 5.2 g KIIO_3 + 62 g H_2O), p_H 6.2-6.4, b_p 101.5°, gave 1.2% acetol. Glucose and 40% Na_2SO_4 , p_H 6.3-6.4, b_p 101-6°, gave 3% acetol, as detd by iodometry, but some SO_2 may have distd over. Some acetol semicarbazone was isolated. Solns of KCl , NaCl , K_2SO_4 , and Na_2SO_4 , b_p 101-6°, gave no acetol in Pyrex glass but did give traces of CH_3I forming compds in common glass. To det the effect of certain metallic ions on the rate of acetol formation the rate curve for purified glucose and phosphate soln was plotted and the same curve was plotted for similar solns contg 0.003-0.01 M solns of salts. It was found that Ca^{++} , Mg^{++} , and Fe^{+++} had little effect while Zn^{++} and Cu^{++} retarded the reaction. Fe^{++} alone accelerated the reaction. John E. Milbery.

The behavior of carbohydrates toward hot alkali solutions. R. S. Hilpert and A. Wolter. *Angew. Chem.* 49, 54-5 (1935).—11 even sugars were heated between 100° and 170° with Na_2CO_3 solns. This resulted in the evolution of CO_2 , whose amt gave a measure of the alkali used and the amt of acid formed. The influence of temp and the quantity of soda upon the decomposition process were investigated. I xptl data are presented. Karl Kammermerer.

An improved preparation of diacetoneglucose. D. J. Bell. *J. Chem. Soc.* 1935, 1871-5.— α -Glucose (190 g) in 2 l Me_2CO contg 80 ml of concd H_2SO_4 , on standing 4-5 hrs, gives 72% (102-106 g) of diacetoneglucose and 20 g of the monoacetone deriv. C. J. West.

Esters of the aldehydrol form of sugars. M. L. Wolfrom. *J. Am. Chem. Soc.* 57, 2198-500 (1935).— α -Hydo-Galactose pentaacetate β hemiacetal (I) (5 g) and 50 cc hot AcCl , cooled and poured into 1 l ice- H_2O , give 3 g α -aldehyde-1-chloro- α -galactose hexaacetate, m 174-5°, $[\alpha]_D^{25}$ -41° (CHCl_3 , c 4); this also results from the free carbonyl or aldehydrol forms of aldehyde-galactose pentaacetate. AcBr gives the 1-*Br* deriv, m 179-81°, $[\alpha]_D^{25}$ -79° (CHCl_3 , c 4), shaking with Ag_2CO_3 and crysts from EtOH give I, thus showing that the acetyl halide was attached to C 1. AcI gives the 1-*I* deriv, yellow, m 152-3°, $[\alpha]_D^{25}$ -111° (CHCl_3 , c 2). These substances are the open-chain analogs of the cyclic acetalohexalogen sugars. aldehyde-Glucose pentaacetate and Ac_2O in $\text{C}_6\text{H}_5\text{N}$ give aldehyde- β -glucose hexaacetate, m 118.5-9.5°, $[\alpha]_D^{25}$ 8° (CHCl_3 , c 4). It does not decolorize Br in CCl_4 and on deacetylation with 1 tONa followed by reacytation with Ac_2O AcONa yields β glucose pentaacetate, lower yields are obtained from the pentaacetate and Ac_2O with tNCl , aldehyde-*l*-Arabinose hexaacetate,

m. 80.5°, $[\alpha]_D^{25}$ -27° (CHCl₃, c 1). These compounds may be expected to be formed in reactions involving the cyclic forms of the sugars, rather than the free carbonyl or aldehyde structures.

C. J. West

Theory of sugar absorption by hydroxyanthraquinones. II. M-containing derivatives of hydroxyanthraquinone glucosides. Sándor Mállér. *Magyar Kémiai Folyóirat* 41, 9-15 (1935), cf. C. A. 29, 4001*—Hydroxyanthraquinone glucosides which retain the 1,2,9- or 1,8,9-dihydroxyl carbonyl grouping take up ammonia on their one carbonyl group with formation of the imino group. The specific effect of the O-rich sugar radical makes this possible. The structure of the derivs. is discussed on the basis of decomposition expts.

S. S. de Mirly

Multiplanar cyclohexane rings. R. D. Dean and R. F. Hunter. *Nature* 136, 953-4 (1935), cf. C. A. 30, 436*. D and H confirm their former contention that only 2 stereoisomers of this type of ring are formed.

Gerrig M. Evans

Ketones obtained by condensation of saturated hydrocarbons with acetyl chloride in the presence of aluminum chloride. Costin D. Nemitzescu and Grigore G. Vantu. *Bull. soc. chim.* [5], 2, 220-20 (1935)—In the presence of AlCl₃, cyclohexane (I) is transformed by the action of AcCl into methylcyclopentane which loses H₂ and then adds AcCl to form a Cl ketone. In the presence of inactive AlCl₃ this intermediate splits out HCl and gives 1-methyl-2-acetylcyclopentene (II) but with active AlCl₃ hydrogenation takes place simultaneously and produces the said 1-methyl-2-acetylcyclopentane (III), b. 161.5° (cor.).

The distn. by the aid of a Golodetz column of 1500 g. of ketones obtained from I and AcCl failed to isolate any compd. with a b. p. in the range of that of acetylcyclohexane, b. 179.5-80.5°, and, contrary to the findings of Zelinskii and Tarnasova (C. A. 28, 3381*), proved that hexacyclic ketones are not formed in this reaction. The structure of II was established by heating 21 g. of methylcyclopentanecarboxyl chloride (IV) with 22.5 g. of Br in 3 scaled tubes at 125° for 5 hrs. The combined product was vacuum-distd. and yielded 22 g. of product, bp. 94-103°. This was taken up in a 3 fold amt. of benzene contg. 2 mols. of NaN₃ activated with (NH₄)₂H₂O (C. A. 28, 2329*) and heated for 40 min. at 80°. The cooled soln. was saponified with 2.5 mols. KOH, neutralized with HCl and steam-distd. The distillate was extd. with Et₂O and redistd., yielding a fraction between 130-40° consisting of 1-methyl-2-cyclopentanone (semicarbazone, m. 173°). The distillate contained also a solid, 1-methyl-2-cyclopentanecarboxylic acid, m. 131.5°, formed by the elimination of HBr from the brominated acid. The formation of III from I by the action of AcCl in the presence of AlCl₃ provides a stirring material for the ready synthesis of a great no. of derivs. The Clemmensen reduction of 40 g. of III with 400 g. of Zn-Hg and an excess of concd. HCl produced a mixt. of 78.7 and 21.3% of the trans and cis forms (C. A. 26, 1111) of 1-methyl-2-ethylcyclopentane, b₁₀ 121°, d₄ 0.7728, n_D 1.42835, M. R. 37.36 (calcd. 36%). Reduction of III with Na and moist alk. gave a secondary alk. which was dehydrated by the aid of oxalic acid. The loss of H₂O can also take place by enlargement of the ring (C. A. 13, 1831) and, accordingly, the dehydration was carried out by Frank's modification of the method of Chugaev (C. A. 27, 3552) which cannot produce catenary isomerization. To a mixt. of 120 cc. Et₂O, 10 cc. CCl₄, 25.6 g. of carbonyl and 81 g. of finely powd. KOH was added 15.2 g. of CS₂ over a period of 1 hr., maintaining the temp. at 30°. After 3 hrs. 50 g. of MeI was added dropwise and the stirring was continued for 6 hrs. The KI was filtered off and the xanthogenate was vacuum-distd., yielding 20 g. of crude yellow liquid, b₁₀ 80°. After redistn. and washing with KOH and with HgCl₂, the distn. over Na gave 1-methyl-2-ethylidenecyclopentane (V), b. 123-4°, d₄ 0.7915, n_D 1.44421. V, contaminated with a small amt. of a hexacyclic isomer, was also obtained by dehydration of 24 g. of the alk. with 13 g. of KHSO₄. Condensation of 12 g. of III with 10.6 g. of HBr in the presence of 3 cc. of dil. alk. MeONa gave 1-(1-methyl-2-

cyclopentyl)-1-keio-3-phenyl-2,3-propylene, b₁₀ 153°, d₄ 1.0180, n_D 1.57220, di-Br deriv., m. 107°. Oxidation of III with NaOBr readily gave the carboxylic acid whose Li ester, C₁₁H₁₄O₂, b. 179-80°, d₄ 0.8397, n_D 1.43130, was reduced with Na and alc. to 1-methyl-2-hydroxymethylcyclopentane, b₁₀ 171-2°, d₄ 0.9146, n_D 1.4512. By heating with 120 cc. of 45% HBr for 4 hrs. on the steam bath, 20 g. of the alc. was converted into 17 g. of the Br deriv. (VI), b₁₀ 65°, d₄ 1.2608, n_D 1.4835, which, on treatment with the calcd. amt. of Mg, yielded 1,2-di-methylcyclopentane, b. 93-4°, d₄ 0.7013, n_D 1.41745. Sapon and distn. of the condensation product of VI and NaCH(CO₂H)₂ produced 1-methyl-2-cyclopentyl-β-propiolic acid, b₁₀ 147-8°, acid chloride, b₁₀ 98°, amide, m. 141°. The catalytic hydrogenation of 20 g. of IV in 100 g. of xylene in the presence of 4 g. of Pd charcoal for 16 hrs. until the evolution of HCl ceased and isolation of the alkide with 10% NaHSO₄ gave 1-methyl-2-formylcyclopentane, b. 118-50°, d₄ 0.9060, n_D 1.43558, semicarbazone, m. 121.5°.

C. R. Addinall

Phosphoric acid as catalyst for alkylation of aromatic hydrocarbons. V. N. Ipatieff, Herman Pines and V. I. Komarevsky. *Ind. Eng. Chem.* 28, 222-3 (1936). Benzene, naphthalene and tetralin dromaphthalene were alkylated with C₂H₅I, and naphthalene and fluorene were alkylated with propene, using 85-95% H₃PO₄ as catalyst. Among the products in the last case were identified: mono-, di-, sym-tri- and tetra-ethylbenzene, diethyl-naphthalene, mono- and di-ethyltetralin dromaphthalene, in the 2nd case propylnaphthalene and propylfluorene.

O. W. Wilcox

Behavior of ketene in the Friedel-Crafts reaction. F. S. Spring and T. Vickerstaff. *J. Chem. Soc.* 1935, 1873-4.—Ketene and C₆H₆ with AlCl₃ give PhAc and p-FC₆H₄Ac (probably due to the presence of C₆H₅I), whose semicarbazone m. 106°. Ketene, passed into PhOH at 80°, causes quant. acetylation. C. J. West

Kinetics of the Friedel-Crafts reaction and activity of mixed catalysts in the reaction of benzoyl chloride with toluene. Lawrence F. Martin, Philip Pizzolito and Lynn S. McWaters. *J. Am. Chem. Soc.* 57, 2584-9 (1935).—A correct method of calcg. velocity constants, from data obtained by Steele's method has been applied to expts. on the Friedel-Crafts reactions of BrCl and PhCH₂Cl with PhMe. The relative order of activity of various catalysts depends upon the type of reaction and in the case of BrCl the activity increases with increasing percentage of FeCl₃. Mixed catalysts covering a wide range of compn. of AlCl₃ and FeCl₃ have been investigated in respect to the reaction of BrCl with PhMe. At comparable concns. the activity increases with increasing mole percentage of FeCl₃ and reaches a max. at percentages in excess of 50 mole %. The mixed catalysts have been shown to produce less than 1 mole of product for each mole of total metal chlorides present. Evidence is given in support of the explanation that this is due to the removal of the catalyst in the form of a bimetal complex with the reaction product, such as Br₂AlCl₂CH₂Ph, AlCl₃FeCl₃. Variation of the reaction velocity over a 10-fold range of concn., the PhMe being always in large excess, has been detd. and is of the same order of magnitude as that reported in a similar reaction by Olivier. The present work furnishes evidence in support of the explanation of this effect as being due to assocn. of the reacting complex. The new exptl. data and method of calcn. lead to results in satisfactory agreement with a unimol. order for the reaction, and thus lends support to the mechanism proposed by Steele (*J. Chem. Soc.* 83, 1470 (1903)).

C. J. West

Oxidation in the benzene series by gaseous oxygen. V. The oxidation of tertiary hydrocarbons. H. N. Stephens and Feliciano L. Roduta. *J. Am. Chem. Soc.* 57, 2380-1 (1935); cf. C. A. 22, 3883.—Oxidation of tertiary hydrocarbons always takes place at the α-C atom; the reactions are not inhibited by H₂O. MeI t₁PhCH₃, MePhCH₂CH₂ and MeMePhCH₂ give PhAc, MePhCH₂CH₂Ph, PhCH₂CH₂Ph give Ph₂CO, PhCH₂Ph, is not oxidized in the presence of H₂O.

C. J. West

Reaction of paraffins with aromatic hydrocarbons (destructive alkylation). Aristid V. Grose and V. N. Ipatieff *J Am Chem Soc* 57, 2415-19 (1935).— $\text{Me}_2\text{CCH}_2\text{CHMe}_2$ (I) and C_6H_6 with AlCl_3 or ZrCl_4 give Me_2CCH_2 and PhCMe_2 (II). It then reacts with more I to give Me_2CCH_2 and $p\text{-C}_6\text{H}_4(\text{CMe}_2)_2$. With AlCl_3 the reaction takes place at 25–50° and the ordinary pressure during about 4 hrs., with ZrCl_4 a temp. of 50–75° is required. HCl gas promotes the action of the chlorides (II), and MgCl_2 have no action. Complete details of the reaction are given. The reaction also occurs with other aromatic hydrocarbons and with other paraffins.

C. J. West
The hydrocarbon $\text{C}_{11}\text{H}_{12}$: II I. K. Meyer and H. Loebeck *Holt. Chem. Acta* 18, 1404 (1935).—Different values have been reported for the b. p. and m. p. of $\text{C}_{11}\text{H}_{12}$ (I) prepd. by different methods. Chemo and McQuillen (C. A. 29, 5820) report $\text{C}_{11}\text{H}_{12}$ in -1.0° , b. 82.5°, Wilson (C. A. 29, 7155), m. 6.5°, b. 0.8° lower than Chemo. I was prepd. by heating $\text{Ca}(\text{CO}_3)_2$ with $\text{Ca}(\text{OD})_2$ (cf. von Bayer, *Ann. Suppl.* 7, 1 (1970)). $\text{Ca}(\text{OD})_2$ was prepd. by staking CaO with D_2O in *vacuo*. Comparative details were made of the b. p. and m. p. of $\text{C}_{11}\text{H}_{12}$ and $\text{C}_{11}\text{H}_{14}$, b. 79.2°, m. 5.5°, $\text{C}_{11}\text{H}_{14}$ b. 78.5°, m. 6.8°. I and L. discuss the sources of error inherent in the detn. of C and D in org. compds. W. Gordon Rose

Monodeutenobenzene [benzene-d] Noriyoshi Morita and Toshio Tani *Bull. Chem. Soc. Japan* 10, 557-8 (1935).—PhD was prepd. from CaO and 97% D_2O by heating the resulting $\text{Ca}(\text{OD})_2$ at 300° with $(\text{D}_2\text{O})_2\text{Ca}$ and distg. off and drying the PhD with P_2O_5 . $\text{C}_{11}\text{H}_{12}$ prepd. in the same manner using H_2O was compared with this product. $\text{C}_{11}\text{H}_{12}$ has d₄ 0.8754 and $\text{C}_{11}\text{H}_{12}\text{D}$ 0.8809. If the mol. vols. are the same 97% PhD should have d₄ 0.8804. The m. p. of PhD was about 0.1° higher than for $\text{C}_{11}\text{H}_{12}$. n. of PhD for white light at 23° is about 0.00065 smaller than for $\text{C}_{11}\text{H}_{12}$. Oden E. Sheppard

Polymethylenes XIII Mercuration Lee I. Smith and I. Lowell Taylor *J Am Chem Soc* 57, 2370-2 (1935), cf. C. A. 29, 5820.—The following acetoxymercuric acids were prepd. by refluxing the hydrocarbon with $\text{Hg}(\text{OAc})_2$ in MeOH or AcOH for varying periods. $\text{C}_{11}\text{H}_{12}\text{Me}$, m. 180°, 80% yield, 1,2,4,5- $\text{C}_6\text{H}_4\text{Me}_2$, m. 158–9°, 60% solv., 12 g. per 100 cc. boiling MeOH , 3 g. at 0°, 1,2,3,5- $\text{C}_6\text{H}_4\text{Me}_2$, m. 105°, 30% 1,2,3,4- $\text{C}_6\text{H}_4\text{Me}_2$, m. 147°, 15%, 1,3,5- $\text{C}_6\text{H}_3\text{Me}_3$, m. 102.3°, 30%, 1,2,4- $\text{C}_6\text{H}_3\text{Me}_3$, m. 115–7°, 30%. The action of HCl , NaBr or NaI on the above compds. gave halomercuric acids. $\text{C}_{11}\text{H}_{12}\text{Me}$, Cl, m. 205°, Br, m. 195.4°. Durene, Cl, m. 188–9°, Br, m. 174°, I, m. 161.2°. Isodurene, Cl, m. 174°, Br, m. 160°, I, m. 163.4°. Prehnitene, Cl, m. 216.15°, Br, m. 213.14°, I, m. 200°. Digestion of the iodides with 4 mols. NaI in LiOH gives bis(polymer) phenylmercury compds. $\text{C}_{11}\text{H}_{12}\text{I}_2$, m. 278° durene, m. 242–3° isodurene, m. 217.18°, prehnitene, m. 200°.

XIV Reaction between organomercury compounds and nitrosyl compounds *Ibid.* 2403–3.—The action of NOCl upon organomercury compounds of polymethylenes gives NO compds. Thus, 20 g. of the acetoxymercuric deriv. of $\text{C}_{11}\text{H}_{12}\text{Me}$ in 100 cc. CHCl_3 , treated with 5 cc. EtNO , 15 cc. concd. HCl and 20 cc. AcOH gives 50% of nitrosopentamethylbenzene, m. 160°, reduction gives H_2NCMe . Nitrosodurene (I), m. 160° (decompn.), 73% yield, nitrosodurene, m. 132°, 61% the 3f OH addn. product, m. 135°, nitrosoprehnitene, green, m. 72°. 70% NO_2 also forms NO compds. Oxidation of I or the action of HNO_3 on the Hg compd. gives nitrodurene, m. 112–13° (40 and 80% yields, resp.), nitrosodurene, m. 39°. XV The Jacobsen reaction 4 Lee I. Smith and Clarence L. Mowle *Ibid.* 58, 1–10 (1936).—Chlorodurene, chlorosodurene and chloroprehnitene rearrange in contact with H_2SO_4 to give chloropentamethylbenzene (I) and 3-chloropseudocumene-5-sulfonic acid (II), a Me group migrating in such a manner that the same chlorotrimethylbenzene deriv. resulted. Chlorosodurene also gives a small quantity of a compd., $\text{C}_{11}\text{H}_{11}\text{Cl}$, m. 209.5°, the structure of which is not known. 5-Chloropseudocumene and the 6-isomer give II, chloro-

mentylene and 4-chlorohemamelitene were stable toward H_2SO_4 . Bromomesitylene gives mesitylenesulfonic acid and di- or tribromomesitylene, depending upon the temp., 5-bromopseudocumene gives largely 3-bromopseudocumene-5-sulfonic acid, together with a small quantity of tribromopseudocumene; no pseudocumene-5-sulfonic acid was found. The following did not rearrange with H_2SO_4 : hemamelitene, 5-nitropseudocumene, 5-pseudocumidine, Me pentamethylbenzenesulfonic acid, pentamethylcyclohexane, 2,3- $\text{C}_6\text{H}_3\text{Me}_2$ and $p\text{-BrC}_6\text{H}_4\text{Ph}$. Yields are given, together with the conditions used. I was identified by analysis and conversion into $\text{C}_{11}\text{H}_{12}\text{Me}$; II was identified by conversion into the amide, m. 183°. 3-Chloro-5,6-dinitropseudocumene is reduced by SnCl_4 in EtOH or HCl to the di-NH₂ deriv., m. 130.5°, stable in the air for some time, phenanthrenequinone (III) in AcOH - EtOH gives 12-chloro-10,11,13-trimethylphenanthrophenazine, yellow, m. 330.5–1°. Reduction of the di- NO compd. with SnCl_4 in AcOH - HCl yields 6-chloro-2,4,5,7-tetramethylbenzimidazole, m. 250–1°. 5-Chloro-1,3-diaminomesitylene, m. 137–8°, this does not react with HCl or form a benzimidazole. Nitration of Na 4-chlorohemamelitene sulfonate gives 4-chloro-5,6-dinitrohemamelitene, m. 152–2.5°. SnCl_4 in AcOH yields 7-chloro-2,4,5,6-tetramethylbenzimidazole, m. 280.5–7.5°. 10,11,12-Trimethylphenanthrophenazine, yellow, m. 253°. Many other details are given of the prepn. of products used for the identification of the compds. formed in the rearrangement, as well as starting materials. Na chloromethylsulfonate crystallizes with 0.5 mol. H_2O , as does the Br deriv. bromomethylsulfonamide, m. 160–60.5°. 3-Chloro-5,6-dibromopseudocumene, m. 224°, 6-chloro-3,5-dinitropseudocumene, m. 163°. 6-Bromo-5-pseudocumidine, m. 60° (56.8% yield). 4-Chloro-5,6-dibromomesitylene, m. 229–30°, 13-chloro-10,11,12-trimethylphenanthrophenazine, yellow, m. 346.5–7°. 7-Chloro-2,4,5,6-tetramethylbenzimidazole, m. 288.5°. 10,11,12-Trimethylphenanthrophenazine, orange, m. 311°. Pentamethylbenzenesulfonamide, m. 41–1.5°. The ease of migration of groups present in the chloro- and bromotrimethylbenzenes is in the order $\text{Br} > \text{Me} > \text{Cl}$, in case of the corresponding derivs. of the $\text{C}_{11}\text{H}_{12}\text{Me}$, the order is $\text{Br} > \text{Cl} > \text{Me}$. Attempts to find mild conditions which would cause Jacobson rearrangements without producing amorphous by-products were unsuccessful. Dln of the H_2SO_4 with 10% of H_2O or with H_2PO_4 or AcOH inhibited the rearrangement and the side reaction as well. The use of CaCl_2 , $\text{Mg}(\text{ClO}_4)_2$, PhSO_3H , AcOH or H_2PO_4 merely caused by hydrolysis of the sulfonic acid to the hydrocarbon and no rearrangements were found, other than those already known, which would cause any rearrangements to take place. Little can be said with regard to the mechanism of the reaction. C. J. West.

Rearrangements of polyynes VII Formation of allenenes J. H. Ford, C. D. Thompson and C. S. Marvel *J Am Chem Soc* 57, 2619–23 (1935); cf. C. A. 28, 117°. *tert*-BuCOPh (2,4-dinitrophenylhydrazones, yellow, m. 194–5°) in Et_2O , added to the Grignard reagent from *tert*-BuCOPh in Li_2O , gives 68% of phenyl-*tert*-butyl-*tert*-butylethynylcarbinol (I), b. 125–8°, n_D²⁰ 1.5025, d₄²⁰ 0.9334 heating with AcOH compd. a little H_2SO_4 gives 2,2,6,6-tetramethyl-3-phenyl-3-hepten-5-one, b. 96–7°, n_D²⁰ 1.5003, d₄²⁰ 0.9300, m. 30.5° (2,4-dinitrophenylhydrazones, bright orange red, m. 150–1°), I and PhBr in petrol ether give 91% of phenyl-*tert*-butyl-*tert*-butylethynylbromomethane (II), b. 115–17°, n_D²⁰ 1.5400, d₄²⁰ 1.081, boiling in Me_2CO contg. Ag_2O gives I. The Grignard reagent from II, decomposed by H_2O , gives 82% of 2,2,6,6-tetramethyl-3-phenyl-3,4-heptadiene (III), b. 78–80°, n_D²⁰ 1.5031, d₄²⁰ 0.890, heating at 145° in a sealed tube for 90 hrs. gives 85% of unchanged III, and 2 products, m. 145–2°, to be described later, ozonolysis of III gave *tert*-BuCOPh and $\text{Me}_2\text{CCO}_2\text{H}$. *tert*-BuCOPh (OH)Ph was converted into the bromide (93% yield), the Grignard reagent of which yielded 13% of phenyl-*tert*-butylethynylcarbinol, m. 105°. It gave no *tert*-BuCOPh. With CICO_2Me the Grignard reagent from II gives 64% of 2,2,6,6-tetramethyl-3-phenyl-3-carbomethoxy-3,4-heptadiene (IV), b. 116.20°, n_D²⁰

1,5029, d₄²⁰ 0.9584; with O₂ this yields Me trimethylpyruvate (2,4-dinitrophenylhydrazone, m. 205-6°, also prep'd. synthetically) and probably *tert*-BuCOPH, the action of CO₂ upon the Grignard reagent gives 72% of the free acid corresponding to IV, m. 160-1°, also prep'd. by hydrolysis of IV. II reacts with 40% Na-Hg but does not give a stable Na alkyl. The products are III and 2 isomeric hydrocarbons, C₁₀H₁₆, m. 148-9° and 115-25°, which are thought to be diallenic hydrocarbons. Ag and Cu have no effect on solns of II, Li gives the same products as Na-Hg, reduction with Zn in EtOH gives the same mixt of hydrocarbons. Trimethylpyruvic acid 2,4-dinitrophenylhydrazone, m. 169-71° (decompn) VIII. Formation of diallenes E. D. Farley and C. S. Marvel. *Ibid* 58, 29-31 (1936).—The hydrocarbon prep'd from Me₂CC CCl₂Br, previously assumed to be a bundenyl (C. A. 26, 2452), is 1,1,6,6-tetraphenyl 3,4-di-*tert*-butyl-1,2,4,5-hexatetraene (I), m. 152°. Oxidation of I with O₂ in boiling C₆H₆Me₂ gives 52% Ph₂CO, O₂ gives BuOH in addn. to products previously reported. Reduction of I with Na and AmOH gives the hydrocarbon C₁₀H₁₆, m. 182° (previously reported as C₁₀H₁₄) and a small quantity of an isomer (?), m. 132°. Reduction of I with HI in AcOH gives a comp'd, m. 210-11°, probably a dimer (II) of 3-phenylindene. I is rearranged to the isomer C₁₀H₁₆, m. 176°, which is stable toward KMnO₄ in AcOH, does not form a metal deriv with 40% Na-Hg and could not be reduced with Na and AmOH, reduction with HI in AcOH gives II. The Na deriv of I gives with CO₂ an acid, m. 171°, identical with acid prep'd by the action of CO₂ on Na diphenyl-*tert*-butylethynylmethyl, ClC₆H₄Me gives the comp'd C₁₀H₁₆(CO₂Me), m. 173°, hydrolysis gives an acid, m. about 160° and decompn 180° to the comp'd C₁₀H₁₆CO₂Me, m. 162°, H₂O gives the comp'd C₁₀H₁₆ (III), m. 163°. The Na deriv and (CH₃)₂Br₂ give the isomeric C₁₀H₁₆ (IV), m. 179-80°. Oxidation of III with KMnO₄ in Me₂CO gives the comp'd C₁₀H₁₆O₄, m. 217-18°, K₂Cr₂O₇ in AcOH gives the comp'd C₁₀H₁₆O₄, m. 169°, reduction with Na and AmOH gives the comp'd C₁₀H₁₆ (V), m. 197°, and a lower-melting isomer, treatment with 40% Na-Hg and then with H₂O gives V. Oxidation of IV with K₂Cr₂O₇ gives the comp'd C₁₀H₁₆O₄, m. 169°, neutral KMnO₄ was without action, reduction with Na and AmOH gives the C₁₀H₁₆, m. 197°, and an isomer, m. 155-6°. IV, treated with 40% Na-Hg and then with H₂O, gives the hydrocarbon C₁₀H₁₆, m. 163°. 1,1-Diphenyl-1,4-dimethyl-1,2-pentadiene with 40% Na-Hg in Et₂O, treated with (CH₃)₂Br₂, gives the comp'd C₁₀H₁₆, m. 143-4°; the Na comp'd. with H₂O does not give a cryst product. The dimer, treated with Na-Hg and then with (CH₃)₂Br₂, gives only the unchanged material, H₂O gives the comp'd C₁₀H₁₆ (VI), m. 133°. Reduction of the dimer with Na and AmOH probably gives VI, as does HI in AcOH, oxidation of the dimer gives the comp'd C₁₀H₁₆O₄, m. 227°. C. J. West. Decomposition of di-*o*-tolylodoniun iodide H. J. Lucas, F. R. Kennedy and C. A. Wilmut. *J. Am. Chem. Soc.* 58, 157-60 (1936).—(*o*-MeC₆H₄)₂I₂ decomposes at 155° into *o*-MeC₆H₄I and not into a mixt of isomers. The nature of the reaction product indicates that the (*o*-MeC₆H₄)₂I₂ ion splits into *o*-MeC₆H₄I and positively charged *o*-C₆H₄Me ion by a scission of the C—I bond. This ion and the neg I ion produce *o*-MeC₆H₄I. In the formation of *o*-(*o*-MeC₆H₄)₂IO from *o*-MeC₆H₄IO and *o*-MeC₆H₄IO, Ag₂O acts catalytically. The following phys. consts. of MeC₆H₄I are given *o*, b_p 95.5°, b_m 205.5°, d₄²⁰ 1.0700, n_D²⁰ 1.6030, *m*, b_p 210°, d₄²⁰ 1.6381, n_D²⁰ 1.6012, *n*, b_p 34.5-5° (cor). The *o*-MeC₆H₄I was identified by conversion into *o*-MeC₆H₄CO₂H through the Grignard reagent. C. J. West. 2,4,6-Trichloro-3-amino-1-methylbenzene and some of its derivatives I. Bureš and M. Trpšovská. *Časopis Českoslov. Léčnického 15*, 174-81 (1935).—By the action of Cl on *m*-acetotoluene in glacial AcOH there was obtained 2,4,6-trichloro-3-acetamino-1-methylbenzene, m. 192°. The sapon. of this product gave 2,4,6-trichloro-*m* toluidine, m. 85°. By the nitration of 2,4,6-trichloro-

there was obtained 2,4,6-trichloro-3-nitrotoluene, m. 50° and by the nitration of 2,3,4,6-Cl₄C₆HMe the resulting product was 2,3,4,6-tetrachloro-5-nitrotoluene, m. 148-50°. V. D. Karpenko. The coloration of aniline Tatsuo Yamanaka. *Bull. Inst. Phys.-Chem. Research* (Tokyo) 14, 396-405 (1935).—(Abstracts in English) published with *Sci. Papers Inst. Phys.-Chem. Research* (Tokyo) Nos. 573-5).—The causes for the coloration of PhNH₂ have been worked out; it is attributed to the effects of impurities including water, air (O₂), materials of the vessels, light of wave lengths 5100-3000 Å, especially 4537-4300 Å. Cu has the strongest coloring effect, when kept with PhNH₂ at 60° for 10 hrs. In the semi-industrial scale expts., Pb or Sn cooling tubes and enameled Fe reaction app. gave the same result as glass app. in the lab expts. K. K. Production of aromatic amines by hydrogenation II. Kiyoshi Yoshikawa, Tatsuo Yamanaka and Bannosuke Kubota. *Bull. Inst. Phys.-Chem. Research* (Tokyo) 14, 409-11 (1935) (Abstracts in English) published with *Sci. Papers Inst. Phys.-Chem. Research* (Tokyo) Nos. 573-5), of C. A. 29, 7957.—The manuf. of PhNH₂ by the hydrogenation with poisoned Ni catalysts has been tried in the semi-industrial scale. The enameled Fe reaction tubes were used. The single tube app., 5.1 cm in diam. and 158 cm long, filled with 380 g Ni-Cu-Al catalyst on a Cu support, and fed with PhNO₂ at a velocity of 180 cc. per hr at 180°, gives 52 kg PhNH₂ in 370 hrs with a 97.1% yield of the theoretical. The multi-tube app., consisting of 19 reaction tubes, 3.2 cm in diam and 81 cm long, immersed in a PhNO₂ bath to control the temp., and supplied with the mixt of H₂ and PhNO₂ vapor at a velocity of 800 cc per hr, yields 200 kg PhNH₂ in 250 hrs. III. Tatsuo Yamanaka, Sakae Yamada, Bannosuke Kubota and Kiyoshi Yoshikawa. *Ibid* 412-23.—The preceding hydrogenation method with a thiophenepoisoned catalyst has been applied to the manuf. of aromatic nitro and azo compds and quinones. For less volatile substances, the proper solvents were used for their vaporization. In general, these catalysts are very well adapted to the hydrogenation of such compds, and the reactions proceed at lower temps., in almost all cases without decompn. The simple NO₂ derivs. of aromatic hydrocarbon are very easily hydrogenated to the corresponding amines, while with derivs. with substituted radicals other than NO₂, the results differ with the nature of the radical. Thus *o*- and *p*-toluidine, *m*- and *p*-phenylenediamine, tolylenediamine, *α*-naphthylamine are obtained pure in theoretical yields. The manuf. on a semi tech. scale has also been carried out for toluidine, xylidine and naphthylamine with good results. K. K. Halogenation of phenolic ethers and anilides. V. Alkyl and *ω*-substituted alkyl ethers Brynmor Jones. *J. Chem. Soc.* 1935, 1831-5, of C. A. 28, 2689.—Earlier studies of the interpretation of the Arrhenius expression, $k = ae^{-E/RT}$, as applied to the C₆H₅-substitution problem (cf C. A. 26, 1203), showed that the term a is constant within the error of expt and that in compds of the type *p*-ROCC₆H₄X the groups OR and X each contributed a characteristic quota to the activation energy of further substitution. The series of ethers studied has been further enlarged, the additive relationships receiving further illustration. Velocity coeffs for the chlorination of compds of the type *o*- and *p*-XC₆H₄OR in 9% AcOH at 20°, [Cl₂] 0.0075, [Et₂O] 0.0225, [HCl] 0.0375, were det'd. as follows: X = *p*-CO₂H, R = Me 0.444, C₆H₅ 0.966, C₆H₄ 0.960, C₆H₃ 0.947, C₆H₂ 0.919, C₆H₁ 1.114, Ph(CH₃)₂ 0.528, Ph(CH₃)₃ 0.760; X = *p*-Cl, R = Me 1.236, C₆H₅ 2.735, C₆H₄ 2.770, C₆H₃ 2.743; X = *p*-Br, R = Me 1.256, *iso*-Bu 2.738, C₆H₅ 2.665, Br(CH₂)₂ 0.266, Br(CH₂)₃ 0.819, X = *o*-CO₂H, R = Me 3.463; X = *o*-Cl, R = Me 4.441, *p*-Pr 10.05, *iso*-Pr 16.16, Bu 10.07, Am 9.33. Tables are given showing the relative directive powers of the groups OR in compds. of the above type with R = Me as 100 and also of the groups CO₂H, Cl and Br, taking *p*-CO₂H as 100. As an example the relative directive powers of *n* alkyl groups are: Me 100, 1 t 199, *p* 223, Bu 223, Am 221, C₆H₅ 221, C₆H₁₁

219, $C_{11}H_{17}$ 207, $C_{11}H_{19}$ 201; iso-Pr has a value of 440 (which cannot be explained at present), while iso-Bu is 216. The introduction of Br into Et produces a marked decrease in reactivity, the intervention of an addl CH_3 group diminishes the effect but slightly, the values relative to the Me ether = 100 being 21 and 65 for $(CH_3)_2Br$ and $(CH_3)_3Br$. The Ph group exerts a similar but much weaker effect than Br. MeO 100, $PhCH_2O$ 70, EtO 199, $Ph(CH_2)_2O$ 119, PrO 223, $Ph(CH_2)_3O$ 171. *p*-Chlorophenyl Am ether, b_{11} 132-3°, *hexyl* ether, b_{11} 172°, *heptyl* ether, b_{11} 162°, *cetyl* ether, b_{11} 49°, *p*-bromophenyl *cetyl* ether, b_{11} 49°, *o*-Chlorophenyl Pr ether, b_{11} 119°, iso-Pr ether, b_{11} 103°, Bu ether, b_{11} 117°, Am ether, b_{11} 117°. *p*-*Phenylethoxybenzoic acid*, m 160°, *p*-*phenylpropoxybenzoic acid*, m 166°, *p*-Bromophenyl *γ*-bromopropyl ether, b_{11} 169°, m 49.5°, the by-product is *trimethylene glycol bis-p-bromophenyl ether*, m 143°. VI Benzyl and substituted benzyl ethers. *Ibid* 1835-40.—The following are velocity coeffs for the chlorination of compds of the type o - and p - $XC_6H_4CO_2H$ in 90% AcOH at 20°, using conditions given in part V. $X = p$ - CO_2H , $R = Me$ (I) 0.444, $PhCH_3$ (II) 0.314, p - $FC_6H_4CH_3$ (III) 0.262, p - $ClC_6H_4CH_3$ (IV) 0.200, p - $BrC_6H_4CH_3$ (V) 0.203, p - $MeC_6H_4CH_3$ (VI) 0.441, m - $FC_6H_4CH_3$ (VII) 0.157, m - $ClC_6H_4CH_3$ (VIII) 0.153, m - $BrC_6H_4CH_3$ (IX) 0.159, m - $MeC_6H_4CH_3$ (X) 0.475, o - $FC_6H_4CH_3$ (XI) 0.160, o - $ClC_6H_4CH_3$ (XII) 0.152, o - $MeC_6H_4CH_3$ 0.465, $X = p$ - Cl , $R = I$ 1.226, II 0.837, III 0.674, IV 0.489, V 0.483, VI 1.153, p - $OC_6H_4CH_3$ (XIII) 0.174, VII 0.394, $VIII$ 0.372, IX 0.377, X 0.203, $NC_6H_4CH_3$ (XIV) 0.195, XII 0.346, o - $OC_6H_4CH_3$ (XV) 0.175, $X = p$ - Br , $R = I$ 1.256, II 0.850, IV 0.521, VI 1.170, $XIII$ 0.177, XIV 0.201, $X = o$ - CO_2H , $R = I$ 3.483, II 2.700, III 2.192, IV 1.827, V 1.855, VI 3.710, $X = o$ - Cl , $R = I$ 4.441, III 2.481, IV 1.861, V 1.850, VI 4.201, $XIII$ 0.642, XV 0.628, $X = o$ - Br , $R = I$ 5.457, IV 2.155, XII 0.750, XIV 0.884, XV 0.753. The relative effects of the groups OR and X are independent, both contributing additively to the energy of activation of chlorination. Tables give the results of calcn of the relative directive powers of the various groups studied. In the acid series the variations in the ratios for the different groups are 2-3 times as great as in the Cl and Br series. The velocity coeffs for the chlorination of the series of *p*-substituted benzyl ethers fall into the expected order, the reactivities of the halobenzyl ethers being intermediate between those of the nitro- and the methyl benzyl ethers. The general polar series $Me > H > halogens > NO_2$ is thus again observed. This order also obtains in the *o*- and *m*-series but the order of the halogens among themselves is not that of their inductive effects, the *p/m* ratios are F 1.68, Cl 1.27, Br 1.24. The main results are summarized as follows. For a wide range of compds of the type ROC_6H_4X , the 2 groups OR and X contribute characteristically and additively to the energy of activation of chlorination, with ethers of o - $HOC_6H_4CO_2H$ and iso- $PrOC_6H_4Cl$, minor anomalies are observed. The const reactivity characteristic of long-chain compds is observed from Pr to heptyl, the octyl and cetyl ethers exhibiting slightly lower reactivities, the introduction of a Ph or Br into the Et and Pr groups produces a marked decrease in reactivity. For polar groups in the $PhCH_2$ radical, the order of reactivity for *p*-substituents is $Me > H > I > Cl > Br > NO_2$, in the *m*-position the halogens show almost identical effects. To account for the relative reactivities of the halobenzyl ethers, a mesomeric effect in the order $F > Cl > Br$ would appear to be necessary. *p*-Chlorophenyl ethers: *p*-fluorobenzyl, m 60°, *p*-chlorobenzyl, m 81°, *p*-bromobenzyl, m 93°, *m*-isomer, m 43°, *p*-methylbenzyl, m 97°, *m*-fluorobenzyl, b_{11} 223-5°, *m*-chlorobenzyl, b_{11} 222-4°, *o*-isomer, b_{11} 191°, *o*-nitrobenzyl, m 73°, *o*-Chlorophenyl ethers: *p*-fluorobenzyl, b_{11} 170°, m 35°, *p*-chlorobenzyl, m 69°, *p*-methylbenzyl, m 76°, *o*-nitrobenzyl, pale yellow, m 84.5° *p*-Bromophenyl ethers: *p*-chlorobenzyl, m 98°, *p*-methylbenzyl, m 105°, *o*-Bromophenyl ethers: *p*-chlorobenzyl, m 69°, *o*-nitrobenzyl, m 107°, *m*-isomer, m 100°, *p*-(*p*-Fluorobenzoyloxy)benzoic acid, m 213°, *p*-Cl deriv, m 218°, *p*-Br deriv, m 231° (max soly

in AcOH at 20° 0.3-0.5 g/100 cc). *p*-(*p*-Methylbenzoyloxy)benzoic acid, m 212°; *m*-isomer, m 157° *p*-(*m*-Fluorobenzoyloxy)benzoic acid, m 194°, *m*-Cl deriv, m 194°, *m*-Br deriv, m 202° *p*-(*o*-Fluorobenzoyloxy)benzoic acid, m 181°, *o*-Cl deriv, m 183° *o*-Me deriv, m 169° *o*-Benzoyloxybenzoic acid, m 77° *o*-F deriv, m 87°; *p*-Cl deriv, m 115°, *p*-Me deriv, m 111°. C J West

Geometric isomerism of asymmetric quaternary ammonium salts and betaine hydrates derived therefrom and a study of the reactions yielding them. Mime M Guaisnet-Pilaud *Ann chim* [11], 4, 365-448(1935)—*MePhPrNCH_2CO_2Et* (I), b_{11} 145-6°, was prepd from *MePhNH* and $ClCH_2CO_2Et$ or $IClCH_2CO_2Et$, *EtPhNCH_2CO_2Et* (II), b_{11} 149-50°, and *EtPhNCH_2CO_2Me* (III), b_{11} 147-8°, from *EtPhNH* and the suitable halo acetate and *PhPrNCH_2CO_2Et* (IV), b_{11} 161-2° from *PhPrNH*. *EtMePhN* on standing with $IClCH_2CO_2Et$ gave the quaternary *NH* salt *EtMePhN(Pr)CH_2CO_2Et* (V), which was treated with moist AqO to produce the betaine *EtMePhNCH_2COO* (VI), in the form of 2 hydrates Th

"metastable monohydrate" (VIA) is $C_{11}H_{19}O_3N \cdot H_2O$ tiny needles, m 175° (decompn), very sol in H_2O , HOAc, sol in EtOH, difficultly sol in EtOAc, n_D^{20} 1.553 + 0.003, n_D 1.549 + 0.003 (method of Becke). Heating VIA to 100-10° at 16 mm for 24 hrs, then increasing the temp to 180-90°, resulted in loss of water and decompn into *EtMePhN* and I, identified by conversion to *MePhNCH_2CONH_2*, m 164°. Treatment of aq VIA with $Ba(OH)_2$ and pptn of the excess Ba ions with CO_2 filtration and distn to dryness *in vacuo* yielded *EtMePhN* and a residue of $(HOCH_2CO_2)_2Ba$. VIA formed the following salts: chloroplatinate, orange, m 134°, picrate, yellow, m 158.5° (decompn); *d*-camphorsulfonate, m 214-15°, $[α]_D^{20}$ 8.45°, acid oxalate, $C_{11}H_{19}O_3N \cdot H_2C_2O_4$, m 124.5°. Acidification of the picrate with HCl and subsequent treatment with Ag_2O gave the 2nd hydrate of VI, a "stable dihydrate", $C_{11}H_{19}O_3N \cdot 2H_2O$ (VIB). VIA and VIB were obtained from V in proportions of 1 or 1.5 to 10. VIB exists as monoclinic crystals (goniometric measurements given), m 79.5°, resolifies, in aq above 100°, decomposes 145-50°. Heating of VIB first at 70-80° at 17 mm, then increasing the temp to 200-205°, produced *EtMePhN* and III, identified by conversion to *EtPhNCH_2CONH_2*, m 108°, and, at the highest temp, a fluorescent liquid, b_{11} 195-205°, apparently *MePhNCH_2CO_2CH_2CO_2Et*. After treating aq VIB with $Ba(OH)_2$, then CO_2 , 96% of the VIB was recovered. The salts of VIB with H_2PtCl_6 , picric acid, *d*-camphorsulfonic acid were identical with those obtained from VIA. VIB yielded a neutral oxalate, m 166°, and an acid oxalate, m 69.5°. Treatment of II with MeI gave V, which reacted with moist Ag_2O to give VI in the form of a "stable hydrate" (VIE), along with VIB and *EtMePhN*. VIE was obtained in a purer state similarly from III obtained by the isomerization of VIB. VIE is apparently a monohydrate, $C_{11}H_{19}O_3N \cdot H_2O$, m 104°, orthorhombic, strongly birefringent, n_D 1.549 + 0.003, n_D 1.585 + 0.003, n_D 1.658 + 0.003, on heating it is converted to I (predominantly) and III, identified by conversion to the amides, m 164° and 108°, resp. Treatment with $Ba(OH)_2$ and CO_2 results in the recovery of VIE unchanged. VIE forms the following salts: chloroplatinate, orange, m 169°, picrate, yellow, m 186° (decompn), from which VIE may be recovered, *d*-camphorsulfonate, m 190-91°, $[α]_D^{20}$ 8.48°, neutral oxalate, m 173° (decompn), acid oxalate (probably), m 134.5° 230 g of *MePhPrN* on standing 10 days with 475 g of $IClCH_2CO_2Et$ yielded *MePhPrNCH_2CO_2Et* (VII), which reacted with moist Ag_2O to produce, after repeated crystals from EtOH, 30 g of *MePhPrNCH_2COO* (VIII) in the form of a "metastable monohydrate" (VIIIa), and 66 g in the form of a "stable dihydrate" (VIIIb). VIIIa, m 171° (decompn), n_D 1.595 + 0.003, n_D 1.555 + 0.003, sol in H_2O , slightly sol in abs EtOH, very slightly sol in MeOAc, was weakly acidic, was converted by heating 12 hrs at 100°.

then increasing the temp. to 170–90°, to MePhPrN and 1
 $\text{MePhNCH}_2\text{CO}_2\text{Pr}$, b_p 150–2°, identified by conversion
 to the amide, m. 164°. Treatment of VIIa with Ba(OH)₂,
 then CO₂, converted it to MePhPrN and (HOCH₂CO₂)₂Ba.
 VIIa yielded the following salts. chloroplatinate, yellow,
 powder, m. 198° (decompn.), picate, yellow, m. 127°
 (decompn.), neutral oxalate, m. 203°, very slightly sol
 in 95% EtOH, d-camphorsulfonate, m. 227–27.5° (de-
 compn.), [α]_D 8.63°. The dihydrate, VIIb, was ob-
 tained also by treatment of the picate of VIIa with
 HCl, then with moist Ag₂O, m. 81.5°, resolidifies and
 again m. approx 160° (decompn.), is much more sol in
 abs EtOH than is VIIa, n_D 1.595, n_D 1.555 = 0.003.
 The action of heat converts VIIb to MePhPrN, Me-
 PhNCH₂CO₂Pr (predominantly), and PhNCH₂CO₂Me,
 identified by conversion to their amides, m. 164° and 80°,
 resp. Treatment with Ba(OH)₂, as above results in
 almost complete recovery of unchanged VIIb, the salts
 formed are identical with those derived from VIIa. A
 3rd "stable hydrate" (VIIc), m. 109° (accompanying
 some Me₂PhN ClH, CO O, m. 124°, chloroplatinate, m.

196°), was obtained by treatment of PhPrNCH₂CO₂Et
 with MeI, n_D 1.595 = 0.003, n_D 1.555 = 0.003, picate,
 m. 189° (decompn.). The reaction of p-MeC₆H₄NEt₃
 with ICH₂CO₂Et, and subsequent treatment with Ag₂O
 gave p-MeC₆H₄NEt₃ ClH, CO O (IX), very sol in H₂O
 and EtOH, very hygroscopic, oxalate, m. 138–9° IX,
 like Et₃PhN ClH, CO O and Me₂PhNClH, CO O, exists

in only 1 form. Attempts to resolve these betaines,
 carried out with VIIb, VIIc and VIIb by recrystn. of the
 d-camphorsulfonates, and on VIIb, VIIc and VIIa with
 a culture of *Penicillium glaucum* were unsuccessful. The
 aryl betaines studied produce stable gels with org. acids
 as pyrid. by silicotungstic acid, SiW₁₂O₄₀H₁₂, 20H₂O, in the
 form of definite cryst. silicotungstates, while the asym.
 betaines form only tiny spheroidal particles of the silico-
 tungstates. In prep. the quaternary NH₄ salts, gel
 formation took place as the mixt. of tertiary amine and
 halogen compd. stood; the progress of the reaction could
 be followed by the changing thickness of the gel layer
 and by the changing total vol. of the reaction mixt. The
 rate of reaction varied with conditions of illumination,
 EtMePhN, prep. from MePhNH and EtI, differed in
 reaction rate from that prep. from EtBr, although both
 samples of EtMePhN, carefully purified, had the same
 const., and produced identical Raman spectra. G-P
 concludes from the existence of the betaines in several
 forms that the asym. quaternary NH₄ salts exist in 3
 different inactive stereoisomeric (geometric) forms, and
 explains their existence on the basis of the bipyramidal
 bipolar and monopyramidal monopolar formulas of
 H. D. Jones (Proc. Cambridge Phil. Soc. 11, 111, J.
 Chem. Soc. 83, 1400(1903), 87, 135(1905)), Willgerd
 (J. prakt. chem. 41, 291(1890)) and Brechhoff (Ber. 23,
 1972(1890)), indicating that changing the order of attach-
 ing the different groups to the N atom produces the
 different isomers. Other compds. prep. during the
 study of the reaction giving rise to the quaternary NH₄
 salts are: EtMe₂PhN₂, m. 134°; p-MeC₆H₄Et₃N₂,
 m. 156.5°, sol in H₂O, 1 EtOH, nearly insol in EtOAc, p-
 MeC₆H₄Et₃NCH₂CO₂Et, b_p 160–2°; p-MeC₆H₄Et₃NCH₂-
 CO₂Et, m. 123°. G. R. Yohle

Condensation of α-bromocetophenone with 1-ω-amino-
 phenyl-3-phenylthiocarbamide. Tejendra N. Ghosh,
 Current Sci. 4, 312(1935).—The product obtained by
 G. (cf. C. A. 25, 4625) is not identical with that described
 by Pathak (cf. C. A. 30, 4379). W. J. Peterson

Phenylthiocarbamides. Triad NCS. I. Aniline
 thiocyanate. Hans Krall and Rameshwar Dayal Gupta,
 J. Indian Chem. Soc. 12, 629–34(1935).—Aniline thio-
 cyanate (I) has been prep. in theoretical yields by the
 direct union of PhNH₂ (II) and HSCN (III). A measured
 quantity of III, prep. by passing H₂S through H₂(SCN)₂
 in Et₂O and estd. by Volhard's method, was added to 1

equiv. of freshly distd. II in Et₂O. On cooling a heavy
 liquid sepd. which crystd. to colorless shining scales
 of I, m. 80–1°. Prepn. of I by the double decompn. in
 concd. aq. soln. of Ca(SCN)₂ and PhNH₂, HCl gave 30%
 yields. The conditions must be carefully controlled or
 various double compds. sep. The isomerization of I to
 PhNHSCNH₂ (IV) takes place over a wide range of
 temp. with considerable evolution of heat. The trans-
 formation never exceeds 80% and suggests an equil.
 Up to 110°, IV does not revert to an appreciable rate.
 This apparent equil., the sepn. of I in liquid form during
 its prepn. in Et₂O, and the presence of a H₂O-sol sub-
 stance with the properties of a thiocarbamide in the prepn.
 of I from Ca(SCN)₂ and PhNH₂, HCl indicate the existence
 of a 3rd unknown isomer of I and IV which undergoes
 desulfurization with ease and which is freely sol. in H₂O.

II. Action of hydrolytic agents on phenylthiocarbamide.
 Santaran Mehta and Hans Krall. Ibid. 635–9.—Phenyl-
 thiocarbamide (I), PhNHSCNH₂, is not hydrolyzed
 normally to give NH₃ or PhNH₂ with the simultaneous
 production of a OHI compd. In concd. alkali I is dissocd.
 into H₂S and PhNH₂ (II). Some NH₃ is produced
 together with CO₂ by the hydrolysis of II to PhNH₂ in
 secondary reactions. I (5 g.) was refluxed with 1.0, 0.5,
 0.25, 0.125, 0.0625 and 0.00 equivs. of KOH in 132 cc.
 for 1 hr. Depts. of H₂S and HSCN (III) by titration
 with alk. 7n soln. and by acidification with H₂SO₄, de-
 compn. of H₂S with SO₂, oxidation of excess SO₂ with
 HNO₃, and titration with 0.01 N AgNO₃, showed the
 presence of 23.20, 8.67, 2.29, 0.86, traces and 0.00% of
 H₂S and 5.7, 6.8, 7.0, 7.9, 8.7 and 8.8% of III. Thus,
 diminishing alk. favors a disocn. into III and PhNH₂.
 Similar results were obtained by hydrolysis with 1 equiv.
 of Ba(OH)₂, which gave 13.21% of H₂S and 0.89% of
 III in comparison to the 29.6 and 0.66% obtained with
 1 equiv. of KOH. Hydrolysis with AcOH and HCl
 gave no H₂S, 16.08 and 0.185% of III together with
 faint and strong smells of PhNCS. Thus the C–S bond
 is ruptured in the presence of alkali and the C–NHPh
 linkage by treatment with acids. The C–NH₂ bond is
 only cleaved in the presence of strong mineral acids.

III. Action of nitrous acid on phenylthiocarbamide.
 Ibid. 640–6.—In the presence of acids HNO₂ reacts with
 PhNHSCNH₂ (I) to give a base (II) (cf. Iffector, Ber.
 22, 1170(1899)) and NO or PhNCS (III) and N₂ accord-
 ingly as a strong or weak acid ionizer is present in the
 soln. To obtain an idea of the progress of the 2 reactions,
 expts. were carried out in Allen's modification of Lunge's
 nitrometer and other depts. were made on a larger scale
 to est. the yields of solid and liquid products. The
 gradual addn. of 1 equiv. of pure NaNO₂ to a soln. of
 I in excess dil. HCl pptd. the yellow nitroso deriv. of
 I. Addn. of a 2nd equiv. of NaNO₂ acted upon the
 unchanged I. The soln. smelled of PhNC from the
 beginning of the reaction which finally yielded 82–5%
 of II, 10% of III and a gas composed of 90.5% NO and
 9.5% N. In the presence of dil. AcOH, equimol. quanti-
 ties of HNO₂ and I gave 66.5% of III, 23% of I and a
 gas contg. 80% N and 20% NO. Under any conditions
 the 1st change is an oxidation producing II and NO,
 followed by the normal reaction of amines forming N and
 III. The evolution of N in the presence of AcOH shows
 that I contains an NH₂ group and that its configuration
 must be represented by PhINC(S)NH₂ or PhN:C-
 (SH)NH₂. In the presence of HCl the configuration
 changes to that of a mol. which has no NH₂ group. Oxidation
 eliminates 1 S and 4 H atoms from 2 mols. of I.

C. R. Addinal
 Possible rearrangement reactions of monochloramine
 and certain Grignard reagents. Geo. H. Coleman and
 Robert A. Forrester. J. Am. Chem. Soc. 58, 27–8
 (1936).—PhCl₂·MgCl and CINH₂ yield 92% of Ph-
 CH₂NH₂; α-C₆H₄·MgCl gives 47% of α-C₆H₄NH₂; if
 α-MeC₆H₄NH₂ or α,β-MeC₆H₄NH₂ are formed in these
 reactions, they are present in less than 1% of the reaction
 product. PhCH₂CHCl₂·MgCl yields 14% of PhCH₂-
 CHCl₂NH₂. Thus no indication of rearrangement
 products was found.
 C. J. West

The preparation of *m*-phenylenediethylamine, *p*-phenylenediethylamine and benzohexamethylamine from the three phenylenediacetonitriles. Paul Ruggli, B. B. Bussemaker, Wilhelm Müller and Alfred Staub. *Helv. Chim. Acta* 18, 1388-95 (1935). —By employing pressures of 70-75 atm H_2 at temps of 90-100°, it is possible to obtain 50-60% yields of primary amines by reduction of nitriles, since the higher temp. and pressure shortens the time of reaction, and of aldime formation. Ten g. m - $C_6H_4(CH_2CN)_2$ (cf. Tuttle, *C. A.* 20, 1794) in 100 cc. abs. alc. salted with NH_3 was reduced with H_2 (70 atm) at 90-100°, with 20 g. Ni on clay (Rupe, *C. A.* 13, 2196) as catalyst. Removal of alc. in *vacuo* (the amine protected from CO_2) and distn. gave 6 g. m - $C_6H_4(CH_2CH_2NH_2)_2$ (I), b.p. 152-3°. The residue contains secondary amine as shown by analysis of the HCl salt and Pt salt. The following derivs. of I were prep'd: *di*-HCl salt, m. 300-302° (decompn.) (black); *Pt* salt, m. 242°; *di*-Bz deriv., m. 181°. Similarly, 40 g. p - $C_6H_4(CH_2CH_2NH_2)_2$ (cf. Tuttle, *C. A.* 20, 1794) (40 g. catalyst) gave 24 g. p - $C_6H_4(CH_2CH_2NH_2)_2$, b.p. 130°, m. 36°, *di*-HCl salt, m. only in a free flame; *Pt* salt, darkens 280°; *picrate*, m. 246° (decompn.); *di*-Bz deriv., m. 225°; *di*-Ac deriv., m. 210°. 15 g. o - $C_6H_4(CH_2CH_2NH_2)_2$ (III) (Moore and Thorpe, *C. A.* 2, 1443) in 100 cc. solvent was reduced in the same manner, using 80 g. catalyst. 12.5 g. distillate was obtained, 7.6 g. b.p. 120-9°. Redistn. yielded a product, b.p. 120-7°, which was shown to be o - $C_6H_4(CH_2CH_2NH_2)_2$ (IV) (cf. von Braun and

Reich, *C. A.* 20, 1413), and not o - $C_6H_4(CH_2CH_2NH_2)_2$, prep'd. in 20% yield by reduction of III with Na and alc. (von Braun, *et al.*, *C. A.* 11, 2676). Several mechanisms are proposed to account for the formation of IV.
W. Gordon Rose.
Some remarks with regard to the communication of J. Reilly and P. J. Drumm on the mechanism of diazotization. J. Böeseken and H. Schoutissen. *Rec. trav. chim.* 54, 956-8 (1935). —B and S criticize the paper of Reilly and Drumm (*C. A.* 29, 6588*), stating that R and D have paid no attention to the earlier work of B and S (*C. A.* 15, 1023, etc.) and that R and D fail to give details of their procedure for the detn. of the quantity of diazotized amino salt with the colorimeter so that it is impossible to discuss the results on the basis of the B and S expts.
Oden E. Sheppard.
Condensations between maleic anhydride and phenylhydrazones. Guido la Parola. *Gazz. chim. ital.* 65, 624-7 (1935). —The condensation reaction of $OC(=CH)CH(=O)CO_2$ (I) with Schiff bases (cf. *C. A.* 29, 3315*) was extended to phenylhydrazones of aromatic aldehydes to learn whether, besides the expected formation of an acyl group in the NH group, the HC=N group would be hydrolyzed. However, the only reaction was the following: $I + PhHN=CHAr \rightarrow ArCH=NNHPhCOCH_2CH_2O$. In each case when equimol. quantities of the 2 reagents in C_6H_5 were mixed at 70°, the products were pptd. directly on cooling. Since the reaction seems to be a general one, it should be of utility as a means of identification of phenylhydrazones. When the NH group in the phenylhydrazone contains an alkyl group, as in $PhMeNN=CHPh$, there is no reaction with I, even after prolonged refluxing. *N*-Maleylbenzophenylhydrazone-carboxylic acid, $PhCH=NNHPhCOCH_2CH_2O$, m. 123-4°; *N*-*p*-Tolual homolog, p - $MeC_6H_4CH=NNHPhCOCH_2CH_2O$, m. 107°. Aromatic compd., m. 136°. Salicylic compd., m. 126°. All 4 acids are hydrolyzed by hot aq. 0.5 N NaOH to the corresponding phenylhydrazones.
C. C. Davis.

Constitution of some additive compounds of tertiary phosphines. W. Cule Davies and W. P. Walters. *J. Chem. Soc.* 1935, 1786-92. —The disson of the compd. R_3R_2P CS₂ results in CS₂ (gas) + R_3R_2P (liquid) \rightleftharpoons R_3R_2P (vapor). The empirical index of stability is obtained by comparing the temps. at which the disson. pressure of a deriv. of $PhMeP$ (taken as unity) and of the standard become 50 mm. The following give the index of stability, the m. p. (sealed tube) and color of the finely powd. compd.: p -OMe 1.34, 119°, deep orange; p -Me 1.11, 118°, light brown; $PhMeP$ 1.00, 102°, terracotta; p -PhO 0.97, 88°, salmon-pink; p -Br 0.92, 96°, orange; 2,5-Me₂ 0.81, 71.5°; 2,4,6-Me₃ 0.55, 46°; $PhEtP$ derivs.: p -Me₂N 1.27, 103°, deep orange; p -PhO 0.77, 69°, brown; p -Me 0.62, 55°, chocolate, unsubstituted 0.49, 45°, brown; p -Br <0.4. The stability of the compd. is increased by an electron-releasing group (p -Me) and diminished by an electron-attracting group (p -Br). Comparison of the CS₂ compds. of p -tolyl-, p -xylyl- and 2,4,6-trimethylphenyldimethylphosphines shows that the introduction of o -Me groups decreases the stability. Change from arylidimethyl to arylidithiophosphines considerably depresses the stability of the additive compd. The mechanism of the formation of the CS₂ compds. is discussed. Values are given for the disson. consists of the above compds.; also, for the vapor pressures of $PhMeP$ and p - $MeC_6H_4PMe_2$. Et_3P formed the following compds.: phenylthiocarbamate, pale yellow, m. 61°; p -tolylthiocarbamate, pale yellow, m. 85-90°; p -nitrophenylthiocarbamate, lemon-yellow, m. 99°, p -benzoquinone, black, m. about 180°, tributylphosphine- p -benzoquinone, cream, m. about 180-90°, p -tolylmethylphosphine- p -benzoquinone, cream, does not m. 250°. Mol.-wt. detns. showed the following degree of disson.: Et_3P CS₂ 0.13, 0.07, $PhMeP$ CS₂ 0.59-0.77, p -MeOC₆H₄PMe₂ CS₂ 0.54-0.69, Et_3P CS₂ (in C_6H_6) 0.72, $PhNCS$ Et_3P (ebullioscopic in Me_2CO) 0.38, p -O₂N C_6H_4 NCS Et_3P 0.06; p - MeC_6H_4 NCS Et_3P 0.52. Et_3P CS₂ has a mol. cond. of 0.015 and 0.019 for 20 and 100 l./g.-mol. The reaction between a *tert* phosphine and S is practically instantaneous. There is no evidence of combination between Bu_3P and the following compds. in Et_2O at -80°: $PhCO$, dimethyl- γ -pyrone, thiourea, thioisamine, thiocarbamide, 4,4'-bisdimethylamino bisbenzophenone, Na diethyldithiocarbamate and p -dimethylaminobenzylidenehydrazine. C. J. West.

Two methods for iodinating phenols. C. J. West. *Ann. sci. univ. Jassy* 20, 131-8 (1935). —Two new more or less general methods have been developed for iodinating phenols. In the 1st, I₂ in MeOH was added drop by drop to a soln. of the phenol in MeOH contg. dry NH_3 . The reaction was rapid at first but slowed up near the end. The yields were better by this method than with aq. NaOH although arisols, if formed at all, were formed by either method. Methylamines, even NMe_3 , could be substituted for NH_3 . The I entered para and then ortho to the OH group. In this method the NH_3 served to neutralize the HI and may have also formed intermediate products such as NH_4I and NH_3 . A soln. of 13 g. I₂ was added to 6 g. 3,4-Me₂C_{6H₃O} in NH_4 MeOH. H_2O was added, the soln. was extd. with Et_2O , the Et_2O was washed with aq. SO_2 , dried and evapd., leaving 3,4-dimethyl-5-iodophenol, m. 71° (from petroleum ether). 3,5-Me₂C_{6H₃O} when treated in the same way gave a diodo-3,5-dimethylphenol, m. 176-7° (decompn.), *acetate*, m. 153-4°. This diiodophenol gave an arisol with the liberation of I₂ when heated with 10% NaOH in the presence of $K_2S_2O_8$. In the 2nd method the acetoxymercuri deriv. of the phenol was dissolved in NaOH soln. and slowly poured into dil. aq. AcOH contg. I₂ and KI. The reaction $ArHgOAc + I_2 \rightarrow ArI + IHgOAc$ was instantaneous and quant. In fact the reaction could be used for detg. acetoxymercuri compds. by using excess standardized I₂ soln. and titrating back. The advantages of the method are that the acetoxymercuri derivs. are easy to prep., that no arisols are formed and that the I enters the ring in the same position as the AcOH group, thus orienting the I deriv. 4,6-Diacetoxymercuri-2,5-dimethylphenol (64 g.) was mixed with 180 cc. 5% NaOH, dild. to 1 l. and slowly poured into 52 cc. I₂ and 60 g. KI in AcOH. After standing the soln. was decanted, the HgI₂ was dissolved in KI soln. and the phenol was taken up in petrol ether and treated with SO_2 . Yield, 93% of 4,6-diiodo-2,5-dimethylphenol, m. 63° (from AcOH). When heated with NaOH or NaI soln. this gave an arisol 2-Acetoxymercuri-6-bromothymol,

when treated in the same way, gave 92% 2-iodo-6-bromo-*thymol*, an oil. When heated with 10% NaOH this liberated Br₂ and formed an arisol. John E. Milbrey

Identification of phenols with 2,4-di-*nitrochlorobenzene*. R. W. Bost and Frank Nicholson. *J. Am. Chem. Soc.* 57, 2368-9 (1935) —The following 2,4-dinitrophenyl ethers were prep'd from the Na salt of the phenol and 2,4-(O₂N)₂C₆H₃Cl in 95% EtOH. PhOH, pale yellow, m 69°, *o*-MeC₆H₄OH, pale yellow, m 90°, *m*-isomer, pale greenish yellow, m 74°, *p*-isomer, m 93.5°, *thymol*, pale yellow, m 67°, *guaiacol*, pale yellow, m 97°, *C₆H₅OH*, pale yellow, m 128°, *β*-isomer, m 95°, *p*-HOC₆H₄Ph, pale greenish yellow, m 118°, *resorcinol*, buff, m 101°, *isoeugenol*, *S*-yellow, m 130°, *o*-O₂NC₆H₄OH, buff, m 142°, *m*-isomer, light yellow, m 138°, *p*-isomer, light yellow, m 120°, 2,5-Cl(OH)₂C₆H₃Me, pale greenish yellow, m 112°, *o*-ICl₂OH, pale yellow, m 93°, *o*-ClC₆H₄OH, pale greenish yellow, m 99°, *m*-isomer, pale yellow, m 75°, *p*-isomer, pale yellow, m 126°, 2,4-Cl₂C₆H₃OH, pale yellow, m 110°, 2,4,6-Cl₃C₆H₂OH, pale yellow, m 136°, *o*-BrC₆H₄OH, pale greenish yellow, m 89°, *p*-isomer, pale yellow, m 141°, 2,4-Br₂C₆H₃OH, pale yellow, m 135°, 2,4,6-Br₃C₆H₂OH, pale greenish yellow, m 135°, *p*-ICl₂OH, light yellow, m 166°.

Carvacrol V Benzyl ethers of acetylated methylisopropylphenols. Hanna John and Paul Beetz. *J. prakt. Chem.* 144, 49-52 (1935). cf. *C* 29, 7038, —*p*-Acetothymol (I) and PhCH₂Cl with EtOH-KOH give about 85% of *p*-acetylthymyl benzyl ether, m 71°, *p*-propionyl homolog, m 64°, *p*-butyryl homolog, m 47°, *p*-isovaleryl homolog, m 40°, *p*-acetylthymyl 4-nitrobenzyl ether, pale yellow, m 104°, *p*-propionyl homolog, pale yellow, m 110°, *p*-butyryl homolog, yellow, m 97°, *p*-isovaleryl homolog, yellow, m 84°, *p*-benzoyl homolog, yellow, m 91°, *p*-Acetocarvacryl benzyl ether, m 64°, 4-nitrobenzyl ether, yellow, m 114°, *p*-propionacarvacryl 4-nitrobenzyl ether, yellow, m 128° I and Cl₂(CH₂Cl)₂ with EtOH-KOH give glycerol *α,α'*-bis(*p*-acetylthymyl) ether, m 100°; the *o*-nitro-*p*-acetylthymyl ether, m 95°.

C. J. West
Synthesis of certain alkyl and aryl cryptophenols. Martin E. McGreal and Joseph B. Niederl. *J. Am. Chem. Soc.* 57, 2625-7 (1935) —Condensation of Me₂(iso-Pr)₂COH and PhOH with ZnCl₂ gives *p*-(2,2,3-trimethylpropyl)phenol, m 105°, PhOH coeff (P. C. 45, Me₂BuCOH gives *p*-tert-heptylphenol, b₁₀ 280°, (iso-Bu)₂COH and PhOH did not give the expected *p*-tert-octylphenol but *p*-tert-butylphenol. 1-Methyl-2-cyclohexanol and PhOH give *p*-2-methylcyclohexylphenol, m 107°, P. C. 55; *β*-Me isomer, m 101°, P. C. 45; *α*-Me isomer, m 108°, P. C. 70. PhCH₂OH gives *p*-PhCH₂C₆H₄OH, m 82°; PhMeC₆HO or PhCH₂CH₂OH yields *p*-PhMeC₆H₄OH, m 64°, P. C. 40, PhMeEtCOH gives 2-phenyl-2-(4-hydroxyphenyl)butane, b₁₀ 145-8°, P. C. 33, PhMe(iso-Pr)COH gives 2-methyl-3-phenyl-3-(4-hydroxyphenyl)butane, b₁₀ 157-60°.

C. J. West
Thyroxine from hydroquinone monomethyl ether and 3,4,5-triodonitrobenzene. A. Ya Savitzkii. *Med. eksptl. (Ukrain.)* No. 1, 39-49 (1934) —To make 3,4,5-IC₃NO₂, *p*-nitroaniline was iodated in MeOH with ICl and 2,6-diiodonitroaniline thus obtained was diazotized with nitrosylsulfuric acid in acid, and treated with KI and Na. Hydroquinone mono-Me ether and 3,4,5-IC₃NO₂ were condensed in MeCOEt, producing pure 3,5-diiodo-4-(4'-methoxyphenoxy)nitrobenzene. The nitro group was reduced to amino, diazotized to CN, changed to imino, and hydrolyzed to 3,5-diiodo-4-(4'-methoxyphenoxy)-benzaldehyde, which, condensed with hippuric acid, produced 4-[3',5'-diiodo-4'-(4'-methoxyphenoxy)benzylidene]-2-phenyl-5-oxazalone. It was possible to eliminate the etherification and obtain directly 3,5-diiodo-4-(4'-hydroxyphenoxy)phenyl-*α*-aminopropionic acid, which, after introduction of 2 I atoms, produced thyroxine with much higher yield.

Leo Nazarek
The action of hydrogen sulfide on acid chlorides. Ludwik Szperl and Lucjan Oziolek. *Roczniki Chem.* 15, 408-12 (in French 413) (1935) —By the action of H₂S

on *as*-*o*-xyloyl chloride, di-*as*-*o*-xyloyl sulfide, m. 119-20°, and di-*as*-*o*-xyloyl disulfide, m. 127-8°, are formed. The disulfide was sep'd. after decompn. of the monosulfide by NH₃. Di-*as*-*o*-xyloyl sulfide, treated with alc. NH₃, gives 3,4 Me₂C₆H₃CONH₂ and 3,4 Me₂C₆H₃COSNH₂. 3,4-Me₂C₆H₃CO₂H was obtained by the Grignard reaction in 60% yield. M. Wojciechowski.

Phenyl ether series IV. Phenoxybenzene-4,4'-di-thiol and related compounds. C. M. Suter and Paul H. Scrutcheild. *J. Am. Chem. Soc.* 58, 545 (1936), cf. *C* 24, 2501, 2701 —Reduction of phenoxybenzene-4,4'-disulfonyl chloride with SnCl₄-HCl-AcOH gives 71% of phenoxybenzene-4,4'-dithiol (I), m. 103-4°, with Cl-CH₂CO₂H in 5% KOH there results 83% of phenoxybenzene-4,4'-dithioglycolic acid, m. 165-6°, various amts. of ClSO₂H in Ac₂O or in H₂SO₄ either did not affect this acid or produced H₂O-sol derivs., SOCl₂ gives an oily material, C₆H₅SO₂Cl₂, which yields with AlCl₃ a red tar. I and Me₂SO₄ in NaOH give 89% of 4,4'-dimethylthioldiphenyl ether, m. 81-5°.

C. J. West
Reaction of aldoxime derivatives with bases. II. The reaction of carboxy-*α*-benzaldoximes with sodium hydride. Charles R. Hauser, Earl Jordan and Ruth O'Connor. *J. Am. Chem. Soc.* 57, 2150-8 (1935), cf. *C* 28, 1281 —The relative yields of nitriles and oximes formed in the reactions of carboxy-*α*-benzaldoximes with NaOH are a function of the temp. Contrary to the previously accepted view that certain carboxy derivs. of *α*-benzaldoximes have *β*-configurations, it has been shown that they are all of the *α*-type. The carboxy derivs. with NaOH give higher yields of nitrile and lower yields of oxime than the corresponding Ac derivs. Data are given for 30° and 100°.

C. J. West
Removal of hydrogen and acid radicals from organic compounds by means of bases. II. The removal of acetic acid from acetyl aldoximes by alkalis. Charles R. Hauser and Earl Jordan. *J. Am. Chem. Soc.* 57, 2150-6 (1935), cf. *C* 28, 1281, 29, 5001 —Acetyl-*β*-benzaldoximes and 2 N NaOH give both nitrile and oxime, the yield of oxime in most cases predominating at 0° and those of the nitrile at 30°. With acetyl-*α*-benzaldoximes 2 N NaOH gives both nitrile (or the corresponding acid) and oxime at 100° and, in certain cases, even at 30°; with the exception of the *o*-NO₂ deriv., the yields of oxime were much greater than those of the acid, the yields of acid were extremely small at 30°. *β*-3,4-Methylene-dioxybenzaldehyde acetate is hydrolyzed somewhat more rapidly than the corresponding *α*-isomer, but it is probable that there is no very great difference in these rates. It is concluded that *α*- and *β*-aldoxime acetates undergo fundamentally the same types of reaction with alkali, they form oxime by hydrolysis and nitrile by elimination of AcOH. They differ primarily in the ease with which they eliminate AcOH, the *β*-isomers undergoing this reaction much more readily than the corresponding *α*-isomers. These results are discussed on the basis of the hypothesis that the formation of nitrile from acetyl aldoximes consists of the removal of a portion of alkali, followed by the release of acetate ion. In the presence of Na₂CO₃ certain acetyl-*β*-benzaldoximes give high yields of nitrile and low yields of the corresponding oxime. Certain acetyl-*α*-benzaldoximes with KNH₂ in liquid NH₃ form both nitrile and oxime, the yields of nitrile being greater. Tables give the yields of products.

C. J. West
Nitro and bromonitro derivatives of *p*-aminoacetophenone. Chr. W. Raadsweld. *Rec. trav. chim.* 54, 813-27 (1935) —The nitration and bromination of several derivs. of *p*-aminoacetophenone were studied. The following new comp'ds were prep'd: Me *p*-acetylphenyl carbamate, m. 162°, Et *p*-acetylphenyl carbamate, m. 156°, N-(4-acetylphenyl)-N'-ethylurea, m. 157°, Me 2-nitro-4-acetylphenyl carbamate, m. 107°, Me 2,6-dinitro-4-acetylphenyl carbamate, m. 213°, Et 2-nitro-4-acetylphenyl carbamate, m. 111°, Et 2,6-dinitro-4-acetylphenyl carbamate, m. 176°, N-(2-nitro-4-acetylphenyl)-N'-N'-ethylurea, m. 91°, N-(2,6-dinitro-4-acetylphenyl)-N'-N'-ethylurea, m. 120°, N-(2,6-dinitro-4-

acetylphenyl)-*N'*-phenylurea, m 191°, 3,5-dinitro-4-aminoacetophenone (I) (*N*-Ac deriv, m 178°, 4-(bromoacetyl)aminoacetophenone, m 157°, 3-bromo-4-amino-5-nitroacetophenone (II) (*N*-Ac deriv, m 203°), m 181°. I and II could be diazotized only by Witt's procedure ($K_2S_2O_8$ and abs. HNO_3). When the diazotized II was heated, 3,5-dinitrobenzene was obtained, the Ac group thus being displaced by the NO_2 group.

E. W. Scott

Some derivatives of *p*-aminoacetophenone Chr W. Raadsvelde *Rec trav chim* 54, 827-32 (1935).—The following derivs of $p-H_2NC_6H_4CO_2Me$ were prep'd: *N*-(4-acetylphenyl)urea, m 183° (148° reported), *N*-(4-acetylphenyl)-*N'*-phenylurea, m 195°, *N*-(4-acetylphenyl)-*N'*- α -naphthylurea, m 209°, 2,4-dinitro-4'-acetylphenylamine, m 192° (185° reported); 2,4-dinitro- α -naphthyl-4'-acetylphenylamine, m 162°. Derivs of acetophenone ketazine 3-nitro-4-amino, m 350°; 3-nitro-4'-acetylamine, m 270°, 3,5-dinitro-4-amino, m 345°, 3-bromo-4'-acetylamine, m 315°; 3-nitro-4-amino-5-bromo, m 315°; 3-nitro-4'-acetylamine-5-bromo, m above 350°. Derivs of acetophenone phenylhydrazones 3-nitro-4-amino, m 135-8°, 3,5-dinitro-4-amino, m 245°, 3-nitro-4-amino-5-bromo, m 80°, 3-nitro-4'-acetylamine, m 160°.

E. W. Scott

Hydrazones and semicarbazides from *p*-thioacetylphenylhydrazine Zenichi Horii *J Pharm Soc Japan* 55, 880-7 (in German 195-8) (1935).—Reduction of diazonium compds of *p*-thioacetylphenylamine with $SnCl_4$ gave *p*-thioacetylphenylhydrazine-HCl (I), decomps 188°, the free base, $C_6H_4N_2S$, m 95-6°. Condensation of I (in 95% alc) with the following ketones and aldehydes gave the corresponding *p*-thioacetylphenylhydrazones whose m ps are given: Me_2CO , colorless needles, m 123-5-9°, acetyl-*p*-thioacetylphenylhydrazine, $C_6H_4N_2S$, yellow needles, m 217°, Ac_2O , CO_2H , yellow needles, m 191-15°, $AcPh$, yellow plates, m 109-10°, BzH , yellow needles, m 135-6°, α - HOC_2H_4CHO , yellow needles, m 172-3°, *m*-isomer, colorless needles, m 167°, *p*-isomer, yellow needles, m 154°, α - $MeOC_6H_4CHO$, yellow plates, m 147-8°, *p*-isomer, yellow-brown needles, m 129-9-6°, heliotropin, colorless needles, m 153-4°, veratraldehyde, yellow plates, m 117°, isovanillin, yellow brown plates, m 148-9°, 3- ClO_4 - $MeOC_6H_4CHO$, yellow needles, m 113-14°, resorcyaldehyde, yellow needles, m 191-2°, 2,4-(MeO) $_2$ C_6H_3CHO , yellow needles, m 129-9-5°, *p*-tolualdehyde, yellow needles, m 118-19°, cumaldehyde, yellow prisms, m 140°, α - $O_2NC_6H_4CHO$, orange red needles, m 171°, *m*-isomer, yellow crystals, m 161-2°, *p*-isomer, orange-yellow needles, m 185-6°, *p*- $Me_2NC_6H_4CHO$, yellow flakes, m 158-9°, m - $Cl_2C_6H_3CHO$, yellow needles, m 125-5-5°, 5- Cl -2- HOC_6H_4CHO , yellow needles, m 217-18°, 3,5- Cl_2 -2- HOC_6H_4CHO , yellow prisms, m 223-4°, $PhCH$ $CHCHO$, yellow prisms, m 139-40°, 2-furaldehyde, yellow prisms, m 124°, β -naphthaldehyde, yellow needles, m 207-8°, δ -galactose, colorless needles, m 181-5°, δ -mannose, colorless plates, m 185-6°, δ -arabinose, colorless needles, m 160-0-5°. 1-*p*-Thioacetylphenylsemicarbazide, m 217° (thio deriv, m 187°), 4-phenyl deriv, m 239-9-5° (thio deriv, m 190-1°), 4- α -tolyl deriv, m 188-9° (thio deriv, m 163-4°), *m*-isomer, m 230° (thio deriv, m 177-8°), *p*-isomer, m 238-9° (thio deriv, m 170-1°).

F. I. Nakamura

2',6'-Dihydroxy-4'-methoxy- β -phenylpropionophenone, extracted from the oil of *Populus balsamifera* Albert Goris and Henri Canal *Compt rend* 201, 1435-7 (1935).—Elimination of free acids, phenols, phenylethylcinamic and cinnamic esters from the coned essence obtained by the extrn of fresh buds of *Populus balsamifera* produced a viscous yellow-brown liquid partially sol in cold benzene. Recrystn of the insol fraction from alc gave fine pale yellow needles of a dihydrochalcone (I), $C_{15}H_{12}O_4$, m 168°, cleaved by boiling for 3 hrs with concd HCl into 1 mol of $PhCH_2CH_2CO_2H$ (II), m 49°, and 1 mol of 3,5-(HO) $_2$ C_6H_3OMe , m 78°. Demethylation with boiling HCl formed equimol amts of MeI , II and 3,5-(HO) $_2$ C_6H_3OH . In its compn. I resembles the

flavones from poplar buds, chrysol and tectochrysol (Piccard, *Ber* 10, 176 (1877)), but its resistance to alk. sapon suggests its formulation as 4',2',6'- $MeO(HO)_3C_6H_2COCH_2CH_2CH_2Ph$.

C. R. Addinall

Diphenylmalonic acid. H. J. Morssman. *Helv. Chim. Acta* 18, 1460-8 (1935).—Sapon of $Ph_2C(CO_2H)_2$ and $Ph_2C(COCl)_2$ (I) with dil $NaOH$ yields Ph_2CHCO_2H (II) (Staudinger, *et al*, *C. A.* 8, 1112). 4.1 g I, b.p. 150-2°, was agitated 17 hrs with 20 g H_2O . The acid was extd with ether. After removal of the ether *in vacuo*, the residue was triturated with CaH_2 and the cryst. product (III) dried in a high vacuum at room temp. III loses CO_2 below its m p, and m at the same temp as II. The mixed m p of II and III shows no depression. Analysis of III gives results in agreement with the theoretical values for $Ph_2C(CO_2H)_2$, 195 mg III and CH_3N_2 in ether gave 120 mg. $Ph_2C(CO_2Me)_2$, m 93.0-3.5°.

W. Gordon Rose

Higher benzenoid hydrocarbons II The isomeric bromofluorenones Harry F. Miller and C. Bryant Bachman *J. Am. Chem. Soc.* 57, 2443-6 (1935); cf. *C. A.* 28, 3671-2.—2-(4-Bromobenzoyl)benzoyl chloride, m 162-3°, results in 92% yield from the acid and PCl_5 in CaH_2 ; liquid NH_3 gives 95% of the amide, m 184-5°, $NaOBr$ gives 82% of 2-(4-bromobenzoyl)aniline (I), m 106-7°. 2 $C_6H_5SO_2NH_2$, $COCl_2$ and $PhBr$ with $AlCl_3$, followed by hydrolysis of the impure sulfonamide with H_2SO_4 - $AcOH$, give 28% of I. The Osterlin reaction (*C. A.* 26, 5559) gives only 1% of I from 2-(4- BrC_6H_4) CO_2H , CO_2H . Through the diazo reaction I gives 92% of 3-bromofluorenone, light yellow, m 162°, the over-all yield from α - $C_6H_4(CO_2O)$ is 55%, from α - $HOC_6H_4NH_2$, 21%. 2-Benzoyl-6-bromobenzoyl chloride, light brown, m 119-20° (85.9%), 2-bromo-6-benzoylbenzamide, m 135-40° (87%); 2-bromo-6-benzoylaniline, m 128-30° (57%), the diazo reaction gives 70% of 4-bromofluorenone (II), light yellow, m 185-7° (25% over-all yield from the anhydride). α - BrC_6H_4 and α - $IC_6H_4CO_2Me$ with Cu powder give 14% of 2-bromo-2'-carboxyfluorenyl, m 186-7°; with concd H_2SO_4 it gives a quant yield of II. III The isomeric monobromo 9-fluorenols and monobromofluorenones *Ibid.* 2447-50.—Bromofluorenones (II) are reduced to bromofluorens by Zn in $EtOH$ - NH_4OH , 2-, m 130° (97%); 3-, m 142-5° (85%), 4-, m 149-50° (82%); with I and red P in glacial $AcOH$ these are reduced to the bromofluorens (II) 2-, m 110° (82%); 3-, m 90-1° (quant); 4-, m 165° (80%). II are obtained from I by reduction with amalgamated Zn in $EtOH$ - HCl (practically quant yield). Satn of II in $EtOH$ with dry HBr gives dibromofluorenes 2,9-, m 107-5-8° (quant), 3,9-, m 124-5° (92%), 4,9-, m 194-5° (83%); HCl gives the bromo-9-chlorofluorenes 2-, m 102° (quant), 3-, m 116-17° (87%), 4-, m 141-2° (86%). In the presence of $AcOH$ fluorene mercurates predominantly in the 4-position, in the absence of solvents the 3-isomer is also formed, the sepn of the isomers was not attempted because of their insolv. Treatment of the products with $PhIOH$ - $CaCl_2$ and subsequent bromination gave the Br derivs.

C. J. West

Free radicals E. Darmon *Bull. soc. chim.* [5], 2, 2053-67 (1935).—Lecture on free radicals of various types, long-life radicals such as Ph_3C , short life of the type Me and Et , and radicals discovered by mass and ordinary spectrographic methods. The use of these methods for the detn of mol dimensions and vibrations and the calcn of energies of disson was discussed and the importance of the study of free radicals was stressed. Thirty references.

C. R. Addinall

Hydroxy polyketones II Dibenzoylcarbinol A. H. Blatt and W. Lincoln Hawkins *J. Am. Chem. Soc.* 58, 81-4 (1936), cf. *C. A.* 29, 5097.— Bz_2CHOAc (I) in 95% $EtOH$ shows 5.1% enol content; it is not affected by $AcCl$, by p - $MeOC_6H_4COCl$ in CaH_2N or by AcO alone or with H_2SO_4 , it does not form a Cu deriv. with $CuSO_4$. In aq. Na_2CO_3 I gives $BzOH$, $AcOH$ and Bz_2CH_2OH , aq. $NaOH$ gives $BzOH$ and $AcOH$; Na_2CO_3 in $MeOH$ gives $BzOH$, $AcOH$ and $BzOMe$, $EtOH$ gives $BzOEt$,

this cleavage must involve the addn. of alc. followed by cleavage of the addn. product and, from the color changes during the course of the reaction, it is probably the ene-diol which adds alc. Acid hydrolysis (H_2SO_4) gives 25% of $\text{Br}_2\text{CH}_2\text{OH}$, m. 111–12°. AcCl gives the acetate, $\text{Cu}(\text{OAc})_2$ in AcOH gives benzal, Na_2CO_3 gives BrOH and $\text{Br}_2\text{CH}_2\text{OH}$, aq. NaOH gives BrOH , in MeOH these results BrOme . Distn at 4 mm gives *terphenylcarbinol benzoate*, m. 120°. $\text{Br}_2\text{CH}_2\text{OH}$ does not give a color test with NH_3 acids. C. J. West.

Salt formation of mononuclear naphthalene derivatives Herbert H. Hodgson and Reginald L. Elliott. *J. Chem. Soc.* 1935, 1850–4.—2-Nitroaceto-1-naphthalene (20 g.) and Cl in AcOH at 100° give 11 g. of the 4- Cl deriv., m. 219°, hydrolysis of 10 g. with H_2SO_4 , $\text{EtOH-H}_2\text{O}$ gives 8.4 g. of 4-*chloro-2-nitro-1-naphthylamine*, orange m. 202°, removal of the NH_2 group through the diazo reaction gives 1-*chloro-3-nitrophenylamine*, dark brown, m. 127°, reduced by SnCl_2 to 4-*chloro-2-naphthylamine*, m. 68° (*stannichloride*, light brown plates). The 4- Br deriv. was similarly prepd (*Ac deriv.*, m. 186.5°, *stannichloride*, buff-brown). 2-Nitro-1-naphthylamine 4-*mercurioacetate* (II), orange-red, m. 242°, *mercurichloride*, brown, m. 280°, *mercuribromide*, red brown, m. 248°, *mercuriodide*, deep scarlet, m. 237°, *mercuriodibromide*, scarlet, m. 260° (decomp.). I and KI-I give 4-iodo-2-nitro-1-naphthylamine, which was transformed into 4-iodo-2-naphthylamine, brown, m. 78° (*Ac deriv.*, m. 201°, *Br deriv.*, m. 145°, *stannichloride*, light brown). Reduction of 2-chloro-4-nitro-1-naphthylamine with SnCl_2 in HCl-EtOH gives the HCl salt, needles, of 2-*chloro-1,4-naphthylendiamine*, pale green, m. 114°, oxidation gives 2-chloro-1,4-naphthoquinone, N,N'-di-*Ac deriv.*, m. 314°, di-*Br deriv.*, m. 235°. Reduction of 2-chloro-4-nitroaceto-1-naphthalene gives 2-*chloro-1-N-acetyl-1,4-naphthylendiamine*, pink, m. 215° (*stannichloride*, cream). 2-Bromo-1,4-naphthylendiamine, greenish yellow, m. 110° (*di- Ac deriv.* , m. 318°, di-*Br deriv.*, m. 239°, mono- HCl salt, needles; *stannichloride*, needles). 2-Bromo-4-nitroaceto-1-naphthalene, pale green, m. 230°, 2-bromo-4-nitro-1-naphthol, pale yellow, m. 236°, 2-bromo-1-N-acetyl-1,4-naphthylendiamine, light brown, m. 217° (*stannichloride*, pink needles). 2-Iodo-1,4-naphthylendiamine, pale green, m. 119° (mono- HCl salt, needles; di- Ac deriv. , pink, m. 322°, di- Br deriv. , pale purple, m. 282°). 2-Iodo-1,4-naphthoquinone, yellow, m. 120°. I with Ag_2O yields the 4-nitroaceto deriv., mustard yellow, m. 270°. I-KI gives 2-*iodo-4-nitroaceto-1-naphthalene*, greenish yellow, m. 220°, 2-*iodo-4-nitro-1-naphthol*, pale yellow, m. 249°, 2-*iodo-1-N-acetyl-1,4-naphthylendiamine*, m. 235° (*stannichloride*, cream needles). 4-*Chloro-1,2-naphthylendiamine*, pink, m. 93° (mono- HCl salt, light brown plates; 2-N- Ac deriv. , brown, m. 233°; 1-N- Cl deriv. , cream, m. 243° (*stannichloride*); di- Ac deriv. , cream, m. 174°). 4-*Chloro-1,2-naphthoquinone*, maroon, m. 188°. 4-Bromo-1,2-naphthylendiamine, cream, m. 97° (mono- HCl salt, needles; 2-N- Ac deriv. , m. 225°; 1-N- Ac deriv. , m. 248° (*stannichloride*, needles); di- Ac deriv. , brown, m. 225°). 4-Bromo-2-nitroaceto-1-naphthalene, pale green, m. 229°. 4-Iodo-1,2-naphthylendiamine, purple, m. 98° (mono- HCl salt, pale brown needles; 2-N- Ac deriv. , m. 238°; 1-N- Ac deriv. , m. 271° (*stannichloride*, needles); di- Ac deriv. , m. 167°). C. J. West.

Methylethynaphthalenes III Synthesis of 2-methyl-6-ethynaphthalene Otto Brunner and Franz Grof-Morawak. 66, 433–7 (1935); cf. *C. A.* 28, 3070. $\text{p-ETC}_6\text{H}_4\text{CHO}$ (50 g.) and 67 g. MeCH_2Br in CuO_2Et with 53 g. Zn in C_6H_6 give 45 g. $\text{Et-2-methyl-6-ethynaphthalene}$, b. 159–60° (purified from the HIO ester by transformation into the HBr addn. product and removal of HBr by PhNMMe_2 at 180°); redn. of 4.2 g. of the ester with Na and EtOH gives 23 g. of 3-(β -ethynaphthyl)-2-methylpropyl- I-ol , b. 140°; HBr gives with 20 g. of the alc. 20.5 g. of the bromide, b. 141–2°; action of KCN , followed by hydrolysis with 10% EtOH-KOH , gives from 10 g. bromide 15 g. 7-(β -ethynaphthyl)-3-methylbutyric acid, b. 185–7°, concd. H_2SO_4 on the H_2O bath for 2 hrs.

gives from 14 g. acid 9.2 g. 2-methyl-6-ethyl-4-*iso*-1,2,3,4-tetrahydronaphthalene, b. 143–8°; Zn and HCl give 2-methyl-6-ethyl-1,2,3,4-tetrahydronaphthalene, b. 140–5°; heating with S at 270–300° gives 2-methyl-6-ethynaphthalene, b. 145–30°; *picrate*, golden yellow, m. 100–1°; *styphate*, yellow, m. 138–9°. C. J. West.

Estimation and purification of β naphthylamine in the presence of α -naphthylamine and properties of some sulfonyl derivatives Herbert H. Hodgson and Ernest W. Smith. *J. Chem. Soc.* 1935, 1854–6.—The solubilities of α -toluene- α' -(I) and β -naphthylamine (II) in 2% aq. NaOH at 16° are 125 g. and 3 g. per l., resp.; II is practically insol in 10% NaOH , in 2% KOH the values are 185 g. and 110 g. per l. β - $\text{C}_6\text{H}_5\text{NH}_2$ may be estimated in the presence of the α -isomer by the complete pptn. of II in the presence of a high concn. of Na ions; however, when the concn. of I exceeds 20%, II is only partly pptd.; for concns. of I between 25 and 50%, the soly. of II is almost exactly proportional to the quantity of I in soln. On the addn. of aq. KOH solns. of II to solns. concg. Na ions, the Na can be detected with ease when the concn. is 2% or higher. When an aq. acid soln. contg. both α - and β - $\text{C}_6\text{H}_5\text{NH}_2$ is gradually neutralized the β -isomer is pptd. first, which is used as a means of purifying the β -isomer. The Na salt of II crystallizes in silky needles, m. 370°, the NH_4 salt could not be isolated owing to hydrolysis. *m*-Nitrobenzenesulfonyl- α -naphthalide yields a Na salt with 4 mols. H_2O , indescnt scarlet needles; at 50° it forms a chocolate-brown *monohydrate* and at 120° the anhyd. salt is formed as pale orange needles, m. 236°; the K salt reps. as a *dihydrate*, brick-red needles; at 120° the H_2O is lost, giving pale orange needles, m. 232°. The β -isomer, pale cream, m. 166.5°; Na salt, as the tetrahydrate, pale cream, m. 77°, at 60° it forms a pink *monohydrate*, and at 120° the pale yellow anhyd. salt, m. 200°, the K salt forms a trihydrate, pale yellow, m. 77°, forming a monohydrate at 60°, pink-orange, and at 120° the pale yellow anhyd. salt, m. 210°; Br salt, pale orange dihydrate and light brown anhyd. salt, chars about 280°. The definite m. ps. indicate that these salts are coordinated compounds. C. J. West.

Sulfonation of naphthalene. II. Determination of the mechanism of monosulfonation. Robert Lantre. *Bull. soc. chim.* [5], 2, 2092–2108 (1935); cf. *C. A.* 30, 1694. —Energetic sulfonation was carried out by heating 0.1 g. of naphthalene (II) with 0.5 cc. of H_2SO_4 , varying in concn. from 51.4–70.3%, at 180° for 10 hrs. in sealed tubes. The unchanged I was detd. by CrO_3 oxidation and the proportions of α - and β -sulfonic acids (II and III) was estd. by methods previously described. After II and III had been eliminated by filtration, I was removed by boiling with H_2O and the sulfones were detd. by CrO_3 method. Similar expts. were carried out with β - $\text{C}_6\text{H}_5\text{SO}_2\text{Na}$ (IV) in place of I. Equil. between I and IV exists only when the rate of sulfonation is equalled by that of hydrolysis due to H_2O formed in the sulfonation process. To elucidate the sulfonation mechanism it was found necessary to study the rates of sulfonation of I and of desulfonation and to det. their variations under various conditions. Sulfonation at 140° of 0.1 g. of I with 2 cc. of 70.3, 64.0 and 57.7% H_2SO_4 and expts. with 70.1, 76.1 and 82.2% H_2SO_4 at 90° and 82.2, 88.3 and 94.4% H_2SO_4 at 60° were carried out which showed the considerable influence of the concn. of the acid on the rate of sulfonation. Desulfonation at 140° of β - $\text{C}_6\text{H}_5\text{SO}_2\text{Na}$ (V) in the presence of 2 cc. of 45.1, 51.4, 57.7 and 64.0% H_2SO_4 showed that the rate increases with the concn. of the acid. Similar expts. at 100° with 51.4, 57.7, 64.0 and 70.3% acid showed that the rate of hydrolysis is an exponential function of the concn. (cf. Crafts, *Fer.* 34, 1350 (1901)). Analogous results were obtained with IV. A study of the action at 140° of 16 cc. of 64.2 and 45.0% H_2SO_4 on 2 g. of V proved that sulfonation produces both α - and β -sulfonic acids since the transposition of the α - into the β -acid is the result of a desulfonation followed by re-sulfonation. It was further demonstrated that in the elementary process of sulfonation of I, 80–90% of the sulfonic acids produced is the α -modification. By sulfona-

tion at 100° with 81.7 and 85.1% acids it was shown that at a given temp., the transformation of the α - into the β form accelerates with increase in concn of the acid. This results from hydrolysis and resulfonation, both of which reactions are favored by increasing concn. Sulfones are only found in small quantities (2-4%) on desulfonation of IV or sulfonation of I for 39 hrs at 140° with acids varying from 45.1 to 70.3% H_2SO_4 . The above expts prove that in the presence of acids contg. 53.0-68% H_2SO_4 there is an equilibrium between I and the sulfonic acids, I decreasing as the acid concn increases, that this equilibrium is the result of the opposed reactions of sulfonation and desulfonation whose rates increase with the concn. of the H_2SO_4 , the former more quickly than the latter; that the relative quantities of α - and β -sulfonic acids formed are independent of the concn of the H_2SO_4 but that desulfonation destroys the α form more readily. This explanation of the phenomena of transformation of α into β by sulfonation and desulfonation makes explicable the various problems presented by the process of monosulfonation of I and, in particular, explains the methods utilized for the prepn of each of the isomeric monosulfonic acids. Details are given for the prepn of the sample for the detn. of I by the CrO_3 method. To est. $C_{12}H_{10}SO_3$ in the presence of the β isomer the sulfonation mixt. is poured into a 10-fold amt. of H_2O and is neutralized by pure Na_2CO_3 . The neutral soln is boiled, filtered and washed and the combined filtrate is evapd to dryness and pulverized. A portion is used for the estn. of the total sulfonic acids by the CrO_3 method. The remainder is brominated for 6 hrs in the presence of H_2SO_4 to detn. the α sulfonic acid content. C. R. Addinall

Preparation of α naphthoic acid. D. J. Loder and F. C. Whitmore. *J. Am. Chem. Soc.* 57, 2727 (1935).— α - $C_{12}H_9MgBr$ (5 mols) in 2.5 l. abs. Et_2O , slowly added to 7.5 mols $PtCl_2$ in 500 cc. Et_2O , and the mixt. treated with a slight excess of 30% H_2SO_4 , gives 70% α - $C_{12}H_9CO_2H$. Hydrolysis gives 90% α - $C_{12}H_9CO_2H$. C. J. West

Additions to conjugated systems in the anthracene series. III. Factors influencing the mode and extent of reaction of the Grignard reagent with ketones. Percy L. Julian, Wayne Cole and Thomas F. Wood. *J. Am. Chem. Soc.* 57, 2508-13 (1935). cf. C. A. 29, 7320. Benzanthrone (14 g) and $MeMgI$ give, on decomp. the product with NH_4Cl and passing O_2 through the Et_2O soln, in addn to 12 g of I, 0.3 g of a compd. (III), decomp. at 74° with sepn of anthraquinone (III). I, m 148°, in the Grignard machine it gives 1 mole gas and consumes 1 mole of reagent, oxidation of I gives III and Br_2O_3 I (3.6 g) and 1.6 g Br in $CHCl_3$ give 4 g of IV, m 168° (decomp.), further action of Br gives V, yellow, m 200°, with $AcOH$ Ac_2O IV yields a diacetate, light yellow, m 188°. Ethyldieneanthrone (VI) is obtained as a red oil by destructive distn of ethyloxanthrone in N_2 , it b.p. 245-7°, distn at atm pressure yields III and CH_2 . VI exists in an enolic form involving a 1,7-shift of H , the anthranol suffering oxidation to a peroxide, which cleaves spontaneously to III and vinyl ac. Anthraphenone undergoes 1,5-dimol reduction on treatment with $PhMgBr$ or $PhMgI$ and no reaction with $MeMgI$. Dihydroanthraphenone gives normal 1,2-addn. Definite products could not be isolated from the reaction of phenylanthraphenone (VII) and $PhMgBr$, the dihydro deriv. and $PhMgBr$ yield VII and unchanged material. Striking analogies are given between *meso*-unsatd anthracene ketones and α,β -unsatd ketones. The analogies are also maintained when the unsatd is removed in both types of ketones.

C. J. West

Dissociable anthracene oxides. The influence of *meso*-naphthyl groups. Antoine Willemart. *Compt. rend.* 201, 1201-2 (1935).—9,10-Di- β -naphthylanthracene (I), m 378-0°, was obtained by the method of Guyot and Stachling from 9,10-di- β -naphthylhydroxydihydroanthracene and KI in $HIOAc$ soln. I and 9,10-di- α -naphthylanthracene are thermochromes. A soln of the hydrocarbons, exposed to sunlight in the presence of air gives, after evap. of the solvent, a residue which when heated at 180-200° yields pure O , about 70% of the amt. calcd for 1 mol of O per mol of hydrocarbon.

Rachel Brown

Preparation of 9,10-dihydrophenanthrene and its derivatives. Alfred Burger and Frich Mosettig. *J. Am. Chem. Soc.* 57, 2731-2 (1935).—Catalytic reduction of phenanthrene in abs. $PtOH$ with catalyst 37 KAF (C. A. 26, 2428) at pressures from 2000-4000 lb./sq. in for 24-36 hrs gives 60-80% of crude 9,10-dihydrophenanthrene, with the Friedel Crafts reaction there results 90% of the 2-Ac deriv., m 51-2° (oxime, m 146-7.5°, semicarbazone, m 236-7°), CrO_3 gives 2-acetyl-9,10-phenanthrene-quinone, m 223-4°, while $NaOCl$ yields 9,10-dihydrophenanthrene-2-carboxylic acid, m 211.5-12.5° (Me ester, an oil), transformed by Se at 300° in 20 hrs to phenanthrene-2-carboxylic acid, 9,10-dihydro-2-bromoacetylphenanthrene, m 93.5-5°. $C_{12}H_{10}$ on high pressure hydrogenation with Cu chromite is reduced nearly quantitatively to the 9,10-dihydro deriv.; this is completed at 160° within a few hrs. C. J. West

Synthesis of certain hydrogenated phenanthrenes. F. E. Gruber and Roger Adams. *J. Am. Chem. Soc.* 57, 2555-6 (1935); cf. Barnett and Lawrence, C. A. 29, 7319. The synthesis of 1,1'-dihydroxy-1,1'-bicyclohexyl, di- Δ^4 -cyclohexene (I) and the anhydride of II is described. Δ^4 - Δ^4 -Dodecahydrophenanthrene-9,10-dicarboxylic acid (II), from the anhydride in 5% $NaOH$, m 242° (bloc Maquenne), the anhydride and NH_4OH in 250-300° give the imide of II, m 182-3°. I and acrolein in C_6H_6 , heated 22 hrs. at 50-60°, give 20% of Δ^4 - Δ^4 -dodecahydrophenanthrene-9-ol, b.p. 130-7°, semicarbazone, m 170-80°. C. J. West

Dissociable organic oxides. A tetra bromotetraphenylrubene and its dissociable oxide. Charles Dufraisse and Henri Rocher. *Bull. soc. chim.* [5], 2, 2235-40 (1935).—Only limited yields of the carbinol (I), (β - BrC_6H_4) $_2$ C(OH)C Ph, were obtained by the action of β - BrC_6H_4 MgBr on PhC CCO_2Et and, accordingly, (β - BrC_6H_4) $_2$ CO (II) was used as starting material. II was prepd. by the CrO_3 oxidation of (BrC_6H_4) $_2$ CH $_2$ (*Am. Chem. J.* 30, 418 (1907)) according to the method of Goldwithe. Into a Grignard reagent from 1 g Mg , 6 cc anhyd Et_2O and 3 cc 1 tBr to which 4.6 cc of PhC CH had been added dropwise was introduced gradually, with const stirring, 12.40 g of powd. II, m 177°. After refluxing the mixt for 1 hr, the product was worked up and the resulting oil was taken up in a min. amt. of petroleum ether (b.p. 80-100°). The pptd. carbinol was recrystd. from petroleum ether and yielded colorless, cryst. I, $C_{24}H_{18}Br_4O$, m 170-1° (mixed m p with II, 142°), sol in concd H_2SO_4 with purple color; Me ether, $C_{24}H_{18}Br_4O$, m 103°. Refluxing a mixt of 1 g of I in 25 cc alc and 2.5 cc concd H_2SO_4 for 25 min. gave, after the usual treatment, clear yellow crystals of the ethylene ketone, (β - BrC_6H_4) $_2$ C $CHCOPh$, m 112.13°. The HCl ester of I, m 122-3°, is extremely sensitive to moisture and accordingly is not isolated when used as an intermediate in the prepn of the rubene. A cold soln of 3 g of I in 60 cc of anhyd Et_2O was treated with 0.9 cc of PCl_5 for 6 hrs. at -15° to -20° in a well-stoppered flask. The solvent was evapd *in vacuo* and the residue was heated *in vacuo* with 1 cc of quinoline at 115° for 50 min. The mass was disintegrated with benzene and, after removal of the resin, the quinoline was washed out with 5% HCl . The benzene was distd. off and the residue was worked up and, on crystn., yielded 30% of deep clear or clear orange crystals of tetra bromotetraphenylrubene (III), $C_{24}H_{18}Br_4$, m 391-10°. The absorption spectrum of III is similar to that of tetraphenylrubene except that the summits of the

sources and sinks such as the CH_2O and NO_2 groups. The bromination of CH_2O , $\text{C}_6\text{H}_5\text{CH}(\text{CH}_2\text{Br})$ (I) with 1 mol of Br gave CH_2O , $\text{C}_6\text{H}_5\text{CHBrCHBrBr}$ (II) which, on boiling with EtOH or MeOH, yielded CH_2O , $\text{C}_6\text{H}_5\text{CH}(\text{OEt})\text{CHBrBr}$, m 143-4°, or CH_2O , $\text{C}_6\text{H}_5\text{CH}(\text{OMe})\text{CHBrBr}$, m 115-16°, since the nucleus containing the activating group may be expected to influence the nearer Br atom. The addition of 2 mols of Br to I by adding 32 g of Br in 50 cc of glacial AcOH to 25 g of I in 150 cc of hot AcOH and heating the mixture at 100° for 30 min gave 30 g of CH_2O , $\text{C}_6\text{H}_5\text{BrCHBrCHBrBr}$ (III), m 174-5°, converted into CH_2O , $\text{C}_6\text{H}_5\text{BrCH}(\text{OEt})\text{CHBrBr}$, m 126-7°, and CH_2O , $\text{C}_6\text{H}_5\text{BrCH}(\text{OMe})\text{CHBrBr}$, m 131-2°, by boiling with the corresponding alc. On heating Me₂CO solutions of II and III with KI in H₂O and Me₂CO the corresponding chalcones, I and CH_2O , $\text{C}_6\text{H}_5\text{CH}(\text{CHBr})\text{CHBrBr}$ (IV), m 146-7°, were formed. IV was also produced by heating a mixture of 6-bromopropional (4.6 g), AcPh (2.4 g), alc (100 cc), and 10% NaOH (2 cc) at 80-100° for 15 min. Chlorination of I with 1 and 2 mols of Cl₂ gave CH_2O , $\text{C}_6\text{H}_5\text{CHClCHClBr}$ as a pasty mass (which gave, on crystals from EtOH, CH_2O , $\text{C}_6\text{H}_5\text{CH}(\text{OEt})\text{CHClBr}$, m 118-19°), and CH_2O , $\text{C}_6\text{H}_5\text{CHClCHClBr}$, m 127-8°. Refluxing 20 g of II and 10 g of KCN in 100 cc of alc for 3 hrs gave 8 g of CH_2O , $\text{C}_6\text{H}_5\text{CH}(\text{CN})\text{CHBrBr}$ (V), m 132-3°, hydrolyzed by heating for 8 hrs with alc 10% NaOH to CH_2O , $\text{C}_6\text{H}_5\text{CH}(\text{CO}_2\text{H})\text{CHBrBr}$ (VI), m 143-4°. The formulations of V and VI were confirmed by the production of PhCH(CN)CHBrBr, m 126-7° (identical with a specimen prepd by the action of HCN on PhCH₂CHBrBr) from PhCHBrCHBrBr and alc KCN, and by the hydrolysis of this nitrile to the known carboxylic acid (J. Chem. Soc. 85, 1359 (1904)). The bromination of 3,4,6- CH_2O , $(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{CHCHBrBr}$ (VII) gave only CH_2O , $(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{CHBrCHBrBr}$, m 174-5°, reconverted into VII by treatment with KI in Me₂CO. Chlorination of VII in AcOH and treatment of the pasty product with NaHCO₃ solution yielded CH_2O , $(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{CHClCHClBr}$, m 151-2°. A mixture of 0.8 g of Na in 25 cc abs alc, 8 g of AcCH₂CO₂Et, 10 g of I and 100 cc abs alc was refluxed at 80-90° for 3 hrs and produced 13 g of Et 2-(3',4'-methyleneedioxyphenyl)-4-phenyl-4-cyclohexenecarboxylate, $\text{C}_{21}\text{H}_{24}\text{O}_4$, m 151-2°. VII did not react. I was catalytically hydrogenated in the presence of Pd to the corresponding alc CH_2O , $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{CH}(\text{OH})\text{Ph}$, m 95-6°, but the said ketone, dihydropyrenonalacetophenone, m 39-40°, was not obtained. VII could not be reduced. With $(\text{NH}_4)_2\text{H}_2\text{O}$, I gave unstable white crystals of 3-phenyl-5-(3',4'-methyleneedioxyphenyl)pyrazoline, HCl salt, m 197-8°, picrate, m 185-6°. Ac deriv, m 153-4°. I reacted with PhNHNH₂ to give the corresponding 1,3-diphenyl-5-(3',4'-methyleneedioxyphenyl)pyrazoline, $\text{C}_{21}\text{H}_{24}\text{N}_2\text{O}_4$, m 129-30°, which was easily sol in concd H₂SO₄ and gave an intense blue color on the addition of FeCl₃ and gave a NO deriv which decomposed when dry. Treatment of 20 g of I in a warm mixture of 250 cc of alc and 150 cc Me₂CO with 120 cc of 6% H₂O₂ and 20 cc of 10% NaOH produced 18.5 g of white prismatic needles of the oxide of Ph 3,4-methyleneedioxy-1-phenyl ketone (VIII), $\text{C}_{15}\text{H}_{12}\text{O}_3$, m 99-100°, hydrazone, m 173-4°, converted into the corresponding pyrazole, $\text{C}_{15}\text{H}_{12}\text{N}_2\text{O}_3$, m 194-5°, by boiling with NaOEt or Ac₂O. Treatment of a suspension of VIII in MeOH or EtOH with a little concd H₂SO₄ ruptured the oxide ring with the formation of CH_2O , $\text{C}_6\text{H}_5\text{CH}(\text{OMe})\text{CH}(\text{OH})\text{Ph}$, m 117-18°, or CH_2O , $\text{C}_6\text{H}_5\text{CH}(\text{OEt})\text{CH}(\text{OH})\text{Ph}$, m 93-4°. Both these alkoxy compounds were transformed by boiling with alc NaOH into the diketone, CH_2O , $\text{C}_6\text{H}_5\text{CH}_2\text{COBr}$ (IX), m 114-15°. IX was best prepd by boiling alk VIII with NaOH for 30 sec. Boiling alk IX with $\text{C}_6\text{H}_5\text{NH}_2$ for 5 min. produced 2-phenyl-3-(3',4'-methyleneedioxybenzyl)quinoxaline, $\text{C}_{21}\text{H}_{20}\text{N}_2\text{O}_3$, m 137-8°. Refluxing 10 g of VIII in 75 cc. of alc for 4 hrs with 5 g NaOH in 15 cc H₂O and acidifying the filtrate with dil HCl gave 6.2 g of white needles of phenyl(3,4-methyleneedioxybenzyl)glycolic acid (X), $\text{C}_{15}\text{H}_{12}\text{O}_4$, m 149-50°, which was readily oxidized by K₂Cr₂O₇ in AcOH to CH_2O ,

1 $\text{C}_6\text{H}_5\text{CH}_2\text{Br}$, m 70-1° (C. A. 24, 2450), proving the structure of X. The oxidation of VII with 6% H₂O₂ gave the oxide of Ph 3,4-methyleneedioxy-6-nitrosostyryl ketone, (XI), m 159-60° (C. A. 7, 3748). Unlike VIII, XI did not react with MeOH, EtOH or NaOH but with HCl and AcOH gave CH_2O , $(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{CHClCHCl}(\text{OH})\text{Ph}$, m 183-4°. With $(\text{NH}_4)_2\text{H}_2\text{O}$ in AcOH, VII gave CH_2O , $(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{CH}(\text{CHClPh})\text{NNHAc}$, $\text{C}_{21}\text{H}_{24}\text{N}_2\text{O}_4$, m 244-5°. The phenylhydrazones of VII, $\text{C}_{21}\text{H}_{24}\text{N}_2\text{O}_4$, m 159-60°, was cyclized by boiling for 1 hr to give 1,3-diphenyl-5-(3',4'-methyleneedioxy-6-nitrophenyl)pyrazoline, $\text{C}_{21}\text{H}_{24}\text{N}_2\text{O}_4$, m 203-4°, which responded to Knorr's test and was converted by heating with AgNO₃ into the corresponding pyrazole, $\text{C}_{21}\text{H}_{24}\text{N}_2\text{O}_4$, m 163-4°, which was better obtained by treating XI in hot AcOH with PhNH-NH₂. The results indicate that the NO₂ group removes the enhanced activity conferred on I of the Br atoms in the chalcone dibromide by the presence of a nuclear alkoxy group. It also reduces the reactivity of the oxide toward EtOH, MeOH or alkali but not toward HCl.

C. R. Addinall

ω Benzyl derivatives of acetophenone and their reduction products. G. Albert Hill and A. J. Colfrancesco. J. Am. Chem. Soc. 57, 2426-8 (1935).—The preps of BzCH₂CH₂Ph and BzCH₂CH(Ph)₂ (I) (oxime, m 157°) and their reduction products are discussed. 1,3-Diphenyl-2-benzylpropan-1-ol phenylurethan, m 185°. I and BzCl with NaNH₂ in PhMe gave 68% of tribenzylacetophenone, m 127-8°, Na and abs EtOH reduce this to 1,3-diphenyl-2,2-dibenzylpropan-1-ol, viscous, light yellow liquid, decomps on heating at low pressures; heating the ketone with H₂ and red P at 200° for 4 hrs gives 13% of tetra-benzylpropane, m 164°.

C. J. West

Reduction reactions and oxidation reactions. Vincenzo Paolazi. Gazz. chim. ital. 65, 630-2 (1935).—The work of Tollens and of others has indicated that aromatic aldehydes, unlike aliphatic aldehydes, do not react with Fehling's solution. Nevertheless when BzH, anisaldehyde or cinnamic aldehyde is agitated with Fehling's solution (2 mols of CuO), clear odorless liquids are obtained, which contain no Cu₂O. From the reaction products are obtained, by extrn with Et₂O, PhCH₂OH, anisic alc. and cinnamic alc., resp., while the residual liquors yield, on treatment with H₂SO₄, BzOH, anisic acid and cinnamic acid, resp. Fehling's solution thus reacts only in virtue of its alkali, as follows: 2BzH + NaOH → PhCH₂OH + BzONa. The reaction is therefore similar to the Cannizzaro reaction: o-HOC₆H₄CHO and vanillic aldehyde do not react with Fehling's solution, nor do they give the Cannizzaro reaction, probably because of the OH group. This is supported by the fact that PhCH₂OH, anisic alc. and cinnamic alc. can be prepd from the resp aldehydes by the Cannizzaro reaction, whereas salicylic alc. and vanillic alc. cannot be prepd thus, but only by the action of nascent H on the corresponding aldehydes.

C. C. Davis

Preparation of 1,2 (dimethylaminomethylmethylmethyleneoxy)benzene. Jean Druey. Bull. soc. chim. [5], 2, 2261-4 (1935).—The ω-aminomethylbenzodioxans are physiologically interesting and the prepn of their isomers, the phenylene acetals of N-substituted amino ketones was undertaken. The addition of 22 g of P₂O₅ to a solution of 11 g of o-(HO)C₆H₄ in 25 g of MeCOCH₂Cl, b 119-20°, gave 40-45% of 1,2-(chloromethylmethylmethyleneoxy)benzene (I), $\text{C}_{12}\text{H}_{12}\text{ClO}_2$, b 104-5°, d₄²⁰ 1.2285, n_D²⁰ 1.5265, M_r 180.13 (calcd 102); o-N deriv, m 80-1°. By heating with 3 mols of N₂H₄ at 180° for 43 hrs 9.3 g of I was converted into 1.3 g (13%) of 1,2-(dimethylaminomethylmethylmethyleneoxy)benzene, $\text{C}_{12}\text{H}_{16}\text{N}_2\text{O}_2$, b 115-17°; HCl salt, m 217-18° (decomp.). The di-Et and isopropylidene analogs, $\text{C}_{14}\text{H}_{18}\text{N}_2\text{O}_2$, b 123-5°, and $\text{C}_{14}\text{H}_{18}\text{N}_2\text{O}_2$, b 150-1° (HCl salt, m 224-5° (decomp.)) were similarly prepd. Contrary to the aminomethylbenzodioxans, which have a strong action on the sympathetic nervous system, these new compounds are absolutely inactive in this respect.

C. R. A.

Sulfarsphenamine. A new method of preparation. W. J. C. Dyke and Harold King. J. Chem. Soc. 1935, 1745-7, cf. C. A. 29, 5822¹.—Arsphenamine base (3.66

g.) with $\text{HOC}_6\text{H}_4\text{SO}_3\text{Na}$ in H_2O at 60° (CO_2 atm.) gives 1.64 g. of Na 3,3'-diamino-1,1'-dihydroxyarenebenzenesulfate (I), yellow, 2.5 g. I in 25 cc. H_2O (CO_2 atm.), treated with 0.7 cc. 40% HClO and then with concd. NaHSO_3 (3 mols.), gives 2.6 g. sulfarysphenamine, it is not necessary to isolate the I in the prepn. 2,5-HO-(O-N) $\text{C}_6\text{H}_4\text{NHCH}_2\text{SO}_3\text{Na}$ with HClO and NaHSO_3 gives 1 nitro-2-hydroxyaniline, *N,N*-dimethylsulfur, isolated as the tri Na salt, thus also results by the action of HClO and NaHSO_3 in succession on 4,2-O $_2$ N(H $_2$ N) $\text{C}_6\text{H}_3\text{OH}$ in HCl soln. C. J. West

Iodine substitution products of vanillin and some of their derivatives. L. Chas. Raiford and Eugene H. Wells. *J. Am. Chem. Soc.* 57, 2000 (1935). 2-Amino-vanillin through the diazo reaction gives 54% of 2-iodo-vanillin (I), m. 155-6°. *Ac. deriv.* m. 70-2°, *oxime*, with 0.5 mol. H_2O , solvents 122° (anhyd.), m. 142-5-5°. *Semicarbazone*, in 190-200°; *p*-nitrophenylhydrazones, m. 211-12°, *bis-benzidine*, with 2 mols. $\text{C}_6\text{H}_5\text{N}$, brown, m. 228-30° (decompn.) I and Me_2SO , in KOH give 84% of 2-iodo-3,4-dimethoxybenzaldehyde, pale yellow, m. 82°. Reduction of 5-nitrovanillin gives 88% of the SnCl_4 salt of 5-amino-vanillin di-HCl, orange, H_2S gives 5-amino-vanillin di-HCl, yellowish brown, AcO gives 165% of 3-methoxy-4-acetoxy-5-acetylamino-benzaldehyde, m. 174-6°, the corresponding di-Bz deriv. m. 101-2°, the diazo reaction gives 79% of 5-iodovanillin, light brown, m. 179-80°, identical with Carles' product (*Bull. soc. chim.* 17, 14 (1872)), *Ac. deriv.* (II), m. 105-6°, *Bz. deriv.* m. 135-5-6°, *acetyl diacetate*, m. 132-3°, *oxime*, m. 178-9°, *semicarbazone*, yellow, m. 205-5-5°, *p*-nitrophenylhydrazones, red, m. 242-3° (decompn.), *bis-benzidine*, brown, m. 242° (decompn.), *Ac. deriv.* m. 69-70°. Nitration of II with fuming HNO_3 at 6° gives 53% of the *Ac. deriv.* m. 124-5°, of 2-nitro-5-iodovanillin (III), m. 140-7°, *oxime*, yellow, m. 128-9°, *semicarbazone*, yellow, m. 187-8° (decompn.), *p*-nitrophenylhydrazones, red, with 0.5 mol. H_2O , in 228-30° (decompn.), *bis-benzidine*, yellow, does not m. 335°. Reduction of III with $\text{Fe}(\text{OH})_2$ in NH_4OH gives 69% of 2-amino-5-iodovanillin, light brown, m. 155°; through the diazo reaction or by the action of I on I in AcOH - AcONa there results 2,5-diiodovanillin (IV), m. 200°, *Ac. deriv.* m. 127-8°, *oxime*, m. 174-5-5°, *semicarbazone*, m. 235° (decompn.), *p*-nitrophenylhydrazones, orange, m. 252-3° (decompn.), *bis-benzidine*, no m. p. With Me_2SO , IV yields 33% of 2,4-diiodo-3,4-dimethoxybenzaldehyde, m. 91°. 6-Iodo-vanillin could not be prep'd from acetylvanillin with I or ICl ; 3-methoxy-4-acetoxybenzal diacetate also failed to give this product. C. J. West

Reaction of carbonyl chlorides with metallic hydrides Otto Neunhoeffer and I. Friedrich Nerdel. *J. prakt. Chem.* 144, 63-66 (1935).—Repetition of the work of Chinoza (*Compt. rend.* 63, 632 (1852)) shows that CuI and BiCl_3 do not give BaI_2 , other hydrides and other chlorides gave no evidence of reduction. The formation of esters is due to the presence of alk. in the reaction mixt. C. J. West

Action of aromatic sulfonic and hydroxy sulfonic acids upon α - and β -amino acids. Guido Machek. *Monatsh.* 66, 315-56 (1935). cf. C. A. 29, 6827. —Thiopyruvic acid (I) and PhSO_3H , heated 21 hrs. in CaH_2Me , give 92% of the comp'd $\text{CaH}_2\text{O}_2\text{NS}$, m. 185-9° (all m. ps. cor.). heating I with CaH_2 and H_2SO_4 for 19 hrs. in CaH_2Me bath gives unchanged I, H_2O was not formed. PhMe , H_2SO_4 and I, on heating 20 hrs., give 72% of the comp'd $\text{CaH}_2\text{O}_2\text{NS}$, m. 200-1°. CaH_2Me gives the comp'd $\text{CaH}_2\text{O}_2\text{NS}$, m. 171-5-2-6°; CaH_2 , 25-35% of the comp'd $\text{CaH}_2\text{O}_2\text{NS}$ (II), m. 195-6°; β - $\text{CaH}_2\text{SO}_3\text{H}$ gives 93-6% of II, yielding with NaOH β - $\text{CaH}_2\text{SO}_3\text{Na}$. The α -isomer of II, m. 170-1°. Alanine, PhOH and H_2SO_4 , heated 24 hrs., give 70% of the comp'd $\text{CaH}_2\text{O}_2\text{NS}$, m. 170-5-80-5°; PhMe gives 64% of the comp'd $\text{CaH}_2\text{O}_2\text{NS}$, m. 193-5-8°; β - $\text{CaH}_2\text{SO}_3\text{H}$ gives 69% of the comp'd $\text{CaH}_2\text{O}_2\text{NS}$, m. 227°. Leucine, PhMe and H_2SO_4 , give 71-3% of the comp'd $\text{CaH}_2\text{O}_2\text{NS}$, m. 153-3-5°; β - $\text{CaH}_2\text{SO}_3\text{H}$ gives 65% of the comp'd $\text{CaH}_2\text{O}_2\text{NS}$, m. 202-3°; PhOH , H_2SO_4 and $\text{MeCHNH}_2\text{CH}_2\text{CO}_2\text{H}$ give the comp'd $\text{CaH}_2\text{O}_2\text{NS}$, m. 182-3°, β - $\text{CaH}_2\text{SO}_3\text{H}$ gives 55% of the comp'd $\text{CaH}_2\text{O}_2\text{NS}$, m. 157-8°, $\text{MeCaH}_2\text{SO}_3\text{H}$ does not react. These comp'ds do not give a color reaction with FeCl_3 . C. J. West

Fictitious dihydroxyphenylbenzamidines. A. V. Kirsanov and Ya. N. Ivashchenko. *Bull. soc. chim.* [5], 2, 1944-50 (1935).—Treatment of PhCH NPh (I) with NaNH_2 gave $\text{PhC}(\text{NH})\text{NHPh}$ (II) and $\text{PhC}_2\text{H}_4\text{NHPh}$ (III) (cf. following abstr.). III is obviously formed by the reduction of I but the reduction of II to $\text{PhC}(\text{NH})\text{NHPh}$ (IV) is less probable although Bernthsen (*Ber.* 13, 917 (1880)) described IV as the product formed by the reduction of II in the presence of NaNH_2 . The prep'n was repeated under various conditions and a careful check was made of the starting material and the products of the reaction. The reduction of 25 g. of II (m. 114-15°) in 250 cc. of alc. with 194.7 g. of 3% NaH gave sufficient amts of BzH, PhNH_2 , III, and $\text{PhC}_2\text{H}_4\text{NH}_2$, together with unchanged II, to account for 90-95% of the starting material. It is concluded that the material obtained by Bernthsen was unchanged II. When recrystd from alc., II m. 111-12°, rising to 114-15° on recrystn. from petroleum ether. The yield of II from I and NaNH_2 can be increased to 27% by slowly adding I to a large excess of powd. NaNH_2 in boiling toluene. I is immediately reduced and the side reactions are appreciably diminished. C. R. Addinall

Mechanism of amination with sodamide. New procedure for the preparation of substituted amides. A. V. Kirsanov and Ya. N. Ivashchenko. *Bull. soc. chim.* [5], 2, 2109 (1935).— NaNH_2 (I) acts on comp'ds contg. a pyridine nucleus by adding to the C-N linkage, the Na and NH_2 components attaching themselves to the N and C atoms, resp. The product loses NaH (II) and is transformed into the corresponding amine which reacts with II or with I to give a Na amino deriv. and H_2 or NH_3 . This process is confirmed in a series of analogous reactions and examples. To prove that in the reaction between the pyridine ring and I only the N and the α -C atoms are involved to the exclusion of the other members of the ring, the reaction of I with 3 Schiff bases, PhCH NPh (III), $\text{PhCH NCH}_2\text{Me}$ (IV) and CH_2O , $\text{CH}_2\text{CH NPh}$ (V) was studied. The mixt. formed by the addn. of 24 g. (0.6 mol.) of carefully powd. I to a soln. of 48.3 g. of III in 50 cc. of dry toluene was heated under reflux with continuous stirring at 120°. NH_3 was evolved and the cooled, brick-red solid reaction mass was taken up in 300 cc. H_2O and 250 cc. Et_2O . The Et_2O layer was extd. with AcOH . This ext. was decomp'd with NH_4OH , extd. with Et_2O and the ext. was dried and evapd. The bruc products were vacuum-distd and fractionated. The Et_2O ext. of neutral products was dried and evapd. and the oily residue was distd. *in vacuo*. Working up of the crude fractions gave 5.8 g. (12%) of PhNH_2 , 9.93 g. (19.6%) of $\text{PhC}(\text{NH}_2)\text{NPh}$ (VI), 7.2 g. of $\text{PhC}_2\text{H}_4\text{NHPh}$ (VII) and 6.2 g. (12.8%) of lophine (IX), together with a small amt. of colorless fine needles, m. 207-8°. These results show that the action of I on a toluene soln. of III takes place in a manner exactly analogous to that of I on pyridine and similar to that of the action of organometallic comp'ds on Schiff bases. The intermediate $\text{PhCH}(\text{NH}_2)\text{NNAh}$ is formed, which loses NaH to produce VI. The action of NaH on VI gives H_2 , which reduces III to VII. By the action of VI on excess of I, NH_3 is liberated which ammonolyzes III to give PhNH_2 and amine which is oxidized to IX at the expense of the reduction of VII (cf. Strain, C. A. 22, 3147). No $\text{PhC}(\text{NH})\text{NHCH}_2\text{Ph}$ was found in the above reaction which, evidently, takes another direction to that carried out at the temp. of liquid NH_3 . Similar anomalies have been noted in the reaction between I and α -picoline under the action of heat and in liquid NH_3 . VI was identified by comparison with a sample prep'd from the HCl salt of III and NH_3 (cf. Pechmann, *Ber.* 30, 1786 (1897)). Reduction of III with alc. NaH gave a test sample of VII, m. 35-6°. *Ac. deriv.* m. 56-7°, nitroso deriv. m. 56°. IX, CaH_2Me , m. 273-4-7°, yielded a HCl salt, m. 155-60°. The amination of 9.7 g. of IV produced 2.2 g. (22.6%) of β - $\text{MeCaH}_2\text{NH}_2$, 2.2 g. (22.6%) of $\text{MeCaH}_2\text{C}(\text{NH}_2)\text{NPh}$.

m 90°, 2.0 g (20.6%) of $\text{PhCH}_2\text{NHC}_6\text{H}_4\text{Me}$, m 19–20° (nitroso deriv., m 45.5–8.5°), and 1.2 g (12.3%) of IX. V was obtained by the reciprocal action of equimol quantities of PhNH_2 and CH_2O , $\text{C}_6\text{H}_5\text{CHO}$ in alc. The crude product, m 60°, was dissolved in 40 cc. of toluene and, on treatment with 4 g. of finely powd. I, gave 13% of the amidine, CH_2O , $\text{C}_6\text{H}_5\text{C}(\text{NH})_2\text{NPh}$, m 138–9°, and a minute quantity of CH_2O , $\text{C}_6\text{H}_5\text{C}(\text{NH})_2\text{NPh}$, m 79–80°, identified by a mixed m. p. detn. with a sample obtained by the reduction of CH_2O , $\text{C}_6\text{H}_5\text{CH}$ NPh by alc. Na-Hg. Thus the amination of the C N group with I is a general reaction, of which the reaction of I with compds contg a pyridine ring is a particular case. It is highly possible that the reaction can be broadly generalized and that, under special conditions, I reacts analogously to organo-metallic compds, the NH_2 group filling the role of the alkyl radical. Thus in the formation of BaNH_2 and PhCH_2OH in the reaction between I and BaH the first step consists in the addn. of Na and NH_2 to the C O linkage, a process similar to the addn. to the C N group in the amination of the anils and pyridine bases. C. R. Addinall

Preparation of β -n-dichloro-p-sulfonylbenzoic acid. I. G. Zil'berg *Khim. Farm. Prom.* 1935, No. 2, 114–17. The by-product of saccharin manuf. is used as a starting compd. $\text{p-MeC}_6\text{H}_4\text{SO}_2\text{Cl}$ is treated with 25% NH_4OH (100% excess of the theory), the amide oxidized with $\text{Na}_2\text{Cr}_2\text{O}_7$ in 75% H_2SO_4 and recrystd. from alc. The available Cl = 25.7%. L. Nasarevich

Dehalogenation of β -bromo acids. IV. β -Bromophenylpyruvic acid. Ben Sobin and G. Bryant Bachman. *J. Am. Chem. Soc.* 57, 2158–60 (1935), cf. C. A. 29, 2813. β -Bromophenylpyruvic acid (I), yellow, m 103–4°, boiling with H_2O gives 77% of $\text{PhCH}_2\text{CO}_2\text{H}$, shaking I in H_2O with Ag_2O gives 94% of the same acid, in abs. 1.0N Ag_2O gives 36% of $\text{PhCH}_2\text{CO}_2\text{Li}$, at Na_2CO_3 gives, after refluxing 0.5 hr., BzCH_2OH and BaOH , at Na_2HCO_3 and I, allowed to stand overnight, give about 40% each of $\text{PhCH}_2\text{CO}_2\text{H}$ and BzCH_2OH . $\text{C}_6\text{H}_5\text{N}$, PhNH_2 , PhNMe_2 and $\text{C}_6\text{H}_5\text{NH}_2$ all cause evolution of CO_2 but give tarry and gummy masses, with NH_4OH a little BzCH_2OH was isolated. In the formation of the $\text{PhCH}_2\text{CO}_2\text{H}$ it is assumed that $\text{PhCH}_2\text{C}=\text{O}$ is an intermediate product. The possibilities and some of the difficulties of utilizing the dehalogenation of α keto β -bromo acids as a new method of synthesizing ketene derivs. are pointed out.

C. J. West
Preparation of isovalerylaldehydic acid. Jean Milhiet *Bull. soc. chim.* [5], 2, 2134–5 (1935).—According to Linhorn and Sufferit, isovalerylaldehydic acid (I), m 85°, can be prepd. from salicylic acid (II) and $\text{Me}_2\text{CHCH}_2\text{COCl}$ in the presence of pyridine. Daliotos (C. A. 22, 2808) reported the prepn. of I, m 225°, from II and $(\text{Me}_2\text{CHCH}_2\text{CO})_2\text{O}$ after failing to repeat the prepn. according to I and S in the presence of alc. NaOH . M. has checked the findings of I and S. C. R. Addinall

Apparent cases of liquid-crystal formation in β -alkoxybenzoic acids. Brynnor Jones. *J. Chem. Soc.* 1935, 1874, cf. Bradfield and J. C. A. 24, 1776.—The acids were prepd. from $\text{p-HOC}_6\text{H}_4\text{CO}_2\text{H}$ and the alkyl iodide with aq. KOH . β -Amyloxybenzoic acid, t. p. (transition pt.) 122°, m 148°, hexyl deriv., t. p. 105°, m 150°, heptyl deriv., t. p. 91°, m 145°, octyl deriv., t. p. 100°, m 145°, cetyl deriv., t. p. 99°, m 131°. The t. p. is the temp. at which the solid changes into a cloudy liquid. The m-series do not exhibit this phenomenon.

C. J. West
The condensation of aldehydes with malonic acid in the presence of organic bases. IV. The condensation of piperonal. Toqur Ahmad Vahidy and K. C. Pandya *Proc. Indian Acad. Sci.* 2A, 402–5 (1935), cf. C. A. 29, 5830.—The condensation of piperonal with malonic acid in the presence of small traces of pyridine, lutidine, quinoline, isouquinoline, quinaldine, PhNMe_2 , PhNH_2 , piperidine, PhNHMe , PhNH_2 , NH_4OH , aniline, α , β - and γ -toluidine, α and β - $\text{C}_6\text{H}_5\text{NH}_2$, NH_4OH and NH_4Cl malonate was studied. The yields varied from 40% to theoretical. The time for completion of reaction was about 4 hrs., compared to 18 hrs. when the piperonal and malonic acid

were heated in the absence of the org. bases. The product in all cases was piperonylacrylic acid. These reactions may throw light on the sp. catalytic influence of each of the bases used. L. L. Quill

The synthesis of 6-methylcoumarin. A. M. Buluigina, *Moskovskoe Zhivoe Delo* 1934, No. 4, 43–4.— $\text{MeC}_6\text{H}_4\text{O}-\text{COCH}_2\text{CH}_3$ was prepd. on a semi-com. scale by condensa-

tion of p-cresol (500 g.) and fumaric acid (650 g.) and 72% H_2SO_4 (2.5 g.) Yield of pure I, m 73–4°, 40%. L. Bielous

Hydrogenation of carbonyl compounds by nickel and platinumized nickel. Influence of an alkali. Marcel Lépine and Alain Horcau. *Compt. rend.* 201, 1301–5 (1935).—The hydrogenation of pinonic acid (I) in the presence of Ni obtained by decompn. of 73% Raney Ni-Al alloy takes place readily on the addn. of an excess of NaOH . I is isomerized in the presence of NaOH , and reduction of various ketones at ordinary temps. and pressures was carried out to test the theory that the enolic form was more readily reduced. Ketones such as Me_2CO , MeCOEt , $\text{MeCOCH}_2\text{CH}_3$, MeCOPh , 2,4-dimethyl-2-phenylhexanone and cyclohexanone, which are reduced slowly in the presence of Ni and alc. media, are hydrogenated much more rapidly after the addn. of alkali. The theory of a preliminary enolization was abandoned when it was found that PhCO and PhCOBz gave results of the same order of increased speed of reduction. Similar results were obtained with ketones of complex function such as $\text{AcCH}_2\text{CO}_2\text{Et}$, $\text{LiCH}_2\text{COCH}_2\text{CO}_2\text{Et}$ and levulic acid . With methyl oxide, methylheptenone and benzylidenacetone, the 1st mol. of H_2 fixed itself rapidly but the 2nd was only absorbed on the addn. of alkali to the reaction mixt. Crotonic, benzoic, salicylic and $\text{p-hydroxybenzoic aldehydes}$ and such compds as galactose, levulose and 1-dimethylamino-4-pentanone behaved analogously. The necessity of the presence of alkali for increasing the speed of the reaction was demonstrated by the action of AcOH in slowing up the rate of reduction. Various references to the favorable action of alkalis in hydrogenation are quoted. The activity of the Ni catalyst is enhanced by plating with Pt which can be simply carried out by shaking an aq. suspension of Ni with a dil. alc. platinumchloride soln. Similar but less effective reinforcement of the catalytic effect can be obtained by plating Ni with Pd, Rh and Ru. Thus the hydrogenation of carbonyl compds at ordinary temps. and pressures in the presence of Raney Ni catalysts is facilitated by the addn. of alkali and even by treatment with Pt. C. R. Addinall

Some urea derivatives in the terpene series. Robert L. Bateman and Allan R. Day. *J. Am. Chem. Soc.* 57, 2196–8 (1935).—1-Methylamine-HCl and nitrourea with NaHCO_3 in H_2O give 78% menthylurea, m 140–2–40.6° (all m. ps. cor.), $[\alpha]_D^{25}$ –50° (95% $\text{C}_6\text{H}_5\text{OH}$), sym-Ac deriv., m 118–19°, $[\alpha]_D^{25}$ –87.3°, chloral addn. product, m 146.2–72°, $[\alpha]_D^{25}$ –49.1°, sym-bromoacetyl deriv., m 111.8–2.2°, $[\alpha]_D^{25}$ –66.9°, sym-cinnamoyl deriv., m 144.3–5.1°, $[\alpha]_D^{25}$ –67.9°, sym-p-nitrobenzoyl deriv., m 158.7–0.2°, sym-p-aminobenzoyl deriv., m 205–10° (decompn.), $[\alpha]_D^{25}$ –72.3°. d-Bornylurea results in 90% yield by the above method, m 165.7–6.3°, $[\alpha]_D^{25}$ 5.83°, sym-Ac deriv., m 129.9–5°, $[\alpha]_D^{25}$ 23.5°, chloral addn. product, m 180° (decompn.), $[\alpha]_D^{25}$ 7.3°, sym-bromoacetyl deriv., m 136.1–6.5°, $[\alpha]_D^{25}$ 16.3°, sym-cinnamoyl deriv., m 220.2–20.8°, sym-p-nitrobenzoyl deriv., m 230° (decompn.), sym-p-aminobenzoyl deriv., m 233° (decompn.), $[\alpha]_D^{25}$ 15.6°. The amine from isonitrosocamphor yields 2-keto-3-carbamidocamphane, with 0.5 mol. H_2O , m 177.8–8.4°, $[\alpha]_D^{25}$ 18.3°, p-nitrobenzoyl deriv. Preliminary tests on the narcotic effects indicated that menthylurea was the most promising and may have some value, it acted rapidly without evident after-effects. C. J. West

Pinenemagnesium chloride. Action of phthalic anhydride. René Bouisset *Bull. soc. chim.* [5], 2, 2183–7 (1935).—The action of diacid anhydrides on aliphatic and aromatic Mg compds. produces ketonic acids, disubstituted lactones or, more rarely, ditertiary glycols. Thus

action has not been previously carried out with terpene Mg compounds and it has been demonstrated that pinene-magnesium chloride (I) gives almost exclusively a ketonic acid with phthalic anhydride (II). The reaction of 103.5 g. (0.6 mole) of ordinary pinene-HCl with Mg in 250 cc. of anhyd. Et_2O gave 0.5 l. of I, $m.p. 125-6^\circ$, $[\alpha]_D^{25} -33.5^\circ$, $[\alpha]_{435} -39.0^\circ$, $[\alpha]_{415} -64.55^\circ$. A mixt. of 74 g. (0.5 mole) of freshly distd. II, $b.p. 284^\circ$ (cor.), and 750 cc. of anhyd. Et_2O was boiled for a few min. and cooled to 0° in a Hi atm. I was added dropwise at 0° and the mixt. was occasionally stirred for a period of 20 hrs. Hydrolysis was carried out with air-free H_2O at -20° and the product was decanted and filtered. The solid residue was dissolved in glacial $AcOH$ and on diln. with ice-d H_2O gave 115 g. (80%) of *o*-(camphene-2-carboxyl)benzoic acid (III), $C_{17}H_{18}O_4$, $m.p. 154^\circ$, $[\alpha]_D^{25} 58.92^\circ$, $[\alpha]_{435} 69.45^\circ$, $[\alpha]_{415} 119.2^\circ$. The total yield of III was increased to 95% by the recovery of 21 g. from the Et_2O layer which also contained traces of another acid, (IV), $m.p. 137^\circ$, together with a little *d*-bornylene. That the formation of bornyl phthalates by the action of I on $CaH_2/OMgCl$ formed by the exposure of I to the air was avoided in the above procedure was shown by the complete absence of bornol on refluxing 10 g. of the solid residue with 150 cc. of alc. 0.97 $N KOH$ for 5 hrs. at 125° . The position of the CO group between the benzene and camphene nuclei hinders the formation of a semicarbazone. The ease with which III can be prep'd makes the synthesis of many optically active compounds possible. It is unlikely that the action of an excess of I on II would give dibornylphthalate by the reaction of I with the intermediate Grignard reagent CaH_2CO_2MgCl , but with a different reagent $RMgX$ (where R varies from Me to C_6H_5) the new mol. might be fixed with the production of a disubstituted phthalide which in turn might split off the terpene nucleus as bornylene, with the formation of interesting optically active compds. C R Addinall

Synthesis of "ketonopinone" (4,6-diketopinane). P. C. Gupta and K. Gnaniathi. *Current Sci.* 4, 312-13 (1935); cf. C. A. 29, 5418. The conversion of the *Me* ester (I) of pinonic acid (II) into ketonopinone (III) has been accomplished by means of Na in $PhMe$ or $MeONa$ in alc. III, $m.p. 104^\circ$, purified through its Cu deriv., gives a violet color with $FeCl_3$, dissolves in $NaHCO_3$, decolorizes alk. $KMnO_4$, and absorbs Br_2 in $CHCl_3$. The constitution has been confirmed by hydrolysis with $Na(OH)$, to II. W. J. Peterson

Plurality of primary bicyclic terpene alcohols. René Bousset. *Bull. soc. chim.* [5], 2, 2187 (1935).—Contrary to the statement of Dufont and Zacharewicz (C. A. 29, 4757) myrtanol is not the only primary bicyclic terpene alc., since 2 other members of this series, 2-methanol- (C. A. 25, 507) and 2-ethanolcamphane (C. A. 29, 1798), have been previously prep'd. C R Addinall

The physical identity of enantiomers I. Rotatory dispersion of l-bornol, enantiomeric camphors, camphoric acids, sodium camphorates, camphoric anhydrides and camphorimides. Bawa Kartar Singh and Indramani Mahanti. *Proc. Indian Acad. Sci.* 2A, 378-98 (1935), cf. C. A. 29, 3316. The rotatory dispersions of *d*- and *l*-camphoric acids in acetone, $EtOH$ and water, *d*- and *l*-camphor in $EtOH$, $CHCl_3$ and water, *d*- and *l*-camphorate in water, *d*- and *l*-camphoric anhydride in $EtOH$ and $CHCl_3$, *d*- and *l*-camphorimide in $EtOH$, $CHCl_3$ and $CHCl_3$, and l-bornol in $EtOH$ and $CHCl_3$ were det'd for 10 wave lengths (λ 4358 to 7600 Å). Pasteur's law of mol. dissymmetry was shown to hold in all cases. The rotatory power of *d*- and *l*-camphoric acids in different concns. of $EtOH$ first decreases with increase of concn., and then becomes almost const., these changes indicate the identity of the magnitude of the rotatory power of the 2 opposite and active forms. The effects of cyclic structure, and of the substitution of the ketomethylene group of camphor are discussed. The methods of prep'n of the compds. studied and 20 tables of data are given. L. J. Quill

The relation of production of synthetic camphor to consumption in the United States. Robert L. O'Brien,

Thomas W. Page, Edgar H. Broward and Oscar B. Ryder. *U. S. Tariff Comm. Rept. No.* 104, 5 pp. (1935). L. H.

Camphor series. I. Dines Chandra Sen. *J. Indian Chem. Soc.* 12, 647-52 (1935).—A general method of synthesis of cyclic thio ketones is described by means of which this camphor (I) has been produced in good yields. I is probably formed through an unstable chlorohydrin which on conversion into chlorothiohydrin breaks down to the thio ketone which is analogous in its behavior with ketonic reagents to ketones. A soln. of 30 g. of camphor in 150 cc. abs. alc. at 0° was said. with HCl and H_2S for 6-6 hrs. The red, unstable ppt. produced by adding 25 cc. of cold H_2O was filtered, washed and taken up in benzene. The dried ext. was evap'd and yielded 15 g. of racemic I, $C_{15}H_{18}S$, $m.p. 145^\circ$, phenylhydrazone, $b.p. 190^\circ$, $n_D^{20} 1.50$ (decompn.), oxime, $m.p. 118-19^\circ$, semicarbazone, $m.p. 217^\circ$, all are identical in $m.p.$ with the corresponding camphor derivs. The same material was obtained from *l*-camphor but the *d*-isomer gave *l*-thiocamphor, $m.p. 146^\circ$, $[\alpha]_D^{25} -12^\circ$. The reduction of 5 g. of I in 25 cc. cold alc. with Zn and 25 cc. of alc. HCl and extn. with Et_2O gave a crude product which was ppt'd as an insol. Pb salt from alc. Treatment with H_2S in alc. and extn. with Et_2O gave thiobornol (II), $C_{15}H_{18}S$, $m.p. 120^\circ$ (cf. Wuyts, Ber. 36, 803 (1903) for $m.p.$ of 61-25), Pb salt, minute yellow needles sol. in Et_2O . Treatment with I converted II into disbornyl disulfide, $C_{30}H_{38}S_2$, $m.p. 199^\circ$. C R Addinall

Anomalous mutarotation of salts of Reychler's acid. IV. Comparison of 2-(*N*-phenylketimine)-4-camphene-10-sulfonic acid with *d*-camphor-10-sulfonamide. Harry Sutherland and R. L. Shriner. *J. Am. Chem. Soc.* 58, 62-3 (1936), cf. C. A. 29, 7764. 1'-*d*-Camphor-10-sulfonamide, $m.p. 120.5-1^\circ$, $[\alpha]_D^{25} 76^\circ$ ($CHCl_3$), 29.5° (95% $EtOH$), differs markedly from the dehydration product of the $PhNH_2$ salt of Reychler's acid. This excludes I from consideration as the dehydration product and constitutes further proof that the ketimine structure is correct. I shows no mutarotation, it did not undergo hydrolysis on standing in aq. $EtOH$, refluxing with 25% HCl for 36 hrs. gives 77% $PhNH_2$ and the acid. C. J. West

Ozonation of certain hydrogenated biphenyls. C. R. Noller and G. K. Kaneko. *J. Am. Chem. Soc.* 57, 2442-3 (1935).—1-Phenyl-1-cyclohexene (I) adds 1 mole of O_3 to the double bond in the cyclohexene ring and 1,1'-cyclohexenyl adds O_3 to both double bonds. This indicates that steric hindrance in the 1- and 1'-positions is not the factor involved in the failure of Ph_2 to form a hexaozone. Tetrahydrobiphenyl prep'd. by reducing Ph_2 with Na and $AmOH$ is chiefly I. C. J. West

Syntheses in the biphenyl series. David D. Hartley and Robert E. Lyons. *Proc. Indust. Acad. Sci.* 44, 121-8 (1934).—*o*-Nitrophenyl has been electrolytically reduced to *o*-azoxyphenyl, $m.p. 155^\circ$, at a Ni cathode and to *o*-hydroxyphenyl (I), $m.p. 183^\circ$, at a Pb cathode. Yields, 61.8 and 81% resp. *p*-Nitrophenyl has been electrolytically reduced to *p*-azoxyphenyl (II), $m.p. 213^\circ$, at a Ni cathode. Yield 90.6%. The approx. soly. of *o*-azoxy-, *o*-hydroxy- and *p*-azoxyphenyl in g. per 100 cc. of soln. at 20° are as follows: 95% alc., 0.11, 0.03, 0.01; acetone, 2.65, 0.74, 0.15. I undergoes rearrangement to *o,o'*-diphenylbenzidine (II) in HCl (d. 1.18) when maintained at 55° for 24 hrs. in a sealed tube. Diazotization of II and coupling of the resulting tetrazonum salt with some common intermediates in the usual manner yielded the following 3,3'-diphenyl-4,4'-disubstituted phenyl dyes (as Na salts): bis-*o*-naphthylamine-4-sulfonic acid, bis-8-amino-1-naphthol-3,5-disulfonic acid, bis-1,8-dihydroxynaphthalene-3,5-disulfonic acid, bis-8-naphthylamine-6-sulfonic acid, bis-2-amino-5-naphthol-7-sulfonic acid, bis-2-naphthol-3,6-disulfonic acid, bis-2-amino-8-naphthol-6-sulfonic acid, bis-6-naphthol. These dyes are less sol than the corresponding *o*-toluidine dyes, have a slightly greater color intensity in equal molar concns., and give similar though not identical colors. W. J. Peterson

Complex formation between polystyrene compounds and aromatic hydrocarbons. II. The system 2,4-dinitro-2'-methylbiphenyl 6-carboxylic acid benzene. Daniel J. Hammett and R. Branstetter Williams. *J. Chem. Soc.*

1935, 1856-60, cf C. A. 29, 5337¹-2,4-Dinitro-2'-methylbiphenyl-6-carboxylic acid (I) (cf Levide and Turner, C. A. 24, 529²) forms 2 solid complexes with C_6H_6 , in the mol ratios 1 and 2 and 1 and 128³ and 138³, resp (decd from solid liquid eq), crystn of I from C_6H_6 gives the 2:1 complex, m 138-40° (sealed tube) and 154-6° in an ordinary m p tube (i.e., m p of I). Resolution of I with d-MePhCHNH₂ gives a d-l with [α]_D²⁰ (+0.5), d_B d_A, pale yellow, m 238°, [α]_D²⁰ 57.1° (Me₂CO, c 1.12), the most completely resolved d l has the same rotation in EtOH as it has when measured in the same solvent in the form of its C_6H_6 complex. Removal of the solvent and the C_6H_6 yields the I unchanged in rotation. Either the complex does not exist in appreciable amt. in soln or else the rotatory power of I is the same per g. per cc whether it is attached to C_6H_6 or not. Partially resolved I can be further resolved by crystn from C_6H_6 . I also crystallizes with 1 mol H₂O and 1 mol MeOH, the activity of the I is unchanged by complex formation.

C. J. West

Interaction of amines and ammonia with diphenyleneethylene L. A. Pinck and Guido E. Hilbert J. Am. Chem. Soc. 57, 2398-2402 (1935) —(C_6H_5)₂C(C_{6H_5})₂ (I) (1 g) and 15 cc liquid NH₃, heated 3 weeks at 65°, give 0.5 g of a compd, m 300° (all m ps cor), insol in Et₂O, while the Et₂O-soln portion yields 0.4 g of 9-amino-fluorene (II) as the HCl salt and 0.07 g of fluorene. I and EtNH₃, heated 2 days at 65°, give 65% of 1-ethylaminodiphenyleneethylene (III), m 165°, HCl salt, m 210-15° (decompn), p_{icat}, yellow, m 228° (decompn). NO deriv, pale yellow, m 217°, does not give the Liebermann nitrosamine test. Heating III in abs EtOH at 100° for 10 days gives a mixt. of fluorene, fluorenone and 9-ethylaminofluorene (IV), in EtNH₃, there result fluorene and diphenyleneethylene, which are also isolated as by-products in the prepn of II. IV, from 1.3 g of II and EtNH₃ at 55° for 18 hrs, gives 0.57 g of the p_{icat} of IV, orange, m 206° (decompn). 1-Methylamino deriv, m 151°, Ac deriv, m 232°, NO deriv, m 203°. 1-Dimethylamino deriv, m 215° (decompn). I and PhCH₂NH₂ react after standing 6 months in a sealed tube, giving the 1-benzyl amino deriv (V), m 168°, HCl salt, m 215-18°, NO deriv, m 217-18°. V also results on heating the reactants at 100° for 6 days, together with fluorene, a hydrocarbon, m 318° (decompn), a base, m 90°, and (C_{6H_5})₂CHCH₂(C_{6H_5}). V is decompd on heating in EtOH at 100° for 10 days.

Formation of a single diastereoisomer in the reaction of organomagnesium derivatives with amino ketones M. Tiffeneau, Jeanne Lévy and E. Ditz Bull. soc. chim. [5], 2, 1949-55 (1935) —Experience has shown that the action of organomagnesium compds on ketones with an asym. C atom in the α-position, whether substituted or not by a OH group, leads to 1 only of the 2 possible diastereoisomers and that the other form can be obtained by inverting the order of substitution of the radicals in the tertiary alc produced. These results can be explained by postulating a controlling action on the rupture of the bonds of the CO grouping. These facts are generalized by the following study of the action of an organomagnesium compd on a ketone deriv in which the asym. C atom has an NH₂ group as substituent. Aryl amino ketones of the type ArCOCH(NH₂)Me have been treated with various ArMgX compds in such a way that 3 pairs of diastereoisomeric amino alcs have been prepd in a series of reactions from each of which only 1 diastereoisomer resulted. The ketones ArCOCH(NH₂)Me were prepd by the method of Iredell and Crafts and transformed into the isomeric derivs which, in turn, were reduced to the HCl salts of ArCOCH(NH₂)Me. Pairs of diastereoisomers were then produced by reacting ArMgBr with Ar'COCH(NH₂)Me and Ar'MgBr with ArCOCH(NH₂)Me. A mixt of 131 g of anisylpropanone in 550 cc Et₂O was satd with a current of HCl and treated with 100 g of freshly distd Am₂NO₂. At the end of the reaction the product was refluxed, cooled and extrd with dil Na₂CO₃. Acidification of the alk extrd and recrystn of the ppt from benzene gave 80% of MeOC₆H₄COC(NOH)Me, m 125°. The propanones, 1-

COC(NOH)Me and MeC₆H₄COC(NOH)Me were similarly prepd according to this procedure of Hartung and Munch (C. A. 23, 3113). These isomeric derivs were reduced by NaCl in concd HCl (Ber 30, 1515 (1897)) to the corresponding HCl salts of 1-aryl-2-aminopropanones, Ph (I), m 185-9°, p-tolyl (II), m 217°, anisyl (III), m 242°. The bases are unknown and attempts to prep them by neutralization with NaOH or NH₄OH cyclized them to dihydromethylidylpyrazines which, on oxidation, were transformed into the corresponding 2,5-dimethyl-3,6-diarylpyrazines, m 125°, 168° and 196-7°, resp. The reaction of I, II and III with PhMgBr (IV), p-MeC₆H₄MgBr (V) and MeOC₆H₄MgBr (VI) presented no peculiarities and after decompn with dil H₂SO₄, extrd with 1 H₂O and treatment with NH₄OH in the presence of NH₄Cl, gave, after the usual procedure, HCl salts of amino alcs from which p_{icat}s with characteristic m. ps. were prepd. I and V gave a phenyl-p-tolylaminopropanol, m 65° (HCl salt, m 249°, p_{icat}, m 209°), whereas II and IV yielded the β-diastereoisomer, m 95° (HCl salt, m 275°, p_{icat}, m 132°). Mixed m p deins gave 56°, 223° and 126°, resp, thus demonstrating the different nature of the 2 isomers. Similarly were prepd the α- and β forms of phenylaminoaminopropanol, m 77° and 74° (62°) (HCl salts, m 265° and 255° (240°)); p_{icat}s, m 198° and 205° (188°), and of p-tolylaminoaminopropanol, m 90° and 84° (92°) (HCl salts, m 280° and 242° (234°)), p_{icat}s, m 217° and 197° (195°). Thus the reaction of the reagent Ar'MgBr with an amino ketone ArCOCH(NH₂)Me gives a unique amino alc, ArAr'C(OH)CH(NH₂)Me, which is diastereoisomeric with that obtained by inversion of the radicals introduced. If the amino ketone is of the type ArCOCH₂NH₂ and has no asym. C atom, the amino alc produced is the same whatever the order of introduction of the groups. Thus PhCOCH₂NH₂ and MeOC₆H₄MgBr give the same phenylaminoaminoethanol, m 100°, as MeOC₆H₄COCH₂NH₂ (HCl salt, m 195-6°), and PhMgBr. Thus, the inductive role of the asym. C atom is perfectly demonstrated. C. R. A.

Simultaneous formation of two diastereoisomeric alcohols in the action of organomagnesium derivatives on active camphenyl ketones M. Tiffeneau, Jeanne Lévy and E. Ditz Bull. soc. chim. [5], 2, 1855-66 (1935); cf preceding abstr.—A study of the action of organomagnesium derivs on ketones with an asym. C atom in the β-position has shown that the formation of 1 diastereoisomer is not exclusive but that both forms are obtained in unequal proportions. The yields are reversed when the order of introduction of the 2 radicals neighboring on the OH group is inverted. The decompn. of the reaction product from camphenyl nitrile, [α]_D²⁰ 12.3°, and an excess of EtMgBr in anhyd Et₂O gave 30% of Et camphenyl ketone (I), b_p 107°, d₄²⁰ 0.9201, n_D²⁰ 1.468, surface tension at 19° 32.6 dynes per sq cm, [α]_D²⁰ 21.9°, [α]_D²⁵ 24.5°. Attempts to purify this product by distn caused racemization and, accordingly, another prepn. was made by the action of LiMgBr on camphenyl amide, [α]_D²⁰ -5°, which produced 55% of I, b_p 77°, d₄²⁰ 0.9176, n_D²⁰ 1.463, [α]_D²⁰ 27.5°, [α]_D²⁵ 30.6°, semi-carbazone, m 162°, oxime, b_p 145°. Similarly the action of PhMgBr on the nitrile and amide gave 2 samples of Ph camphenyl ketone (II), b_p 172°, d₄²⁰ 1.0145, n_D²⁰ 1.5354, [α]_D²⁰ 33.1°, [α]_D²⁵ 37.3°, surface tension at 19° 38 dynes per sq cm, and b_p 121°, d₄²⁰ 1.0151, n_D²⁰ 1.5321, [α]_D²⁰ 38.6°, semi-carbazone, m 167°. Treatment of II with an excess of H₂O₂ in CHCl₃ gave the characteristic epoxycamphenyl Ph ketone, in 64-5°, [α]_D²⁰ 27.8°, [α]_D²⁵ 31.0°. The action of a large excess of PhMgBr on I from the nitrile and working up of the reaction mixt. gave 60% of a mixt of the 2 isomeric camphenylphenylethylcarbinols (III), b_p 148-50°, d₄²⁰ 0.995, n_D²⁰ 1.5267, [α]_D²⁰ -12.5°, [α]_D²⁵ -15.0°, surface tension at 19° 36.4 dynes per sq cm. A purer product, b_p 154-60°, d₄²⁰ 0.910, n_D²⁰ 1.5220, was obtained from the ketone prepd from the amide. Treatment of this product with H₂O₂ gave a crude, m 85-6°, which was fractionally crystd from alc and by evapn from benzene and xylene solns into a more sol prepolymer. An epoxide (III), in 98°, [α]_D²⁰ -42.7°, [α]_D²⁵ -51.7°.

tion complexes or entities with some degree of kinetic stability and independence. The tautomeric system chosen for study was the system $\text{CHN} \rightleftharpoons \text{C} \rightleftharpoons \text{NCH}$, which can be obtained in associ. with suitable asymmetry and convenient rates of interchange in either direction. The 1st example studied was $\text{PhMeCHN}(\text{C}_6\text{H}_5\text{Cl } p)\text{-Ph} \rightleftharpoons \text{PhMeC}(\text{NCH}(\text{C}_6\text{H}_5\text{Cl } p))\text{Ph}$; in this case the non-optically measured rate const., k_1 and k_2 , were used to calc. the rates at which the 1st compd. should racemize if no optical activity is lost in any intermediate state, the observed rate of racemization was exactly equal to the calcd. The same results were obtained with $\text{PhMeCHN}(\text{C}_6\text{H}_5\text{Cl } p)\text{-Ph} \rightleftharpoons \text{PhMeC}(\text{NCH}(\text{C}_6\text{H}_5\text{Cl } p))\text{Ph}$. The 3rd case, studied by the mutarotation method, was $\text{p-PhCH}_2\text{Cl}_2\text{CHPh} \rightleftharpoons \text{p-PhCH}_2\text{Cl}_2\text{CHN}(\text{C}_6\text{H}_5\text{Cl } p)\text{Ph}$, the non-optically measured rate const. of the forward reaction was 0.0128 hr^{-1} under the conditions of the comparison; the const. for the rate of mutarotation was 0.0122 hr^{-1} , which is equal to the non-optical rate const. to within the error of measurement of the latter. These results are considered to establish with a high degree of probability the conclusion that the mechanism of interchange in the tautomeric system studied is such as to preclude the possibility of losing optical activity in any reversibly formed intermediate state. *di-Benzoylhydrazide- α -phenylethylamine*, m $52-3^\circ$ (63% yield), d-*isomer*, b $_{182}^\circ$, hydrolysis gives a PhMeCHNH_2 with $\alpha = -14.53^\circ$. The fusion curve of mixts. of the 2,4-dinitrophenylhydrazones of PhAc and PhBz is given. *di-Benzylidene p-phenylbenzohydrazylamine* (I), m $133-4^\circ$, *p-phenylbenzohydrazidebenzylamine*, m $90-1^\circ$. Resolution of *p-phenylbenzohydrazylamine* with d-tartaric acid gives 15% of a d-base, m 78° , $[\alpha]_D^{25} 22^\circ$ (1 g in 40 cc. Et_2O), 16.5% (1 g in 52 cc. 1,4-dioxane), d, l, m 133° , $[\alpha]_D^{25} 3^\circ$ (0.5 g in 32 cc. dioxane). *p-Phenylbenzophenone 2,4-dinitrophenylhydrazone*, orange, m $217-7.5^\circ$, the m p curve with the hydrazone of BzH is given.

C J West

Structure of the metallic derivatives which are formed by adding Grignard reagents to unsaturated ketones. E. P. Kohler, M. Tisdler and H. Potter. *J Am Chem Soc* 57, 2017-21 (1935).—The Mg compds., $\text{Ph}_3\text{CHCH}(\text{COC}_6\text{H}_5)_2\text{MgBr}$, prep'd from (1) $\text{Ph}_3\text{CH}(\text{CHClCO}_2\text{C}_6\text{H}_5)_2 + \text{PhMgBr}$, (2) $\text{Ph}_3\text{CHCH}_2\text{COC}_6\text{H}_5\text{Me}_2 + \text{LiMgBr}$ and (3) $\text{Ph}_3\text{CHCHBrCOC}_6\text{H}_5\text{Me}_2 + \text{FMgBr}$, are similar in appearance, soly and many of their chem. properties but differ in the reaction with BzCl , (1) gives at least 90% of a benzate of benzohydrazylbenzylacetomestylene, m 161° , while that from (2) and (3) gives an equally high yield of an isomer, m 148° , these results are not affected by the solvents used or the temp. at which the successive reactions are conducted. Alc. NaOH hydrolyzes both to diphenylpropionylmesitylene (I) and BzONa . They are not interconvertible by heating above the m p or by exposure to sunlight. Both Mg derivs. give with Br the α -Br deriv. of I. The Mg deriv. from (3) and $\text{Me}_2\text{C}_6\text{H}_4\text{-COCl}$ give a mixt. of 40% II, and about 57% of $\text{Ph}_3\text{CHCH}(\text{PhOCOC}_6\text{H}_5)_2$, m 93° . The action of Bz upon the Mg deriv. from (3) yields α -benzohydrazyl-8-phenyl-8-hydroxypropionylmesitylene, $\text{Ph}_3\text{CH}(\text{CH}(\text{OH})\text{Ph})\text{COC}_6\text{H}_5\text{Me}_2$, m 132° , oxidation with CrO_3 in AcOH yields benzohydrazylbenzylacetomestylene (II), $\text{Ph}_3\text{CHCHBrCOC}_6\text{H}_5\text{Me}_2$, m 107° , solz in MeOH KOH and acidification gives an enolic form, m 137° , it gives a blue purple color with FeCl_3 and forms a green Cu compd. it cannot be reduced catalytically nor does it react with O_2 . Benzylacetomestylene and MeMgBr , followed by BzCl , give an oil, cold MeOH -KOH gives BzOH and an enolic form of the diketone (8%), m 128° , recryst. from MeOH -piperidine gives the diketone, m 139° . Benzylacetomestylene, pale yellow, b $_{191}^\circ$, the MgBr deriv. gives with BzCl benzylbenzylacetomestylene, m 118° , the product is an enol but could not be converted into a diketone by piperidine, 4% solns in MeOH , equilibrated with piperidine, contain about equal quantities of enol and diketone. Trimethylbenzylacetophenone and PhMgBr , followed by BzCl , give the compd. $\text{C}_{12}\text{H}_{10}\text{O}$, m 110° , the yield is 50% of, apparently, a benzate. Benzylacetomestylene and PhMgBr , followed by O_2 , give α -methyl-

γ, γ -diphenylpropenol peroxide, $\text{C}_{20}\text{H}_{18}\text{O}_2$, m $116-17^\circ$ (decomp.). These results show that the mesityl group in some manner decreases the speed of the processes represented by $\text{C}(\text{OH})\text{R} \rightleftharpoons \text{CHC}(\text{O})\text{R}$. There is also a certain degree of correlation between the complexity of the hydrocarbon residues surrounding a CO group, the stability of the enolic form and the mode of acylation.

C J West

Reduction of certain oximes. Anna Wohl. *Bull. soc. chim.* [5], 2, 2135-40 (1935).—Some oximes, particularly the α -trisubstituted acetophenone oximes, may have the isoxime or closed ring structure postulated by Beckmann. They have absorption spectra similar to those of monosubstituted benzene derivs. (cf. Ramarat-Lucas and Bruzau, C. A. 28, 5061). The chem. character of the 2 series of oximes should show a corresponding difference to that of their optical properties and attempts have been made to show this difference by a study of the hydrogenation of oximes with differing optical properties. To avoid the influence of the presence of HCl on the structure and behavior of the functional group the oximes, $\text{PhMeC}(\text{NOH})$ (I) and $\text{Me}_2\text{BuCCPh}(\text{O}(\text{NH}))$ (II) were reduced in alk.

media. The hydrogenation of 5 g. of oxime in 50 cc. of 95% alc. by shaking in II in the presence of Adams' catalyst was ineffective although $\text{PhCH}(\text{NOH})$ was reduced to PhCH_2NH_2 (III) under the same conditions. The absorption of hexane and alc. solns of III in the ultraviolet showed a band, in the portion nearest the visible, coincident with that of EtPh . The position of the 2nd band and the variation of the coeff. of absorption showed the mutual effect of the 2 chromophores. Attempts to reduce the oximes with Zn and CaCl_2 in alc. media failed. The addn of 30 g. of I in Li_2O to 10 g. of Al-Hg (C. A. 19, 3477) gave a product b $_{107}^\circ$, which, on redist., yielded 19 g. of PhMeCHNH_2 (IV), HCl salt, m 156° , Bz deriv. m 115° . The crude product was heated at 100° with 50% HCl for 30 min. but in the absence of any imino compd. gave no ketone. Thus, the reduction of I gave only IV while corresponding attempts to reduce II were futile and it is shown that oximes which according to their absorption spectra have different configurations react differently to the same reducing agent. Chemical and spectral study of some acetylated derivatives of oximes. *Ibid.* 2140-3.—The formation of amines and amides in the reduction of the acetylated oximes has been explained by Czerch and Dumitrescu-Colesiu (C. A. 28, 7245) by supposing that the acetylated derivs. occur to some extent in the iso form. The oximes of BzH, $p\text{-MeOC}_6\text{H}_4\text{CHO}$ and Ph_3CO and their Ac derivs. were prep'd according to the directions of C. and were submitted to an absorption spectral study. It has been shown that the spectra of the oximes and their Ac derivs. are altogether similar and that, consequently, the introduction of the Ac group into the mol. provokes no change in the structure of the oximes. $\text{PhMeC}(\text{NOAc})$ (I) was prep'd. by heating the oxime with excess Ac_2O for 3 hrs. The complex formed by the reaction of FMgBr on $\text{Me}_2\text{BuCCPh}(\text{O}(\text{NH}))$ (II) was treated with a corresponding

quantity of Ac_2O and the product was poured into dil. HCl . After decantation and evap. of the solvent, the product was distd. and gave the Ac deriv. (III), $\text{C}_{15}\text{H}_{15}\text{NO}$, of II, b $_{172-3}^\circ$. Both I and III gave the same absorption spectra as the parent oximes. Reduction of I with Al-Hg yielded a mixt. of PhMeCHNH_2 and its Ac deriv., $\text{C}_{15}\text{H}_{15}\text{NO}$, m 75° . III was not reduced. It is conceded that the Ac derivs. contain isoximes as postulated by C. but in amts. too small to be detected by spectral analysis and that during hydrogenation the equil. between the normal and iso forms of the Ac derivs. of the oximes is displaced in favor of the latter and with the consequent formation of amides. Attempts to resolve certain oximes into optical antipodes. *Ibid.* 2163-8.—The more transparent form of oximes has no double linkage and thus the oximes of this class, such as those of the α -trisubstituted acetophenone which have the iso form proposed by Beckmann, should exist in 2 enantiomorphic modifications. F. p. detn. showed that the Bz deriv. of Me_2CBz oxime was monomol.

and evidently the absence of a double bond in $\text{Me}_2\text{BuC-CPH O NH}$ (I) is not due to polymerization. To aid the

proposed resolution of I the group $-\text{CH}_2\text{CO}_2\text{H}$ was attached to the N atom and, since this modification might change the structure of the functional group, the operation was carried out with the Na deriv. of EtPhC NOH (II) (absorbed normal form) and the Na deriv. of I (transparent iso form). A soln. of 1 mol. of the oxime in 1 mol. of alc. 1:1 NaOH was heated for 1 hr. and the theoretical amt. of $\text{ClCH}_2\text{CO}_2\text{Na}$ was added portionwise and the mixt. was refluxed for 3 hrs. The product was then treated with H_2O and the unchanged oxime was removed. The acidified solns. were extd. with Et_2O and the evapd. exts. gave I ($\text{PhC NOCH}_2\text{CO}_2\text{H}$ (III), m. 58°), and $\text{Me}_2\text{BuCCPh O NCH}_2\text{CO}_2\text{H}$ (IV), m. 70° . Both III and IV

possess spectra analogous to those of II and I, thus establishing that the condensation with $\text{ClCH}_2\text{CO}_2\text{H}$ does not affect the functional grouping of the present oxime. Fractional recrystn. failed to resolve IV and resolution of the brutine salt, m. 103° , was ineffective. To obtain better cryst. derivs. by introducing a Me radical in the α -position to the CO_2H group, the Na salt of I was condensed with Na α -bromoisobutyrate (V), yielding a product, m. 55° , transformed by recrystn. and drying over H_2SO_4 into a compd., $\text{C}_{12}\text{H}_{15}\text{NO}_3$, m. 135° . A repetition of the condensation gave different results and produced an isomeric compd., m. 79° . Both products gave analogous absorption curves and possess the same functions. It is supposed that V acts in 2 modifications, $\text{MeEtBrCCO}_2\text{H}$ and $\text{Me}(\text{CH}_2)_2\text{BrCCO}_2\text{H}$. Biochem. sepa. with *Aspergillus niger*, *Penicillium glaucum*, etc., failed to give active modifications of IV. Optical resolution to confirm the results of spectra observations has, so far, been unsuccessfully attempted. C. R. Addinall

The unequal activity of the carbonyl group in succinic methylamide and N-methylpyrrolidone toward organometallic reagents. R. Lukes and K. Smolek. *Collection Czechoslov. Chem. Communications* 7, 476-81 (1935), cf. C. A. 23, 4784.—Succinic methylamide (I) and N-methylpyrrolidone (II) undergo the normal reaction with Grignard reagents to give a carbinol which can be dehydrated to an unsatd. compd. In addn. II undergoes a reaction in which 2 radicals are substituted for the O of the carbonyl group (cf. C. A. 25, 102). The reaction between I and PhMgBr was too rapid for an effect of time on yield to be detected between 0 and 48 hrs. In the reaction between II and PhMgBr , however, time was an important factor in the amt. of reactions as detd. by titration of the bases volatile with steam. The amide N in II exercises an important restraint on the activity of the adjacent carbonyl group. While I and II both have the form of an intramol. salt, which form best explains the high b. p. and dielec. const. of amides, I had in addn. a 2nd carbonyl group which accounts for its greater activity. W. F. Bruce

Action of the Grignard reagent on the amide group VIII. Action of organomagnesium compounds on ethyl 1-methyl-2-keto-2,3-dihydro-5-pyrrylacetate. R. Lukes and J. Preuß. *Collection Czechoslov. Chem. Communications* 7, 482-90 (1935), cf. preceding abstr.—The action of MeMgI on 1,2-dimethyl-1,3-carbetoxy-5-pyrrylone resulted in the evolution of CH_4 , indicating an enol form. No other definite product was isolated. The carbonyl group adjacent to the N rather than the carbetoxy group in 1,1-dimethyl-2-keto-2,3-dihydro-5-pyrrylacetate reacted with MeMgI , giving *Et* 1-methyl-5-pyrrylacetate (I), $\text{C}_{12}\text{H}_{15}\text{NO}_3$, b. 135.6° , d_4^{20} 1.0458, n_D^{20} 1.49428. On hydrolysis I gave 1,2-dimethyl-5-pyrrylacetic acid, $\text{C}_{12}\text{H}_{15}\text{NO}_4$, m. 119.5° (decompn.), which on distn. at ordinary pressure gave 1,2,5-trimethylpyrrole. By using $\text{C}_6\text{H}_5\text{MgBr}$ the product was *ethyl* 1-methyl-2-ketyl-5-pyrrylacetate, $\text{C}_{18}\text{H}_{21}\text{NO}_3$, b. 184.5° , d_4^{20} 0.9784, n_D^{20} 1.4636, which on hydrolysis gave 1-methyl-2-ketyl-5-pyrrylacetic acid, $\text{C}_{18}\text{H}_{21}\text{NO}_4$, m. 84.91° . On distn. at ordinary pressure this gave 1,2-dimethyl-5-ketylpyrrole, $\text{C}_{12}\text{H}_{15}\text{NO}$, b. 171.2° . By using PhMgBr the product was *Et* 1-methyl-2-phenyl-5-pyrrylacetate, $\text{C}_{18}\text{H}_{19}\text{NO}_3$, b. $205-10^\circ$, d_4^{20}

1.1095, n_D^{20} 1.57435, which on hydrolysis gave 1-methyl-2-phenyl-5-pyrrylacetic acid, $\text{C}_{18}\text{H}_{19}\text{NO}_4$, m. 157° (decompn.). On decarboxylation this gave 1,2-dimethyl-5-phenylpyrrole, $\text{C}_{12}\text{H}_{15}\text{N}$, m. $50-1^\circ$. All these pyrrole derivs. gave intense colors in the pine splinter test with concd. HCl . W. F. Bruce

The synthesis of amino acids. III. Tryptophan. Wm. J. Hoyle and Wm. Robson. *Biochem. J.* 29, 255-8 (1935), cf. C. A. 29, 5094, 5111.—Indole-3-aldehyde was condensed with β -ketoanion by refluxing for 30 min. in piperidine (65% yield). The indolallyketoanion was heated with $(\text{NH}_4)_2\text{S}$ (16%) and NH_4OH (3%) in a closed vessel at $100-3^\circ$ for 500 hrs. Tryptophan was obtained in 70% yield by filtration of the reaction mixt., followed by evapn. of the filtrate, extn. of the residue with H_2O contg. NH_3 in small amts., evapn. of the ext. and pptn. with EtOH . L. W. Scott

Quinoline acids from oxindole derivatives. F. Ward Zike and H. G. Lundwall. *J. Am. Chem. Soc.* 58, 40-50 (1936), cf. C. A. 29, 1420.—Isatin, $\text{PhCH}_2\text{CO}_2\text{H}$ and EtNH in abs. EtOH gave 71% 3-hydroxy-3-phenylcarbethoxymethyl-oxindole, m. $154-6^\circ$, while 1% NaOH gives isatin, refluxing with concd. HCl contg. a little EtOH gives 90% of 3-phenyl-2-quinoline-4-carboxylic acid. The isatonomalonitrile (I) of Walter (*Ber.* 35, 1321 (1902)), on reduction with $\text{Na}_2\text{S}_2\text{O}_4$, yields 10% of 3-(decanamethyl)-oxindole, m. $181-5^\circ$, by hydrolysis with 33% NaOH gives 1,2,3,4-tetrahydro-2-quinoline-4-carboxylic acid (II) Isatin and $\text{NCCCH}_2\text{CONH}_2$ give 3-(cyanomorphomide)methyl-oxindole (III), red, m. $248-50^\circ$. I or III with concd. HCl gives the compd. $\text{C}_{12}\text{H}_{11}\text{O}_4\text{N}$ (IV), m. above 310° , which yields a *di-El* salt and a *di-El* ester, pale yellow, m. $150-1^\circ$, IV also results from the tetra-*Et* ester of oxindole-3,3-bis(methanecarboxylic acid) (C. A. 29, 3674) by hydrolysis with 10% NaOH . Reduction of IV with Zn and AcOH or Na-Hg gives II, CO_2 being lost. C. J. West

Some alkyl glyoxalimides. Henry C. Chutwood and E. Emmet Reid. *J. Am. Chem. Soc.* 57, 2124-6 (1935).—The best method of prep. methylglyoxalimide (I) is to heat 30 g. (AcNHCH_2I), with 5 g. Mg at 270° for 75 min., the yield being 68%. Results are given for other methods, yields varying from 8 to 44%. The higher homologs were prep. by distg. the diacyl derivs. with Na or Mg or by refluxing the hydrides with the metal and extg. the bases with CaH_2 . The diacyl derivs. of $(\text{CH}_3)_2\text{NH}$, (I) can be made by heating I with the Et esters, although the lower members are conveniently prep. by refluxing the I with the free acids. The following m. ps. of $(\text{RCONHCH}_2)_2$ are given, where R is: Me 175.6° , *i* 101.4° , *p* 192° , Bu 184.2° , *n* 178.5° , *hexyl* 173° , *heptyl* 171° , *octyl* 167° , *nonyl* 164.6° , *decyl* 160.8° , *undecyl* 158.8° . The following figures are the m. ps. of the alkyl glyoxalimides and their picrates, with the yields of the former, R in the formula $\text{RC}_2\text{H}_4\text{N}$, being: Me 103° , 20%, 68%; *i* 135.1° , 137%, 46%; *p* m. 35.8° , 121%, 40%; Bu 41° , 125.8%, 27%; *n* 33.8° , 128.4%, 31%; *hexyl* 48.2° , oil, 1.7%; *heptyl* 60° , 104.8%, 47%; *octyl* 52.1° , oil, 21%; *nonyl* 71.4° , 121%, 5.6%; *decyl* 79.5° , 82%, 22%; *undecyl* 79.8° , oil 5° , 24%. I and Br in CHCl_3 give 82% of $\text{C}_2\text{H}_5\text{NBr}$, *yellow*. The soly. decreases with the lengthening of the alkyl side chain, the undecyl deriv. being practically insol. in H_2O , all dissolve in HCl to give well-defined salts, which form Au and Pt double salts. The toxicity of the 1st 5 members of the series decreased with the increase in the length of the alkyl radical. Goldfish and tadpoles survived in solns. of 1:5000 but succumbed when placed in solns. of 1:1000, 10 mg. of the Me compd., administered intraperitoneally, killed mice but the higher members of the series were not so toxic; 0.5 g. per kg. of any of the compds., given by stomach, was not toxic for rabbits and did not impair their kidney functions; the Me compd. increased the acidity of the urine; 10 mg., injected intravenously in cats under ether, produced a transient fall in blood pressure but little effect on the respiration. C. J. West

Some reaction products of aromatic amidines with diketones, dialdehydes and their monoximes. John B.

Ekeley and J. Lell Elliott. *J. Am. Chem. Soc.* 58, 163-4 (1936) — Phenanthrenequinone (I) dissolves in aq. solns of amidine-HCl on addn of 50% KOH; acidification gives 80-90% of the following amidines benz, m 277-8°, nitrobenz, m 269-70°, o-isomer, m 287-5-8°. The benz- and m-tolonylamidines of the diacetylmoxime in 105-7° and 94-6°, resp. The monoxime of I forms benz, m- and p-tolonylamidines, dark green and dark red (last 2), m 186°, 165-6° and 182-3°, resp. An improved method for the prepn of substituted 2,4-diphenyl-5-hydroxypyrimidines (benzoyl, oxalines) from a glyoxal amidine addn product is described, using benzamidine and glyoxal, products were prepd from the following aldehydes: phthalaldehyde, lemon-yellow, m 259-60°, o-ClC₆H₄-CHO, lemon-yellow, m 260°, p-isomer, yellow, m 305-6°, dimethoxyresorcydaldehyde (Ia), orange, m 248-9°, 2,5-(MeO)₂C₆H₃CHO (II), orange, m 268-9°, 3,4-isomer (III), brown-orange, m 297-60°, p-MeNC₆H₄CHO, red-brown, m 277-8°, p-EtOC₆H₄CHO (IV), lemon yellow, m 292-3°, m-HOC₆H₄CHO, yellow, m 265-5-5°, dibromosalicylaldehyde, orange-red, m 311°, homosalicylaldehyde, bright red, m 287-8°, 5-nitrosalicylaldehyde, red brown, m above 300°, cumenol (V), orange, m 246-7°, 3,4-Me(MeO)₂C₆H₃CHO (VI), orange-yellow, m 253-4°, p-peronal (VII), yellow-brown, m 285-7°, m-MeC₆H₄CHO, lemon-yellow, m 237-8°. 5-Hydroxy-2-(3-tolyl)pyrimidines from m-tolonylamidine, glyoxal and the following aldehydes Ia, orange, m 250-1°, II, orange yellow, m 229-30°, III, orange-brown, m 238-9°, IV, yellow, m 237-8°, V, yellow, m 263-4°, o-MeOC₆H₄CHO, yellow, m 272-3°, p-MeOC₆H₄CHO, lemon-yellow, m 227-4°, VI, orange, m 237-9°, VII, yellow-brown, m 249°. C. J. West

Unsaturation and tautomeric mobility of heterocyclic compounds VI The mobility of 5 substituted 1-hydroxybenzothiazoles and the ultraviolet absorption of mobile and static derivatives of 1-hydroxybenzothiazole Robert G. Hunter and Edwin R. Parken. *J. Chem. Soc.* 1935, 1755-61, cf. C. A. 28, 6439¹ — Ethoxybenzothiazole, pale yellow, m 35-6°, was prepd from p-tolylthiourethan, hydrolysis with concd HCl of 1-ethoxy-5-methylbenzothiazole gives I hydroxy-5-methylbenzothiazole (I), m 168-9°. Ag salt (II), cream, decomp 180°. Na salt, decomp 260-1°, partly hydrolyzed by H₂O. I (1 g) in 2 cc CHCl₃ and 20 cc 2a% aq NaOH with 2 cc Me₂SO, refluxed 10 min, gives 1 g 1-keto-2,5-dimethyl-1,2-dihydrobenzothiazole (III), m 76-7°, methylation of the Na salt with MeI at 100° for 5 hrs also gives III, 0.5 g of II gives 0.2 g of III with MeI at 100°. The methosulfate of 1-amino-5-methylbenzothiazole with alkali gives the oily iminodimethyl base, which yields with NaNO₂ in AcOH at 5° 1-nitrosoimino-2,5-dimethyl-1,2-dihydrobenzothiazole, dark red brown, explodes 144°, heating in C₆H₅Me gives III p-Tolylthiocarbamide and MeOH with a little quinoline give Me p-tolylthiocarbamate, m 79-80°, K₂Fe(CN)₆ gives I methoxy-5-methylbenzothiazole (IV), m 32-3°, hydrolysis gives I. The Ac deriv of I m 109° I and Br in CHCl₃ at 6° give the 4(or 6) Br deriv (V), m 239-40°, Me₂SO, and 2a% aq NaOH give 4(or 6)-bromo-1-keto-2,5-dimethyl-1,2-dihydrobenzothiazole (VI), m 145°, III and Br also give VI IV and Br in CHCl₃ appear to give a mixt. of V and the Br deriv of IV, converted into V by hydrolysis with HCl o-Bromo-p-tolylthiourethan, m 32-3°, 3-bromo-1-hydroxy-5-methylbenzothiazole, m 209°, Me₂SO, gives the 3-Br deriv of III, m 116° 2-Bromo-p-tolylthiocarbamide, m 44-5° 2-bromo-p-tolylthiourethan, m 106° 4(or 6)-bromo-1-ethoxy-5-methylbenzothiazole, m 50-1°, hydrolysis gives V p-Phenylthiourethan, m 93-4°, 1,5-dithoxybenzothiazole, m 54°, 1-hydroxy-5-ethoxybenzothiazole (VII), m 147°, Me₂SO, gives I keto-2,5-dimethyl-1,2-dihydrobenzothiazole, m 85° Me p-phenylthiocarbamate, m 68-9°, 1-methoxy-5-ethoxybenzothiazole, m 75-6°, hydrolysis gives VII p-Iodophenylthiourethan, m 106-7°, 5-odo-1-ethoxybenzothiazole, m 76-7°, 5-odo-1-hydroxybenzothiazole, m 225-6°, Me₂SO, gives 5-odo-1-keto-2-methyl-1,2-dihydrobenzothiazole, m 135°, this also results from 5-odo-1-nitroso-

imino-2-methyl-1,2-dihydrobenzothiazole, salmon-pink, explodes 160°. Me p-bromophenylthiocarbamate, m 90-100°, 5-bromo-1-methoxybenzothiazole (VIII), m 82-3° Me phenylthiocarbamate, m 93°; 1-methoxybenzothiazole, m 88-9° Methylation of 5-bromo-1-hydroxybenzothiazole gives no trace of VIII 5-Chloro-1-ethoxybenzothiazole, m 60-1°, 5-chloro-1-hydroxybenzothiazole, m 204°, 5-chloro-1-keto-2-methyl-1,2-dihydrobenzothiazole, m 112°, also from the 5-chloro-1-nitrosoimino deriv, explodes 138-9°. 5-Nitro-1-nitrosoimino-2-methyl-1,2-dihydrobenzothiazole, salmon pink, explodes 152°, heating in C₆H₅Me, gives the 5-nitro-1-keto deriv, yellow, m 162-3° Phenylthiourethan disulfide is unchanged after heating at its m p for 0.5 hr, no trace of this compd could be obtained by heating phenylthiourethan and 1-ethoxybenzothiazole slightly above the m p of the disulfide Absorption spectra are given for I in MeOH, NaOH, NaOEt and KOH, also for I, III and IV, and their significance is discussed VII. Selenazole derivatives Churagh Hasan and Robert F. Hunter *Ibid* 1762-6 — Phenylselenourea and Br in CCl₄-CHCl₃ give 1-amino-benzoselenazole (I), m 142° Heating I with Me₂SO in MeOH for 2 hrs gives after heating with an excess of alkali 1-amino-2-methyl-1,3-dihydrobenzosenazole, yellow, m 104°, NaNO₂ in AcOH gives the 1-nitrosoimino deriv, brown, explodes 142-4° s-Phenylmethylselenourea, m 111°, turns gray on keeping, Br in CHCl₃-CCl₄ gives the N-Me deriv of I, m 140° I and Ac₂O give the 1-acetamido deriv (II), m 190°, and a compd, m 130°. s-Acetylphenylselenourea, light brown, m 195°, Br in CCl₄-CHCl₃ gives II Diphenylselenourea and Br give 1-anilino-benzoselenazole, m 170° (picrate, yellow, m 245°), methylation gives a mixt. of 1-phenylimino 2-methyl-1,2-dihydrobenzosenazole, whose picrate m 172° (about 72% of the product) and 1-phenylmethylaminobenzosenazole, whose picrate, yellow, m 200°, the synthesis of the latter is described Bis-o-aminophenyl diselenide and CCl₄/Et give bis-o-urethanphenyl diselenide, brown, m 110°, Sn and HCl give 1-hydroxybenzosenazole (III), m 140°, Sn was also obtained by the action of COCl₂ upon the Zn salt of o-H₂NCH₂SeH and also by the hydrolysis of 1-chlorobenzosenazole in EtOH, methylation gives the 1-keto-2-methyl deriv (IV), m 60° IV was also prepd by heating the nitrosoimino deriv in C₆H₅Me 1-Thiolbenzosenazole, m 159°, was prepd by the condensation of nascent o-H₂NCH₂SeH with CS₂ from the Zn salt and CSeCl₄ and from 1-chlorobenzosenazole and NaSH Methylation gives an oil, which appears to be the expected 5-Me deriv, since it is different from the 1-thio-2-methyl-1,2-dihydrobenzosenazole, m 80°, obtained from IV and P₂S₅ 1-Amino-α-naphthoselenazole, m 252°, results from 1,2-BrC₁₀H₇NH₂ HCl and KSeCN in H₂O, Ac deriv, m 250°, fusion with NaOH gives β C₁₀H₇NH₂ and bis-2-amino-α-naphthyl diselenide (V), brown, decomp 120° s-Phenyl-β-naphthylselenourea, m 174°, Br in CCl₄-CHCl₃ gives 1-anilino-α-naphthoselenazole, m 210°, fusion with KOH gives V V, NaHS, aq NaOH and CS₂ in a stream of H₂S give on heating 1-thio-α-naphthoselenazole, yellow, m 228°. C. J. West

Some alkyl derivatives of certain aryl-substituted thiazolidones John A. Davis and F. B. Dains. *J. Am. Chem. Soc.* 57, 2627-30 (1935), cf. C. A. 27, 5075 — Thiazolidones (I) were prepd from RNHCOCH₂Cl and KSCN (refluxing in alc for 1-5 hrs) or from the monoaryl thioureas (refluxing in alc for 1-3 hrs with equal mol quantities of C₆H₅N and CICH₂CO₂Et). The Na salt (hot 5% NaOH) and an alkyl halide give a mixt. of the 2- and 3-alkyl derivs, sep'd by the soly of the former in dil HCl The following yields of 2- and 3-Et derivs of I were obtained from o-IC₆H₄NH₂, 68%, 1%, p isomer, 50, 1, o-MeOC₆H₄NH₂, 65, 0, 6, m isomer, 40, 6, p isomer, 50, 1, pseudocumidine, 56, 0, 2-amino-p-cymene, 65, 0, p-IC₆H₄NH₂, 74, 16, 2,4-IC₆H₃NH₂, 0, 85 The Na salt of the I from p-IC₆H₄NH₂ and MeI gave 60 and 75% of the 2- and 3-alkyl deriv, EtI, 74 and 16%; AmI, 34 and 4%, PhCH₂Cl, 60, 4% The following thioureas were prep'd N-ethyl-N'-p-ethoxyphenyl, m 112°, o-isomer, m 88°, N-ethyl-N'-pseudocumyl, m 138°, N-Me analog,

m 179°; *N*-ethyl-*N'*-*o*-methoxyphenyl, m. 77°; *p*-isomer, m. 147°; *m*-isomer, m. 112°; *mono-p*-cymyl, m. 152°; *N*-ethyl-*N'*-*p*-cymyl, m. 126°; *N*-ethyl-*N'*-2,4-diiodophenyl, m. 164°; *N*-methyl-*N'*-*p*-iodophenyl, m. 171°; *N*-Et analog, m. 147.5°; *N*-Am analog, m. 130°; *N*-benzyl analog, m. 147.5°; 4-Thiazolidones 2-*p*-ethoxyphenylamino-3-ethyl, m. 93°; 2-*o*-ethoxyphenylamino-3-ethyl, m. 99°; 3-Et deriv, m. 70°; 2-Pseudocumyl-3-ethyl, m. 77°; 3-Me analog, m. 91°; 2-*o*-methoxyphenylamino-3-ethyl, m. 114°; *p*-MeO isomer, m. 83°; 2-methoxyphenylamino, m. 105°; 2-Et deriv, m. 112°; 3-Et deriv, m. 65-67°; 2-*p*-cymylamino, m. 174°; 2-Et deriv, m. 85°; 3-Et deriv, m. 61°; 2-(2,4-diiodophenylamino), m. 233°; 3-Et deriv, m. 173°; 2-iodophenylamino, m. 226°; 1-Me deriv, m. 207°; 3-Me deriv, m. 152°; 2-Et deriv, m. 110° (II); 3-Et deriv (III), m. 103°; 2-Am deriv, m. 116°; 3-Am deriv, m. 57°; 3-benzyl deriv, m. 137°; 2-benzyl deriv, m. 170°; 2-phenylamino-3-ethyl, m. 137°; 2-benzylamino-3-ethyl, m. 74°; 5-Benzal-4-thiazolidones 2-Ethyl-2-*p*-ethoxyphenylamino, m. 210°; 3-Et isomer, m. 135°; 2-*o*-ethoxyphenylamino-3-ethyl, m. 113°; 2-Et isomer, m. 164°; 2-Ethyl-2-pseudocumyl, m. 180°; 2-pseudocumylamino-3-ethyl, m. 141°; 3-Me analog, m. 130°; 2-Ethyl-2-*o*-methoxyphenylamino, m. 140°; 3-Et isomer, m. 93°; 2-Ethyl-2-*p*-methoxyphenylamino, m. 198°; 3-Et isomer, m. 125°; 2-Ethyl-2-*m*-methoxyphenylamino, m. 135°; 3-Et isomer, m. 100°; 2-Ethyl-2-*p*-cymylamino, m. 169°; 3-Et isomer, m. 73°; 2-(2,4-diiodophenylamino)-3-ethyl, m. 210-11°; 2-methyl-2-iodophenylamino, m. 218°; 2-*p*-iodophenylamino-3-methyl, m. 167°; 2-Ethyl-2-iodophenylamino, m. 231°; 3-Et isomer, m. 172°; 2-Am analog, m. 202°; 2-phenylamino-3-ethyl, m. 78°; 2-benzyl-2-*p*-iodophenylamino, m. 221°; 3-benzyl isomer, m. 162°; 2-benzylamino-3-benzyl, m. 109°; *ω*-Chloroacetamino-*p*-cymene, m. 85°; 2,4-diiodo-*ω*-chloroacetamido, m. 153°; *N*-Ethyl-*N'*-*o*-ethoxyphenyl-*N'*-phenylurea, m. 93°; *p*-nitrobenzyl-*o*-phenetidine, m. 155°; *N*-*o*-tolyl-*N'*-*o*-ethoxyphenylurea, m. 172°; *o*-Phenetidylbenzenesulfonate, m. 61°; *Et*-*o*-amidybenzenesulfonate, m. 60°; 5-benzal-3-benzyl-2,4-thiazolidone, m. 134°; 3-Am analog, m. 74°. The hydrolysis products of the 5-benzal-4-thiazolidones are given. The I condense with *p*-ONC₆H₄NMe₂, the compd. C₁₈H₁₇ION₂S, from II, dark yellow, m. 246° (decomp.); that from III, red, m. 212°; C I W.

Constitution of calycotripter II S. Mahal and K. Venkataraman *Current Sci* 4, 111-121(1935), cf. *C A* 29, 2534—Treatment of calycotripter (I) with AlCl₃ has resulted in a new flavone which exhibits the usual properties of a catechol deriv and must therefore be 5,6,4'-trihydroxy-3,7,8-trimethoxyflavone or 3,5,6,4'-tetrahydroxy-7,8-dimethoxyflavone. The second HO in I being in the 8-position, I may now be formulated as 6,4'-dihydroxy-3,5,7,8-tetramethoxyflavone W J Peterson

Pyridine-2-acetic acid. M P Oparina *Khim farm Prom*, 1936, No. 2, 99-101.—Pyridine-2-acetic acid very easily loses CO₂ (in H₂O at 50-60°). The Me ester is quite stable; reduced in the presence of Pt it forms piperidine-2-acetic acid, it liberates C₂H₄ with Grignard reagents. The nitroso deriv (in H₂SO₄ + NaNO₂) does not produce the Liebermann reaction. L Nasarevich

Iodo-hydroxyquinolinesulfonic acid S Vinaver *Khim Farm. Prom*, 1935, No. 2, 109-110.—The iodination of the hydroxyquinolinesulfonic acid is best effected by direct addn. of I to the Na salt. 7-Iodo-8-hydroxyquinoline-5-sulfonic acid is liberated with HCl L N

Preparation of *o*-hydroxyquinoline. O Yu Magidson and M V Rubtsov *Khim. Farm. Prom*, 1935, No. 1, 20-3.—A practical method in which aniline is treated according to Skraup, the quinoline sulfated at 160° with 20% oleum, treated with CaCO₃ and the Ca salt of 8-sulfonquinoline is decomposed under pressure with NaOH at 225° (17-19 atm.). The ppt is dissolved in dil. H₂SO₄, boiled, filtered and hydroxyquinoline pptd with NH₃ and NaHCO₃. L Nasarevich

p-Dimethylaminobenzalquinaldine. A contribution to the action of chromophoric and auxochromic groups, Hans Rupe, Heinrich Hagenbach and August Collin *Helv. Chim. Acta* 18, 1395-1413(1935); cf. *C A* 26,

2185, 27, 2446.—Condensation products between *p*-Me-NC₆H₄CHO (I) and ketones are highly colored, but their salts are colorless. A similar behavior is shown by *p*-dimethylaminobenzalquinaldine (II) (cf. Noetting and Witte, *Ber* 39, 2750(1906)), m. 183-5°, which dyes cotton orange-red but gives a colorless di-HCl salt, C₁₈H₁₉Cl₂N₃, and a blue mono-HCl salt, C₁₈H₁₉ClN₃, m. 239-40°; diperchlorate, C₁₈H₁₉Cl₂N₃O₈, monoperochlorate, C₁₈H₁₉ClN₃O₄, red-violet, m. 229-30° (decomp.); monoperochlorate, C₁₈H₁₉N₃O₄, red-violet, m. 167-8°. With MeI II gave a light yellow monomethiodide, C₁₈H₁₉IN₃ (III), m. 250-1° (decomp.), and a dark blue-red form, C₁₈H₁₉IN₃ (IV), m. 253-4° (decomp.). To det. the point of addn. in each case, I was allowed to react with MeI to give a methiodide, C₁₈H₁₉INO₄, m. 141° (decomp.), which was condensed with quinaldine to give III. The methiodide of quinaldine condensed with I gave IV. Upon catalytic hydrogenation II gave a colorless dihydro deriv, C₁₈H₂₁N₃, m. 68-85°, di-HCl salt, C₁₈H₂₁Cl₂N₃, m. 210-11°, diperchlorate, C₁₈H₂₁Cl₂N₃O₈, m. 157-8°; methiodide, C₁₈H₂₁IN₃, m. 158-9°; nitrosamine, C₁₈H₂₁N₃O, m. 90.5-91°; *Me* deriv, C₁₈H₂₁N₃O, m. 120.5-121.5°. By the addn. of Me₂SO, II gave a colorless di-*N*-Me deriv, C₁₈H₂₁N₃O₂S, m. 253-3° (decomp.), and a red mono-*N*-Me deriv, C₁₈H₂₁N₃O₂S, m. 242-3°, which was identical with the condensation product between *N*-methylquinaldine sulfate, C₁₈H₂₁N₃O₂S, m. 223-4°, with I. The product, C₁₈H₂₁N₃O₂S, m. 201-2.5° (decomp.), from the condensation of the *N*-Me sulfate of I, C₁₈H₂₁N₃O₂S, m. 154°, with quinaldine, was nearly colorless. By the action of PhMgBr on II, α -*p*-dimethylaminophenylethylidene-1,2-dihydroquinoline (V) was isolated as the perchlorate, C₁₈H₂₁Cl₂N₃O₈, m. 192-4° (decomp.), from which was obtained the pure base VI, C₁₈H₂₁N₃, m. 125°, di-HCl salt, C₁₈H₂₁Cl₂N₃, monomethiodide, C₁₈H₂₁IN₃, m. 125-6° (decomp.), nitrosamine, C₁₈H₂₁N₃O, m. 105-6° (decomp.), dimethiodide, C₁₈H₂₁IN₃, m. 206-8° (decomp.). In addn. to VI, PhMgBr and II gave a substance of unknown structure, possibly an isomer of VI, m. 191.5°, methiodide, C₁₈H₂₁IN₃, m. 196-7° (decomp.) W. F. Bruce

Some esters of amino alcohols with 9-acridinecarboxylic acid B Sandahl and Chr I'r Weider. *Bull. soc. chim.* [5], 2, 209-16(1935)—Esters of amino alcs. have generally a more or less anesthetic action and acridine derivs. act as bactericides. Attempts have been made to make compds. with both physiol. properties by prep. a series of acridinecarboxylic esters of β -aminoethanol and β -dialkylaminoethanols. The products are very feebly anesthetic and are non antiseptic. A mixt. of 1 part of 9-acridinecarboxylic acid (I) (C A 23, 144) and 4 parts of SOCl₂ was refluxed until the acid dissolved and was then distilled to remove most of the excess SOCl₂. The cooled product gave 85-90% of 9-acridinecarboxyl chloride (II) (I) (C A 23, 144). To a stirred suspension of 13.9 g of II in 20 cc. of dry benzene was added dropwise 3.3 g. of H₂NCH₂CH₂OH, prep. by the action of NH₃ on ethylene oxide. The thick warm brew was dried with benzene and the mixt. was refluxed for 4-5 hrs. The cooled product was filtered off, washed with benzene and dried i. xtn. with HCl, neutralization and recrystn. from 20% alc. gave β -aminoethyl 9-acridinecarboxylate (III), C₁₈H₁₉N₃O₂, m. 234-40°, which in alc. with dry HCl yielded only the mono-HCl salt, m. 238-40° (decomp.). Esterification of Me₂NCH₂CH₂OH, prep. by the action of NIMe₃ on ethylene oxide, by treatment with II proceeded directly to the di-HCl salt of β -dimethylaminoethyl 9-acridinecarboxylate (IV), m. 172-3° (decomp.). An equimol. mixt. of the free base and IV yielded the mono-HCl salt, m. 189-90° (decomp.). The following dialkylaminoethyl esters of I and their HCl salts were similarly prep.: *Et*, HCl salt, m. 179-80° (decomp.); *di*-HCl salt, m. 170-80° (decomp.); *Pr*, HCl salt, m. 177-8° (decomp.); *iso*-Bu, HCl salt, m. 178-80° (decomp.); *di*-HCl salt, m. 169° (decomp.); *iso*-Am, HCl salt, m. 146°; *di*-HCl salt, m. 167-8° (decomp.). The dialkylamino alcs. were prep. in good yields by the action of CICH₂CH₂OH on the requisite amine (*Org. Synthesis* XIV, 28 (*C A* 28, 2078)); *Pr*-

$\text{NCH}_2\text{CH}_2\text{OH}$, b_p 90-2° (70%); (iso-Bu) $_2\text{NCH}_2\text{CH}_2\text{OH}$, b_p 90-8° (60%), (iso-Am) $_2\text{NCH}_2\text{CH}_2\text{OH}$, b_p 126-8° (60%) C. R. A.

3,6-Dialkory-10-alkylacridinium derivatives with various kinds of amino groups on the 9-carbon atom XVI. Synthesis of 3,6-dialkory-9-*m*-aminoamino-10-alkylacridinium derivatives and [3',6'-dialkory-10'-alkyl-10'-D-acridine]-9',9'-*m*-phenylenediamino-3,6-dialkory-10-alkylacridinium derivatives-D. Kiyoyuki Ishihara *J. Chem. Soc. Japan* 56, 1368-87 (1935), cf. *C. A.* 30, 462¹—Derivs are prepd according to the scheme

In the reaction of I and II in water, the compds of type III crystd. out first, except the 3,6-diethoxy-10-methylacridinium deriv. which is a gelatinous ppt but may be crystd as the iodide by addg KI in AcOH. The mother liquors after the sepn of III contain the more sol. IV, of which the 3,6-dimethoxy-10-methylacridinium deriv. can be crystd with an excess of HCl but all the others crystd as the iodides by addg. KI and HCl. Dissolving IV or the iodides in MeOH and pptg them with ether gives various cryst. salts of following compn

Below are given R, R', D, *n*H A, *n*, *p* and the *m* p, resp., for those salts: Me, Me, 1, 0 8H1, 1, 0, 209°, Me, Me, Cl, 1HCl, 0, 0, 9, 228°, Me, Ft, 1, 0, 5H1, 1, 25, 0, 219°, Me, Me, 1, 0, 5H1, 0, 0, 237°, Ft, Et, 1, 0, 6H1, 0, 1, 224°. The V forms yellow crystals, sol in water with yellow color or nearly insol, sol in glacial AcOH, CHCl₃ and acetone. Their constns (R, R', *m* p) are: Me, Me, 110° (foaming); Me, Ft, 173°, Ft, Me, 163°; Ft, Ft, 150°. Treating V with aq AcOH and adding aq KI while hot gives 9-*m*-aminoaminoacridinium iodides (VII). Constns of VII (R, R', *m* p): Me, Me, 225° (cs), Me, Ft, 220°

(ca), Et, Me, 240°, Ft, Et, 235°. Consts of III (R in 3,6,3',6'-(RO) $_2$, R' at 10 and 10', *m* p (decompn): Me, Me, 230°, Me, Ft, 240°, Ft, Me, 251°, Et, 1 t, 239°. (10'-Iodoacridine)-9,9'-*m*-phenylenediamino acridinium iodides have (R and R' as in III, *m* p (decompn): Me, Me, 271°, Me, Et, 276°; Et, Me, 253°, Et, 1 t, 285°. Consts of VI (R and R' as in III, *m* p): Me, Me, 232°, Me, Ft, 219°, Et, Me, 197°, Ft, 1 t, 193°. Cf. *C. A.* 29, 7484¹ K. Katsuta

6,9-Diamino-2-ethoxyacridine M. Bazurim *Khim. Farm. Prom.* 1935, No 2, 108-9—The reduction of 6-nitro-9-amino-2-ethoxyacridine is best conducted in weakly acid or neutral medium and Fe filings. L. N. Reaction of certain diazosulfonates derived from β -naphthol 1-sulfonic acid XIII. Fission of the naphthalene nucleus and subsequent closure in two directions. F. M. Rowe, W. C. Dovey, B. Garforth, Esther Levin, J. D. Pask and A. T. Peters *J. Chem. Soc.* 1935, 177¹

1808; cf. C. A. 29, 73177.—Previous work has been extended to 2'-substituted compounds. Na β -naphthol-1-diazo-sulfonate and α -ON $_2$ C₁₁H₁₁N₃ at 0° give 2'-nitrobenzene-2-naphthol-1-diazo-sulfonate, Na₂CO₃ in H₂O gives 1-(2'-nitrobenzenesulfonyl)- β -naphthoquinone-1-sulfonate; soln in cold an. NaOH and acidification after 1 min. gives 81.8% of Na benzaldehyde-2'-nitrophenylhydrazono-sulfonate-2- β -acrylic acid (I), orange-red with yellow reflex, it is an orange acid dye of good tinctorial power but fugitive to light. The 4'-Cl deriv. (II), yellow needles, changing to red on drying, 5'-Cl deriv. (III), red with a yellow reflex. Heating I with dil. HCl for 8 hrs. (end of evolution of SO₂) gives a mixt of benzoyl-2'-nitrophenylhydrazide-2- β -acrylic acid (IV), orange-yellow, m. 220–5° (conversion into V), and 2-(2'-nitrophenylamino)isondolone-3-acetic acid (V), greenish yellow, m. 224–5°, these are sep'd by rapid crystn from AcOH. 4'-Cl deriv. of IV, orange, m. 272–8°, 4'-Cl deriv. of V, yellow, m. 278°, 5'-Cl deriv. of V, yellow, m. 245°. V forms a Me ester, yellow, m. 164° (4'-Cl deriv., yellow, m. 152°, 5'-Cl deriv., yellow, m. 182°), Et ester, yellow, m. 153° (5'-Cl deriv., yellow, m. 144°), amide, yellow, m. 272° (4'-Cl deriv., orange-yellow, m. 265°). V, refluxed with Ac₂O, alone or better with CaH₂N, or refluxed with PCl₅ in PhMe, loses 1 mol H₂O and gives 80.7 or 81.7% of 2,5-diketo-3-(2'-nitrophenyl)isondolone-pyrazolocoline (VI), pale yellow, m. 191°, 4'-Cl deriv., pale yellow, m. 218–9°, 5'-Cl deriv., pale yellow, m. 209°. VI is hydrolyzed readily to V, preferably by acids but also by rapid soln. in aq. NaOH. Reduction of VI with Fe and AcOH gives the 2'-NH₂ deriv. (VII), m. 231–6° (82% yield), which seps with 1 mol H₂O (Ac der., with 0.5 mol H₂O, m. 175–9°, 4'-Cl der., m. 233–4°, 61.4% (Ac der.), m. 243–4°), the action of 1 l. H₂SO₄ or 7% PCl₅ in PhMe gives 53.5 or 42.8% of 2,2'-anhydro-2,5-diketo-3-(2'-amino)phenylisondolone-pyrazolocoline (VIII), m. 219–21° (picrate, yellow, m. 234–6°, also obtained directly from VII), 4'-Cl der., m. 274.5 or 53.2% yield, m. 238–9° (sulfate, m. 278°). Reduction of V in 10% NaOH with Na₂SO₄ at 70° gives 77% of 2-(2'-amino)phenylamino)isondolone-3-acetic acid (IX), m. 182–3° (decomp.), rapidly turns brown in the air, 4'-Cl der., m. 193° (decomp.) (48% yield), with Ac₂O and CaH₂N these yield the Ac der. of VII or its 4'-Cl deriv. Refluxing IX with H₂SO₄ (about 1 l.) for 1 hr. gives 25.6% of 2-(2'-amino)phenylamino)isondolone-3-acetic acid lactam (X), m. 227°, this also results from refluxing VII with 1 l. H₂SO₄ for 3–4 hrs. in 40% yield, 4'-Cl deriv., m. 237°, 27.5 or 31.7% yield, X yields a picrate, yellow, m. 229–30°, it is converted into VIII by picric acid. In the prepn. of I, the soln is kept at room temp. for 2 days, there results, in place of I, 69.5% of Na H 3-(2'-nitrophenyl)-3,4-dihydrophthalazine-1-sulfonate-4-acetate, yellow needles from AcOEt or orange-yellow prisms from an. EtOH; this also results in nearly quant. yield from I in NaOH at room temp. for 3 days or at 60° for 3.5

days, yellow, m. 167–4°, 5'-Cl deriv., yellow, m. 163°, Et ester, yellow, m. 163° (4'-Cl deriv., yellow, m. 145°, 5'-Cl deriv., yellow, m. 153°); anilide, orange-yellow, m. 128° (4'-Cl deriv., pale yellow, m. 130°, 5'-Cl deriv., pale greenish yellow, m. 223°). The N-Me ether of XI, 1-keto-1-(2'-nitrophenyl)-2-methyltetrahydrophthalazine-3-acetic acid (XII), yellow, m. 207° (Me ester, orange-yellow, m. 137–4°), 4'-Cl deriv., yellow, m. 205° (Me ester, orange-yellow, m. 129–30°), 5'-Cl deriv., orange-yellow, m. 225° (Me ester, m. 141°). Reduction of XII with Fe in AcOH gives the 2'-NH₂ deriv., analyzed as its lactam (XIII) (boiling with HCl), m. 335–17°, 4'-Cl deriv., m. 225° (lactam, m. 321°). Refluxing XII with Ac₂O and CaH₂N for 15 hrs. gives 52.9% VI, the 4'-Cl deriv. behaves similarly, the yield being 36.9%. Reduction of XI with Fe in AcOH (boiling for 10 min.) gives 81.5% of 1-hydroxy-3-(2'-amino)phenyl)-3,4-dihydrophthalazine-2-acetic acid (XIII), m. 160°, with formation of the lactam, m. 291°, which also results on crystn. of the acid, 4'-Cl deriv., m. 214°, lactam, m. 304°, 5'-Cl lactam, m. 303–4°. The action of 1 l. H₂SO₄ on XIII appears to give 2'-amino-3-phenylphthalaz-1-one, although analyses were not satisfactory, 4'-Cl deriv., pale greenish yellow, sublimes slowly at 300–50° (Ac der., pale yellow, m. 139–1°). XI with SnCl₄ and HCl or XIII, refluxed 2 hrs. with 1 l. H₂SO₄, Zn added and again refluxed for 1 hr., gives 47.6 or 63.4% of *o*-benzylbenzimidazole (Thiele and Falk, Ann. 347, 125 (1906)), 5'-Cl deriv., m. 212°, K₂MnO₄ in AcOH transforms the latter into 5-chloro-*o*-benzoylbenzimidazole, yellow, m. 156°, boiling aq. Na₂CO₃ forms 5-chloro-2-phenylbenzimidazole-*o*-carboxylic acid, m. 235°. XI, refluxed with H₂SO₄ (25 cc.) and H₂O (10 cc.) for 2 hrs., gives 97% of 2'-nitro-3-phenylphthalaz-1-one (XIV), yellow, m. 266° (picrate, yellow, m. 214–15°, 4'-Cl deriv., yellow, m. 233°, 45.6% yield). XIV with Me₂SO, in PhNO₂, gives a comp'd which, crystd. from MeOH, analyzes for CaH₂NO₂N, yellow, m. 135°, and from EtOH, CaH₂NO₂N, yellow, m. 150°, the 4'-Cl deriv., yellow, m. 158° and 110°, resp. Both are decomp'd by heat but without formation of 4-keto-1-methoxy-3-(2'-nitrophenyl)-3,4-dihydrophthalazine or its 4'-Cl deriv. XI with Na₂Cr₂O₇ in dil. H₂SO₄, allowed to stand about 12 hrs. at 30°, gives 68.7% of 2'-nitro-3-phenyl-4-methylphthalaz-1-one (XV), greenish yellow, m. 237° (picrate, yellow, m. 217°); 4'-Cl deriv., greenish yellow, m. 237° (picrate, yellow, m. 233°), Me₂SO, in PhNO₂ at 110–20° for 0.75 hr. gave comp'ds which did not show the presence of a reactive CH₃ group. XIII, oxidized as above, yields 80.4% of 2'-amino-3-phenylphthalaz-1-one-4-acetic acid lactam (XVI), m. 302°, 4'-Cl deriv., in 314°. In boiling Na₂S soln XVI yields 61.8% of 2'-amino-3-phenyl-4-methylphthalaz-1-one, pale yellow, m. 218° (Ac der., m. 274°), 4'-Cl deriv., pale yellow, m. 235° (Ac der., m. 296°). Reduction of XV (Zn and dil. H₂SO₄) gives 33.3% of 2-keto-3-(2'-amino)phenyl)-4-methyltetrahydrophthalazine, pale yellow, m. 221°; 4'-Cl deriv., m. 200°.

hrs. It is a level-dyeing orange-yellow acid dye of less tinctorial power than the β -somer and fugitive to light. 4'-Cl deriv., yellow prisms from H₂O (94.8% yield), the 5'-Cl deriv. was obtained only in a resinous condition. 4-dihydrophthalazine-4-nitric acid (XI), yellow needles (AcOEt) or orange-yellow prisms (AcOH), m. 248°. 4'-Cl deriv., orange-yellow, m. 229–30°, 5'-Cl deriv., yellow, m. 211–2°. XI yields a Me ester, yellow, m. 146° (4'-Cl

XIV. Preparation of 1,4-diketo-3-(nitroaryl)tetrahydrophthalazines and 4 keto-1-hydroxy-3-(nitroaryl)-3,4-dihydrophthalazines and related compounds. I. M. Rowe, J. G. Collin and A. T. Peters. *J. Ind. Hyg. & Sanit.* 1928, 11, 111–15. α -ON $_2$ C₁₁H₁₁N₃ and α -CaH₂(CO)₂O in CHCl₃ give 80% of 2-carboxybenzo-4'-nitrophenylhydrazide (I), m. 211–5°; the dil. Na₂CO₃ soln is deep red. If the above reactants are heated to 150° for 10 min. or if I is refluxed for 1 hr. there results 73.2 or 85.9% of phthalyl-4'-nitrophenylhydrazide

(II), very pale yellow, m 248°, pptn from dH_2CO_3 soln with acid gives I. Refluxing II with $\text{EtONa}-\text{EtOH}$ for 18 hrs or the action of KMnO_4 on 1-hydroxy-3-(4'-nitrophenyl)-3,4 dihydrophthalazine-4-acetic acid (III) yields 30.5 or 71.6% of 1,4-diketo-3-(4'-nitrophenyl)-tetrahydrophthalazine (IV), m 307° (C 23, 145). Ag salt, yellow needles. The Ag salt and AgCl in C_6H_6 or boiling III with Ag_2O for 3 min give the 4-keto-1-acetoxy deriv of III, pale yellow, m 232°. Mel and the Ag salt in MeOH , refluxed 0.25 hr, give the 4-keto-1-methoxy deriv of III, m 199°. 3'- NO_2 isomer of I, pale yellow, m 193-4°, 3'- NO_2 isomer of II, pale yellow, m 227-8°; this results in 59% yield on heating the isomer of I in PhNO_2 for 1 hr, together with 19% of 1,4-diketo-3-(3'-nitrophenyl)tetrahydrophthalazine Ag salt, pale yellow; 4-keto-1-acetoxy deriv, m 164°, 4-keto-1-methoxy deriv, m 182°. 2'- NO_2 isomer of I, orange yellow, m 290-4° (99% yield), 2'- NO_2 deriv of II, pale yellow, m 293-4°; the 2'- NO_2 deriv of IV, pale yellow, m 293-4°. Ag salt, yellow needles, 4-keto-1-methoxy deriv, m 176-7°. o-Carboxybenzo-4'-nitro-2'-methylphenylhydrazide, pale yellow, m 219°, phthalyl-4'-nitro-2'-methylphenylhydrazide, m 228°, 1,4-diketo-3-(4'-nitro-2'-methylphenyl)tetrahydrophthalazine, m 271°. Ag salt, yellow needles. 2'-Cl deriv of I, m 270-5°, 2'-Cl deriv of II, m 267°. 2'-Cl deriv of IV, m 271-2°, the 4-keto-1-methoxy deriv, pale yellow, m 193-4°. 2'-Br deriv of I, m 232°. 2'-Br deriv of II, m 282-3°, 2'-Br deriv of IV, m 273-4°. 4-keto-1-methoxy deriv, pale yellow, m 167-8°. 2,6-Dichloro-4-nitrophenylhydrazide, yellow, m 133°, from 2,6,4- $\text{Cl}_2(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{NH}_2$ (BzH deriv, orange, m 153°). 2',6'-di-Cl deriv of I, m 192°. 2',6'-di-Cl deriv of II, m 202°. 2',6'-di-Cl deriv of IV, m 309-10°. 4-keto-1-methoxy deriv, m 178-9°. 2,6-Dibromo-4-nitrophenylhydrazide, pale yellow, turning red at 110° and gradually converted into deep red prisms by heating at 80° or leaving in EtOH for several weeks, both forms m 135-6° (BzH deriv, orange, m 168-9°). 2',6'-Di-Br deriv of I, m 200°. 2',6'-di-Br deriv of II, pale yellow, m 230°. 2',6'-di-Br deriv of IV, pale yellow, m 327-9°. o- $\text{HO}_2\text{CC}_6\text{H}_4\text{CONHNH}_2$, reduced in PhNO_2 for 2 hrs, gives the NaCO_3 insol phthalylphenylhydrazide, m 178-9° (32.3%) and the sol 1,4-diketo-3-phenyltetrahydrophthalazine (V), m 212-13° (43%). The Ag salt of V and EtI in EtOH give 33.3% of 4-keto-1-ethoxy-3-phenyl-3,4-dihydrophthalazine, m 108-9°, the 1 MeO deriv, m 109-11°. C J West

Synthesis of 4-ethyl-6-aminopyrimidine Wm T Caldwell and Wm M Ziegler J Am Chem Soc 58, 78-9 (1936) — Condensation of $\text{MeCH}(\text{OEt})\text{CO}_2\text{Et}$ with ethylpseudourea-HBr, using $\text{MeOH}-\text{KOH}$, gives 80% of 2-ethylmethyl-4-ethyl-6-hydroxypyrimidine, hydrolysis of the latter gives 4-ethyluracil m 204-5°, refluxing 17 g with 70 cc POCl_3 for 1 hr yields 17.5 g of 2,6-di-Cl deriv, b 90-5°, 17 g of this product with III and red P gives 21 g of 4-ethyl-6-hydroxypyrimidine III, yellow, m 170.5-1.5°, 20 g of which yield 9.1 g of 4-ethyl-6-chloropyrimidine (I), b 195°, 8.5 g I and 250 cc satd $\text{EtOH}-\text{NH}_3$, heated at 150° for 4 hrs, give 6.2 g 4-ethyl-6-aminopyrimidine, with 3 mols H_2O , m 45-8°, picric acid, yellow, m 204.5°, HCl salt, m 198-9°, chlorourate, yellow, m 159-1°. C J West

Dioxane series II Aryl substituted dioxanes Synthesis of p-dioxane R K Summerbell and L N Bauer J Am Chem Soc 57, 2264-8 (1935), cf C A 28, 150° — 2,3-Dichloro-1,4-dioxane (I) and PhMgBr give 80% of the 2,3-di-Ph deriv. The following 1,4-dioxanes were similarly prep'd (yields in % of dioxane) 2,3-di-o-tolyl, m 105.7-6.2° (m ps cor) (61%); m-isomer, m 85° (51%) (picric acid, m 91.2°), p-isomer, m 56-7.2° (72%) (picric acid, m 96.5°), bis(p-chlorophenyl), m 152.3° (49%), di-p-anisyl, m 79.80.2° (67%) (picric acid, m 107°), di-o-naphthyl, b 25.80.8° (53%) (picric acid, m 166-7°), di-phenyl, m 144.5-6°, di-benzyl, m 62.2° (22%). I and EtMgBr give principally p-dioxane, $\text{CH}_3\text{CH}(\text{OCH}_3)\text{CH}_2\text{O}$ (II), b 111°, 94.2°, d 1.083, n_D 1.462, a 2nd product may be 2,3-diethylidioxane, b 111°,

164-75°, the gas evolved in the reaction consisted of 48.5% C_2H_4 , 48.2% C_2H_6 and 3.4% C_2H_2 . The chief reaction product of MeMgBr and I is II; BuMgBr also gives II and about an equal quantity of 2,3-diethylidioxane (I), b 120-2°. II and O_3 give HCO_2H and $(\text{CH}_3\text{OH})_2$; II and Cl_2 give 53.4% I. Br gives 92.2% of 2,3-dibromo-1,4-dioxane, m 69-70°, which evolves HBr on exposure to the atm, but yields the 2,3-di Ph deriv. with PhMgBr . II and HCl at 0° give monochloro-p-dioxane, b 62-3°, d 1.276, BiCl_3 is a catalyst for the reaction, it decomposes rapidly in the air, with PhMgBr it yields 49% of monophenyl-p-dioxane, m 46°. C J West

Catalytic chlorination of dioxane J J Kucera and D C Carpenter J Am Chem Soc 57, 2346-7 (1935) — ICl and SnCl_4 are suitable catalysts for the chlorination of dioxane to the 2,3-di Cl deriv, the yield being almost quant. Their use is not adapted to the further chlorination to the tetra-Cl deriv, because of the high temp required for the latter reaction at ordinary pressure; the yields of the sym. tetra-Cl isomers, m 70° and 143°, were 83 and 33%, resp, with or without catalyst. C J W.

Piperazine S Vinaver Khim Farm Prom 1934, No 6, 11-14 — Piperazine is made by decompn with H_2SO_4 of diisobutylisocyanilpiperazine, made by condensation of toluenesulfonylamide and $(\text{CH}_3)_3\text{N}$. For medicinal purposes piperazine acid tartrate is used in preference to piperazine. L Nasarevich

Derivatives of piperazine VIII Condensation with aldehydes W T Forsee, Jr, and C B Pollard J Am Chem Soc 57, 2363-4 (1935), cf C A 29, 7990° — Aldehydes react with piperazine (I) or N-mono-substituted piperazines so that 1 mol aldehyd. reacts with 2 NH_2 groups, with the elimination of 1 mol H_2O . I and HCHO or CH_3CHO give methylenepiperazine in 97 and 98% yields, m. above 300°; BzH or PhCH_2CHO gives benzylidene-piperazine in 98 and 46% yields, resp, m 270° (decompn), o-HO deriv, m 210° (decompn), 44%, p-Me deriv, m 275° (decompn), 90%, o-Cl deriv, m 240° (decompn), 95%, p-MeO deriv, m 290° (decompn), 85%. The N-Ph deriv of I and HCHO or CH_3CHO give N-bis(N'-phenylpiperazyl)methane, m 123-4°, 79 and 24% yields, resp. The ethane, m 121-3°, 25%, the phenylmethane m 125-6°, 90%; the o-methylphenylmethane, m 144-5° 83%; the o-methoxyphenylmethane, m 135-6°, 67%. All the condensation products are readily decomd by acids. The compds from the N-Ph deriv of I are readily crystd. C J West

Quinoxaline VII The interaction of 2,4-dichloroquinoxaline in alcohol with ammonia and with methylamine Edw Vopicka and N A Lange J Am Chem Soc 57, 1068-70 (1935), cf C A 27, 2957° — 2,4-Dichloroquinoxaline (I) (2 g) and 20 cc $\text{EtOH}-\text{NH}_3$, heated 2 hrs at 150°, give 0.7 g of the 2,4-di-NH₂ deriv, m 230° (all m ps cor), HCl salt, m 308°, sulfate, m 359°; acetate, with 1 mol H_2O , m 208°, nitrate, m 280°, oxalate, m 274°, picrate, yellow, m 304° (decompn), di-Ac deriv, m 230° I (3.5 g) and 35 cc $\text{EtOH}-\text{MeNH}_2$ give 2 g of the 2,4-bis(methylamino) deriv, m 120°, HCl salt, m 312°, picrate, m 232°. C J West

The reduction products resulting from the condensation of sugars and aromatic amines P Karrer, H Salomon, R Kunz and A Seebach Helv Chim Acta 18, 1338-42 (1935) — A report of the prep'n and properties of several substances prep'd in connection with the flavin synthesis (C A 30, 4689°) The sugar, in H_2O or MeOH , is added to the amine in alc, the soln heated 2 hrs, evap'd to dryness in vacuo, the residue washed twice with ether, dissolved in MeOH and reduced at 100° with Ni catalyst at 20-25 atm H_2 , or at 30-60° with Pd on charcoal. The product is obtained in 60-90% yield on tcn of the soln PhNH_2 and d-glucose (I) yield N-phenyl-d-glucamine, m 134°. The monobenzal deriv (II), needles, m 197-8°, is assigned the probable structure $\text{PhNHCH}_2[\text{CH}(\text{OH})]_4\text{CH}_2\text{CH}_2\text{OCHPh}$ Acetylation of II in pyridine with

Ac_2O yields a triacetate, m 118-19°. p-MeC₆H₄NH₂ and I yield N-p-tolyl-d-glucamine, m 123°. p-C₆H₄OC₆H₄NH₂ and I give N-p-ethoxyphenyl-d-glucamine, m 123°.

N-*p*-Hydroxyphenyl-*d*-glucamine, m. 163° after repeated recryst. from MeOH, was obtained from *p*-HOC₆H₄NH₂ and I and I and *p*-HOC₆H₄C₆H₄NH₂ yield *N*-*p*-hydroxyphenylethyl-*d*-glucamine (III), isolated as the HCl salt which melts 206° and m 208° (decompn). Reduction of CH₃OH[CH(OH)]₄CH₂NEt, m 116°, obtained by Irvine (C A 7, 1709), yields *N*-ethyl-*d*-glucamine (IV) isolated as the HCl salt, m 134°. Full details are given for the isolation of III and IV which are more difficult to obtain than the other compds described. III and IV have but little pharmacol activity. W Gordon Rose.

Flavin syntheses VIII Synthesis of 6-methyl-9-(*d*-1'-ribityl)isalloxazine and further synthetic experiments in the flavin series. P. Karrer and F. M. Stronza, *Helv. Chim. Acta* 18, 1443-51 (1935). To continue the study of the relation between chem. constitution and phys. activity of the flavins, 6-methyl-9-(*d*-1'-ribityl)-isalloxazine (I), which differs in the position of the Me group on the benzene ring from that described in C A 29, 6490, was prep'd by the following steps: Nitration of *m*-cresol (250 g) gave 4-nitro-3-hydroxytoluene (78 g) which on alkylation by C₆H₅N₃O₂ gave 4-nitro-3-methoxytoluene (yield 94.7%). This compd was heated with NH₄OH and Cu₂O at 140° to prep 4-nitro-3-aminotoluene (yield 14%), which with ClCO₂Et gave 4-nitro-3-carbethoxyaminotoluene, C₈H₇N₃O₄, m 51.2° (yield 69.1%). On reduction by Pt and H₂ this gave 4-amino-3-carbethoxyaminotoluene, C₈H₉N₃O₄, m 120° (yield 85.3%). Reductive condensation of this compd with *D*-ribose gave 3-carbethoxyamino-4-methylphenyl-*d*-ribamine, C₁₃H₁₅N₃O₆, m 153° (yield 61.5%), 3.8 g of which on hydrolysis by KOH and condensation with alloxan in the presence of H₂BO₃ (cf. Kuhn and Weygand, C A 29, 6237) gave I, C₁₈H₁₇N₃O₆, m 292°, [α]_D²⁰ = +84.6° = 5 (0.6 g). The phys. action of I in daily doses of 10-20 γ was comparable to that of vitamin B₂. In an attempt to prep 3,7-dimethyl-9-(*d*-1'-ribityl)isalloxazine the following syntheses were made: Nitration of 2,4-Me₂C₆H₃NHAc by an improved method gave 2,4-dimethyl-6-nitroacetamide, m 176.5° (yield 60-65%), in addition to an unidentified compd, C₈H₉N₃O₄, m 73°, probably 2,4-dimethyl-6-nitrophenol. Hydrolysis by 80% H₂SO₄ converted the nitroacetamide to 2,4-dimethyl-6-nitroaniline, yield (60-65%). Because of steric hindrance this with ClCO₂Et did not give the desired compd, 2,4-dimethyl-6-nitrocarbethoxyaniline (II). However, by condensation of 2,4-Me₂C₆H₃NH₂ with ClCO₂Et, 1, 2,4-dimethylphenylcarbamate, m 63°, was obtained (yield 90.5%), and thus on nitration gave II, m 135° (yield 83%). Catalytic reduction of II yielded 2,4-dimethyl-6-amino-1-carbethoxyaniline, C₁₃H₁₅N₃O₄, m 99.5° (yield, 77.4%). Reductive condensation with *D*-ribose gave 2-carbethoxyamino-3,7-dimethylphenyl-*d*-ribamine, C₁₈H₁₇N₃O₆, m 139° (yield 69.5%). The further steps to the flavin were unsuccessful, since alk. hydrolysis yielded chiefly 1-*d*-ribityl-2-hydroxy-4-β-dimethylbenzimidazole, C₁₈H₁₇N₃O₄, m 248°. W F Bruce.

Synthesis of lactoflavin P. Karrer, B. Becker, F. Benz, P. Ifer, H. Salomon and K. Schöpp, *Helv. Chim. Acta* 18, 1435-48 (1935). cf. Kuhn et al. C A 30, 464. — Kuhn's synthesis of flavins is unsatisfactory because of low yield. The prep'n of *D*-ribose and lactoflavin is given in detail. From 1 kg of Ca gluconate, 175 g of pure *D*-arabinose was obtained (cf. Hockett and Hudson, C A 28, 5047). From 3 kg of *D*-arabinose, 270 g of *D*-ribose was prep'd. An improved synthesis of lactoflavin is given. 1 kg of *o*-xylene gave 250 g of 3,4-dimethyl-1-nitrobenzene, b. 123.30°. From 60 g of this product 43 g of 3,4-dimethylaniline, m 49°, was prep'd and from 30 g of the latter, 45 g of 3,4-dimethyl-6-aminocarbethoxyaminobenzene. From this 45 g of 3,4-dimethyl-6-nitrocarbethoxyaminobenzene, m 54°, was prep'd, from which 3,4-dimethyl-6-aminocarbethoxyaminobenzene, m 111°, was secured. By reductive condensation of the latter (7 g) with *D*-ribose (5 g), 4,5-dimethyl-2-carbethoxyaminophenyl-*d*-ribamine, m 170° (9 g), was prep'd. From the ribamine by hydrolysis with KOH and condensation with alloxan was obtained after purification by adsorption 1.8 g. of lactoflavin. W F Bruce.

Thiochrome. Richard Kuhn and Hellmuth Vetter, *Ber.* 68B, 2375-85 (1935), cf. C A 29, 6242. — Vitamin B₂ (I) was dehydrated to thiochrome (II) in strongly alk. soln. by the action of porphorexide, a reduction-oxidation indicator, or by K₂Fe(CN)₆. The conditions for this reaction lead to the conclusion that a pseudo base is first formed. II does not have the phys. activity of I. The max. fluorescence of II in 0.01 N NaOH is in the region 460-470 mμ. Fluorescence is visible in dilns of 0.5 mg per l. Graphs show the relation of fluorescence to diln, pH and thickness of the layer observed. Comparison of II from I and from yeast showed complete identity. By hydrogenation of II in H₂O or 0.1 N HCl 2 mols. of H₂ were absorbed and a soln. with an absorption spectrum in part identical with that of I resulted. Detn. of C-Me showed that Me was not involved in the ring closure of I to give II. The detn. of MeNH is shown frequently to be unreliable. II gave a neg. van Slyke test. Its fluorescence was destroyed by 1 hr. boiling with 2 N NaOH after which NaS was demonstrated and extn. with CHCl₃ gave a blue fluorescent S-free substance. W F Bruce.

Thiochrome from vitamin B₂ (antixerin). G. Barger, F. Bergel and A. R. Todd, *Ber.* 68B, 2257-62 (1935), cf. Kuhn, C A 29, 6242. Barger, C A 29, 7329. — Conversion of vitamin B₂ (I) to thiochrome (II) by oxidation with alk. K₂Fe(CN)₆ was accomplished in 30-40% yield. The HCl salt of II, C₁₀H₇N₂O₂·2HCl, was catalytically hydrogenated in MeOH-HCl to yield a hygroscopic substance which does not fluoresce or yield I on oxidation. By concd. HCl at 100° I was deaminated but II was not altered. W F Bruce.

Sinomenine XLII *d*- and *l*-Bromothebenone. Kakui Goto, Hiroshi Ogawa and Jun Saito, *Bull. Chem. Soc. Japan* 10, 481-5 (1935), cf. C A 25, 3002; 29, 6238. — Direct bromination of thebenone gave a mixt. which could not be sep'd. In prep. the bromothebenones by indirect methods it was shown that demethoxysinomenone and thebanone and their corresponding derivs. are optical isomers and that when they are mixed they form optically inactive racemates. A soln. of 1.1 g. dihydrodes-*N*-methyl-demethoxydihydro-sinomenone in 5 cc. AcOH was brominated with 0.55 g. Br₂ in 10 cc. AcOH at 16° to give *d*-9,10-dihydrodes-*N*-methyl-1-bromodihydrothebenone (I), C₁₁H₁₁NO₂Br, m 192°, [α]_D²⁰ 61.60°. *l*-I, m 257° (decompn.); methiodide, m 273°. *l*-I, m 192°, [α]_D²⁰ -62.67°, was prep'd from the thebanone deriv. in the same manner. *l*-I-*l*-I, m 257° (decompn.); *l*-I-Mel, m 273°. Equal parts of *d*-I and *l*-I were recryst'd from MeOH to give *d*-I, m. 175-7°. *d*-I-Mel (1.5 g) was boiled 20 min. with 10 cc. 25% KOH to give *l*-1-bromothebenone (II), C₁₁H₉O₂Br, m 70°, [α]_D²⁰ -22.67°. *d*-II, m 70°, [α]_D²⁰ 23.33°, was prep'd similarly from *l*-I-Mel. *d*-II, m 191-3°. *l*-Bromodemethoxydihydro-sinomenone-Mel (3 g) was boiled with 15 cc. of 15% NaOH for 12 min., did with 8 cc. H₂O and pptd. with CO₂ to give *l*-des-*N*-methyl-1-bromodihydrothebenone (III), C₁₀H₉NO₂Br, m 200-1°, [α]_D²⁰ -8.67°. methiodide, m 241° (decompn.). *d*-III, m 199°, [α]_D²⁰ 8.90°, was prep'd in the same way from the corresponding thebanone deriv. *d*-III-Mel, m 241°, *d*-III, m 189-92°. *l*-III-Mel (2.5 g) was refluxed 40 min. in 30 cc. of 11% NaOH

and acidified to give *l*-1-bromo-9,10-dihydrothebenone (IV), C₁₀H₉O₂Br, m. 145°, [α]_D²⁰ -18.80°. *d*-IV, m 148-50°, [α]_D²⁰ 187.33°, was prep'd in the same way from *d*-III-Mel. *d*-IV, m 159-62°. When 1.8 g. *l*-dehydrothebenone in 10 cc. AcOH was brominated with 1.1 g. Br₂ in 5 cc. AcOH, using ice, 1 g. of a mono-Br deriv. was obtained.

This was probably 1-(10¹⁰) bromo-9,10-dehydrothebenone (V), m 125-33°, $[\alpha]_D^{25}$ -113.33°. Bromination of d-dehydrothebenone gave d-V, m 127-30°, $[\alpha]_D^{25}$ 112.67°, d-I, m 156-8°.

John F. Milberry

Alkaloids from seeds of Cassia absus, Linn. Salimuzzaman Siddiqui and Zafaruddin Ahmed *Proc Indian Acad Sci* 2A, 421 5(1935)—The small seeds of the indigenous annual, *Chakras*, contains a kernel used in the treatment of ophthalmia and skin affections and as a cathartic. The 2 bases, *chaksine* (I) and *isochaksine* (II), have been isolated as carbonates in a total amt of 1.5% of the kernel. Dil aq solns of the H_2SO_4 salt of I are general depressants of the heart, respiration and nerves, 0.1 g per kg being lethal to frogs. Percolation of 3.6 g of powd kernel with cold 0.3% MeOH, neutralization with NH_4OH , acidification, removal of the alc and extrn with Li_2O gave a residual sirup. The soln of the residue in 2 l of acidulated H_2O was treated with 50 g of KI and, on working up, yielded 46 g of *chaksine iodide* (III) and about 5 g of *isochaksine iodide* (IV). A soln of 5.3 g of III in 50 cc of hot alc was treated with the freshly pptd Ag_2O from 4.5 g of $AgNO_3$. The mixt. was filtered and dried with 200 cc of Li_2O and 50 cc of petroleum ether. The colorless Ag free filtrates obtained were evapd in an open dish and produced hydrated *chaksine bicarbonate* (V), m 167.9°. I could not be isolated except as an impure product, $[\alpha]_D^{25}$ 32° (abs alc), but the following salts were isolated: *iodide*, $C_{17}H_{19}N_3O_4$, m 168° (decompn), *sulfate*, m 316° (decompn), *picrate*, m 239-40° (decompn), *chloroplatinate*, m 232° (decompn). Treatment of alc IV with freshly pptd Ag_2O and purification of the filtrate with Li_2O and petroleum ether gave II as a cream-colored hygroscopic sirup converted by CO_2 to *isochaksine carbonate*, sintering at 108° and decompn at 128°. Addn of ethereal HCl to II in abs alc and Li_2O formed *isochaksine chloride*, $C_{17}H_{19}ClN_3O_4$, m 250-2° (decompn). I gave a *picrate*, m 184°, and a *chloroplatinate*, m 172° (decompn). I is partially isomerized when liberated from its iodide and is completely converted into II by treatment of its sulfate with $Ba(OH)_2$. The formation of the picrate of II from the alc- Me_2CO sol iodide after the sepn of the iodide of I, showed that II is present in the seeds and is not formed by isomerization during the isolation process.

C R Addinall

Cactus alkaloids XV Separation of the anhalonium bases. Ernst Späth and Friedrich Becke *Monatsh* 66, 327-36(1935), c f C A 29, 7989¹—*Anhalonium lewisii* (1330 g) was extrd with $EtOH$ at 15-20° and the aq soln of the sirup from the evapd ext was treated with 2% HCl , the filtrate made alk and extrd with Et_2O , the soln finally extrd with 50% KOH . The Et_2O soln of the nonphenolic bases (2.83 g) on treatment with alc H_2SO_4 gave mesaline sulfate (I) (0.97 g), the filtrate, made alk, yielded 0.4 g anhalonium (as the HCl salt) and 0.09 g anhalimine (I Me ether) as the HCl salt, a further quantity of I (0.194 g) was isolated from the filtrate and also 0.04 g lophophorine picrate. Details are also given of the sepn of the phenolic bases, including anhalamine, anhalonidine, pellettine and anhalidine. Formulas of the compds are given.

C J West

Conessine series I Isomerization of conessine and its nor bases. Salimuzzaman Siddiqui *Proc Indian Acad Sci* 2A, 426-37(1935), c f C A 29, 2960¹—The alkaloids of *Holarrhena antidysenterica* all bear a simple relation to conessine (I), $C_{17}H_{19}N_3O_4$. A study has been made of the isomerization of I and its nor bases, *isocossamine* (II), $C_{17}H_{19}N_3O_4$, and *conamine* (III), $C_{17}H_{19}N_3O_4$, by the action of cold concd H_2SO_4 . The gradual addn of 50 g of I to 150 g of ice-cooled concd H_2SO_4 gave a bright yellow soln which began to evolve SO_2 and deepen in color to red. The soln was added slowly to 2 kg of crushed ice and the cold mixt was made alk with $NaOH$. The liberated base was extrd with Et_2O , shaken out with $AcOH$ and treated with concd KI soln. The cold turbid mixt yielded 5 g of *hydrindole*, m 325-6°, together with oxidation products of I. Neutralization of an $AcOH$ soln of the hydrindole with $NaOH$ yielded a light straw-colored sirup of *isocossamine* (IV), $C_{17}H_{19}N_3O_4$,

m 239-41°, $[\alpha]_D^{25}$ 97° (1% abs. alc. soln), dissolving in concd H_2SO_4 to a bright yellow soln changed to dark blue and, finally, to bright violet on the addn of H_2O , *HCl salt*, m 318° (decompn), $[\alpha]_D^{25}$ 72° (1% aq soln), *chloroplatinate*, m 271-3°, *chloraurate*, m 293.5° (decompn), *picrate*, 240-2° (decompn), *II Br salt*, (V) m 318-22° (decompn), *di-Mel deriv*, m 316-8° (decompn). Titration of $CHCl_3$ solns of IV with Br gave V by elimination of HBr from the initial addn product and its combination with IV. The presence of a single ethylene linkage in the isocossamine series was established by titration of the di-Ac deriv. of isocossamine with Br in $CHCl_3$ and the formation of a di- Br compd, m 185-0 (decompn). The isomerization of I to IV by concd H_2SO_4 is followed by slow oxidation. A similar isomerization of II gave *isocossamine* (VI), $C_{17}H_{19}N_3O_4$, as a straw-colored sirup, $[\alpha]_D^{25}$ 101° (1% abs alc soln), *III salt*, m 280° (decompn), *HCl salt*, m 335° (decompn), $[\alpha]_D^{25}$ 72.80° (1% aq soln), *picrate*, m 166°, *chloroplatinate*, m 290-2° (decompn). By refluxing with a mixt of HCO_2H (1.5 mols) and $HCHO$ (1.5 mols) and treating the product with H_2O , VI was transformed to IV. VI was converted into a *nitroso base*, *HCl salt*, $C_{17}H_{19}N_3O_4$, m 282-4°. The isomer of II was named "isocossamine" to avoid confusion in the nomenclature of conessamine and II and the name "norisocossamine" has been reserved for the isomer of conessamine. The isomerization of III gave *isocossamine* (VII), $C_{17}H_{19}N_3O_4$, $[\alpha]_D^{25}$ 89° (1% abs alc soln), *III salt*, m 332° (decompn), *HCl salt*, m 335-6° (decompn), *picrate*, m 135°, *chloroplatinate*, m 285-6° (decompn), *diminor deriv*, $C_{17}H_{19}N_3O_4$, m 123.5°, *di-Ac deriv*, m 190-1°. Methylation of VII by refluxing with 0.5 g of the base in a min of HCO_2H with 2.5 mols of $HCHO$ for 1 hr gave IV. The optical activity of the isomers of the conessine series is about three times as pronounced in the pos. direction as that of the corresponding conessine bases. IV is also 3 times more potent than I in its action on the respiration of frogs and this potency may enhance the therapeutic value of the holarrhena alkaloids since IV may prove to be a potent aid in the treatment of amebic dysentery. C R Addinall

Reduction studies in the morphine series VII. Pseudocodone. Robert E Lutz and Lyndon Small *J Am Chem Soc* 57, 2651-6(1935), c f C A 29, 1829¹—Pseudocodone (Knorr and Hörlein, *C A*, 1, 2125) (10-15% yields) forms a *HCl salt*, (I), with 1 mol of H_2O , m 201.3° (decompn) (all m ps cor), $[\alpha]_D^{25}$ -24° (H_2O , c 1), *semicarbazosemicarbazone*, with 1 mol H_2O , m 225-7° (decompn). Catalytic reduction of I in $AcOH$ with Pt oxide gives 46% of the *dihydro deriv* (II) and 34% of the *tetrahydro deriv*, (III). II m 113°, $[\alpha]_D^{25}$ 37° ($EtOH$, c 0.62), *HCl salt*, with 1 mol H_2O , m 172-3°, $[\alpha]_D^{25}$ 13° (H_2O , c 0.65), *III salt*, m 250-5° (decompn), $[\alpha]_D^{25}$ 8.1° (H_2O , c 0.91), *oxime*, m 244-5°. Reduction of II with Na in $EtOH$ gives 78% of *dihydro-pseudocodone-A*. Heating II in Ac_2O - $AcONa$ for 3 hrs at 100° gives a nearly quant yield of *des-N-acetyl-dihydro-pseudocodone enol acetate*, m 191.5-2°. III, with 0.5 mol H_2O , m 137-8.5° (anhyd, m 170-1°), $[\alpha]_D^{25}$ 8° ($EtOH$, c 0.55), it does not react with CH_3N_3 , Ac_2O in CH_3N_3 at 100° gives a *mono-Ac deriv*, glassy, *oxime*, m 218-9°, *HCl salt*, with 2 mols H_2O , m 165-6°, $[\alpha]_D^{25}$ -6.2° (H_2O , c 1.20), *III salt*, with 1 mol H_2O , m 151-5°, $[\alpha]_D^{25}$ -5.9° (H_2O , c 0.85). Reduction of either I or III with Na in $EtOH$ (N atm) gives 62% of *tetrahydro-pseudocodone*, Na - II in $AcOH$ gives the same compd. Demethylation of 4.5 g of II yields 2.45 g of *dihydro-morphine*, m 198° $[\alpha]_D^{25}$ 46° ($EtOH$, c 0.44). I (12 g) and $MeMgI$ in Et_2O give 3.3 g of *methyl-dihydro-pseudocodone*, m 213.5-14.5°, which shows no reaction of a CO group or of a double bond. Comparison of the physiol action of *dihydro-pseudocodone* and *dihydro-morphine* with that of *codeine* and *dilaudid* and that of the *codeine* and *morphine* isomers indicates that morphine derivs with the functional group at C-4 are more effective than those with the same group at C-3 but that spatial relationships are also very important.

Styrene and brucine XXXV. Hofmann degradation of dihydrobrucine O Achmatowicz, P. Lewi and Robert Robinson *J. Chem. Soc.* 1935, 1855-54, cf. *C. A.* 29, 7991. *N*(b)-Methylidihydrobrucine iodide and 20% excess Ag_2CO_3 , heated 20 hrs. at 100°, give the carbene (I), amorphous, deep red, hygroscopic solid, *N*(a), *N*(b)-dimethylidihydrobrucine disulfonate (II), with 16 mols H_2O , m 190-2° (decompn) with III both I and II lose CO_2 and yield the iodides Thermal decompn of I yields 15% of dihydrobrucine and 5% of *N*(b)-methylidihydrobrucine-A (III). Heating 200 g II over a free flame in lots of 1-2 g gives the following products: 45 g III; 34 g dihydrobrucine, 19 g of *N*(b)-methylidihydrobrucine iodide (IV); 17 g dihydrobrucine-2 methiodide, with 1 mol CHCl_3 , the final fraction (12 g of a gum) probably consists largely of IV. III (methyl-4-dihydrobrucine of part V) in 221.2°, sol in concd LiOH 1.2%, in boiling FIOH 1.65, sol in 40% HCl give a green color with FeCl_3 , changing to pale yellow on warming or standing. III was not reduced electrolytically or catalytically. With MeI at 50° (2) there results a dimethiodide, with 4 mols H_2O , of which 2 are lost at 130°, m 294-6° (decompn), with MeSO_2 , III gives a very methide, converted to the MeI deriv with an NaI , dimethiodide, with 3 mols H_2O , m 206-8°, 2 mols H_2O are lost at 105°, the anhyd salt is very hygroscopic. Refluxing III with MeI gives an isomeric dihydrobrucine, with 3 mols H_2O , m 145-6° (decompn), 1 mol of H_2O are lost at 105°, dimethiodide, with 4 mols H_2O and 3 mols of MeOH , m 202-4° (decompn), with MeONa-MeOH this yields 90% of *N*(b), *N*(b)-dimethylidihydrobrucine, m 165-6°. Catalytic reduction of III in AcOH and the action of Na on the acetates formed gives *N*(b)-methylidihydrobrucine- δ iodide (V) and the ϵ -isomer (VI). V m 317-18°, of 2 mols of H_2O 1 is not lost at 270° and 1 mm; crystals from BuOH give a product with 1 mol H_2O , the chloride, deep red, with 3 mols H_2O (2 of which are lost at 105°), m 204-6°, with MeOH-MeONa it yields III. V decomposes on heating before any MeCl is split off, VI, with 2.5 mols H_2O (1 mol retained at 105°), m 204-8° (decompn); chloride, pink, with 2.5 mols H_2O , m 273-5°; on heating extensive decompn occurs and dihydrobrucine- ϵ was not formed. This chloride is resistant to boiling MeOH-MeONa but yields III on heating 0.5 hr. at 120-5°. Hydroxymethylidihydrobrucine (VII), pale yellow, m 160-1°, is recovered unchanged after refluxing with MeI and is indifferent towards BuLi . *Ac der*, prepd in the cold, m 258-60°, it is simply saponified by MeOH-MeONa , but on heating dihydrobrucine is formed. VII with MeSO_2 and 40% NaOH gives *methoxybrucine methoxybrucine methoxide*, which yielded an iodide, m 166-7° (part V). VII is not attacked by boiling 10% H_2SO_4 in 3 hrs but with 25% acid about 10% of the base is converted into methylidihydrobrucine. II sulfate. *N*(b)-Methylidihydrobrucine- δ dione- δ - MeI saps with 1 mol CHCl_3 , which is replaced by 2 MeOH on crys, from this solvent, *methochloride*, reddish brown, amorphous, m 165-70°, solidifies and then m 216-8° (decompn). *N*(b)-methylidihydrobrucine- δ is formed, this base gives a green color with FeCl_3 ; it combines with MeI in the cold, on catalytic reduction it absorbs 2 H. On heating dihydrobrucine- MeCl or MeSO_2 with MeONa-MeOH in an open flask, there results dihydrobrucine and III. J. W. Lupine alkaloids. VIII. C. R. Clemm, W. Mc G. Morgan and R. Raper. *J. Chem. Soc.* 1935, 1743-6, cf. *C. A.* 27, 4235. The following excerpts were carried out in an attempt to synthesize norlupine. Catalytic reduction of *El pyridyl-2-acetate-3- β -propanolate*, b 52°, *picrolone*, m 141° (*picrate*, yellow, m 84°); $\text{BrCH}_2\text{CO}_2\text{Et}$ and the ester in Me_2CO , refluxed 6 hrs, give *El pyridinium-1-acetate-2- β -propanolate bromide*, m 163°. The Diels-Alder reaction of *El pyridyl-1-acetate-2- β -propanolate*, b 135-40°, the Diels-Alder reaction yields *3-ketobidihydroxyproline*, b 74-76° (*picrate*, yellow, m 145°), Clemmensen reduction

gives norlupine (octahydroproline A), b 74-76°. *El pyridyl-2-acetate*, pale greenish yellow oil, b 134-5°. (*picrate*, yellow, m 130-7°), *El pyridyl-2-acetate*, b 130-5° (*picrate*, m 125°), *El pyridyl-2-acetate-1-methoxypropanolate*, b 135-40°, *3-keto-2-methylidihydroxyproline*, b 67-9° (*picrate*, yellow, m 162°); *3-hydroxy-2-methylidihydroxyproline*, b 100-5° (*picrate*, m 157°), *picrolonate*, orange-yellow, m 181°. With NaOH reduction gives *2-methylidihydroxyproline*, b 32-5° (*picrate*, yellow, m 167°, *picrolonate*, light brown, m 208°).

C. J. West

Quinoid oxidation products in the brassin series. Paul Pfeiffer and Paul Schneider *Z. prakt. Chem.* 144, 53-62 (1935).—One of the formulas (I) proposed by Pfeiffer and Robinson (*C. A.* 2, 2064) is substantiated by the following work. Oxidation of 120 g trimethyldeoxybrassin gives principally trimethylbrassinolone but also 4.2 g of II, red with beautiful surface luster, m 241°, sol in concd H_2SO_4 with a deep pure blue color changing to deep violet, EtOH-KOH gives a green and then a violet soln, aq alkali give reddish brown solns, while NH_4OH gives a gray violet soln. II also results from the oxidation of trimethylidihydrobrassin. Oxidation of II with 33% H_2O_2 in MeOH-KOH yields 2,4-HO(MeO) $\text{C}_6\text{H}_3\text{CO}_2\text{H}$. II with AcO-AcONa yields a yellow *Ac der*, m 158-60°. The sol in concd H_2SO_4 with a marine-blue color, quickly changing to violet. Reductive acetylation of II yields a *tri-Ac der*, m 129°, giving a light orange color in concd H_2SO_4 , slowly changing to violet, acid hydrolysis gives II. The oxime of II, violet powder which could not be crystd. Bromotrimethyldeoxybrassin is likewise oxidized by CrO_3 in AcOH to a quinoid compd, $\text{C}_{20}\text{H}_{20}\text{Br}$, orange, m 218°, *Ac der*, light yellow, m 208-10°. (With H. Koles) 2-Phenylindan-1-one yields an *Ac der*, m 103-10°.

Androsterone and related sterols Russell E. Marker, Frank C. Whitmore and Oliver Kamm. *J. Am. Chem. Soc.* 57, 2355-60 (1935); cf. *C. A.* 29, 7342. —Reduction of cholesteryl chloride, the action of PCl_5 on cholesteryl chloride, or the action of SOCl_2 upon β -cholestanol gives β -cholesteryl chloride (I), m 112°, the action of PCl_5 on β -cholestanol or the action of SOCl_2 upon epicholestanol gives the β -isomer (II), m 102-3°. Hydrolysis of I gives epicholestanol, while II gives β -cholestanol. Oxidation of I with CrO_3 in AcOH gives α -chloroandrosterone (III), semicarbazone, m 279-81° (decompn), and α -chlorocholane, m 174-5°. Hydrolysis of III with AcOH yields α -androsterone.

Sex hormones VIII Preparation of testosterone by means of mixed esters L. Ruzicka, A. Wettstein and H. Kägi. *Helv. Chem. Acta* 18, 1478-82 (1935); cf. *C. A.* 30, 493. *trans*-Androstene-3,17-diol 3-monoacetate in CH_2Cl_2 treated with BrCl gave Δ^4 -*trans*-androsterone-3,17-diol 3-acetate 17-acetate (II), m 183-25. I partially saponified with aq KOH gave Δ^4 -*trans*-androsterone-3,17-diol 17-benzoate (II), m 120.5-22°. This method gave much better yields of the half ester than the one previously described. II is isomated, oxidized and debrominated in the usual manner gave Δ^4 -*trans*-androsterone-3,17-diol 17-benzoate (testosterone benzoate) (III), m 194-6°. III on sapon gave testosterone IX Δ^4 -*trans*-Dehydroandrosterone and the preparation of Δ^4 -*trans*-Dehydroandrosterone from stigmasterol, L. Ruzicka, W. Fischer and J. Meyer. *Helv.* 1863-7. Δ^4 -*trans*-Androstene-3,17-diol-17-one in abs. Et_2O treated with a satd. soln of HCl

in abs EtOH gave the chloride (I), m 156-7°. I dehalogenated gave Δ^{14} -trans-dehydroandrosten-3-ol-17-one, m 128-5-30°. Stigmasteryl acetate (II), brominated, oxidized and debrominated, gave Δ^{14} -trans-dehydroandrosterone, m 145° (semicarbazone, m about 270°). Stigmasteryl, treated with HCl, gave the chloride (III), m 152-3° III, treated with AcO, gave the chloride of II, m 183-3-5° II, treated with HBr, gave the bromide, m 160-5-61° X Preparation of 17 methyltestosterone and other androstene and androstane derivatives Relationship between chemical constitution and male hormone activity L Ruzicka, M W Goldberg and H R Rosenberg *Ibid* 1487-98—The relative hormone activity of 20 related compds of testosterone and androstene are given Testosterone was converted to 17-methyltestosterone, m 163-4°, by treatment with MeMgI. The following were likewise prepd 17-Methyl- and 17-ethylandrostan-3-on-17-ol, resp, m 192-3° and 137 8°; Δ^{14} -17-methyl- and Δ^{14} -ethyl-trans-androstene-3,17-diol, resp, m 204° and 173°, 17-methyl- and 17-ethyl-trans-androstane-3,17-diol, resp, m 282-3° and 211°; 17-ethyl-cis androstane-3,17-diol, m 143-4°.

The physical and chemical properties of biosterol and its physiological significance IX Condensation of biosterol with maleic anhydride and citraconic anhydride 2 Juro Nakamiya *Bull Inst Phys-Chem Research* (Tokyo) 14, 584-607 (1935). (Abstracts in English) published with *Sci Papers Inst Phys-Chem Research* (Tokyo) Nos 577-9), cf C A 28, 5107°—The non-condensing part of biosterol (I) from Ischnagi (*Stereolepis ischnagi*) liver oil and citraconic anhydride gives a new satd hydrocarbon, *israconane*, $C_{28}H_{48}$, m 65° From the condensing part, a new cryst addn product, *biosterol-citraconic acid*, rhombic plates or cubes, $C_{48}H_{76}O_8$, m 207°, is obtained, *perhydro deriv*, $C_{28}H_{48}O_4$, m 65-6°, bromide, $C_{28}H_{48}O_4Br_2$, m 186-8°, HCl salt, $C_{28}H_{48}O_4HCl$ The crude condensation product of I and maleic anhydride (II), brominated and fractionally pptd by MeOH from the $CHCl_3$ soln, gives the following fractions white powder, m 247-5°, Br 33-5%, light yellow powder, $C_{28}H_{48}O_4Br_2$, m 230°, Br 42-3%, lemon-yellow powder, $C_{28}H_{48}O_4Br_2$, m 215°, Br 42-3%, and yellow powder, m 160-70°, Br 45% A cryst addn product, $C_{28}H_{48}O_4$, m 247°, obtained by condensing I and II, is, on heating in pyridine with AcCl, transformed into its isomer, m 227°, no Ac deriv being obtained K Konda

The differentiation of sterols from other alcohols of the polyterpene series and the structure of lanosterol and onoceryl H Schulze *Z physiol Chem* 238, 35-63 (1936)—A no of mono and polyhydric polyterpene alcs have been classed with the sterols because they give the same color reactions and have similar empirical formulas They differ, however, from the sterols in certain properties, especially their non precipitability with digitonin A further distinction is the nature of the product obtained by Se dehydrogenation The sterols, characterized by their cyclopentenophenanthrene structure, yield the diels hydrocarbon $C_{25}H_{40}$, whereas the polyterpene alcs yield a trimethylphenanthrene $C_{25}H_{40}$ or a tetramethylphenanthrene $C_{25}H_{40}$ This dehydrogenation reaction was applied to lanosterol, the main constituent of "ischo-cholesterol," and to onoceryl, a polyterpene alc extd from the roots of *Ononis spinosa* Isocholesterol was heated with Se 49 hrs at 335° until evolution of H_2 Se had ceased, the reaction mixt extd with FeO and the ext fractionated at 15 mm The higher fractions distg at 200-280° yielded crystals of 1,2,8-trimethylphenanthrene, m 142-3° (*picrate*, m 164-5°) Oxidation of the hydrocarbon by CrO_3 in AcOH gave the *quinone*, m 196-7°, which was condensed with o - $C_6H_4(NH_2)_2$ to the *quinoxaline*, m 130-1° An addl hydrocarbon, m 212-3°, was obtained from the highest fraction but was not identified Dehydrogenation of ischolesterol with Pt at 300° was unsuccessful, the original substance being recovered unchanged Onoceryl, $C_{25}H_{40}(OH)_2$, m 231-2°, $[\alpha]_D^{25} 5.04^\circ$ (in pyridine), was prepd in 2% yield from *Ononis spinosa* roots by alc. extn and dehydrogenated by Se at 300-320°. Distn. of the

1 FeO ext and recrystn of the product from MeOH gave 1,2,5,6-tetramethylphenanthrene, m 113-14° (*picrate*, m 152-3°, *styphnate*, m 162°, *trimetobenzene compd*, m 178°) By recrystn from C_6H_6 and drying at 115°, onoceryl, m 232°, was converted into an isomer, m 202° (*acetate*, m 224°, *benzoate*, m 237-8°, $[\alpha]_D^{25} 21.3^\circ$; *chloroacetate*, m 238-44°, $[\alpha]_D^{25} 115^\circ$; 3,5-dinitrobenzoate, m 290-1° (decompn), $[\alpha]_D^{25} 19.4^\circ$; *anisate*, m 233-4°, $[\alpha]_D^{25} 10.03^\circ$) These derivs are identical in m p. and rotation with the corresponding derivs. of onoceryl, m 232° Onoceryl is not a sterol but a triterpene deriv

A W. Dox

Toad poisons VIII The dehydrogenation of cinobufagin H Jensen *J Am Chem Soc* 57, 2733-4 (1935), cf C A 29, 7902°—Cinobufagin and Se at 310-340° for 45 hrs give a small quantity of a hydrocarbon, $C_{28}H_{48}$, m 120-1°, which is believed to be methylcyclopentenophenanthrene, since it gives no depression in the m p when the 2 are mixed It appears, therefore, that cinobufagin and probably also the various other bufagins contain the same ring system as the cardiac plant aglucons and the sterols C J West

Epilcholesterol, a new isomer of cholesterol E A Evans, Jr, and Rudolf Schoenheimer *J Am Chem Soc* 58, 182 (1936)—Reduction of cholesterol with (iso PrO) $_2$ Al gives 2 isomeric sterols, that not pptd by digitonin having the compn $C_{27}H_{46}O$, m 84°, $[\alpha]_D^{25} 120.8^\circ$ (2% in C_6H_6), *acetate*, m 82.5°; that this is *epicholesterol* (I) is indicated by its catalytic reduction to a mixt of epidihydrocholesterol and epicoprosterol, thus the HO group at position 3 is trans to the Me group at C 10, the double bond is in position 4-5 Refluxing I 2 hrs with a dil soln of HCl in 95% EtOH gives a hydrocarbon $C_{27}H_{46}$, m 79°, $[\alpha]_D^{25} -112.8^\circ$ (2% in C_6H_6); the absorption spectrum shows max (244, 235, 229 m μ) at shorter wave lengths than reported for cholesterol C J West

Thermal equl of the *cis trans* isomers of dichloroethylene at high temps (Maroney) 2 Estrogenic activity of 1-oxo-1,2,3,4 tetrahydrophenanthrene (Butenandt, Schirran) 11F Purification and phys properties of org compds (Skau, Rowe) 2 Cause of the von Allwarden reaction (Sturm, Colle) 25 Temp dependence of the energy of activation in the decalidolization of diacetone alc (LaMer, Miller) 2 Carotenoids of purple bacteria (Karrer, Solmsen) 11C Sulfonation of naphthalene (Lantz) 7 Absorption and fluorescent spectra of certain naphthalene hydrocarbons (Titeica) 3 Carotenoids from the anthers of *Lilium tigrinum*—antheraxanthin (Karrer, Oswald) 11D Photochem. stability of crotonaldehyde (Blacet, Roof) 3 Thermal decompn of certain gaseous org compds (Travers) 2. Decompn of propane and *n*-butane and C filaments (Belchett, Rideal) 2 Cryst. derivs of vitamin E (Kimm) 11E Structure and absorption of benzocyclanone oximes (Ramart Lucas, Hoch) 3 Polarographic studies with the dropping-Hg cathode 11I Electroreduction of benzaldehyde (Tokuoka) 4 Effect of addn salts on the electrolytic reduction of 3,5-dimethoxy-*o*-cresol (Bradt, Linford) 4 Sepn and utilization of *o* and *p* nitrotoluenes from the mononitrotoluenes prepd from the gasoline fraction of Syukkkō crude oil II Prepn of toluidine 11I Prepn of safranine and magenta (Mizuta) 22

Cyclohexylphenols Karl Brodersen, Hermann Heinicke and Ernst Korten (to General Aniline Works) U. S. 2,025,271, Jan. 21, 1936; 765,024 (C. A. 29, 6741).

Cleina H. Th. Dulon A. G. Brit. 430,745, Oct. 9, 1935. High-mol. olefins are prep'd by heating secondary amines having at least 1 aliphatic chain of more than 8 C atoms with compounds of an acid nature that form salts with amines, until the amino group is eliminated. Among examples, (1) heptadecylphenylamine is heated in a stream of HCl, heptadecylene and heptadecyl chloride distill over, the latter may be converted into heptadecylamine by treatment with HCl, and (2) undecylphenylamine is heated with ZnCl₂ to give pure undecylene.

Sulfating olefins Robert F. LeBaron (to Standard Alcohol Co.) U. S. 2,025,230, Jan. 21, 1936. For sulfating secondary butene contained in mixed petroleum cracking products, a fraction of the cracked products is used, consisting predominantly a mixt. of branched and straight-chain olefins contg. 4 C atoms per mol. and this fraction, in liquid phase, is admixed with aq. H₂SO₄ of 50-60% strength, the aq. acid layer formed is removed, and residual hydrocarbons, in liquid phase, are treated with aq. H₂SO₄ of 65-70% strength.

Ethyl alcohol A. A. Vansheidt and E. M. Kaganova. Russ. 38,143, Aug. 31, 1933. Glycerol is treated with 0.5-2% H₂SO₄ soln., under elevated pressure and temp. Cf. C. A. 29, 4814.

Alcohols Heinrich Hoff (to I. G. Farbenindustrie A.-G.) U. S. 2,025,018, Feb. 4, 1936. Alcs. such as phenethyl alc. are produced by acting with an alkylene oxide such as ethylene oxide in the presence of a Friedel-Crafts condensing agent such as anhydrous AlCl₃ on a hydrocarbon such as C₆H₆, a nonsubstituted heterocyclic comp'd. such as pyridine or quinoline or a monosubst. deriv. such as a monosubst. benzene, at temps. up to 100° (usually at 60° in making phenethyl alc.). Numerous examples are given.

Dehydrating alkyl alcohol A. A. Dymanikov. Russ. 37,689, July 31, 1934. Aq. alkyl alc. and CCl₄ are continuously dist'd at 65-60° with a continuous return of a part of the distillate into the flask.

Converting alcohols to sulfates Carbide & Carbon Chemicals Corp. U. S. 2,281,405, Oct. 29, 1945. Alcs. contg. at least 8 C atoms are converted to sulfates by treatment with a sulfating agent such as ClSO₃H or SO₃ in the presence of an inert liquid such as an ether which is a solvent of high vapor pressure for the alc. and the sulfating agent, particularly a hydrochloroether. Examples are given of the conversion of phenethyl isobutylcarbinol, (4 heptyl dromethylethylisobutylcarbinol, and 7-ethyl-3-methyl-4-undecanol, in br'd (chloroethers) ether. Temps. from -20° to 100° are used.

Ketones from secondary alcohols Francis M. Archibald and Clayton M. Palmer (to Standard Alk. Co.) U. S. 2,025,267, Jan. 21, 1936. A ketone is formed by passing vapors of a secondary alc. such as sec. hexyl alc. in contact with a catalyst of Cu 60, Zn 28.5 and Sn 1.5%. Cf. C. A. 29, 1431.

Catalytic oxidation N. V. de Batavische Petroleum Maatschappij. Fr. 788,021, Jan. 19, 1935. Primary and secondary unsubst. alc., particularly those which contain at least 4 C atoms and only 1 olefinic bond in the mol., are oxidized to unsat'd carboxylic comp'ds. by treatment with O in the presence of an oxidation catalyst at a high temp., e. g., about 300-500°. Thus, 2-methyl-1-propen-3-ol is oxidized to 2-methyl-1-propen-3-ol-2-ynoic acid, 2-methyl-1-ol to 2-methyl-1-buten-3-ol, b. 116-118°, allylic alc. to acrolein, 2-methyl-1-buten-3-ol to 2-methyl-1-buten-2-one, b. 117°, and 2-methyl-3-phenyl-1-propen-1-ol to 2-methyl-3-phenyl-1-propen-2-one, b. 200°.

Cy. Ni and V₂O₅ are used as catalysts. **Secondary aromatic amines** Waldo L. Seman (to R. T. Goodrich Co.) U. S. 2,024,642, Feb. 4, 1936. In forming a secondary amine such as *p*-phenylammonium chloride, a primary aromatic amine such as aniline is added to an aq. soln. contg. a polyhydric benzene such as hydroquinone to ppt. the polyhydric benzene as its amine salt, and the latter is heated to cause its condensation to produce a secondary amine. Several examples are given. Cf. C. A. 29, 376.

Distilling methylamines F. J. du Pont de Nemours & Co. Brit. 430,874, Oct. 21, 1935. Pure NH₃ or NH₄Me is isolated from mixts. contg. them and NH₄Me by dist. the mixt. without adding NH₃ at elevated pressure until a portion of 1 of the amines is collected. The residue of the mixt. is distilled in 2 fractions, 1 consisting of pure NH₃ or NH₄Me, according to the pressure used and the other an azeotropic mixt. of the amines. After 1 of the amines has been isolated, the pressure is lowered and the other amine dist'd off. App. is described.

Tertiary amines I. G. Farbenindustrie A.-G. Brit. 436,411, Oct. 16, 1935. These are obtained by the reaction of secondary amines, or reagents that form them under the reaction conditions, with alcs. or their carboxylic esters, or with aldehydes or ketones, at a raised temp. in the presence of a hydrogenating catalyst, at least 1 of the reagents contg. a radical of at least 8 C atoms; the reaction is effected in the presence of H if when aldehydes and ketones are treated, in presence or absence of H when alcs. are treated. Cf. C. A. 29, 5839.

Quaternary ammonium compounds I. G. Farbenindustrie A.-G. Brit. 436,725, Oct. 14, 1935. Such comp'ds. containing a radical of at least 1 high-mol. alc. aliphatic radical of at least 8 C atoms which is interrupted by a S or N atom, the remaining org. radicals attached to the N being said radicals, are prep'd by (1) causing a reactive ester, e. g., a *n*-butoxy or benzeneethoxy ester, to react with a suitable amine, (2) treating an amine contg. the high-mol. substituent with a reactive ester of a suitable alc., (3) causing an appropriate thio alc. or amine to react with a said amine contg. a radical with a replaceable substituent, e. g., Cl, or (4) treating a said amine having a replaceable substituent, an amine or H₂S group, with a reactive ester of a suitable alc., the product, in each case, being converted into the quaternary form if necessary. The compounds possess bactericidal and fungicidal properties. Trimethyl-1-dodecylthiomethylammonium chloride is prep'd by heating dodecylthiomethyl chloride, obtained by introducing HCl into a mixt. of dodecylmercaptan and CCl₄ with NH₄Me; and methyldecyl-1-dodecylthiomethylammonium chloride is prep'd by heating MeI with decyl-1-dodecylthiomethylamine, which results from the interaction of Na dodecylmercaptan with decylthiomethyl chloride. In 436,723, Oct. 14, 1935, such comp'ds. contg. attached to N at least 1 high-mol. aliphatic ether radical of at least 8 C atoms in which the O is resp. from the N by at least 2 C atoms, the remaining org. radicals attached to N being said radicals are prep'd by (1) causing a reactive ester of the high-mol. alc. contg. an O atom in the chain to react with a suitable amine, (2) treating an amine contg. the high-mol. ether radical with a reactive ester of a suitable alc., (3) causing an appropriate alc. to react with a said amine contg. a radical with a replaceable substituent, e. g., Cl, or (4) treating a said amine contg. a hydroxy alkyl group with a

reactive ester of a satd alc, the product, in each case, being converted, if necessary, into the quaternary form. The compds. are bactericides and fungicides (γ -Dodecyl-oxy- β hydroxypropyl)trimethylammonium chloride is prepd by treating γ -dodecyl-oxy- β -hydroxy- α -chloropropene with NMe_3 in cold C_6H_6 soln.; methylcyclohexyl-11(γ -dodecyl-oxy- β -hydroxypropyl)ammonium iodide is prepd by heating cyclohexylethylamine with γ -dodecyl- β hydroxy- α -chloropropene and treating the product with MeI. In Brit 436,793, Oct 14, 1935, such compds. contg attached to N an unsulfonated aralkyl radical and a high mol aliphatic radical of at least 8 C atoms, which may be interrupted by an O, S or N atom, are prepd. by (1) causing a reactive ester of the high-mol alc to react with an aralkylamine, (2) treating an amine contg the high mol substituent with a reactive ester of an aryl alc, (3) causing an appropriate alc or amine to react with an aralkylamine having an aliphatic radical contg a replaceable substituent, e.g., Cl, attached to the N, or (4) treating with a reactive ester of an aliphatic alc, an aralkylamine having attached to the N an aliphatic radical contg an amino, OH or SH group, the product in each case being converted into the quaternary form if necessary. Among examples, (1) diethylbenzyltrimethylammonium chloride is prepd by causing benzyl chloride to react with diethyltolylamine, obtained from octyl bromide and NH_4Et , (2) dimethyldodecylbenzylammonium iodide is prepd by the reaction of dodecylbenzylamine with MeI. The products are insecticides and fungicides Cf C A 30, 1049.

Unsulfonated diacylated diamines Guillaume de Montmolin, Jacob Danuser, Gerald Bonhote and Hans Jöhner (to Soc pour l'ind chim à Bâle) U S reissue 19,842, Feb 4. A reissue of original pat No 1,899,856 (C A 27, 2963).

Formic acid Henry Dreyfus U S 2,028,764, Jan 28. CO and water are made to react at temps of about 100–350° in the presence of a lower aliphatic acid such as formic or acetic acid and of Cu_2Cl_2 . U S 2,028,765 relates to a similar process, carried out in the presence of Cu_2O .

Acetic acid concentration Donald F Othner (to Eastman Kodak Co.) U S 2,028,800, Jan 28. A still is charged with aq HOAc and just the right proportion of Pr or iso Pr acetate or propylene chloride to form an azeotropic mixt with the water in the aq. acid, water and water withdrawing agent are distd from the mixt and the distillate is condensed and the added agent is sep'd from the water of the distillate and returned for continuation of the process (various details of app and of continuous operation being described) U S 2,028,801 relates to the use of added agents such as iso-Pr iodide, CH_2BrCl , iso Bu bromide, CH_2Br_2 , iso-Am chloride, BuBr or allyl iodide for removing water in a distn column, from aq HOAc. App and operative details are described.

Hydroxy keto acid esters Henry Gault Fr 784,101, July 22, 1935. Acyclic aldehydes or keto acid esters are fixed in aq medium without elimination of water. Examples are given of the prepn of $\text{Ac}(\text{CH}_2\text{OH})_2\text{CO}_2\text{Et}$ (diacetate, b_p 174°), $\text{EtO}_2\text{CCH}_2\text{CH}_2\text{C}(\text{CH}_2\text{OH})_2\text{CO}_2\text{Et}$ (along with hydroxymethyl cyclohexanecarboxylic ester, m 79°), $\text{CH}_2[\text{C}(\text{CH}_2\text{OH})\text{CO}_2\text{Et}]_n$, in 104°, $\text{AcCMe}(\text{CH}_2\text{OH})\text{CO}_2\text{Et}$ (oxime, m 165°), $\text{AcC}[\text{CH}(\text{OH})\text{Me}]_2\text{CO}_2\text{Et}$, m 33°, $\text{AcC}[\text{CH}(\text{OH})\text{Me}]_2\text{CO}_2\text{Et}$ (its pyrazolone, m 275°) and $\text{AcCMe}(\text{CH}_2\text{OH})\text{CO}_2\text{Et}$, b_p 118–20° Cf C A 29, 1390¹¹.

Aliphatic esters of carboxylic acids William J Banister (to Commercial Solvents Corp.) U S 2,029,694, Feb 4. An ester such as Et, Me or Bu lactate, having a b. p. above 120° but not substantially less than 50° below the b. p. of the acid from which it is derived, is prep'd by introducing an alc such as Lt, Me or Bu alc into the acid such as lactic acid at a temp ranging from about the b. p. of the formed ester to approx 20° below the said b. p., and removing the resulting vapors of the formed ester, water and excess alc Cf C A 29, 692¹².

Esters of levulinic acid Gerald J Cox and Mary L Dodds (to Nacac Chemicals Corp.) U S 2,029,412,

Feb. 4. In forming esters such as 2 methylbutyl levulin-ate, a sirup of levulinic acid obtained by decomp. carbo-hydrates with an inorg acid such as by the action of HCl on a sucrose soln. is esterified with an alc. such as 2 methyl-butanol (suitably by heating in the presence of HCl).

Cyanic and thiocyanic esters Soc. anon des matières colorantes et produits chimiques de Saint-Denis and Jean Claudin Fr 789,500, Oct 29, 1935. Such esters are prep'd by the action of CNCl on the compds RSH in which R is any radical giving to the mol the character of mercaptan, thiocarbonic acid or their derivs. Thus, CNCl gives with a soln of Na dimethylthiocarbamate at 15–70°, tetramethylthiuram monosulfide. The formulae of a large no of compds which may be obtained are given, including S C(OX)C(OX)S, (in which X is Me, m 54–5°, Et, m 55°, C₂H₅, m 54–5°, C₃H₇, brown oil, C₄H₉, yellow oil), S C(NMe)₂SC(NMe)₂, S m 109–103°, S C(NMe)₂SC(Nt)₂, S m 55°, S C(NMe)₂SC(OMe)₂, S C(NMe)₂SC(OEt)₂, S C(NMe)₂SC(OC₂H₅)₂, S m 41°, S C(NMe)₂NHPh, m 127°, S C(NMe)₂NMePh, m 79°, o-[S C(NMe)₂O]C₆H₄NO, m 124°, o-[S C(NMe)₂O]C₆H₄Me, m 55°, and p-[S C(NMe)₂O]C₆H₄Me, m 93°.

Hydrogenating cinnamic acid and its homologs P. Ya Loshakov and D. M. Al'm-Guttsatze Russ. 37,706, July 31, 1934. Hydrogenation is effected in the presence of activated Al and in a medium of abs alc.

Quinic acid A. D. Lebedev, A. V. Lundkvist and I. A. Obergard Russ. 37,707, July 31, 1934. Cranberry juice is treated with chalk, filtered, the filtrate boiled and filtered while hot to sep Ca citrate. The filtrate is mixed with a satd soln of the basic Ph acetate, the ppt. of Pb quinate is filtered off and decomp'd with H-S and the obtained PbS is sep'd from the quinic acid soln which is conc'd till it crystallizes, or it may be ext'd with org. solvents.

Cyanuric acid I. G. Farbernd A-G (Christian Steigerwald, inventor). Ger 620,906, Oct 30, 1935 (Cl 12p 10) Addn to 607,663 (C. A. 29, 4027⁹). The method of 607,663 is modified by carrying out the condensation in the presence of a diluent at temps. above 100° in a reflux condenser. Examples of diluents mentioned are C₆H₆, Cl₂ and C₆H₅Cl Cf C A 29, 480⁸.

Ethers containing at least eight carbon atoms in the molecule F. Herhard Elbel (to Jenkel & Cie. G. m. b. H.) U S 2,028,654, Jan 21. Ethers such as glycerol monododecyl ether, glycerol monotetradecyl ether and the like are readily obtained by allowing the esters of higher aliphatic or hydroaromatic acids and oxyacids to react with alcs or phenols in an alk. medium or with alcoholates or phenolates. Various examples with details and modifications of procedure are given Cf C A 29, 475⁷.

The preparation of ethylene chloride and other chlorine derivatives Gosudarstvennii Trst Rezinovoi Promyshlennosti (inventor A. I. Matsen). Russ 24,877, January 31, 1933. Cl derivs are prep'd from cracked gas (contg CO, 0.2, C₂H₄, 34, C₃H₆, 2.9, C₄H₆, 2.2, C₄H₈, 0.5, O₂, 0.7, C₂H₂, 1.9, H₂, 24.2, C₂H₆, 25.4, C₂H₄, 5.5 and N₂, 2.5%) by chlorination in 2 phases. In the first phase the dry gases are admitted through the lower end of a tower heated to 35° and charged with a chemically resistant filler together with Cl₂ in amount insufficient to effect a complete chlorination, while liquid chlorinated hydrocarbons enter the tower through the upper end and move downward in countercurrent to the gases. In the second phase the chlorination is completed by contact in another tower of the semi finished product with Cl₂ dissolved in liquid chlorides, without an addnl introduction of Cl₂. Details of the equipment are also covered.

Ethylene oxide N. V. De Bataafsche Petroleum Maatschappij Fr 788,975, Oct. 21, 1935. See Brit 434,011 (C A 30, 737⁹).

Addition compounds of nitrated diphenyl ethers Chem. Fabrik von Heyden A. G. (Armin Rost, inventor). Ger 620,761, Oct. 20, 1935 (Cl. 12p 1.01). The compds are obtained by the action of C₆H₅NO₂ or quinoline on diphenyl ethers contg more than two NO₂ groups. Thus, 2,4,6,2',4',6'-hexanitrodiphenyl ether is added drop by drop to C₆H₅NO₂ to give N,2,4,6-tetrinitrophenylhydrazine.

Decylene compounds Carbide & Carbon Chemicals Corp. Fr 788,944, Oct. 19, 1935 1,3-Decylene aldol of the formula $\text{CH}_3\text{CH}(\text{OH})\text{C}(\text{Ft})(\text{C}_4\text{H}_9)\text{CHO}$ is prep'd by condensing ethylhexaldehyde with AcH in the presence of an alk comp'd and subsequently neutralizing the resulting reaction mixt. This aldol is hydrogenated to give an ethylbutyl-substituted 1,3 butylene glycol of 10 C atoms, b_p 132-7°, and this glycol may be esterified to form, e.g., the diacetate, b_p 130-5°.

4-Hydroxypyrene I G Farbenind A-G Fr 789,049, Oct. 22, 1935 This is prep'd by diazotizing 3-aminopyrene-4-sulfonic acid, converting the diazo comp'd to pyrene-4-sulfonic acid by known methods and fusing this with caustic alkalis. The product, m 208°, dissolves in conc'd H_2SO_4 giving an olive-brown fluorescence.

Condensation products of aromatic hydroxy compounds with alkenols Joseph B. Niederl U S 2,029,539, Feb. 4 Alkenols such as vinyl, allyl, crotyl, oleyl and phytlyl alcs or their aryl, halogen or nitro substitution products or the like, or substituted and nonsubstituted phenoxyoctadecyl alc such as phenoxyoctadecyl alc itself, *o*-, *m* and *p*-toloxyl-, thymoxyl, octylphenoxy-, chlorophenoxy-, nitrophenoxyl-, naphthoxy- and such phenoxy-octadecyl alcs in which the Ph radical carries other reactive groups such as amino, hydroxy, carbonyl (aldehyde and ketone) and carboxy groups, are condensed with H_2SO_4 . Derivs of the oleyl alc such as its esters, notably its sulfuric acid ester or acetate can be used for condensation and in such cases, if hydrolysis is avoided, the corresponding hydroxyphenyloctadecyl alcs are obtainable. Similarly the ether of oleyl alcohol can be condensed. The products are colorless or pale yellow oily or waxy solids, useful as antiseptics and germicidal agents. Their sulfonated derivs (sulfates or sulfonic acids) are wetting agents. With formaldehyde and the usual treatment they yield phenolic resins. They no longer contain the unsat'd bond of the oleyl alc. Structurally they are hydroxyaryl-octadecyl alc derivs contg one or more free phenolic hydroxyl groups. Several examples with details of procedure are given, and claim is made to hydroxyaryl stearyl alcs generally as being new compds.

Naphthalene-1,2-dinitrile Imperial Chemical Industries Ltd., Reginald P. Linstead and Eric F. Bradbrook Brit 436,661, Oct. 16, 1935, Fr 788,725, Oct. 15, 1935 This comp'd, m 190°, is obtained by causing the Na or K salts of 1-cyanonaphthalene-2-sulfonic or 2-cyanonaphthalene-1-sulfonic alc to react with NaCN, KCN or Na or K ferrocyanide at not less than 250°, preferably at reduced pressure and in an indifferent atm.

Dibenzanthrone derivatives I G Farbenind A-G Fr 789,451, Oct. 29, 1935 See Ger 621,475 (C A 30, 1067°)

Terpene oxide solutions I G Farbenind A-G (Stamslaus Deichsel, inventor) Ger 620,636, Oct. 24, 1935 (Cl 12o 25) Solns of the above in halogenated hydrocarbons are rendered stable by adding fat sol. dyes which absorb the chemically active light rays. Thus, a soln of the azo dye from *o*-anisidine and β -naphthol in CCl_4 is used as the solvent for ascaridol. The soln is practically insensitive to light and will keep for 2 yr. Other examples are given.

Organic antimony compounds Société des usines chimiques Rhône-Poulenc Brit 436,742, Oct. 17, 1935. Na and Li antimonothiomalates, of therapeutic value, are prep'd by adding SbCl_3 , preferably in CHCl_3 soln, to an aq soln of Na or Li thiomalate.

Tetraalkyl lead Louis S. Bake (to E. I. du Pont de Nemours & Co.) U S 2,029,301, Feb. 4 An org halide such as EtI is brought into contact with a Pb mono Na alloy in the form of small substantially dust free particles of a uniform size (suitably about 0.03-0.12 in in diam) Cf. C A 29, 817°

Benzoyl persulfide Theodore H. Rider and Robert Shelton (to Wm S. Merrell Co.) U S 2,028,216, Jan. 21 Benzoyl chloride is caused to react with an aq soln of Na H sulfide, the resultant reaction mixt. is oxidized with a mild oxidizing agent such as air and the resulting relatively

pure benzoyl persulfide is further purified by dissolving it in an org solvent such as CHCl_3 which is miscible with alc but not with water, washing this soln with dil aq alkali, sepg the soln and pptg the benzoyl persulfide from it by adding an aliphatic alc such as EtOH or MeOH which can be vaporized at a temp below the decompn point of the benzoyl persulfide.

Substituted sulfides Henkel & Cie G m b H (Eberhard Fillel and Alfred Krosthaler, inventors) Ger 620,889, Oct. 29, 1935 (Cl 12o 23 03) See U. S. 1,987,529 (C. A. 29, 1479°).

Halogen compounds N. V. de Bataafsche Petroleum Maatschappij Fr 789,289, Oct. 25, 1935 Polyhalo hydroxy compds or polyhalo hydrocarbons are prep'd by causing an unsat'd monohalide contg at least 4 C atoms, and in which the halogen atom is joined to a sat'd C atom to react with a reagent of the class comprising hypohalogenous acids, aq solns of halogens, solns of hypohalogenous acids and hydrogen halides and org hypohalides. Thus, isobutenyl chloride is converted to 1,3-dichloro-2-methyl- and 1,1-dichloro-2-chloromethyl 2-propanol, isopentenyl chloride to tertiary dichloroamyl alc, crotyl bromide to 1-bromo-3-chloro-2-butanol and a monochlorodisubstituted alkene to a comp'd $\text{C}_8\text{H}_{11}\text{Cl}_2$. The tertiary polyhalo alcs are intermediates for the prep'n of unsat'd aldehydes and ketones to be used for making resins, perfumes, etc. Fr 789,290 Unsat'd polyhalides are treated as in Fr 789,289 to give similar compds. Thus, a comp'd $\text{CH}_2\text{Cl}(\text{CH}_2\text{Cl})\text{CHCH}_2\text{Cl}$ is converted to a tertiary tetrachloroamyl alc of the formula $\text{CH}_2\text{Cl}(\text{CH}_2\text{Cl})(\text{OH})\text{CHClCH}_2\text{Cl}$ Cf. C A 30, 1067°

Polyhalogenated hydroxy compounds and hydrocarbons Herbert P. A. Groll and George Hearne (to N. V. de Bataafsche Petroleum Maatschappij) Brit 436,337, Oct. 9, 1935 Unsat'd polyhalides are caused to react with hypohalous acids, aq halogen solns, solns of hypohalous acids and H halides or alkyl or aralkyl hypohalides in presence of H_2O to give polyhalogenated OH compds and (or) hydrocarbons. Among examples, (1) a cyclic system comprising reaction chamber, separator stage for breaking up emulsions in the reaction products and an absorption column for satg circulating H_2O with Cl_2 is used, the app. is charged with H_2O , CCl_4 and 1,4-dichloro 2-(chloromethyl)-2-butene, which are agitated in the reaction chamber and the H_2O circulated through the system, Cl_2 being introduced continuously into the absorption column, the unsat'd halide is intermittently admitted to the reaction chamber. H_2O is introduced to keep the HCl of the circulating soln at or below 1.13 N. The product sepg into 2 layers and the lower, together with an Et_2O ext. of the upper, is dried and dist'd. to remove most of the Et_2O and CCl_4 and then dist'd at reduced pressure to yield a tetrachloro tertiary Am alc and (2) $\text{CHCl}_3/\text{CCl}_4$ is treated as in (1) to give $\text{CHCl}_2\text{CCl}_3$. Products of the process may be used as solvents and extractants, e.g., in refining mineral oils and purifying refinery and manuf'd gases Cf. C A 30, 1067°

Substituting halogen in the benzene ring by various groups A. I. Poral-Koshitz, I. N. Vikhanski and I. M. Lzelev Russ 24,873, Jan. 31, 1932 Cl in the C_6H_5 ring is substituted by OH, NH_2 , etc., in the presence of emulsifiers, such as petroleum sulfonic acids, sulfonic acids, sulfuric acid esters of high molecular weight, fatty and aromatic alcs and hydroxy acids.

Continuous decomposition of phenolates and naphtholates N. V. Vitevskii Russ 37,709, July 31, 1931 The substances are first treated with SO_2 traveling in the same direction and the excess of the gas is used counter-currently to the phenolates and naphtholates in a sep. app. The equipment is illustrated.

Hydrogenation Wilbur A. Lazier (to Canadian Industries Ltd.) Can 354,246, Nov. 19, 1935 Alkylcyclic acids, hydroterocyclic acids, or their derivs such as esters, chlorides or amides are hydrogenated under high pressure and temp in the presence of a catalyst. E.g., high-mol alcs are produced by reducing naphthenic acids with H in the presence of Cr_2O_3 contg a hydrogenating

metal at 200–400° and a pressure of at least 10 atm. *Cl. C. 29, 217,619.*

Oxidizing unsaturated compounds. N. V. de Bontad-
sche Petroleum Maatschappij. *Tr. 789,633*, Oct. 22, 1935.
Unsat. hydroxy compds. such as nonylic alcohols,
ethers and esters which may contain an unsat. tertiary
C atom are heated with an acid catalyst, e. g., a mineral
acid, or a salt of acid action in a liquid system which con-

tains an aq. or (and) org. solvent for the catalyst. Thus,
2-chlorobutanol is converted to methylacrolein with
H₂SO₄ as catalyst and isobutyric acid as solvent, and iso-
pentenol to methyl isopropyl ketone with H₂SO₄ and AcOH.
Other examples are given.

Crystallization of dextrose. Charles J. Conland (to
International Patents Development Co.). U. S. 2,029,-
360, Feb. 4. See *Tr. 787,060* (C. A. 30, 5895).

11—BIOLOGICAL CHEMISTRY

PAUL H. HOWE

A. GENERAL

ARTIFICIAL DIETS

The formation of heavy hydrogen in growing organisms.
H. O. Reitz and K. F. Bonhoeffer. *Z. physik. Chem.*
A174, 423–434 (1935). cf. *C. A. 29, 5129*.—This study
was a continuation of previous work in which chlorophyl-
litic plants were grown on nutrient salt soils. In this
work water with a high content of D and practically
pure D₂O were used. It is possible to replace half of the
H with D in the solid matter of the organism without in-
jury to the latter. Further increase in content of D de-
creases growth and at 50% growth ceases and the organism
dies. Algae survive several days on nutrient salt
soil in practically pure D₂O and begin to grow again when
transferred to water of low content of D. The D content
of the water was held by a vapor pressure measurement
described by P. Harteck. (*C. A. 29, 9999*). R. H. B.

The effect of heavy water at low concentrations on some
microorganisms. G. Castellani. *Bull. soc. intern. micro-
biol. Sci.*, vol. 7, 296–300 (1935) (in French).—Heavy water at
concn. 0.05–10% has no action on the growth of
Rhizobium radicola and *B. fluorescent liquefaciens*.
On the mycelium of *Penicillium herbarum* and of *Rhizoglyphus*
sp. (isolated from the roots of *Eryngium Canadense*), it
has a slightly stimulating action when the concn. is
0.05–2%, but a very unfavorable action at 10%.

Isolation of nikotinamide from heart muscle. Richard
Kuhn and Helmut Vetter. *Ber. 68B*, 2374–31 (1935).—
From a vitamin B concentrate free from B₁ and B₂, ex-
haustive extn. with CHCl₃, followed by distn. of the ext.
under a high vacuum gave a substance, C₁₀H₁₀N₂O, identi-
fied as nikotinamide (I), in 12%. From 15 kg. of beef
heart, 147 mg. of pure I was obtained. The absorption
spectrum shows maxima at 2150 and 2900 mμ. The concn.
of I in the heart is significant because the heart stimulant
coenzyme (N,N-diethylnikotinamide) has a similar con-
stitution. W. F. Bruce.

Dielectric properties and chemical constitution of the
phospholipids. Richard Kuhn, Isidore Hauser and Wanda
Erdmann. *Ber. 68B*, 2368–8 (1935). cf. *C. A. 30, 321*.
—The diel. const. of lecithin (I) isolated from egg yolk
(cf. Levene and Roll, *C. A. 21, 2003*) was measured in
alc. and in CCl₄ from 20° to 45°. I was dielectrically in-
active in CCl₄, but active in alc. It has a betaine form
which in CCl₄ is a sood. (mol wt. about 3000) and in alc. is
unmol. There is no good evidence for heteropolari-
zing formation. Cephalin in CCl₄ is also inactive.

W. F. Bruce.
Biochemical synthesis of some β-glucosides. I.
Vandeweyer, C. N. Jones and A. Kark. *Bull. soc. chim.*
Rennes, 16, 151–61 (1934).—Correction. The β-glucoside
of ethylene glycol of C. A. 29, 43009 should be β-glucoside
of ethylene glycol mono-β-ether, 15% mannose
should be 15% mannitol and β-mannosomannoglucoside
should be β-mannitolmannoglucoside.

L. T. C.
A histological study of the effects of x-rays on frog skin.
Amos E. Light. *Ann. Entomol.* 25, 701–81 (1935).—The ef-
fects described are evidently due directly to the action
of x-rays on the cells or to the action of the secondary
cathode rays produced by the primary beam impinging
on the tissue. According to the most modern viewpoint,
"H" substance is liberated quite slowly from the injured

cells during a long period of time, causing the capillaries
to dilate. Because of this gradual response of "H" sub-
stance, the dilation persists and the power of contracting
to the original state is lost as other cells grow and fill the
dilated network forming the walls of the vessels. Thus
action undoubtedly thickens the walls and makes them
less permeable to the nutritive elements that are neces-
sary for the growth of the tissue cells. Gradually some
die, while others acquire abnormal forms of growth.
X-ray shock and increased N elimination soon after a
radiation might also be explained by the sudden release
of "H" substance in more sensitive tissue. G. L. C.

The action of short radio waves on myxoma. A. L.
Roussin and L. S. Snamov. *Tr. 789,633* (U. S. R.)
10, 602–704 (1935).—The action of short radio waves
(5–10 m) was tested on blood catalase, peroxidase, trypsin,
amylase, anisoylase and the oxidation of enzyme applied.
No direct chem. action was observed. In cases where
changes were noticed, these were due either to a rise in
temp. or to the laetential action of the radiation. The
action of short radio waves on living tissue is due to the
overheating of the capillaries and to the disintegration
of the intracellular structure, which leads to the destruc-
tion of the cells and of the organism. H. Cohen.

The protein from *Aspergillus oryzae*. P. D'achenko.
Trudn. Lab. Isucheniya Belka Belkovo Obmena Organizma
1935, No. 8, 70–81.—The "proto album" was prep'd.
by Ferrov's method (cf. *C. A. 29, 66127*) in a. e. by extn.
with NaOH and pptn. with AcOH at a pH of 4.6. The
protein was not obtained in a sufficiently pure form; the N
of the various prepns. varied from 12.25 to 15.27%.

R. Cohen.
Caseinic acid in tissue culture. V. Trutskii. *Trudn. Lab. Isucheniya Belka Belkovo Obmena Organizma* 1935,
No. 8, 30–40.—The intravenous injection of casein in fairly
large amts. is not accompanied by any ill effects (cf. *C. A. 29, 66131*). Hence a more sensitive bio. method was
needed for the study of casein. Tissues were cultured
in a 7% soln. of casein in the "natural solvent" (cf. *C. A. 29, 66124*), as well as in a medium composed of 7% casein
soln. mixed with blood plasma (1). In the latter case,
the growth of culture was very near normal, regardless
of whether embryo tissue was used. No harmful
effects of the casein on the tissues and cells could be ob-
served. Casein, in various degrees of dispersion, can be
obtained by adding the cald. amt. of HCl to a dil. Na
caseinate soln. to liberate the free "caseinogenic acid". The
addn. of 2 drops of coarsely dispersed "caseinemic acid"
(1:1000) to 10 drops of blood plasma stimulates the
growth of the culture by 21.5% in comparison with the
control. The addn. of a greater or smaller amt. of "casein-
emic acid" to the plasma leads to less stimulation in growth
or to more at all.

The "anti-complex" of egg white. S. S. Perov.
Trudn. Lab. Isucheniya Belka Belkovo Obmena Organizma
1935, No. 8, 64–74. cf. *C. A. 29, 66114*.—The "anti-
complex" was not isolated. Its presence was suspected,
since the addn. of alkali to dialyzed egg white is attended
by a decrease of the surface tension and an increase of
the η. H. Cohen.

The chemical nature of the acid groups of proteins.
M. L. Lurina. *Trudn. Lab. Isucheniya Belka Belkovo Obmena Organizma* 1935, No. 8, 75–81.—The acidity of

casein and other proteins is ascribed to the presence of aminodicarboxylic acids H Cohen

The titration curves of amino acid mixtures M. Lisitzin and P. D'yachenko *Trudus Lab. Izucheniya Belka Belkova Obmena Organizma* 1935, No. 8, 90-2 (1935), cf. preceding abstr.—Identical titration curves are obtained for casein and a mixt. of monoaminodicarboxylic acids and diamino monocarboxylic acids, in the proportion in which they occur in casein (23% glutamic acid, 1.8% aspartic acid, 5% arginine, 2.0% histidine and 6% lysine) H Cohen

The Stanek and Hausmann numbers of some "proto acids" I. Leont'ev and G. Glukharev *Trudus Lab. Izucheniya Belka Belkova Obmena Organizma* 1935, No. 8, 93-101.—The "proto acids" of casein, egg white, peas and *Phaseolus aureus* R. yield about the same amts. of ammonio, monoamino, diamino and humus N, detd. by a modification of Hausmann's method. These 4 "proto acids" likewise consume the same amts. of HIO_3 on oxidation by Stanek's method (*C. A.* 26, 2141, 2941)

Yeast phosphatases Henry Albers and Irna Albers *Arkiv Kemi, Mineral Geol.* 12B, No. 3, 6 pp (1935); cf. *C. A.* 29, 7352.—A phosphatase which prefers hexosediphosphate and β glycerophosphate to α glycerophosphate was prepd. from a Stockholm top yeast by enzyme action. The top yeast contained 8-9 times as much phosphatase as the bottom yeast. The autolyzed soln. of top yeast contained appreciable quantities of dehydrogenases. The cell residue, which contained the greater part of the phosphatases, was washed, suspended in water, and stirred with dry green malt or green malt ext. in the presence of PhMe for 2 days (pH 6, temp. 34-5°). The liberated phosphatase was sep'd from the cell residue by centrifuging and clarified by filtering through diatomaceous earth. It may be kept under PhMe for months and has a tendency to increase in activity on standing. Phosphatase content is 3.6-15 phosphatase units per cc. (A phosphatase unit is the quantity that at pH 3.8 and a temp. of 35° will in 1 hr. liberate from a 0.1% soln. of Na β glycerophosphate an amt. of phosphate equiv. to 0.1 mg. of P). On dialysis, Mg and phosphate ions are removed rapidly, but the activity remains const. for a time and then decreases gradually. Purification by dialysis is carried to the point where the activity begins to decrease. The product is practically inactive toward α glycerophosphate but it splits both β glycerophosphate, which cannot be split by dehydrogenases, and hexosediphosphate at pH 3.5-4.0. Mg ions retard its action. The name hexosediphosphatase is suggested for it.

A. W. Dexter
The role of adenosinetriphosphoric acid in the enzymic dehydrogenation of hexoses Hans v. Euler and Erich Adler *Arkiv Kemi, Mineral Geol.* 12B, No. 6, 6 pp (1935).—In the system Robison ester (hexosemonophosphate) + dehydrogenase (from yeast) + flavin enzyme + cozymase, buffered to pH 7.6, methylene blue is decolorized in 4 min. Adenosinetriphosphoric acid cannot be substituted for cozymase. When fructose is substituted for Robison ester, methylene blue is not decolorized unless adenosinetriphosphoric acid is present. Dehydrogenase, flavin enzyme and cozymase must all be present also. With glucose, the action is similar but not so rapid (15 min. as compared with 4) suggesting that it may first be changed to fructose. Heating Na adenosinetriphosphate in neutral soln. at 80° for 15 min. does not destroy its activity, but heating in $\text{N H}_2\text{SO}_4$ for 7 min. at 100° forms hydrolysis products that are inactive. A resynthesis in the sense of the Lohmann reaction (*C. A.* 29, 2185) did not occur, neither muscle- nor yeast-adenylic acid + creatinephosphoric acid, nor adenylic acid + creatine could replace adenosinetriphosphoric acid. Within broad limits, the reaction is independent of the concn. of inorg. orthophosphate. It is not retarded by 0.001 M KCN. The cozymase can be replaced by Warburg's cozymase but the Robison ester dehydrogenase cannot be replaced by the sp. alc. dehydrogenases. The Harden-Young ester is not an intermediate since it is not acted upon by the Robison ester dehydrogenase system.

Methylene blue can be replaced by O_2 . Either aerobically or anaerobically, the speed of the reaction is dependent upon the concn. of adenosinetriphosphate. A. W. D.

Highly purified cozymase preparations H. v. Euler, H. Albers, E. Albers, F. Schlenk and G. Günther. *Arkiv Kemi, Mineral Geol.* 12B, No. 4, 6 pp (1935).—Cryst. (unaxial needles) cozymase preps. (activity 100,000) were obtained from concd. aq. solns. by fractional pptn. with alc. Even the purest liberate H_2S on treatment with Zn and HCl. Possibly the H_2S results from the reduction of an S-S group. The KCN-Na nitroprusside test for S-S was adapted to detns. by the addn. of NH_3 to stabilize the color. The relationship between the S and amt. of cozymase values is practically const. regardless of the method used to prep. the pure cozymase, so that the S-contg. substance seems to be a part of the cozymase or at least very firmly attached to it. This may explain the reducing property of cozymase toward reagents used in sugar detns. A. W. Dexter

The relationship of cozymase and an inhibitory substance in yeast cells Hans v. Euler and Erich Adler *Arkiv Kemi, Mineral Geol.* 12B, No. 5, 6 pp (1935).—A lactic acid dehydrogenase (soln. A) was obtained from top yeast R. by autolysis with LiOAc, fractional pptn. with alc. and soln. of the second fraction in water. No cozymase was detected in it until it had been heated at 70° for 10 min. The cozymase in it dialyzes much less rapidly than a soln. of pure cozymase; when the solns. are mixed, each apparently dialyzes at its own rate. A fermentation medium contg. glucose, apozymase, Na hexosediphosphate and buffered to pH 6.4 was used to test its inhibitory effect. Soln. A (partially dialyzed) liberated nearly 9 times as much CO_2 after its enzyme became active through heating than before. The unheated soln. also definitely inhibits the liberation of CO_2 by pure cozymase. It does not retard the cozymase action in the alc.- or Robison ester-dehydrogenase system. A bottom yeast prepn. also shows the presence of an inhibitory substance.

A. W. Dexter
Porphyrin gelatin phosphors Fritz Bandow and Emil J. Klaus *Z. physiol. Chem.* 238, 1-13 (1936).—Phosphors are mixts. which emit an afterglow when the source of illumination has been removed. In gelatin phosphors the porphyrins show the same absorption and fluorescence spectra as in solns. The structure of the substance and state of ionization are therefore not materially altered when the pigment becomes a component of the solid basic material. The solvent used in the prepn. of the phosphor has an influence. Gelatin is *per se* alk. to the porphyrin, but by addn. of sufficient concd. HCl acid spectra can be obtained. By adsorption of the pigment the spectra are displaced to the long wave side. Influences of temp. and decompn. during the mild prepn. of gelatin phosphors are not a disturbing factor. A. W. D.

Urnary phosphatase. II Excretion in man Hajo Wolberg *Z. physiol. Chem.* 238, 23-30 (1936); cf. Kutscher, *C. A.* 29, 6615.—Men excrete 3-5 times as much phosphatase as women, because of admixt. of prostatic secretion. A further increase of 20-30% occurs during periods of fasting. A heavy intake of glucose decreases the phosphatase and increases the phosphate excretion in 75% of the subjects. After insulin injection the situation is reversed. With simultaneous administration of insulin and glucose and with const. blood-sugar level the insulin action predominates. A. W. D.

The chemical composition of the sturgeon proteinates M. A. Lisitzin and N. S. Aleksandrovskaya *Z. physiol. Chem.* 238, 54-8 (1936).—Preps. of protamine sulfate obtained from the milks of 3 species of sturgeon, viz. *Acipenser huso*, *Ac. guldenstadti* and *Ac. stellatus*, showed complete agreement in elementary analyses, and in amine, arginine, histidine and lysine content. It is recommended that the protamine be designated *acipenserin* instead of sturin, husin, stellatin, etc. A. W. D.

Calcium and magnesium contents in the flesh of various animals Makoto Takamatsu *Z. physiol. Chem.* 238, 99-100 (1936).—Ca and Mg detns. were made on the muscle tissue of 20 species of animals comprising mam-

mals, birds, reptiles, fishes, mollusca and arthropods. The high Ca content of the muscle of the latter is added, snail, mussel and crab and the high Mg content of the adder and snail. The highest values, on the dry basis, were 1.3202% CaO and 2.7673% MgO in snail muscle.

The preparation of β -thymonucleic acid by means of nucleotidase R. Feulgen Z. physiol. Chem. 238, 105-110 (1936), cf. C. A. 30, 1394.—It is not possible to obtain the gelatinous β -form of thymonucleic acid in its native state such as occurs in the cell nuclei, since the process of extr. entails some depolymerization. The best preps. are therefore mixts. of various depolymerized β -form types. 1 or more of the completely depolymerized β -form two procedures are applicable. If the cell nuclei have been sepd. or are present in high concn., as for ex. in fish sperm, the material may be digested with pancreatin in the presence of Na_2CO_3 and the filtrate after concn. pptd. with LiOH at alk. reaction, then reprecip. at neutral reaction and finally dehydrated with LiOH. Where the cell nuclei are less abundant, as in the thymus gland, it is best to ext. with NaOH at 65° and ppt. with LiOH, then depolymerize the gelatinous product with pancreatin and purify by reprecip. as above. To obtain the free acid the pptd. Na salt is dissolved in H_2O and pptd. by HCl.

Enzymes of fermentation V. The phosphorylation systems of alcoholic fermentation. Antonicelli and Hilde Ber. Z. physiol. Chem. 238, 111-231 (1936), cf. C. A. 30, 1397.—Although the phosphorylation of hexose by means of yeast enzymes is usually a multistage reaction, extent by hexosediphosphate (I) and by adenosinetriphosphate acid (II), the former is more effective in the case of purified enzyme system. After removal of heterophosphates a reesterification is no longer effected by II, which in this system is entirely inert. The phosphatase is therefore not identical with heterophosphatase. Phosphorylation induced by I occurs in the absence of heterophosphates and also in the absence of II. There exist then 2 phosphorylation systems in yeast exts., which are mutually complementary. Evidence is now presented for the existence of a 3rd mechanism of phosphate transfer. The rearrangement of phosphoglyceric acid to phosphopyruvic acid is completely suppressed by NaF. On the other hand the phosphorylation induced by I in crude *Saccharomyces* juice is only moderately inhibited by NaF, and the quantity of mobile P far exceeds the quantity of P in the added I, i. e., the action of I in the system inhibited by NaF is catalytic. If only the first 2 phosphorylation mechanisms existed this mode of reaction would be inefficient, since the catalysis by I would occur only when II could be regenerated. But the regeneration of II is completely annihilated by NaF. Hence it must be assumed that a 3rd mechanism of phosphate transfer exists, by which the mono ester is converted into di ester. Although the exts. were made with cell-free exts., the utilization of inorg. phosphate induced by I may be of significance as a possible means by which the living cell meets its phosphate requirements. Moreover, the fact that this mechanism accelerates fermentation by the living cell. Phosphorylation of hexose by II is simply a reesterification, not a binding of more phosphate.

Bühselein Edgar Wemberger. Z. physiol. Chem. 238, 124-83 (1936).—From 2.5 g. of palitones a small quantity of bilirubin was obtained by LiOH extn. of the residue remaining after extn. with LiOH, 5% AcOH, 5% HCl and CHCl_3 . The pigment, which could not be crys'd. or esterified, differs from bilirubin in its lower N content. It gives no Gmelin, diazo, Glutinski, Zn(OAc)₂ or pyrazole reaction. It has strong tenebral power and is undoubtedly a typical bile pigment. Occurring in stones from both Prague and Vienna it is not a local phenomenon.

Isolation of adenosinetriphosphate acid from yeast Th. Wagner-Jauregg Z. physiol. Chem. 238, 121-30 (1936).—From 200 g. of fresh yeast some 60 mg. of adenosinetriphosphate acid was isolated as Ag salt and

found to be identical in all respects with a similar prepn. from rabbit muscle. Inorg. pyrophosphate was also obtained, and a Ba salt from which 1/4 of the H_2PO_4 was easily split off and which had a N/P ratio of 4.3; hence it was probably inosopyrophosphate, cf. H. W. D., 1815. **Electrolysis of oxyriazin N. Das, B. N. Ghosh and U. C. Guha Z. physiol. Chem. 238, 131-2 (1936).**—Oxyriazin preps. were subjected to electrodialysis at various H-ion concns. and with stoppage of the electrolysis at pH 9.0 and below, the hormone migrated to the cathode, at pH 10 small quantities were found both at the cathode and the anode. It is assumed that the hormone has a distinctly basic character and by adsorption on a basic carrier substance migrates to the cathode.

Intestinal phosphatase H. G. K. Westphal Arch. uerl. med. physiol. 20, 506-90 (1935).—The speed with which intestinal phosphatase splits off H_2PO_4 from Na glycerophosphate decreases more and more with increasing reaction time. This cannot be explained by checking through the reaction products H_2PO_4 and glycerol, by diminishing substrate concn., or through inactivation by contact with the buffer at pH 8.8. The speed with which H_2PO_4 is split off under the influence of increasing phosphatase concn. increases less rapidly than the phosphatase concn., that is, the activity of the phosphatase is not proportional to the phosphatase concn. A tonality between phosphatase concn. and activity appears, if the phosphatase salts at the dilus. in which they are to act on the substrate are mixed with the buffer and held for some time (1, 2 or 4 hrs.) at a constant pH. This method, however, has influence only on such phosphatase salts as are poor in protein. There is no change in the relationships of the activities of the protein-poor phosphatase salts which are prepared by a similar method from various rat intestines. For the present the customary method for the detn. of intestinal phosphatase must be employed, i. e., the extn. of the amt. of H_2PO_4 split off from a suitable substrate, over not too long a period of time. It is recommended to work in a Ca contg. medium so that at least the checking action of the accumulating phosphate is eliminated.

Repardities in the growth of tissue cultures I. Analysis of the frequency of cell division. P. J. Gaillard. J. protoplasm. 24, 282-403 (1935).—Fr. D.

Biological oxidations V. Copper and hexachromogens as catalysts for the oxidation of ascorbic acid. The mechanism of the oxidation. L. S. Guzman Barron, R. H. DeLew and Frederick Klenz. J. Biol. Chem. 112, 623-40 (1936); cf. C. A. 29, 822.—The so-called autooxidation of ascorbic acid (I) in carefully prep'd buffer solns., the catalysts which accelerate the oxidation, and the mechanism and chem. reversibility of the reaction have been studied under rigidly controlled exp't. conditions. I is not autooxidizable in solns. up to pH 7.0. In alk. solns., it is autooxidizable, the rate increasing with pH. Salts of Mn, Ni, Fe, Cu, Ca and Zn were studied; only Cu catalyzed the reaction, its action being noticed in concns. of 40 g. per l. When catalytic effect is completely inhibited by 0.001 M KCN and 0.005 M FeCl_3 , 95.5 mmts. of CO and O. Thus the oxidation is performed in acid or neutral solns. there is an uptake of 1 O per mol. of I. The oxidized form of I can be completely reduced by H_2 up to pH 8.0; above this amt. recovered decreases until at pH 7.0 only 45% of the oxidized form can be recovered. H_2 and O do not reduce I. The temp. coeff. for the Cu-catalyzed oxidation is 1.6. Electromotically active oxidation-reduction systems of suitable potential also act as oxidizing agents, hexachromogens of neocine, pyridine and picloric acid acting as catalysts. The mechanism of the oxidative reaction is as follows: I is oxidized to dehydroascorbic acid while the catalyst is being reduced, the reduced catalyst is then reoxidized by atm. O. The H_2O_2 formed being split into H_2O and O. Addn. of amino acids retards the catalytic action of Cu, presumably owing to complex salt formation. NaCl had no effect.

Chlorophyll derivatives L. Marchlewski and W.

Urbanczyk *Bull intern acad polonaise, Classe sci math nat* 1935A, 146-55(1935) (in English).—See C. A. 29, 4383⁴

Amylolytic and the phosphoric esters of starch and glycogen Hans Pringsheim and S. Ginsburg *Bull soc chim biol* 17, 1590-1600(1935)—By the use of a purified amylase prep'd from hog pancreas (method given) it was found possible to hydrolyze starch completely without liberating any free H_2PO_4 from the phosphoric ester present in the starch. Under the same conditions glycogen was hydrolyzed with the liberation of only a small fraction of the combined H_2PO_4 . L. E. Gilson

Dephosphorylation of starch by phosphatase Hans Pringsheim and Fritz Loew *Bull soc chim biol* 17, 1607-13(1935)—A very active phosphatase was prep'd from hog kidneys. By its use it was possible to set free much of the combined H_2PO_4 of a boiled starch prep'n without hydrolysis of the starch. L. E. Gilson

Respiration model using sunflower-seed oil with and without carotenoids R. Retovsky *Bull soc chim biol* 17, 1614-29(1935)—When films of sunflower-seed oil, free from carotenoid pigments, were exposed to air in the dark or in bright light the oxidation rate rapidly increased to a max after a short induction period. When crude carotene was added to the oil there was almost no oxidation in the dark or in dim light even after 30 days. When the oil contg added carotene was exposed to bright indirect sunlight the induction period was prolonged several days until the carotene was bleached by the light, after which the oxidation rate increased in practically the same manner as that of the oil without carotene. L. E. G.

Isoelectric point of blood serum N. I. Joukovsky and W. A. L. Decker *Compt rend soc biol* 120, 805-8 (1935)—Bett serum was dild with physal NaCl soln, a colloidal soln of Pt, Au, Se, FeO_3 or TiO_3 added, and cataphoresis observed under the microscope throughout the pH range 0-14. Despite the diversity of the substances added the curves obtained had many points in common. L. E. Gilson

Manganese in biology Ferruccio Marzetti *Ross clin terap sci affini* 34, 271-85(1935)—A comparison of various methods for the detn of a small amt of Mn showed that of Bertrand (cf C. A. 5, 2381) to be the most reliable. With this method to determine Mn, gram was shown to absorb Mn from the soil in proportion to the amt present therein. Fe was absorbed to a lesser extent and could not be substituted for Mn. Expts on rats showed that ingested Mn (in a special diet containing SiO_2) was absorbed by the stomach and rectum but not by the other portions of the alimentary tract. The non-assimilable Mn was absorbed into the circulation and then completely excreted. Helen Lee Gruel

Peroxidase action I The oxidation of aniline Philip J. G. Mann and Bernard C. Saunders *Proc Roy Soc (London)* B119, 47-60(1935)—Horseradish or turnip peroxidase readily oxidizes $PhNH_2$ in the presence of dil H_2O_2 at pH 4.5, the soln becomes blue violet for a few sec., then brown, and a dark brown ppt. forms contg 2,5-diaminoquinoneimide, a mauveine, induline and ungreable aniline black. The primary product of oxidation is $PhNHOOH$, and p - $H_2NCH_2NH_2$ is an important precursor of the final products. The enzyme system converts freshly prep'd $PhNHOOH$ into emeraldine, and 4-amino- p -phenylamine first into the blue imide of Wiltstätter [quinoneimide-14(4-aminoanil)anil], then into emeraldine. Tenton's reagent (H_2O_2 + $FeSO_4$) converts $PhNH_2$ into azobenzene, amino- p -quinoneimide, and 2,5-diaminoquinoneimide. J. S. H.

Urinary phosphatase Waldemar Kutscher and Hayo Wolberg *Naturwissenschaften* 23, 558-9(1935), cf C. A. 29, 6615⁴—Detns of phosphatase at 2-hr interval in human urine showed variations: high early day meals, min at noon, rise after meal and drop toward evening. Starvation results in a const phosphatase level. Glucose diet gives a decreased phosphatase content. It is concluded that phosphatase takes part in the resorption of sugar in the kidney ducts. Abnormally high phosphatase concn is found after eating fruit or

vegetables, after use of 100 mg ascorbic acid it is likewise but not always high. B. J. C. van der Hoeven

Base-protein acid compounds M. H. Fischer and W. J. Suer *Arch Path* 20, 683-9(1935)—After citation of some of the evidence which indicates that "native" proteins are base-protein acid compds, a method for artificial production is described. The end is accomplished by working with reaction mixts contg no free H_2O and by adding to any protein, e. g., casein, first a base and then an acid or vice versa. The allowable limit of H_2O content for these systems, in which such reaction was possible, was found to be well above the normal H_2O content of living tissue, while the amt of "salt" that could thus be bound to a protein, as well as the percentage relation of the base to the acid in such "salt," proved identical with biol values. Harnet F. Holmes

Glucosulphatase XIII Contents of glucosulphatase and phosphatase in various invertebrates Tokuro Soda and Saitaro Koyama *J Chem Soc Japan* 58, 1338-9 (1935), cf C. A. 29, 4380⁴—The content of glucosulphatase was highest in sea-ear, horned top and scallop. The content of phosphatase was not parallel with that of glucosulphatase, but in many cases was inversely related. The activity of glucosulphatase of 1 variety was strong at pH 4.3, that of another at 9.3. There was no definite relation between the dried wt of organisms and the activity of the enzyme. K. Kutsa

Tyrosinase action on mono- and dihydric substrates Mark Graubard and J. M. Nelson *J. Biol Chem* 111, 757-70(1935)—Tyrosinase apparently consists of only 1 enzyme as claimed by Pugh (C. A. 25, 527). Differently treated enzyme preps such as plain potato juice, enzyme obtained from the alc. ppt. in dialyzed and undialyzed states, preps obtained through further treatment by alumina adsorption and elution and finally enzyme prep'd by further treatment with adsorption on kaolin failed to change the relationship in their behavior to p -cresol and catechol. Also when the enzyme is inactivated toward catechol it is invariably inactive toward p -cresol as well. The more purified enzyme preps are less resistant than the cruder material at pH values that are more acid or alk than the optimum. The p -cresol-enzyme reaction seems to proceed differently from the catechol-enzyme reaction since catechol very rapidly inactivates the enzyme while p -cresol does not. With cresol the rate of reaction, not the total O_2 consumed, is proportional to the enzyme concn but with catechol the total O_2 consumed depends entirely on the amt of enzyme (and also pH) added within the limits allowed by amt of substrate. Removal of o -quinone by addn of $PhNH_2$ or $NaHSO_3$ does not inhibit the reaction or change much the nature of the catechol reaction. The major difference between the action of tyrosinase on p -cresol and catechol lies in the fact that the former does not block the enzyme while catechol, though it reacts much faster initially, produces some substance (other than o -quinone) or substances which inactivate the enzyme. Richter's suggestion (C. A. 28, 6736³) of 2 enzymes is not justified. The quantitative measurement of the enzyme tyrosinase *Ibid* 112, 135-41—A new unit is suggested for measuring tyrosinase activity, the magnitude selected being the amt of enzyme under specified conditions which will bring about 10 cu mm of O_2 uptake in 1 min at pH 6.2° and 2°. When low enough concns of enzyme are employed, the slopes of the curve are directly proportional to the amts of enzyme used. Three alumina-dialyzed preps of tyrosinase from mushrooms showed the same relative activities toward p -cresol and catechol, indicating that the enzyme activates O_2 in both cases and that tyrosinase consists of only 1 enzyme. A. P. Lothrop

Pancreatic lipase I S. S. Weinstein and A. M. Wynne *J Biol Chem* 112, 651-8(1935)—Pancreatic lipase was prep'd from fat free dried pig pancreas by extn with 50% glycerol. The dry powder retained its complete lipolytic activity for more than a year when kept in a desiccator at 5° and the clear glycerol solns were stable for 6 weeks. The initial rates of hydrolysis of tripropionin, tributyrin, tricaproin, triacetin and tri-

valent decrease in the order named. The middle ester linkage of tracetin is apparently more slowly hydrolyzed than the end linkage since the ratio of the initial rates of acid liberation from equimol amts of mono-, 1,3-, and tracetin were 1 : 2 : 6. The rate of hydrolysis of esters of monophase acids increased with an increasing \log of the pH of the acid radical and decreased with an increasing length of the alkyl radical. The initial velocity of hydrolysis varied directly as the enzyme concn and with tripropion was directly proportional to the concn of the ester, in the range corresponding to 0.016 to 0.10 M. Velocities calculated from the Michaelis equation did not agree satisfactorily with the observed velocities. The initial rate of hydrolysis of tripropion and Me. Iutyrate with phosphate buffer was greatest at $\text{pH } 7.3$ but with glycine buffer the optimum was $\text{pH } 3$. Influence of various compounds on the hydrolytic activity. *Iod.* 64-61. The optimal rate of hydrolysis of tripropion by pancreatic lipase is affected by the presence of widely different chemical compounds. "Ketones and aldehydes were definitely inhibitory when their reactive groups were free, indicating that the CO group forms some sort of attachment with reactive groups in the enzyme mol., the inhibitory capacities of the closely related ketones and of aldehydes bore a more or less direct relationship to the mol. vol. of the compounds, the inhibitory power of the aldehydes is greater than that of related ketones having the same mol. vol. Heavy metals were inhibitory, copper activated the enzyme. The mechanism of this activation is not clear but preliminary experiments indicate that it is not entirely due to removal of copper from the substrate complex, but caused activation but apparently not, as in the case of urease, by reducing toxic quonones present as impurity to the corresponding alcs. PhOH and the cresols were relatively inert but the presence of the NO_2 group increased the toxicity. The inhibitory capacity of the 3,4,5-trihydroxyphenols increased with increased pH of the OH groups. Guaiacol, in which 1 of the OH groups of catechol has been replaced by an OMe group, was non-inhibitory whereas catechol in the same concn caused retardation. Dihydroquinol and pyrogallol were not inhibitory. Thus, of the hydroxy phenols, only the dihydroxy groups were reactive. Monohalogen derivatives of ArOH caused inhibition in the order $\text{I} > \text{Br} > \text{Cl}$. It is impossible to decide whether reaction with the SH or the NH_2 group or both takes place during the inhibition of lipase activity by the halogen acids. The susceptibility of the enzyme to inhibition by aldehydes and heavy metals suggests that an NH_2 group may be an essential constituent, if so, the halogen acetic acids may quite possibly cause inactivation by union with this group. The halogen anions were inactive in the order $\text{F} > \text{I} > \text{Br} > \text{Cl}$. HCl salts present in digestion mixts buffered at approx. neutrality were without appreciable influence on the activity of the enzyme." Thirty-one references.

The constitution of the prosthetic group of catalase. *Kurt G. Stern, J. Biol. Chem.* 112, 931-934 (1936), *cf.* *C. A.* 7, 4820, 4821, 4824. Catalase has been isolated in crystalline form and identified as the proteolipin of Penicillium by pyren from it of the di-Me ester of meconophosphoric acid and by its conversion into the hemoglobin of the same species by substituting nitric acid for the enzyme protein. A method is described for concg and purifying catalase from yeast prepd from horse liver, 1800 g. yielded 3-6 mg. of crude enzyme hemm, and by working up 50 lb. in 10 hrs approx. 40 mg. was obtained.

Photochemical processes in biology. *H. G. Othman, De Toni, Biochim. terrap. spec.* 22, 577-581 (1935), *C. A.* 30, 1657. A review.

Hydrogen-transferring coenzyme, its composition and mode of action. *Otto Warburg, Walter Christen, and Alfred Giese, Biochem. Z.* 282, 157-205 (1935) (See purest prepn of the H-transferring coenzyme from red blood cells is easily sol. in H_2O , does not co-precipitate with 10% NaCl and 12 pH , and yields on hydrolysis H_2PO_4 , pentose, adenine and the amide of nicotinic acid. H_2PO_4

wt., corresponding to $\text{CaH}_2\text{N}_2\text{P}_2\text{O}_8$, is 733 (calcd. from the lowering of the i. p., 870). One H_2PO_4 group is esterified, the other 2 are easily dissociable. A reactive fluorescent component is regarded as a denatured co-enzyme formed during prepn. The coenzyme is a substance that obtained from yeast and probably the same as the one from heart. It cannot replace coenzyme of fermentation, but chemically the 2 are closely related. Just as coenzyme becomes the fermentation coenzyme in certain bacteria with a particular protein, so this coenzyme becomes the "intermediate" enzyme only in combination with a sp. protein, and is found in all cells so far investigated. It acts on hexosemonophosphate, converting it to phosphohexuronic acid. However, intermediate enzyme and hexosemonophosphate in the presence of a very small amt. of coenzyme do not react either aerobically or anaerobically unless the O transferring enzyme (yellow enzyme) is added also, when the reaction $\text{Co} + \text{RCOOH} + \text{H}_2\text{O} \rightarrow \text{H}_2\text{O}_2 + \text{RCOOH}$ proceeds. Therefore, the intermediate enzyme + coenzyme "activate" while the yellow enzyme "oxidizes" the substrate. If an equiv. amt. of coenzyme (Co) is used instead of a very small amt. the reaction proceeds very vigorously. $\text{Co} + \text{RCOOH} + \text{H}_2\text{O} \rightarrow \text{CoH}_4 + \text{RCOOH}$, the reduced coenzyme not being autooxidizable, but with a catalyst like the yellow enzyme (E) it reacts as follows: $\text{E} + \text{CoH}_4 \rightarrow \text{E} + \text{Co}$, the E is, however, being autooxidizable. The reduced coenzyme, the H_2O , if 1 mol. coenzyme, is added to 20,000 mols. hexosemonophosphate, the reaction comes to a stop when 1 mol. is changed to 1 mol. phosphohexuronic acid. On adding of yellow enzyme the product is 1 mol. of reduced mol. the entire hexosemonophosphate is changed to phosphohexuronic acid. The oxidation of the substrate is thus only a reoxidation of the coenzyme. The reversible reaction between coenzyme and hexosemonophosphate depends upon the presence of intermediate enzyme, but this can be replaced by $\text{Na}_2\text{S}_2\text{O}_4$. $\text{Co} + \text{Na}_2\text{S}_2\text{O}_4 + 2\text{H}_2\text{O} \rightarrow \text{CoH}_4 + 2\text{NaHSO}_3$. The coenzyme can also be hydrogenated by Pt and H in dil. alkali, but it takes up irreversibly 3 mols. H. In this reaction only the pyridine ring is hydrogenated to piperidine and the product is catalytically inactive. Also in the reversible hydrogenation the pyridine ring takes up 1 mol. H, because if such a product is hydrogenated with Pt + H it is now found to take up only 2 mol. H and to lose its catalytic activity. The coenzyme does not absorb the long waves and even in the ultra-violet range it absorbs only 260 m μ . When the pyridine ring is irreversibly hydrogenated to piperidine the 260 m μ band is lost, but when it is partially irreversibly hydrogenated this absorption band is unaffected; this is interpreted to mean that in the latter case the combination C = N remains unchanged. The absorption band at 345 m μ appears, which disappears again on oxidation by the yellow enzyme. This presents an interesting situation because the coloration is associated with reduction and disappears when the enzyme is subjected to the usual behavior of dyes. Nicotinamide *red* from the coenzyme behaves like the coenzyme on hydrogenation with Pt + H, but cannot be partially hydrogenated either by $\text{Na}_2\text{S}_2\text{O}_4$ or by hexosemonophosphate + intermediate enzyme. However, a methyltetraene compd. of nicotinic acid (trigonelline) can be partially hydrogenated by $\text{Na}_2\text{S}_2\text{O}_4$ and also manifests an absorption band at 350 m μ . Both the coenzyme and this compd. manifest great sensitivity to acid, the bands (345 and 350 m μ , resp.) disappearing. The anal. of H which the coenzyme can take up per unit of wt. is expressed by the formula $20 (\text{per cent. H/kg. substance})$, and has been detd. experimentally. The coenzyme can be detd. by measuring the H capacity, but even smaller quantities can be detd. photometrically, when it is reduced with an excess of hexose monophosphate by the intensity of the 345 m μ band. Still smaller amts. (a few \times only) of the coenzyme can be detd. catalytically from the oxidation of a prepn. of known H capacity. The purest coenzyme prepn. turns Congo paper blue, is very sol. in H_2O , from which it can be pptd. by alc. or acetone, and is optically active ($[\alpha]_{\text{D}}^{25} = -24.6$, $[\alpha]_{\text{D}}^{25} = -29.6$).

S. Morrell

The mode of action of the "intermediate" enzyme. Erwin Negelein and Erwin Haas *Biochem Z.* 282, 206-20 (1935).—In the reaction coenzyme + hexose-monophosphate, the former becomes hydrated (CoH_2) while the latter is oxidized to phosphohexuronic acid in the presence of the "intermediate" enzyme. The aim was to determine whether this acts as a catalyst or only as a colloidal carrier of the coenzyme. The method of measuring is based upon the property of the hydrated coenzyme to develop a band in the ultraviolet at 315 m μ , the rate of hydration varies with the rate of absorption. The time intervals were measured in sec., and the coenzyme concn was measured in 0.01 mg per cc. In the reversible system: Coenzyme + "intermediate" enzyme \rightleftharpoons H $_2$ -transferring enzyme, the latter is 0.5 dissociated at a coenzyme concn of about 10^{-4} mol/l. Neutral $\text{C}_6\text{H}_5\text{O}_2$, H_3PO_4 , and neutral coenzyme were dissolved in 0.2% NaHCO_3 , said with 5% CO_2 -argon, warmed to 38°, intermediate enzyme was added ($t = 0$) and the light absorption measured photoelectrically. The method of calcn is discussed in detail. The course of the reaction is formulated as: $dC/dt = RC$, where C is the concn of the free, nonhydrated coenzyme in mg/lcc. S Morgulis

Destruction of the hydrogen-transferring coenzyme by ultraviolet rays. Otto Warburg and Walter Christian *Biochem Z.* 282, 221-3 (1935).—Radiation of 1 γ coenzyme in 1 cc H_2O at 30 cm with a quartz lamp destroys its catalytic activity in 15 min, but if the coenzyme is in a glass tube or the soln is 1000 times more concd (1 mg/cc) there is no measurable destruction in 15 min. The photochem destruction has been studied quantitatively; the radiation intensity is varied between 10^{-4} and 10^{-3} cal/sq m/min and the exposure time between 20 and 60 min. The destruction const $K = s\phi$ (1/min), where s = quantum intensity, ϕ = absorption coeff and ϕ = the amt of substance destroyed. The time required for $1/2$ destruction (1 cal/sq m/min) increases with the wave length and is 520 times as large at 283 m μ as at 186 m μ . The ratio K/s is neither equal nor proportional to ϕ , from which the conclusion is drawn that not the total absorption coeff, but that of a special group in the coenzyme, is responsible for the destruction of the coenzyme. S Morgulis

Structure of desoxyribose from thymonucleic acid. Katashi Makino *Biochem Z.* 282, 263-4 (1935).—The desoxyribose does not give the boric acid reaction and is neutral to phenolphthalein. The formulas for guanine, inosine and thymine-desoxyribosides are given. S M

Carbon monoxide ferrogutathione. Fritz Kubowitz *Biochem Z.* 282, 277-81 (1935).—Ferrogutathione is a dissociable compd which requires a high glutathione concn to secure combination. The binding capacity for CO likewise increases with the glutathione concn until a satn is attained, when 2 mol CO is bound for each mol Fe. The equl where the concn of glutathione is sufficient to bind all the Fe is $K = \beta^2(1 - \alpha)/\alpha$, β being the CO partial pressure, and K the disson const of the CO compd. The CO ferrogutathione is an orange compd which is decomposed by light, most of the CO taken up in the dark being set free. S Morgulis

Phytochemical reduction of lactaldehyde. Fijn Ochiai and Komei Miyaki *Biochem Z.* 282, 293-6 (1935).—D,L-Lactaldehyde is reduced by yeast to propylene glycol. S Morgulis

Increase in cell permeability through mutagenetic radiation. Chemical demonstration of mutagenetic effect. Irv R Bakhrumov *Biochem Z.* 282, 297-302 (1935).—See C. A. 29, 3693

Colloid-chemical studies of edestin. II. K Holwerda *Biochem Z.* 282, 317-41 (1935), cf C. A. 29, 8023¹.—The peptization of edestin by salt solns is not dependent upon the amt of H_2O brought in with the adsorbed ions. In peptization the adsorption was always pos., whereas it is neg. in the salting-out process. In salt concns below the peptization region the adsorption becomes even more strongly pos. The fall in viscosity on either side of its max value is also explained on the basis of adsorption; it is assumed that an increase in surface tension

tends to decrease the viscosity vol. The influence of the lyotropic series on the peptization process is directly dependent on the adsorption. S Morgulis

Affinities between proteins and fat acids, fats or lipoids. St. J. Przylecki, E. Hofer and S. Frajberger-Grynberg *Biochem Z.* 282, 302-73 (1935).—The adsorption of ovalbumin, serumalbumin, edestin, casein, gelatin and peptone by paraffin, fats, fat acids and cholesterol has been studied. Paraffin adsorbs very well ovalbumin, serumalbumin and edestin (50% of a 0.3% soln) but casein, gelatin or peptones only poorly (less than 10%). The adsorption of cholesterol is similar. This adsorption is supposed to take place through the non-polar groupings of the amino acid, especially the leucine radical. The adsorption on acids and esters, on the other hand, is thought to be through the polar groups of the proteins. In the case of combination of protein with cholesterol, this may take place either through the $\text{CH} = \text{CH}$ or the OH groups. S Morgulis

Thermodynamics of enzymic equilibrium. Studies on the aspartase system. Kurt P. Jacobsohn and João Tapadinhas *Biochem Z.* 282, 374-82 (1935).—The equl of the system $\text{K} \rightleftharpoons [\text{aspartate}^-]/[\text{fumarate}^-] [\text{NH}_4^+]$ depends upon T . It has been detd at 37° and 5°, and from the reaction isochore the heat of amination has been calcd. $-\Delta H = -1.939 \times 2.303 \times \log(130/140) \times [(310 \times 278)/(310 - 278)] = +6200$ cal. The aspartase is a true catalyst. S Morgulis

Stereochemical specificity and equilibrium in the fumarase system. Biochemical preparation of *D*-malic acid. Kurt P. Jacobsohn and Manoel Soares *Biochem Z.* 282, 383-6 (1935); cf C. A. 29, 825¹.—Comparative studies of aspartase and fumarase lead to the presence of *D*-malate is shifted toward *L*-malate. S Morgulis

Oxidation, phosphorylation and fermentation by aspartase in the presence of some reversible oxidation-reduction systems. Åke Lennestrand and John Runnström *Biochem Z.* 283, 12-29 (1935).—Suspensions of brewer's dry yeast (washed 5-6 times) were used, pure preps of cozymase were employed whose concn was given by the no. of units per cc.; methylene blue and pyocyanine solns of 0.1% were used, but the 1-naphthol 2-sulfonate indophenol was of variable concn. In one set of expts. the formation of phosphoglyceric acid by dismutation and by oxidation was calcd. Especially in the system contg the pyocyanine good correspondence was found between the formation of phosphoglyceric acid and the phosphorylation. Apparently, phosphorylation comes to an end when no more O_2 is taken up. Expts with naphthol-sulfonate indophenol and methylene blue agree as to the O_2 uptake, but the phosphorylation is somewhat greater in the presence of the latter. No O_2 is used in the absence of cozymase, but neither is it used in the absence of hexosediphosphate. A study of the respiratory quotient indicates that practically no CO_2 is formed and the oxidative process was one concerned with intermediate steps, principally with formation of phosphoglyceric acid. CH_3COOH almost completely checks the oxidative process. The "induction" period is decreased in the following order: pyocyanine > methylene blue > hexosediphosphate, and the phosphorylation is also greatest with pyocyanine. S Morgulis

Separation of diketopiperazines and amino acids in protein hydrolyzates by means of ionophoresis. II. A. S. Balabukha Popitzova, N. I. Gavrilov and A. M. Rikaleva *Biochem Z.* 283, 62-70 (1935); cf C. A. 29, 2180¹.—On subjecting the cathode fluid (obtained from the electrophoresis) to repeated electrophoresis it is possible to sep quantitatively the anhydrides from the amino acids of a mixt. As the cathode, Hg, Ag or Pt can be used, but not Ni because it causes losses in amino acids. From 10 to 13 ma per sq cm cathode surface is employed, and the soln in both the cathode and anode vessels is slightly acidified with 0.1 N H_2SO_4 . Certain tech points in the procedure are discussed. S Morgulis

An attempt at the elucidation of the inhibiting action of oxidizing agents on proteolytic enzyme activity. The

nature of the effect of potassium bromate and similar substances on the baking property of wheat flour. *J. Højer Jørgensen. Biochem. Z.* 283, 134-45 (1935). *C. A.* 29, 5158.—It was found that yeast added to dough increases the activity of the proteases, because it brings in an activator, a pyruvate, which at least in part is glutathione. $KBrO_3$ decreases the activity of the flour in an aqueous suspension, this effect being designated as BI (bromate inhibition). This inhibitory effect is greatly increased by the addition of yeast. This is attributed to the fact that in the presence of yeast the proteases which are inhibited by $KBrO_3$ are being activated. If the proteases of an aqueous suspension of flour are completely or very nearly so destroyed by prolonged heating at 65°, the activity of yeast fails to increase the BI of the protease addition. The mechanism is supposed to be an inactivation by glutathione (phytylase). *S. Morgulis.*

Hydrolysis of nucleotides by acid. Hiteoshi Iohikawa *J. Biochem. (Japan)* 22, 385-91 (1935).—The products of acid hydrolysis of yeast guanilic and xanthilic acids, as well as the liberation of purine bases and H_2PO_4 from muscle adenylic and inosinic acid have been studied.

Does an oxidation-reduction potential exist in the hemoglobin-methemoglobin system? Kōchiro Saito *J. Biochem. (Japan)* 22, 395-397 (1935).—Either by titration of hemoglobin with $K_2Cr_2O_7$ (CN) or by measuring the potential E of mixtures of hemoglobin and methemoglobin, the values for E were found to be independent of the (M/Hb) or (Hb) ratio. Only when the methemoglobin was titrated with Na_2SO_3 was there occasionally a connection with the theoretical formula of the oxidation-reduction system. To explain these results, it is assumed that hemoglobin exists in 2 forms, as an active and an inactive product, only the former existing in reversible equilibrium in the reduction-oxidation system. Furthermore, the reaction active hemoglobin \rightleftharpoons inactive hemoglobin also forms an equilibrium. Hemoglobin prep. from blood corpuscles exists only as the inactive form. *S. Morgulis.*

The influence of histolytic agents on enzymic processes. A. M. Uneykoff and N. S. Levantova *Mol. exp. (Ukraine)* No. 1, 38-50 (1934).—The influence of hepatolytic on the glutathione content of dog blood depends on the total amt. present at the time of expt. If the total glutathione is fairly high, neither high nor low mol. fractions of hepatolytic produce any marked change, in low glutathione bloods a sharp rise is observed on introduction of hepatolytic. *Leo Naasarevich.*

Phosphatase of the brain. K. Venkateshwar and N. C. Dutta *Current Sci.* 4, 424 (1935).—The alk. phosphatase from sheep brain has an optimal reaction of pH 9.6, and is activated by Mg^{++} ; the increases in activity of the enzyme 100% when Mg is added in optimal quantities (0.001 M, 0.002 M), the acid phosphatase, from the same source, which has an optimal reaction of pH 5.0 is not activated by Mg and resembles the urinary and salivary phosphatases. Waldechmidt-Leitz and Nonnenbruch *C. A.* 29, 5133.—They suggest that the acid phosphatase demonstrated by Bamann and Ruedel (*C. A.* 29, 4819) is due to the presence of erythrocytes in their extracts. This appears to be untenable, because the erythrocyte phosphatase is activated by Mg salts, while the acid phosphatase exd. from the brain is not so activated.

The denaturation of egg albumin by ultraviolet radiation. Janet H. Clark *J. Gen. Physiol.* 19, 199-210 (1935).—The coagulation of whole egg albumin by ultraviolet radiation involves (1) the light denaturation of the albumin mol., (2) a reaction between the light-denatured mol. and water, possibly similar to heat denaturation occurring at a lower temp., and (3) the flocculation of the denatured mols. to form a coagulum. Light denaturation is unimol., independent of temp., and occurs over a wide range of pH. The temp. coeff. of the reaction between a light-denatured mol. and water is 10^{+4} . The reaction occurs rapidly at 40°, a temp. at which heat denaturation is inappreciable. *C. H. Richardson.*

The altered effect of electrical stimulation on the metabolism of red cell suspensions. Eric Ponder and

John Macleod *J. Gen. Physiol.* 19, 265-81 (1935).—The apparent increase in rate of O_2 consumption when an a. c. or induced c. c. current is passed through a red cell suspension (mammalian and nucleated red cells) in buffered $CaCl_2$ soln. is not a metabolic effect. The current produces a permanent vol. decrease which has been interpreted erroneously as an increase in O_2 consumption, for O_2 utilization is not involved. The effects occur immediately after Pt electrodes are used, they disappear when the electrodes are platinumized, they are apparently related to obscure electrode phenomena. *C. H. Richardson.*

Acetylation of tyrosine in pepsin. Robert Herriott *J. Gen. Physiol.* 19, 293-301 (1935).—Cryst. 60% active acetylpepsin has 7 Ac groups/mol. of pepsin, 3 of these groups are readily hydrolyzed in acid at pH 0.0 or in weak alkali at pH 10.0. The tyrosine-cryptophenyl content of this acetylpepsin is less than that of pepsin by 3 tyrosine equivalents. Hydrolysis of this acetylpepsin at pH 0.0 or 10.0 results in an increase in no. of tyrosine equivalents, hydrolysis at pH 10.0 also increases the sp. activity. Acetylation of the phenol group of acetyltyrosine by leucine under similar conditions shows a similar effect of pH on the rate. Conclusion: The Ac groups in 10% active acetylpepsin, which are responsible for the decrease in sp. enzymic activity, are 3 in no. and are attached to 3 tyrosine-phenol groups of the pepsin mol. *C. H. Richardson.*

Biofluorescence II. The partial purification of Cyprindina luciferin. Rupert S. Anderson *J. Gen. Physiol.* 19, 301-51 (1935), *C. A.* 27, 4201.—Powd. Cyprindina, exd. with $EtOAc$ and $CHCl_3$ was used in the prepn. of the luciferin exd. *Method.* The powder was exd. with boiling 0.1 M $NaCl$ soln. contg. 10% $EtOH$, the filtrate being run into a chilled mixt. of 2.5 M HCl and $BuOH$. *Method 2.*—The powder was exd. with $CHCl_3$. *C. A.* 18, 2964, 26, 4351, involving exd. with $MeOH$, gave better yields and was used in the later work. The $MeOH$ exd. is made under H for 24 hrs., with 5-10 cc. $MeOH/g$. Cyprindina powder. To the $MeOH$ filtrate is added 25 cc. $BuOH$, the $MeOH$ is removed from the de-aerated soln. *in vacuo* at room temp. The $BuOH$ ext. is chilled and benzoylated with 2 cc. $BzCl$ until the soln. contains no free luciferin. The soln. is then washed with 3 successive equal vols. of water to hydrolyze the excess $BzCl$. The $BuOH$ fraction is then dissolved in 10 vol. of water. A highly colored material, apparently dissolved in the $BuOH$ formed in the reaction, remains as a sep. phase. The inactive luciferin in this suspension is exd. with 80 cc. $EtOAc$, then with 3 portions of 40 cc. $EtOAc$ each. The $EtOAc$ fractions are cured, the $BuOH$ fraction is removed. The residue contg. inactive luciferin in $BuOH$ is mixed with 250 cc. 0.55 M HCl soln. and de-aerated at $35-100^\circ$ for 1 hr., then cooled and exd. with $BuOH$. The exd. is exd. from the HCl soln. by 40 cc. $BuOH$, and then by four 20-cc. portions. The benzoylation and hydrolysis are repeated. The yield of luciferin is 50-65%. *C. H. Richardson.*

Relation of oxygen tension and temperature to the time of reduction of cytochrome. T. J. B. Stuer *J. Gen. Physiol.* 19, 329-30 (1935).—The time of appearance of the cytochrome C absorption band in the supernatant of bakers' yeast contg. various mists. of O_2-N_2 was detd. at 6 temps. At each temp. there was a linear relation between the reduction time of cytochrome and the O_2 tension. Absorption bands of cytochrome were seen when the O_2 tension reached a crit. value $sp.$ for each temp. This pressure is probably identical or very near to the crit. O_2 tension usually found in the O_2 tension relationships. The O_2 tension in the suspension is reduced by the respiratory activity of the yeast cells.—An equation is given with which rates of O_2 consumption are related, from measurements of the reduction time of cytochrome. A rapid optical method of measuring O_2 consumption is proposed for use with cytochrome-contg. microorganisms. More accurate detns. will be attempted with cytochrome and thermocouple amplification. *C. H. Richardson.*

Carotenoid origin of cholesterol. W. M. D. Bryant *Cremistry & Industry* 1935, 1082.—Further evidence is adduced in support of the theory that substances having

the sterol skeleton are formed by cyclization and degradation of the polyene pigments (cf. Bryant, *C. A.* 30, 1044). In meeting Spring's objection (*Chemistry and Industry* 1935, 972) to this mode of formation, B. suggests that the Et and Me groups in the side chains of stigmastanol and ergosterol can be formed by "local synthetic action" or by ring opening of a more highly cyclized carotenoid deriv.

The preparation of sulfur derivatives of proteins by means of carbon disulfide. Jean Lorseleur. *Compt. rend.* 201, 966-8 (1935).—Alk. solns of gelatin, egg albumin and casein react with CS₂ to form S derivs of proteins. These derivs are sol in MeOH, EtOH and Me₂CO. Ten g protein is dissolved in 100 cc 0.1 N soda, and 100 cc alc is added. Ten cc CS₂ is added to this soln in 10-15 min. The yellow soln is warmed under reflux 15 min at 40-45°, 1.51 0.05 N H₂SO₄ is added to the cooled soln, resulting in the formation of a milky ppt similar to fibrin. Drying this ppt causes it to become insol in alc.

W. Gordon Rose

Autoclave splitting of protein by means of absolute methanol. V. S. Sadikov and V. A. Vadova. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 3, 317 20 (1935).—Blood serum was dried at 120°. Two thousand g of this residue was heated with abs. MeOH in an autoclave 3 hrs at 180° (50-60 atm). The reaction products were completely sol in MeOH. 25.7% of protein N is converted to NH₂. A cycloleucylvaline, C₁₁H₁₈N₂O₄, m 275.5°, was obtained from the water-sol fraction of the material remaining after removal of MeOH and NH₃. It is sol in AcOH and CHCl₃, slightly sol in ether and MeOH and insol in H₂O and benzene. Four g dissolves in 100 g boiling abs. alc. After hydrolysis of 0.5 g by refluxing 36 hrs with 25% HCl, analyses of the Cu salts of the resulting amino acids were in accord with the theoretical values for leucine and valine.

W. Gordon Rose

Orienting rat feeding experiments with deuterium oxide. Signe Schmidt-Nielsen and Sigvald Schmidt-Nielsen. *Kgl. Norske Videnskab. Selskab. Forh.* 8, 27-8 (1935).—Rats receiving 10-50 mg D₂O per day for 2 months grew and developed normally. Young rats were given a 20-50% D₂O soln in H₂O corresponding to 1.1-2.7 ml D₂O per rat per day for 8 days. No abnormal effects were observed, except that the rats were unusually thirsty, this thirst persisting 5-6 days.

W. Gordon Rose

The distribution of choline. John P. Fletcher, Charles H. Best and Omond McK. Solandt. *Biochem. J.* 29, 2278-84 (1935).—The total choline content of various rat tissues was estd by digesting the tissue in 18% HCl, acetylating the extd choline and assaying the resultant acetylcholine on the isolated rabbit intestine. The choline contents of 28 different tissues from white rats and of 34 dietary constituents including vitamin-rich foods and concentrates are reported.

E. W. Scott

The action of various chemical compounds on the vegetable phosphatases. Jean Courtois. *Compt. rend.* 201, 855-6 (1935), cf. *C. A.* 30, 490°.—The influence of glycerol, EtOH (90%), PO₄ (0.1 M), AsO₄ (0.02 M), NaF (0.002 M) and strychnine (0.004 M) on the reactions of takadiastase, and the phosphatases of white mustard seed and sweet almond with α- and β-glycerophosphates was studied. The influence of any compound depended on the origin of the enzyme (AsO₄ and PO₄ behaved the same to all 3). For a given enzyme, the same inhibiting agent influenced equally the hydrolysis of either of the 2 glycerophosphates.

E. W. Scott

Dicarboxylic acids as intermediate products in the biological breakdown of normal saturated fatty acids and their derivatives. P. E. Verkade and J. van der Lee. *Rec. trav. chim.* 54, 893 8 (1935).—V. and v. d. L. claim priority of their work over that of Fliscentrauer and Bertrand (*C. A.* 29, 6629°).

E. W. Scott

The destruction of certain hydrolyzing enzymes in the course of their action. Robert Bonnet and Berthe Natal. *Compt. rend.* 201, 1060-2 (1935).—Expts. on the hydrolysis of glucides by enzymes indicate that in every case there is an autodestruction of the enzyme during the progress of the reaction.

E. D. Walter

Oxidative inactivation of cozymase with Schardinger enzyme preparations. Fritz Lipmann. *Nature* 136, 913 14 (1935), cf. *C. A.* 28, 188°, 29, 8011°.—In a mixt. of a milk prepn of Schardinger enzyme and yeast macerate inhibition of glucose fermentation occurred after shaking with O for 1-1.5 hrs. Removal of the O did not restore fermentation. However, addn of a small amt. of boiled yeast macerate or purified cozymase did restore fermentation.

E. D. Walter

Chemical difference between protein linked and free nucleic acid. Gerhard Schmidt. *Science* 83, 15 (1936).—A comparative study was carried out on the effect of phosphatase on thymonucleic acid and thymonucleohistone. While free nucleic acid was nearly quantitatively dephosphorized within 24 hrs in a unimol reaction, only about 20% of the H₂PO₄ was released from the nucleohistone under the same conditions. The nature of this chem. difference is discussed.

E. D. Walter

The aldehyde dehydrogenase (Schardinger's enzyme) of milk and the influence on it of copper and of bacterial activity. W. Ritter. *Landw. Jahrb. Schweiz* 49, 873 85 (1915).—This enzyme is definitely injured by small quantities of Cu, especially when present during low temperature pasteurization of the milk or cream. The methylene blue reduction time is increased. The growth of various organisms can counteract to a considerable degree this effect of Cu during pasteurization. The reason for this effect of bacteria is unknown, but it parallels the inhibitory influence of bacteria on the development of tallowy flavor in milk contg. Cu. H₂O₂ is quite injurious to the enzyme. Metol, hydroquinone and the preparation of Kertesz (*C. A.* 29, 1525°) increase the methylene blue reduction time. Of the metals used in handling milk and its products, only Cu and its alloys have a marked effect on the Schardinger enzyme.

STANLEY R. BENEDICT

The estimation of the total lipides and the lipide partition in feces. Herbert C. Tidwell and L. Emmett Holt, Jr. *J. Biol. Chem.* 112, 609-131 (1936).—A method is described for determining the partition of fecal lipides which permits the estimation of the true neutral fat, unsaponifiable fat acid and soap fractions in a single sample (1.5-2 g. less if quite fatty). The lipides other than soap are first extracted with a fat solvent, weighed and then titrated with alkali to det. the free fat acid and (by difference) the so-called "neutral fat" (neutral fat plus unsaponifiable matter). The ext. is then saponified, the unsaponifiable material being ext. and weighed, all fractions can then be calculated except the soap. The residue from the 1st ext., which contains the soap, is acidified into fat acid, which is extd., weighed and calc'd. as soap. Added material can be recovered in the appropriate fraction with an error rarely exceeding 1%. A more accurate picture of the facts can be obtained by expressing the partition in abs. quantities rather than in percentages of fecal fat, which may lead to quite erroneous conclusions regarding fat splitting.

A. P. LOTHROP

A new color reaction of the hexoses and polyhexoses and its application for the colorimetric determination of glucose in blood. Juan A. Sanchez. *Semana med.* (Buenos Aires) 1935, 11, 914-17.—A mixt. of 15 cc. H₂SO₄ with 5 cc. of a soln. of not more than 0.0001 mg. glucose under the influence of the heat caused by mixing develops an intense red color. This color is caused by hexoses only, whether free or present in polysaccharides. The color is in proportion to the concn. For detn. of glucose in serum mix 1 cc. with 1 cc. of CCl₄-CO₂H reagent, filter, wash and add H₂O to make 5 cc. and pour on 15 cc. H₂SO₄. Shake and keep at 100° for 5 min. Cool and compare with a standard. Citrated blood serum cannot be used, but oxalated plasma is suitable. The standard is prep'd with glucose-free serum. Blood is incubated at 37° for 24 hrs. This destroys the sugar. After deproteinization, sugar is added in suitable quantities to make standards.

C—BACTERIOLOGY

LAWRENCE H. JAMES

Carotenoids of purple bacteria. I. P. Karrer and U. Solmsen. *Helv. Chim. Acta* 18, 1506-15 (1935).—It is probable that the compn. of the carotenoid mixt. from purple bacteria depends on the nutrient medium and the strain. The following results are valid only for Gaffron's strain Z, cultured under definite conditions. The purple bacteria contained an entire series of previously unknown carotenoids which was sep'd into its components by chromatographic analysis. The alc.-washed bacterial mass was ext'd with CS₂ and the deep-red ext. was conc'd. and taken up in a ligron-MeOH mixt. On addn. of a small amt. of H₂O the bacteriorhodospyll sep'd and the lower layer. The ligron soln. of carotenoids was washed and evap'd *in vacuo*. The product was partially sol. in petroleum ether. The insol. violet residue was crys'd. from benzene and yielded 20 mg. of glittering violet crystals of a new carotenoid, *rhodospillactin* (I), C₄₂H₅₄O₆ or C₄₄H₅₆O₆, m. 218°, giving a blue color with SiCl₄ in CHCl₃ (absorption max. 642 mμ), absorption max. of I in CS₂, CHCl₃, benzene and abs. alc., 573.5-534-496, 541-507-476, 548-511-482 and 523-491-(465) mμ, resp. Absorption of the petroleum ether soln. in 8 tubes (60 cm. long, 5 cm. diam.) filled with Ca(OH)₂ and washing with petroleum ether gave a red-brown upper zone from which was recovered by elution with a mixt. of petroleum ether and MeOH one benzene, black-red crystals of *rhodospin* (II), m. 159-60°, absorption max. in CS₂, CHCl₃, petroleum ether and abs. alc., 547-503-478, 521-486-453, 501-497-440 and 505-474-(445) mμ, resp. It is not hydrolyzed on treatment with EtONa. The second red zone consisted of a mixt. of carotenoids the bright red-brown zone was eluted, taken up in petroleum ether and evap'd and yielded, in fine needles, a third carotenoid, *rhodopurpurin* (III), m. 161-2°, absorption max. in CS₂, CHCl₃, petroleum ether and benzene, 550-511-479, 523-487-(458), 502-472 and 537-493 mμ, resp. Preliminary investigation of the purple bacteria showed the presence of a fourth pigment, *flavorhodin* (IV) with absorption max. in CS₂, CHCl₃, petroleum ether and abs. alc. at 502-472, 482-453, 467-437 and 472 mμ, resp., which are in close agreement for those found by Chagaff and Dieryck (C. A. 27, 747) for their acetone from *Sarcina lutea*. Another carotenoid with absorption max. in CS₂, 518-487 mμ significant of *flavocarin* was found in another previous ext. in which IV was not detected. The compn. of the carotenoid mixt. may also vary under the influence of unknown circumstances.

Chaulmoogra oil and the morphological modifications of *Mycobacterium tuberculosis*. F. Baisemli. *Bull. soc. microb. Moscou*, Ser. 2, 1935, 7, 135-42.—Esterified chaulmoogra oil has a specific action on *M. tuberculosis*, modifying its resistance to acids, and favoring the granular decomposition.

G. A. BRAVO

Sulfur bacteria of the mud baths of Bormo. A. Monti. *Boll. soc. med. chir. Pisa* 11 (1935), *Boll. soc. microb. Moscou*, Ser. 2, 7, 353.—In the mucilaginous mud baths of Bormo S bacteria were found which utilize H₂S produced by anaerobic microorganisms in the reduction of MgSO₄ and CaSO₄. In these bacteria, S is contained in form of oil drops, which at the death of the micro-organisms are transformed into rhombic S. G. A. BRAVO

Corynebacterium diphtheriae. Maria T. Cavassa. *Patologia* 27, 726-37 (1935).—Among the various media for the cultivation of *C. diphtheriae* (even with blood of rabbit, horse or sheep, instead of defibrinated ox blood) appears the best for the rapid growth of *C. diphtheriae*, but no medium could supply a very rapid diagnosis (e. g., within 12 hrs.). All media were *pu* always neutral at *pu* = 7.0-7.2, but within 24 hrs. the *pu* was always slightly lowered (5.0-6.8). The behavior of the various strains of bacterium toward the sugars is variable. Tryptone production is greater in the strains cultivated under aerobic conditions and at a *pu* near neutral point. The strains which show a tendency to acidify the

culture medium are unsuitable as producers of toxin

The immunizing antigen of pneumococcus Types I and II Lloyd D Felton and Benjamin Prescott *J Bact* 31, 60 (1936), cf C A 29, 2195. —When Type I pneumococcus polysaccharides were treated with 0.1 N NaOH at 100° or NH_4OH at 4°, there was a drop in the amt of acid in an acid distillate from 7.3 to 0.8%, in the -oxyl group % from 2.9 to 0, in bisulfite addn in a 10 mg sample from 11.9 to 0.23 cc in I addn from 1.3 to 0.03, and in glucose % from 15.0% to 0. Type II polysaccharides showed similar changes

John T Myers

The existence in the *Phytomonas tumefaciens* of an endotoxin capable of causing the formation of tumors in plants André Bonvin, Max Marbe, Lydia Mesrobian and Petre Juster *Compt rend* 201, 984-6 (1935) —Elementary microanalysis of the complete antigen of *Phytomonas tumefaciens* gave the following values: C 44.0, H 7.4, N 1.7 and P 1.0%. Acid hydrolysis yields 40.8% reducing sugars and 18.1% fat acids. Injection of this antigen in the stems of *Helianthus annuus* induces the

growth of tumors in the cortex of the stem, similar to those produced by injection of the live bacillus W. G. R.

Physiological studies of several pathogenic bacteria that induce cell stimulation in plants J A Pinckard *J. Agr. Research* 50, 933-52 (1935). —Routine physiol studies on certain common bacterial media showed that each of the organisms examd gave characteristic growth reactions distinctive for each organism except the oleander and olive-knot bacteria, which showed similar cultural characters in all these media. The H-ion concn at which growth was prevented in liquid culture varied from pH 3.6 to 4.4 in the acid range and approx 9.5 to 10.5 in the alk range. Comparative utilization of several types of compds indicated that oxamide, L-tyrosine and L-cystine were the only sources of N used in which all the organisms distinctly produced similar reactions, and that the only compds of C in which similar reactions were produced were starch, pectin, phlorizin and the Na salts of formic, acetic, propionic, glycolic, malonic, succinic, tartaric and malic acids. H-ion concn of the sterile liquid medium contg yeast ext., glucose and mineral salts had a marked influence on the oxidation-reduction intensity of this medium. Strong acid reactions were accompanied by relatively strong oxidizing potentials. Measurements of oxidation-reduction potential made at frequent intervals with various growing cultures in a yeast-ext medium showed that all the organisms produced relatively strong reducing potentials in undisturbed liquid cultures

W. H. Ross

Enzyme formation and polysaccharide synthesis by bacteria Evelyn A Cooper and John I. Preston *Biochem J* 29, 2267-77 (1935). —Enzyme formation and polysaccharide synthesis by bacteria related to *B. mesentericus* and bacteria pathogenic to plants were studied. *Ps. pruni*, *Ps. prunicola*, *Ps. mors-prunorum*, *Phytomonas aptatum*, *Ph. campestris* and *Ph. syringae* with sucrose as a source readily formed a polysaccharide of the fructosan type which appeared analogous to the levan formed by *B. mesentericus* and *B. subtilis*. *Ph. phaseoli*, *Ph. solanaceorum*, *Erwinia carotovora*, *Ph. tabaci* and *Ph. marginalis* occasionally formed polysaccharides. *Erwinia amylovora*, *Ph. barketti*, *Ph. cannae*, *Ph. malvacearum*, *Erwinia phytophthora*, *Ph. stewartii*, *Ph. juglandis*, *Ph. tumefaciens* and *Radiobacter* gave negative results. Mannose and arabinose inhibited polysaccharide formation from sucrose by *B. mesentericus*, *B. megatherium* and *Ps. pruni* and from sorbitol by *Acetobacter xylinum* apparently by a direct toxic effect on the cells of the organism. Glycerol, mannitol and sorbitol decreased the diastatic power of *B. mesentericus* cultures. *B. megatherium* and *Ac. xylinum* could not synthesize polysaccharides from Na acetate, malonate or succinate and these compds. had no effect on the synthesis from sucrose by *B. megatherium*. The peptone in the media could be replaced by asparagine, leucine or alanine without affecting the polysaccharide synthesis by these organisms. No evidence of dextran or pentosan formation by any plant pathogen was discovered

E W Scott

The action of certain sulfur compounds on the fermentation of glucose by propionic bacteria (*Propionibacterium* 11) Paulette Chair *Compt rend* 201, 857-8 (1935), cf C A 29, 6268. —By the previous technic, it was found that quantitatively cystine, cysteine and glutathione (I) imparted the same amt of activation to the fermentation. The optimum activation concn of I was found to be 1 in 25,000

E W Scott

Does the secretion of proteases exist in bacteria? Wacław Moysch *Compt rend* 201, 859-60 (1935). —The protease of *Serratia marcescens* was not present in fresh cultures, the amt of protease was less in agitated cultures contg more bacteria than in undisturbed cultures contg fewer cells and no protease was found in cultures killed with toluene, $CHCl_3$ or Et_2O . Conclusion. Any protease present in bacterial culture is due to the solution of dead bacteria. Live bacteria cannot set free proteases

Vital staining of bacteria grown on media containing stains Andras Hegedus *Algyar Orvos Arch* 36,

499-401(1975).—Bacteria grown on media which contain stain concentrate the stain in their cells. 31 F

Cellular reactions to wax-like materials from acid-fast bacteria. The unsaponifiable fraction from the tubercle bacillus. Strain H-37. J. R. Sabin, E. C. Southam and R. M. Thoen. *J. Lipid Med.* 62, 75 (10/1975). The unsaponifiable fractions from the mycobacteria, though they are extremely stable, form emulsions and tend in H₂O, are nevertheless remarkable stimulants of cells. They give rise to new monomers which surround these waxes and then flow into cells which engulf them. The property of acid fastness of the waxes makes it possible to identify them within the giant cells which have phagocytized them. Within the foreign body granules the waxes are slowly digested. They appear not to damage the cells and have not as yet induced any effect on part in case of man. C. J. West

Certain chemical and physical factors causing bactericidal action. A. C. H. Yen. *Trans. 14th Congr. Far East Assoc. Trop. Med.* 1, 303 (10/1975). The effect of electricity on bacterial suspensions is due to the chem. substances formed in electrolysis. Hypochlorite, hypobromite and hypiodite are highly effective since there is bactericidal action when these substances appear as products of electrolysis. The hydrolysis of urea is accumulated in many cases of electrolysis within 1 hr. are insufficient to cause bactericidal action because of their low concentrations. J. S. Yen

The chemical influence of bacteria on blood pigments. Maxilian Knorr. *Trans. 14th Congr. Far East Assoc. Trop. Med.* 1, 331 (10/1975). Hematin was produced by bacteria or water vibrio, and oxyhemoglobin will be changed easily under the complete aerobic condition to hematin and oxhemoglobin. J. S. Yen

The influence of etheral oil on the tuberculous bacilli and experimental tuberculosis. Karen Inoué. *Trans. 14th Congr. Far East Assoc. Trop. Med.* 1, 323-23(1975). I theral oil shows sterilizing action on tuberculous bacilli as on colon bacilli. J. S. Yen

THOMAS G. MILLER

Carotenoids from the anthers of *Lilium tigrinum*. A new carotenoid. Anthranaxanthin. P. Karrer and A. Oswald. *Helv. Chim. Acta* 18, 1303-1315 (1975). The anthers of 1200 flowers of *Lilium tigrinum* were vacuum dried in glass ampoules at 40° for 6 hrs. The 160 g. of dried material was extr. with petr. ether and the concd. ext. was taken up in 100 cc. of CH₂Cl₂. The deeply colored petr. ether ext. of phytochemicals was dissolved in 200 cc. of petr. ether and upon with a vol. of 15 g. of Na in 300 cc. alc. Careful dist. with 1 atm. standing for 2 days in a separatory funnel caused the carotenoids to sep. out as a red-brown film between the petr. ether and alc. phases. The ppt. was filtered off, washed and freed from impurities by boiling with petr. ether. The washed ppt. was dissolved in hot 1:1 CH₂Cl₂ and on standing in the ice-box gave 0.3 g. of colored crystals. Chromatographic sep. by absorption by CaSO₄ gave a small overhead zone of impurities, a long brown-red zone from which 0.1 g. of carotenoid (I) was afterward eluted, and a bottom zone of yellow anthranaxanthin (II). The carotenoids were eluted with a mix. of benzene and 10% alc. 1 crystal, common to spindle-shaped crystals and compact clumps, m.

176° (mxd in p. with paprika capsaanthin, 177°). Its absorption spectra in CH₂ and CHCl₃ were in complete agreement with those of capsaanthin from *Caposium annuum*. Apparently, this is the first appearance of this pigment elsewhere than in the species species (II). *Calliandra* (C. *Calliandra*) in 211° (cor.) is very similar to I, but it contains 1 more O atom. It differs very slightly from I in m. p. and also in its absorption spectra. This previously unknown xanthin may contain OH groups but the yield (25 mg.) was too small for further investigation. The CHCl₃ soln. gave a deep blue color with SbCl₅ (adsorption max at 587 mμ). When in a 1% vol. of 11 it layered with concd. HCl, the acid bottom zone takes on a blue color, changing shortly afterward to a greenish tint. C. R. Adair

Effect of artificial wounds on the ripening of some fruits. G. Leoncini. *Ann. sper. agrar. (Rome)* 17, 201(1975). 1. Plums, pears, apples and larks were wounded with a sterilized needle, then analyzed at various periods of ripening. The sugar contents increased, the free acids and tannin contents decreased, and the ripening was always accelerated. G. A. Bravo

Some aspects of the biochemistry of the olive fruit, with regard to the mannitol content. G. Leoncini. *Ann. sper. agrar. (Rome)* 17, 211(1975). The max. of mannitol content in the olive leaves was found in the 4 months of autumn and winter, when the plants show a less metabolic activity. The max. was found in the autumn-lying period, together with a max. content of oleic acid. G. A. Bravo

Chemical researches on early- and late-ripening fruits. I. R. Nucumori and A. Zaccagnini. *Ann. sper. agrar. (Rome)* 17, 41 7(1975). —Ruits ripening in spring and summer (apricots, cherries, peaches, plums and grapes) contain less tartaric acid and more citric acid than late varieties, except grapes. Apples and pears show a nearly inverse behavior. II. R. Nucumori and F. Cerri. *Ibid.* 45-51. —Male acid is always present in greater amt. in the early varieties of fruits, but the total content of the acids is greater in late-ripening fruits. III. R. Nucumori and G. Ducci. *Ibid.* 55-62. —In peaches, the ratio male acid/citric acid is 1:1, and the ripening period is 20-60 days; in apricots, the ratio is 1:1 and the period 70-80 days; in pears and apples the ratio is about 1:0 and the periods are, resp., 70-80 and 80-90 days; in grapes, the ratio male acid/citric acid/tartaric acid is 5:7:1:3, and the ripening period is 100-110 days. These facts show that male acid is utilized in plant metabolism more readily than other acids. IV. R. Nucumori, G. Marchetti and J. Bagnoli. *Ibid.* 63-71. —Complete ripening of the fruits during the total ripening period show a decrease in pectin, an increase in the 1:1-ol, watters, an increase in the content of the pectin substance, and an increase of the tannin up to a max., then a decrease. The total and protein N contents decrease during ripening, but the non-protein (probably amino) N content is const.

G. A. Bravo

The ripening of the sorb apple. R. Nucumori and O. Bartoli. *Ann. sper. agrar. (Rome)* 17, 73-81(1975). —The acid contents decrease slowly during ripening of the apples. The glucose and fructose contents increase with a const. ratio. The sucrose and sorbitol contents increase during the first ripening of the fruits on the plant, but decrease when the fruits ripen on straw. G. A. Bravo

Changes in sugar content during the ripening of some varieties of fruits. G. Leoncini and F. Rogari. *Ann. sper. agrar. (Rome)* 17, 83-104(1975). —The sucrose content in pectin was found in the period of complete ripening, while reducing sugars decrease rapidly. Watering of the plants diminishes, and dryness increases the sucrose content of the fruits. Some explanations of these phenomena are given. G. A. Bravo

Changes in some constituents of olives during the ripening period, in relation to fatty matter formation. G. Leoncini and F. Rogari. *Ann. sper. agrar. (Rome)* 17, 123-127(1975). —No analysis was found between the content of sugars in olives and the formation of fatty matter. It is supposed that reducing sugars are probably formed

by the partial hydrolysis of pectin substances. The changes observed in the behavior of fats, total ext., cellulose, sugars, etc., vary markedly in the varieties examined, but the N-contg. matter is quite const. An approx. inverse relationship exists between N-free ext. and fatty matters.

G. A. Bravo

Effect of the enrichment of the atmosphere in oxygen on the development of plants. Marin Mollard. *Compt. rend.* 201, 1160-2 (1935).—The normal growth of both the radish and *Sterigmatocystis nigra* was definitely inhibited by the presence of increased amounts of O in the atm.

Rachel Brown

The glucide metabolism of *Sterigmatocystis nigra* is a function of the nitrogen source in the culture medium. Robert Bonnet and Raymond Jacquot. *Compt. rend.* 201, 1213-15 (1935), cf. C. A. 29, 5146*.—The formation of citric and oxalic (I) acids was detd. for the growth of *Sterigmatocystis nigra* in sugar media contg. (NH₄)₂SO₄ or KNO₃. The detns. were made at the time the mycelia were young, adult and partially autolyzed. In the presence of gluconic acid, xylose, arabinose, levulose, galactose, sucrose, maltose and inulin, but not lactose I was formed if KNO₃ was the source of N. I is a by-product due to a secondary phenomenon of growth.

Rachel Brown

Phosphorus metabolism in the leaves of some plants with constant foliage during the course of turning yellow. Emile Michel Durand. *Compt. rend.* 201, 1215-17 (1935).—The phenomena of migration which precede the falling of the leaves of Algerian ivy, cherry laurel (I) and aucuba bring about reduction in the total P sol in alc., lipid P, total P sol in dil. acid, mineral P, sol org. P and insol. residual P. In the green leaves phytin is present, the amt. depending upon the species, but with the exception of I it is absent in the yellow leaves.

Rachel Brown

The reaction of the medium and the activity of ordinary vs. performed mycelia of *Aspergillus*. Virgilio Bolcato. *Ann. chim. applicata* 25, 423-32 (1935).—See C. A. 30, 745*.

A. W. Conti

Granule building cell substances enter through the living plasma lemma. (Observations on epidermal cells of *Allium cepa*.) Otto Bank and Karel B. Estefák. *Protoplasta* 24, 404-8 (1935).—The taking up of color (methylene blue, methyl violet, crystal violet, neutral red, methyl green) brings about the entrance through the plasma lemma of the granule-building substances from the protoplasts of the epidermal cells of *Allium cepa*, following plasmolysis with neutral salts. The vitality of the protoplasts is not injured, and the plasma lemma is apparently unharmed. The colloidal cell substances, diffused from the protoplasts and forming granules with the dyes, change their form characteristically in warm solutions (30-50°) or hot solutions of the nitrates of different ions (K, Na, NH₄), these changes do not take place in cold solutions or in solutions of other salts of the same ions. A wound stimulus and plasmolysis with AgNO₃ act similarly to the dyes.

F. L. Dunlap

Biochemical study of the internal mechanism of photoperiodism. A. E. Murneek. Mo. Agr. Expt. Sta., *Bull.* 340 (Ann. Rept. 1933), 63-4 (1934).—As short-day soybean plants approached the reproductive stage there was a rapid accumulation of N in the stems, particularly in the nodes and internodes. All detd. forms of N were found including coagulable, proteose, basic, NH₄, amide, humin and amino, but not NO₃. The greatest differences were evident in the relative concns. of amide, humin, amino and NO₃ fractions. In the long-day plants there was very little NO₃ in the tips of the plants. In the presence of sufficient quantities of labile carbohydrates, NO₃ was used rapidly for the synthesis of proteins, and these in turn for the development of vegetative organs. In reproductive plants there was a rapid movement of N to the flowers and fruits and an accumulation of the carbohydrates, particularly starch, in the stems. Both carotene and xanthophyll were in greater concn. in short-day than in long-day plants.

C. R. Fellers

The hydrogen ion concentration relations of vine leaf

Edith S. Salacz. *Magyar Ámpelológiai Évkönyv* 9, 37-47 (1935).—Vine leaves were disintegrated by hand, moistened with CO₂ free distilled water, mixed to a pulp with purified Danube sand and the turbid liquor was filtered. The pH values of the solutions were detd. according to Gillespie in the presence of Sørensen indicators. American vine types gave values from 3.6 to 4.6, Hungarian ones also from 3.6 to 4.6 but showing less variation. The pH values for 5 vine types were detd. every 10 days from July 8 to Oct. 29. A Furmint vine leaf seemed to be more alk. than an Oporto one, which is said to be more sensitive to *Peronospora*. No connection between pH values and *Peronospora* sensitivity of vine leaves could be proved.

S. S. de Finály

Acidity of vine leaf and *Peronospora*. István Káhn. *Magyar Ámpelológiai Évkönyv* 9, 47-57 (1935).—Colorimetric detn. of pH values of vine leaves showed that direct sunshine increases the pH values of leaves by 0.3 (av.). No connection between chlorosis and pH values of leaves could be detd. The occurrence of *Erysiphe vitis* seemed to have an acidifying influence. Some systematic distribution of pH values of leaves of the same branch could be detected. pH values over 4.1 may give some protection against *Peronospora*. The immunity of some vine types against *Peronospora* is without doubt caused by some other factor than pH value.

S. S. de Finály

Osmotic pressure determinations on vines. Imre Szolnoki. *Magyar Ámpelológiai Évkönyv* 9, 60-7 (1935).—The osmotic pressure of vine leaves was detd. by the plasmolytic method, with 3.53% KNO₃ solutions. The European vine type showed 16.8, and the American 12.6 atm. This explains why the xerophytic leaves of European vines remained fresh 4-5 days when put in water, while the American ones dried in 2 days.

S. S. de Finály

The interrelations of catalase, respiration, after-ripening and germination in some dormant seeds of the Polygonaceae. Elizabeth R. Ransom. *Am. J. Botany* 22, 815-25 (1935).—The seeds of *Rumex crispus* and the 6 species of *Polygonum* studied were dormant at maturity. The optimum temp. for after-ripening of the moistened seeds was 3-6°. When fruits of *P. scandens* were kept for a time in a satd. atm. at 30°, dormancy became more pronounced and the time required for after-ripening at 3-6° was increased. The catalase activity of satd. fruits and seeds was greatest at 3-9° and lowest at 30°, while the rate of respiration was lowest at 3-9° and highest at 30°.

L. E. Gilson

Vitamin A activity of the thallus of a species of *Mucor*. W. H. Schopfer and A. Jung. *Compt. rend. soc. biol.* 120, 1093-5 (1935), cf. C. A. 29, 2198*.—*Phycomyces blakesleanus* was grown as previously described. The vitamin A content of the dry thallus, detd. by feeding expts., was equiv. to 30 mg. % of carotene. Colorimetric methods indicated a higher carotene content. L. E. Gilson.

The capsules of *Mycotorula albicans* and other yeast-like fungi. Pablo Negrom. *Folia biol.* 1, 235-6 (1935).—The isolation of a sp. polysaccharide from the capsules of *M. albicans* is described. The polysaccharide is sol. in water. It acts as a hapten and does not cause the formation of an antibody when injected into animals. It gives a complement-fixation reaction with serum of rabbits immunized with the whole microorganism. It gives a precipitin reaction with some immune sera and not with others. Probably the capsules of other species of yeast-like fungi contain sp. polysaccharides.

L. E. Gilson

The adsorption and elution of cucumber mosaic virus. B. N. Uppal. *Indian J. Agr. Sci.* 4, 650-62 (1934).—The virus is active in the pH range 5-9. It is readily adsorbed by fuller's earth in quantity as small as 0.125 g./100 cc. of the virus ext. Adsorption does not necessarily inactivate the virus unless the acidity of the medium is greater than pH 5. The virus can be eluted by changing the pH of the suspension to 6.0-6.7. Although the virus cannot be eluted with NH₄ salts such treatment does not inactivate the virus, a change in the reaction of the suspension that has been treated with NH₄ to pH 6.7 frees the virus *in vitro* in an active state.

K. D. Jacob

Yield of citric acid from sugar as a basis for estimating the mechanism of its formation from the latter. V. S. Butkevich and M. S. Gusevaya. *Compt. rend. acad. sci. U. R. S. S.* 18, 3, 405-8 (1935).—An active strain of *Aspergillus niger* was grown on 100 cc of nutrient contg sugar, 20g, KNO_3 0.35g, K_2HPO_4 0.04g, MgSO_4 7.74g, 0.04g, ZnSO_4 7.74g, 0.04g, and FeCl_3 0.0015g. Sugar (20%) was introduced under the film. The spores were then brought to pH 3 and 0.1% $\text{Mg}(\text{NO}_3)_2$ and KNO_3 added. The fungus was kept at 30° for 8 days on the nutrient and sugar. Both sugar and citric acid were detected by two different methods. The yield of citric acid exceeded that obtainable for the mechanism in which it is formed from sugar by way of al. fermentation. In expts with sucrose the yields approach the max. if sugar were entirely changed to citric acid. A scheme is proposed in which aldol condensation takes place in the sugar mol, forming a 5-membered ring. This is followed by oxidative breaking of the ring to give citric acid. Various other schemes proposed are discussed. S. P. Jeffrey.

The isolation of pectic substances from wood. Ernest Anderson. *J. Biol. Chem.* 112, 531-9 (1936).—The compn. of certain pectic substances isolated from the cambium layer and the sap wood of black locust approximates closely certain of the pectinic acids and of certain other substances the polygalacturonic acid obtained from *Citrus pectus*. The presence of d. galacturonic acid has been definitely established in the Ca pectate from both cambium and sap-wood. Methyl pentose sugars are apparently absent. "It appears that the pectic materials in wood are deposited in the middle lamella and the primary cell wall in the cambium at cell development and remain even in the old wood. Later in the growth of the wood other materials appear to be deposited on the pectic materials and protect them from the action of pectic solvents. The H₂O-sol. pectic material seems to be composed of a Ca salt with lignin part may be combined with cellulose or with lignin. While no detn. was made of the amt. of pectic material present, the sap-wood apparently contains less than 3% and the cambium less than 15%." A. P. Lotzow.

The storage and physiology of tropical fruits. C. W. Wardlaw and E. R. Leonard. *Trop. Agr. (Trinidad)* 12, 415-10 (1935). cf. C. A. 29, 5359.—Results are presented of expts with bananas, tomatoes, avocados, limes, grapefruits, papaws and other fruits. The rate of respiration and the concn. of gases in the internal cavities of papaws were measured repeatedly during utilization of the flower to decay of the fully matured fruit. The results show that many conclusions based in the past upon measurements of the external respiration of fruits alone will have to be modified. While the curves for rate of respiration and concn. of CO_2 in the internal gases run approx. parallel until the seeds mature and the white flesh begins to color, they do not thereafter. This is due to changes in the permeability of the skin and flesh and consequently to changes in the rate of diffusion of gases. The internal concn. of CO_2 begins to rise when the seeds are mature, although the external rise begins only when the fruit begins to color externally and reaches the characteristic when the fruit is fully ripe. While the metabolism of the fruit as measured by external respiration appears to diminish at this point, the rapid accumulation of CO_2 in the internal cavities from this time on shows that this is not necessarily true.

Physiology of "limb chlorosis" of the lupine. Helmut Schmitz. *Der. deut. botan. Ges.* 53, 897-10 (1935). The onset of lime chlorosis of the lupine depends on the alkali, of the medium directly in contact with the roots. Since the lupine can control this to a certain extent by root excretions the susceptibility to chlorosis depends upon the intensity and quality of these excretions. L. P. M.

Effect of the external medium on plant metabolism I. The metabolism of nitrogenous substances in a woody plant grown in a warm and humid atmosphere. Raoul Combes. *Rev. p. botan.* 46, 513-27 (1914).—A no. of 5-yr.-old beech trees were transferred in Feb. into a greenhouse kept at 23-25° and at a high humidity and compared

at intervals with respect to the ratio protein N/sol. N with similar trees remaining outside. The curve for the buds and the leaves developed therefrom of the trees left outside showed a marked rise from May 12 to June 10, followed by a rapid fall. This rise was due to a decrease in sol. N, at the time of the increase in proteins incident to the developing leaves (Apr. 7-24) the ratio remained unchanged. The corresponding curve for the trees grown in the warm atmosphere showed a smaller maxima in the period from Apr. 29 to Nov. 3. II. The absorption of mineral matter and the elaboration of organic matter in a herbaceous plant grown in light of different intensities. J. Panchaud. *Ibid.* 549-601.—*Raphanus sativus* grew best in full daylight. The water contents of the plants grown under conditions in which they received $1/4$, $1/2$, and $1/3$ of full solar radiation gradually decreased during the course of the development of the plants, while those receiving $1/4$ and full solar radiation increased in water content up to the time of flowering, after which they also decreased. The ash contents of the plants were higher with decreased illumination. III. The respiration of leaf tissues formed at different light intensities. A. M. Bronger. *Ibid.* 641-54.—Leaves of *R. sativus* which had developed in only $1/4$ or $1/2$ full solar radiation respired much more slowly than leaves from plants which had received more light. The highest rates for the CO_2 output of the leaves grown under the most unfavorable light conditions were obtained at the beginning of growth after germination and again at the time of flowering. The R. Q. remained close to unity regardless of light intensity during development. IV. The metabolism of nitrogenous compounds in a herbaceous plant grown at different light intensities. Léon Eschoute. *Ibid.* 47, 70-86 (1935).—The ratio insol. P/sol. P (in 10% $\text{CCl}_3\text{CO}_2\text{H}$) increased rapidly during germination, after which it decreased up to the time of flowering and then rose again (cf. *R. sativus*). The percentage of P was highest at the end of germination and decreased thereafter up to nearly the end of the growth period, when it showed a slight increase. In the early stages of development the plants grown in stronger light had the highest P contents, at later stages more P was present in the plants receiving less illumination. In the course of flowering and fruiting P migrated from the tubers to the aerial parts of the plant. V. The metabolism of nitrogenous substances in a herbaceous plant developed in different light intensities. Marie Moreau. *Ibid.* 523-51.—The percentage of protein, which was very high in the seeds (*R. sativus*), decreased from the beginning of germination to the time of flowering, after which a slow increase took place. At the early stages of development the plants grown in the different light intensities all contained about the same percentage of protein, but as growth progressed the plants under the most favorable light conditions stored up nonnitrogenous substances and thus contained a lower percentage of protein. Sol. N increased from the time of germination to the time of flowering, when it started to decrease.

1. Lawrence P. Miller. The formation of chlorophyll in roots and the reduction of silver salts by chloroplasts. R. J. Cauthbert. *Rev. p. botan.* 47, 401-24, 414-51 (1914).—Under the same conditions the roots of a large no. of plants retranslocated become green when exposed to light. The presence of sugar in the medium or other conditions which increase the quantity of sugar in the roots are favorable for the production of the green color. Only living chloroplasts reduce AgNO_3 . The reduction is considerably augmented by light but is not due to the reducing action of the direct products of assimilation.

Production of flavin enzyme systems in germinating plants. Hans v. Euler and Olof Dahl. *Biochem. Z.* 282, 255-61 (1935).—Total flavins and the nonoxidizable fraction of the flavins were detd. in plant extracts. Barley contains about 3-7 times as much total flavin as oat during the 1st 5 days of germination, and in the former the synthesis is practically completed on the 2nd day; whereas in germinating oats it increases only insignificantly. Ungerer stated peas contain much flavin; it is present almost entirely

as bound flavin. In the exerts from the germinated seeds the bound flavin makes up approx. $\frac{1}{2}$ of the total.

S Morgulis

Types of swelling of various kinds of fibers and their relation to the problem of fiber structure. K. Griffioen. *Plant (A) E. Z. Wiss. Biol.* 24, 584-601 (1935).—Expts. on the swelling of various kinds of fibers showed that NaOH causes regular swelling in fibers without any "balls" or bladder-like swellings, whether the fibers were from monocots, dicots or gymnosperms. Salts also cause a regular swelling. H_2SO_4 and Schweizer's reagent give "ball formations" in monocots and gymnosperms as well as in the wood fibers of *Betula* and *Fagus*, but in the bast fibers of dicots these reagents cause the fibers to swell evenly. The spheroidal (irregular) swelling depends on the width of the fiber (i.e., on the amt. of cellulose) and obeys the laws of surface tension. For all these reasons the "transverse membrane" theory of Léditke is not tenable. It is possible that longitudinal membranes exist but only at the margins of the various layers and not at the borders of the individual lamellae. It is very questionable whether the lamellae are surrounded by special membranes. In swelling studies, too much confidence must not be placed in lines of cleavage, splits and fractures. No reagents could be found which would attack only main valence chains (chem. forces) or only cohesion compds. (van der Waals forces). All cause swelling and hydrolysis, which action is dominant depends on various factors such as the concn. of the reagent, the structure of the fibers, method of handling, etc. Polaroscope studies showed that neither the fibrillar nor the small particles (as seen by Farr when treated with concd. HCl) are homogeneous, on the other hand, they represent heterogeneous mixts. O. R.

The assimilation of oxalic acid by *Aspergillus niger*. Denis Bach and Jean Fourmer. *Compt. rend.* 201, 982-4 (1935).—Nine to 30 mg. oxalic acid is assimilated by 200 mg. *Aspergillus niger* in 8 hrs. at pH 2.03-4.57 from a complete glucose nutritive medium containing 200 mg. oxalic acid. The wt. of the mycelium is doubled or tripled in 24 hrs. in this medium. When the nutrient medium contains no glucose, the wt. of the mycelium does not increase, but oxalic acid is assimilated if the pH is below 5.8. W. Gordon Rose

The participation of potassium in production of material by the higher plants. I. The action of potassium and photosynthesis. K. Mawald and A. Frank. *Z. Pflanzenphysiol., Dargang Boderk* 41, 8-25 (1935).—A review and discussion. Seventy-five references. C. J. S.

The assimilation of calcium by potato plants. K. Heller, K. Peh and J. Pruska. *Z. Pflanzenphysiol., Dargang Boderk* 41, 26-7 (1935).—In connection with the investigation on K_2O . C. A. 29, 1492, similar expts. with Cs showed that about 2% of the Cs offered in Richter's nutrient soln. concn. 0-16 mg. Cs/l. was absorbed by the plants. The error of the mean yields in these expts. was so large that the effect of the smaller additions of Cs is uncertain, the larger additions were certainly toxic. Only the roots of plants in the latter case showed any tendency to accumulate CaO in preference to K_2O . C. J. S.

The chlorosis of hydrangea (*Hydrangea hortensis*) in relation to iron. Werner Scholz. *Z. Pflanzenphysiol., Dargang Boderk* 41, 129-34 (1935).—Shoots of hydrangea were grown in porcelain dishes containing 4 kg. HCl-extd. quartz sand, with 0.21 g. $CaCO_3$ and in half the dishes 0.3 g. $FeSO_4 \cdot 7H_2O$, all watered with a soln. of fertilizer chemicals. Additional dishes with earth-peat mixts., some with 100 g. pptd. $CaCO_3$, were included. Observations on growth, compn. of leaves and incidence of chlorosis led to the following conclusions. The commonest cause of chlorosis in hydrangea is excess CaO in the soil, which makes Fe unavailable to the plant. The Fe of chlorotic plants is immobile, old leaves may contain much Fe, while new growth is deficient and chlorotic. Chlorotic leaves are neither especially high in CaO nor strikingly low in Fe. A special addition of an Fe salt to soil in which chlorosis occurs may prevent the latter without being of particular benefit to the plant in other ways—its growth is still unsatisfactory. Further expts. should be undertaken to

investigate the functional disturbances in root and leaf cells and the P_2O_5 economy of plants grown under conditions favoring chlorosis. Approx. 40 references.

C. J. Schollenberger

The relation between vitamin A and the plastids. Ph. Joyet-Lavergne. *Compt. rend.* 201, 1042-4 (1935); cf. C. A. 29, 1872, 6253.—Vitamin A is localized in the mitochondria of the plastids as shown by the $SbCl_5$ reaction on the leaves of *Elaeagnus canadensis* and *Isis germanica*. The former conclusion, that vitamin A is an essential constituent of chondrome, is verified. E. D. Walter

Characterization of hydroxylamine in autolyzed green leaves. Maurice Lemoigne, Pierre Monguillon and Robert Desvieux. *Compt. rend.* 201, 1077-10 (1935); cf. C. A. 29, 6918.—The plant juice, after clarification with Pb subacetate and destruction of the nitrates, is oxidized by I in $AcOH$ soln. The formation of HNO_2 under these conditions characterizes NH_4OH . E. D. Walter

Toxins of wilting. O. K. Elpidina. *Compt. rend. acad. sci. U. R. S. S. (N. S.)*, 3, 320-4 (1935); cf. C. A. 27, 2979.—Expts. with *Fusarium* preps. on tomato and sweet clover plants indicate that the wilting of plants attacked by fungi is caused by NH_3 , resulting from the N metabolism of the parasitic organism. E. D. Walter

A new type of plant lipochrome. I. M. Heilbron, B. Lythgoe and R. F. Mupers. *Nature* 136, 983 (1935); cf. C. A. 29, 6276.—A new pigment, mioxanthin, was extd. from *Rivularia viridis*, one of the blue-green algae. The carotenoid crystallizes from Et_2O -MeOH in deep Cu-colored needles, m. 117-18°. It has a single absorption band at 458-460 m μ in CS₂ and resembles in this respect the crustacean pigment astaxanthin. It has no acidic properties. Failure to yield a Na salt precludes the possibility of its being hematochrome. E. D. Walter

Plant pigments and reproduction. R. H. Roberts and Norman Livingston. *Science* 82, 595 (1935).—In leaves of Wealthy apple, beets, tobacco and *Datura* there was somewhat less chlorophyll, carotene and xanthophyll in the fruiting than in the vegetative condition. J. J. Willaman

The curly-top-resistant beet variety. A. W. Skuderna, Charles Price, J. O. Culbertson and C. E. Cornman. *Facts About Sugar* 31, 17 (1935).—The new variety, No. 1, bred by the U. S. Dept. of Agr., far surpasses all com. brands in disease resistance, and compares favorably with them in yield, sugar content and purity. F. W. Zerlan

PHILIP B. HAWK

The reed (*Phragmites communis*) as a source of vitamin C. S. Balakrishnan. *Compt. rend. acad. sci. U. R. S. S. (N. S.)*, 3, 270 (1935).—The leaves of the common reed contain 0.2% of ascorbic acid. (1) A daily min. dose of 0.5 mg. of I obtained from aq. expts. of the reed maintained guinea pigs kept on a scorbutic diet free from scurvy for 60 days. Large doses proved nontoxic to human subjects. The inoculation of the ext. with lactic fermentation bacilli under strictly anaerobic conditions augmented the reductive power of the ext. from 2- to 4-fold. Since similar results were obtained with skim milk the procedure may have profitable use in the food industry. C. R. A.

Growth-promotion effects of l- and d-araboflavin (6,7-dimethyl-9-(l- or d-1-araboflavin)-alloxanthin). 1. Luter, P. Kärner and M. Nitschberg. *Held Chim Acta* 18, 1336-37 (1935), cf. C. A. 29, 6237⁷.—Wt curves for rats on a B-free diet to which daily doses of 10, 20, 20-40 γ of l-araboflavin were added failed to show a const rate of growth after 40 days. In contrast to these findings curves for a daily dose of 10 γ of the optical antipode, d-araboflavin (II), show a const rise in wt of 0.8 g per day over a period of 50 days. Synthetic l-nobflavin gave a daily rise of 1.3 g for a daily dose of 10 γ and the d-isomer produced a daily rise of 0.1 g with a daily addn of 3 γ to the diet. It is remarkable that the biologically active form of araboflavin is that optical form in which arabinose does not occur naturally and that II differs from lactoflavin in the spatial disposition of 1 of the OH groups in the sugar residue. C. R. Addinall.

Crystalline derivatives of vitamin E. Preliminary report. Riang Ha Kim. *Sci Papers Inst Phys Chem Research* (Tokyo) 28, 74 (1935).—Treatment of 30 g of vitamin E concentrate, by 210-35 $^{\circ}$, obtained from rice germ oil by the method of Hamano (cf. C. A. 29, 2545¹), gave 8.5 g of white crystals which was dissolved in MeCO and fractionated by treatment with MeCO, MeOH, EtOH, AcOH and AcOH. A difficultly sol fraction (0.5 g), m. 148 $^{\circ}$, was assumed to be inactive and was not further investigated. A second fraction (1.5 g) C₁₈H₃₂O₆, m. 156 $^{\circ}$, was isolated and on hydrolysis with alc. KOH gave a physiologically active vitamin E. Rats kept on a vitamin E free diet (lard 7, cod liver oil 3, Et₂O 65 and dextrin 95%) for 130 days were given an oral dose of 0.5 mg. This single dose increased the wt of the rats gave birth to 40 young. A 3rd fraction, in 158 $^{\circ}$, was isolated from the mother liquor. The residual material was recrystd from MeCO and EtOH and yielded 0.7 g of crystals, m. 134 $^{\circ}$, from which free vitamin E regenerated. The residual amorph of the 4 crystals fractions was saponified with Me alc. KOH at room temp and the liberated material was converted into the ester of β -anthracenecarboxylic acid. The yellow powder (0.8 g) obtained gave Witky's and Lieberman's reactions but the color changed quickly to green and showed fluorescence. Photographic plates of the crystals are given. C. R. Addinall.

Biologic behavior of bran and potato protein in metabolism. A. Bickel, R. Sander and J. Schelling. *Munch med Wochschr* 82, 1482-51 (1935).—The feces N increases on bran and potato diets in comparison with a corresponding casein diet. The urinary excretion of N as a G. N. is higher than when an equimol amt of casein N is given. Eleanor W. J. Butz.

Effect of feeding dogs with vegetable "proto-acid". 1. Leont'ev. *Trudy Leningradskogo gosudarstvennogo Universiteta* No. 8, 13-17 (1935), cf. C. A. 29, 6277⁷.—Young dogs, 9 weeks old, were placed on a diet in which the animal protein was replaced by the "proto-acid" of peas. The exp. lasted 45 days, during which the pups received daily 30-40 g of the "proto-acid". The gain in wt of these pups was identical with that of the controls. X-ray diagrams failed to reveal any signs of rickets. A morphological and analysis of the control and exp. pups, performed at the end of the exp., yielded identical results. H. Cohen.

Water interchange. IX. Variation of diuresis and urine pH in animals with acid and alkaline diet. M. Saviano. *Atti accad. Lincei* 21, 715-20 (1935), cf. C. A. 29, 2210¹.—A dog kept on an acid diet (bread, meat and water) shows a pH of 5.4-5.5, and after diuresis (injection of excess water) the pH drops to 6.0. On an alk. diet (within 3 hrs. of feeding, and then drops to 7.5. On alk. diet the pH increases to 7.7-8.1. Similar results were obtained with rabbits. Poly-pyuria with an acid diet reduces the acidity of the urine, while with an alk. diet it becomes more acid, providing the exps. are not prolonged as to disturb the acid-base equil. of the system, by exhausting the mineral reserves in the system. A. W. Coonten.

Development of Jensen sarcoma under special conditions of diet. V. Iamami. *Atti accad. Lincei* 21, 721-5 (1935).—White rats fed on (1) an ordinary mixed diet, (2) an exclusive diet of corn, corrected for salt and vitamin deficiency, and (3) an oats diet, corrected as in 2, and then all inoculated with Jensen sarcoma tumor showed no difference in the development of the tumor. Another set in which the vitamin-deficient diet was used showed a slower rate of tumor development. A. W. Coonten.

Fat metabolism. VII. β -Oxidation of normal saturated dicarboxylic acids administered orally. P. V. Yrskade, J. van der Lee and A. J. S. van Alphen. *Z. physiol. Chem* 237, 189-90 (1935), cf. C. A. 29, 5429¹.—The excretion of sebatic (C₁₆), suberic (C₁₈) and adipic (C₁₀) acids after ingestion of tetracarin, and of nonadecarboxylic (C₁₉), azelaic (C₉) and pimelic (C₇) acids after ingestion of trandecylin, may represent ω -oxidation before and after one or two β -oxidations, or it may indicate successive β -oxidations after an initial ω -oxidation. The latter process has now been demonstrated by recovery of suberic and adipic acids after feeding β -sebacic acid, and of azelaic and pimelic acids after feeding nonadecarboxylic acid to dogs. A. W. Coonten.

Vitamin-carrier studies. XI. Preserved spinach as vitamin C carrier. N. E. Sheplevska and T. L. Izumrudova. *Z. Untersach. Lebensmittel* 70, 274-6 (1935), cf. C. A. 29, 7401¹.—Certain samples of preserved spinach contained 200 vitamin C units per kg., while other samples were practically free from this vitamin. XII. The onion as a vitamin C carrier. 1. The vitamin C content in onions kept for a short time. N. E. Sheplevska. *Ibid* 277-8.—11teen cc. of onion juice is adequate to protect guinea pigs from the onset of scurvy and the dosage may be less than this amt for protection. In the autumn, 1 l. of onion juice contains 67 antiscorbutic units. Hence the onion has weak antiscorbutic properties. 2. Vitamin C content of onions which have been kept for some time. N. E. Sheplevska and T. L. Izumrudova. *Ibid* 278-9.—One l. of juice obtained from onions which have been kept for some time contained less than 67 antiscorbutic units. XIII. The vitamin C content of dried onions. S. N. Matko. *Ibid* 279-80.—Feeding of cooked ordinary onions and of leeks to exp. animals in amts up to 8 g in the case of the former and 5 g in the case of the latter showed no antiscorbutic action. XIV. The antiscorbutic properties of the rutabaga. *Ibid* 280-2.

The juice of the yellow-meated rutabaga which has been kept through the autumn contains not less than 570 vitamin C units per l. and its min. prophylactic dose lies between 0.35 and 1.75 cc. If these rutabagas are kept through the winter, the vitamin C content per l. is less than 570 and the min. prophylactic dose is greater than 1.75 cc. XV. The antiscorbutic properties of sulfured white and white cabbage. *Ibid*, 283-4.—Dried, sulfured white and completely cooked cabbage which has been kept 2 months after drying and for 3 months during the course of these exps. contained in 1 kg about 160 vitamin C units and its min. prophylactic dose was in the neighborhood of 6 g. XVI. The action of certain extraction agents on the antiscorbutic activity of fir needles. The infusions. N. I. Orlov. *Ibid* 285-8.—The min. therapeutic dose of the original fir-needle infusion (1 l.) for guinea pigs was between 1 and 3 cc. This infusion was prep'd from the fir needles by treatment with a 0.2% HCl soln. A treatment of this infusion with Et₂O lowered the antiscorbutic activity notably and its min. therapeutic dose was between 3 and 6 cc. Treatment with CHCl₃ did not lower the antiscorbutic activity, as much as the min. therapeutic dose of such an infusion was about 3 cc. F. L. Dunlap.

A year's exclusive meat diet and seven years later. Clarence W. Leach. *Am. J. Digestive Diseases Nutrition* 2, 478-58 (1935).—A summary of clinical and lab. findings on 2 Arctic explorers living under av. conditions in a New York climate.

The relation of vitamin A to anophthalmos in pigs. Fred Hale. *Am. J. Ophthalmol.* 19, 1087-91 (1935). In the course of exps. relating to maternal vitamin A

deficiency, 42 pigs (4 litters) were born blind and showed such other defects as cleft palate, cleft lip, accessory ears, etc. Complete genetic tests indicate that maternal deficiency of vitamin A will result in a variety of defects in the offspring. Edward Eagle

The Harben lectures, 1935 Problems of nutrition and growth I The digestion of starch P Armand-Delille *J. State Med.* 43 683 95(1935) II The role of the vitamins *Ibid.* 696 708 III Light and heliotherapy in nutrition *Ibid.* 709-19 Edward Eagle

Miscellaneous studies on poultry grit Roy H. White Md Agr Expt Sta, *Bull.* No 377, 313-35(1935) — Limestone of low Mg content is adequate to supply all the Ca needed for egg-shell making in laying hens Crushed oyster shells serve in the dual role of Ca carrier and grit for laying hens Excess grit or limestone passes from the body in the excrement The grinding of food particles is only a secondary function of grit in chickens Furnishing mineral for egg-shell formation and the sepn of food particles to facilitate the churning action of the gizzard are primary functions C R Fellers

Ten year report of studies in child development and parent education Ethel B Waring N Y (Cornell) Agr Expt Sta, *Bull.* No 638, 69 pp (1935) — A condensation of 67 different research studies or surveys on related subjects Project 26 is a dietary study of nursery school children by Olive R. Jones (*Ibid.* 31 3) J found the av. caloric intake for the noon meal was only 371 cal Protein constituted 13%, fat 39% and carbohydrate 48% of the total cal in the food intake of pre school children Ca, P and Fe intakes were, resp. 0.80, 0.91 and 0.0065 g daily When the meals were begun with a serving of fruit juice the voluntary intake of other food was considerably increased C R Fellers

Ordinary dried blood versus soluble blood flour for calves W L Krauss and C F Monroe Ohio Agr Expt Sta, *Bull.* No 548 (53rd Ann Rept), 57(1935) — A month's feeding trial showed no advantage for the spray dried sol. product in the dry feed system of raising calves C R Fellers

Sources of vitamin A for chicks I Comparison of carotene and vitamin A as found in cod-liver oil R M Bethke and P R Record Ohio Agr Expt Sta, *Bull.* No 548 (53rd Ann Rept), 73(1935) — Approx. 100% of pure carotene per 100 g of basal ration (white corn, wheat middlings, caecm, irradiated yeast, bone meal, CaCO₃ and NaCl) was required to meet the basal requirements of chicks for vitamin A for the 1st 8 weeks Vitamin A as found in cod liver oil was equal to carotene when fed on the same biol. rat unit basis On the basal ration alone, none of the chicks survived longer than 6 weeks C R Fellers

Influence of feed of the cow upon the vitamin G content of the milk C H Hunt and A E Perkins Ohio Agr Expt Sta, *Bull.* No 548 (53rd Ann Rept), 74(1935) — Cows on a low protein ration also low in vitamin G, consisting of timothy hay and beet pulp, produced milk of lower vitamin G potency than cows fed an ordinary winter ration contg. a good grade of alfalfa hay The vitamin G content of milk from cows on pasture varied directly with that of the pasture grasses C R Fellers

Nutrition of turkeys J E Hunter, D R Marble and H C Kneidel Pa Agr Expt Sta, *Bull.* No 320 (45th Ann Rept), 8(1935), cf C A 30, 1095 — When vitamin D is supplied in an oil contg. 108 U S P units per g, the requirement of growing turkeys for this supplement is approx. 68 U S P units per 100 g of rations Corn gluten meal in combination with animal protein feeds produces a superior flesh in young turkeys When a combination of meat, fish and milk protein is used to supply the animal protein in a 24% protein starting mash, 50% of any 2 of the 3 animal protein products may be replaced with protein from soybean oil meal or corn gluten meal, when the loss of Ca and P is compensated C R Fellers

Relation of the color and carotene content of butter fat to its vitamin A potency Ray Treichler, Mary A Grimes and G S. Fraps Tex. Agr. Expt Sta, *Bull.* No 513,

3-34(1935) — The carotene content was estd from the absorption of light by the melted butter fat at 470 and 480 mμ as measured with a spectrophotometer. The absorption was calcd to carotene by means of factors obtained from measurements of the absorption of light by known amts of purified carotene dissolved in butter fat. Both the carotene and the vitamin A decreased during the period of feeding of the cows that had been on pasture before the period of lactation began The carotene of butter fat from a cow fed on white corn decreased from 9.18 p p m at the beginning to 0.06 p p m in 28 weeks Most of the decrease occurred during the 1st 6 weeks The carotene content of butter fat of cows on yellow corn decreased from 10.00 at the beginning to 0.29 p p m in 28 weeks The cows on yellow corn produced butter fat contg. more carotene and vitamin A than the cows on white corn The cow on a daily ration of 3 lb of alfalfa leaf meal in addn. to yellow corn produced butter fat which decreased from 12.1 p p m to 1.78 p p m of carotene in 32 weeks Cows depleted of vitamin A and placed upon Sudan grass pasture produced butter fat in which the carotene content increased during the entire period of the expt from 0.53 to 8.03 p p m of carotene The carotene content of the butter fat of the cows on pasture continued to increase after the vitamin A potency had reached a max. of 50 units per g Sorghum silage fed in liberal amts did not produce butter fat high in vitamin A or in carotene The carotene content of butter fat depends upon the feed, it was high in the butter fats of the cow receiving a high amt of carotene If it is assumed that 0.6 p p m of carotene is equal to 1 unit of vitamin A potency, in the case of the cow fed on white corn the percentage of vitamin A potency due to carotene decreased from 38% at the beginning of the expt to 1% near the end In that of the cow receiving yellow corn, it decreased in one case from 47% at the beginning to 9% at the end In that of the cow receiving daily 3 lb of alfalfa leaf meal in addn. to yellow corn, the percentage of vitamin A potency due to carotene varied from 30 to 55. The high vitamin A potency ascribed to carotene in the butter fat of the cow receiving daily 6 lb of alfalfa leaf meal again raised the question as to whether all of the coloring matter is really carotene and has vitamin A potency The decrease in the carotene and vitamin A contents of butter fat during the lactation period of the cow is due to deficiency of vitamin A potency in the feed and not to the stage of lactation The relation between the carotene content and the vitamin A potency of butter fat depends upon the quantities of vitamin A and carotene stored by the cow at the beginning of the lactation period, upon the length of time which the feed deficient in vitamin A and carotene has been fed, and upon the extent of such deficiency The data resulting from the spectrophotometric analysis of the butter fats from 2 cows were converted into monochromatic eqns and the color was expressed as dominant wave length, colorimetric purity and luminosity A decrease in carotene content was accompanied by a decrease in purity and an increase in luminosity, reflecting the loss of yellow color. The butter fat of the goat on green pasture is low in carotene but high in vitamin A potency Goats seem to have a greater power to transform carotene into vitamin A than have cows Butter high in vitamin A is likely to be highly colored, but all colored butter is not high in vitamin A Light colored butter is likely to be low in vitamin A The chances are high that butter that is naturally very yellow will contain more vitamin A potency than light-colored butter Bibliography C R Fellers

Studies of the values of different grades of milk in infant feeding J A Newlander and C H Jones Vt Agr Expt Sta, *Bull.* No 389, 5-40(1935) — By expts on pigs, the relative feeding values of fresh, evapd, powd and remade milks were detd Fresh milk proved best insofar as gains in wt, dry matter wt, vigor and body compn were concerned next were evapd milk and 1 of the samples of powd milk Marked changes in body compn occurred with age increase Pigs at birth contain about 80% H₂O Protein constitutes approx. 60% of their dry matter while ash and fat contents average about

17% each. The ratio of fat to protein is 1.36. As age advances the dry matter and fat percentages increase decidedly until at weaning time total dry matter is 60% and fat 15.6% greater than at birth. The percentages of fat and protein are approx. equal. C. R. Teller.

The effect of feeding deaminated versus untreated cod-liver oils on growth, egg production and mortality of poultry. H. S. Gutteridge. *Can. Dept. Agr. Pub.* 475, Tech. Bull. 1, 29 pp. (1935).—See C. A. 29, 800-9.

Biological and biochemical investigation of the ascorbic acid content of plant tissues containing chlorophyll or not. Lucien Rasmussen, A. Carot and L. P. Leblond. *Bull. Soc. chim. bel. 17*, 1649-76 (1935).—See C. A. 30, 751.

Crystalline vitamin B. Experimental and observations. M. Vorkau, R. R. Williams and R. J. Waterman. *J. Am. Med. Assoc.* 105, 1540 (1933).—Evidence shows frequent deficiency of vitamin B in the human dietary. In a study of 100 cases of clinical neuritis in which vitamin B crystals, 30 mg. daily, were administered orally, 41 were rendered symptom free, 48 were benefited and 8 showed no improvement. In 8 cases of gastro-intestinal hypomotility and atony, 6 were cured by ingestion of vitamin B. P. P. Griffiths.

Studies on crystalline vitamin B. Observations on diabetes. Martin G. Volinac, Robert B. Williams and Robert J. Waterman. *Am. J. Digestive Diseases Nutrition* 2, 541-57 (1935).—A split deficiency of vitamin B induces a disturbance of the carbohydrate metabolism characterized by a rise in the blood sugar and in the glycogen content of liver and muscle. Diabetes mellitus is suggestive of a nutritional disturbance and there is reason to believe that a deficiency of vitamin B may be a factor in the production and clinical course of this condition. In a series of 11 cases of diabetes mellitus to whom an av. of 10 mg. of vitamin B, was administered daily for 24 consecutive days, 6 showed an increased carbohydrate utilization. Edward Eagle.

Diminution of the iodine number of the fats of guinea-pig liver and adrenals in antismoking C. L. De Caro and M. Chaim. *Biol. sci. stat. bel. 10*, 235 (1935).

Helen Lee Gruehl.

Deficiency osteoporosis. Joseph Lebowich. *Arch. Path.* 20, 742-51 (1935).—A case of deficiency osteoporosis is described in a 61-year-old white woman. Clinically, deficiency osteoporosis appears to be due to lack of vitamin D. The changes at the chondro-osseous junction in deficiency osteoporosis are similar to those in rickets. Osteon is markedly increased in amt. and thickness as it is also in rickets. The last 2 changes are considered pathognomonic of rickets. Hence there is some histologic evidence that deficiency osteoporosis and rickets may be the same entity.

Effect of the plane of nutrition on the course of animal typanosomiasis. M. H. French and H. I. Hornby. *Typanosomiasis Territory, Ann. Entom. Soc. 1024*, 46-50.—The course of *T. congolensis* disease from infection to crisis is unaltered, or at any rate is not favorably affected, by planes of nutrition higher than those of bare maintenance. Digestibility experiments, sheep and goats, with rations of hay and concentrates, showed that even, in the anemia and loss of wt. of affected animals can be attributed to impaired digestion. Analytical data are given. K. D. Jacob.

The lime requirements of sheep. M. C. Franklyn. *New Zealand J. Agr.* 51, 27-36 (1935).—In 127 cases of milk fever in ewes the Ca content of the blood serum amounted to 2-8 mg./100 cc. as compared with about 10 mg. in the blood serum of healthy animals. In the majority of cases the Ca did not exceed 5 mg./100 cc. Several ewes were kept on a diet particularly low in Ca for 2-3 years without showing symptoms usually associated with milk fever. It appears that a low Ca content in the diet is not the sole cause of milk fever in farm animals, although it may contribute to the incidence of the disease. The alfalfa deficiency of sheep in N. Zealand is not caused by Ca deficiency in the diet. In goats with mature wethers

receiving high-Ca diets the storage of Ca was not with certain animals and neg. with others. At present it is impossible to draw up a definite set of Ca requirements for sheep under various dietary conditions.

The hemoglobin content of the blood of laying hens on practical poultry rations. M. O. Scutlar, C. A. Ivey, J. B. Hurt and J. G. Haign. *Poultry Sci.* 15, 9-14 (1936).—A practical laying ration of 15% Ca and 1.5 mg. Cu per hen per day supported heavy egg production without concurrent lowering of the hemoglobin content of the blood. Feeding of added Fe and Cu as FeSO₄ and CuSO₄ failed to increase either the hemoglobin content of the blood or the egg production. There was no evidence of anemia in healthy, noninfected laying hens receiving the practical ration. There was evidence that during heavy laying 20% of the food Cu and 10% of the food Fe may be lost in the eggs. The Fe and Cu contents of some poultry feeds and supplements were for yellow corn 36.4, 2.8, wheat 50.0, 7.2, soyab. 100.0, 2.6, and oyster shell 62.0 and less than 0.2 mg./kg., resp. K. D. Jacob.

Growth of chick embryos from hens fed different protein levels. Robert Proulx, and R. B. Thompson. *Poultry Sci.* 15, 18-24 (1936).—Neither the growth nor the total N content of the embryos was significantly affected by varying the protein content of the hen ration from 12.0 to 24.7%.

K. D. Jacob.

The vitamin D content and hemoglobin building properties of dehydrated kelp for chicks. M. Wain Miller and Gordon J. Pearce. *Poultry Sci.* 15, 15-18 (1936).—A sample of dehydrated kelp contained little or no vitamin D and did not increase the hemoglobin content of the blood of chicks on a normal ration. Extracts supplemented with kelp and cod liver oil were not superior to the ones supplemented with cod liver oil alone. The kelp contained 14.0 7.44, ash 35.44, protein 8.37, Ca 1.60, P 0.33, Cu 0.00094, Fe 0.00091 and B 0.15%.

K. D. Jacob.

The phosphorus requirements of growing chickens, with a demonstration of the value of controlled experimental feeding. W. T. Watkins and H. H. Mitchell. *Poultry Sci.* 15, 32-41 (1936).—In general, it appears that the greater the consumption of a diet uninhibited in some particular, the more poorly nourished will be the animal with reference to the function affected by the unbalanced ration. Chickens in the self-maintaining phase of growth require more than 0.26% of P in the ration but no more than 0.5% for fast growth and calcification of the bone. K. D. Jacob.

Availability of calcium salts for bone formation and rickets prevention in chicks. H. J. Dolan, C. A. Ivey, J. B. Hart and J. C. Haign. *Poultry Sci.* 15, 42-7 (1936).—The Ca in limestone, gypsum, rock phosphate, Ca gluconate, "Dicalpho," steamed bone meal and dolomite appeared to be equally available for bone formation in chicks that were fed a basal exclusively ration supplemented with varying levels of cod-liver oil. The ash content of the fat-free bone was higher when the supplement contained P in comparison with Ca. With the levels of cod-liver oil added to the ration were 0, Ca rickets produced better growth and bone formation than did lipid Ca gluconate. When extremely insol. Ca rickets were fed their availability was proportional to their soly. in 0.5% HCl, increasing the cod-liver oil had no effect on the availability of the Ca in such combs. K. D. Jacob.

A new factor, not vitamin G, necessary for hatchability. R. B. Neulter, T. C. Rye, R. N. Ellis and Harry W. Faust. *Poultry Sci.* 15, 17-20 (1936).—A basal feed mix composed of ground yellow corn 92.0%, pure wheat bran 9.25%, rolled oats 18.8 and alfalfa leaf meal 5.8% contains at least enough vitamin G to meet the requirements of chickens for hatchability but lacks some other factor necessary for high hatchability, which is relatively abundant in dried pork-liver meal and green grass, and is present to some extent in a mix. of desiccated meat meal, fish meal and alfalfa. Dried whey is not a good source of this factor. K. D. Jacob.

Vitamin A storage by chickens. Arthur D. Holme,

Francis Tripp and Percy A. Campbell *Poultry Sci.* 15, 71-8(1936).—The av. vitamin A content of livers from 8-week-old chicks that received 0.5% of sardine oil as a supplement to their ration was about 4 times greater than that of livers from chicks that received 0.25% of oil, a significant difference due to the higher level of oil was also evident in the livers of 12-week-old chicks. Regardless of the amt. of oil fed, the vitamin A content of livers from 12-week-old chicks was larger than that of the livers from comparable 8-week-old chicks. The no. of eggs produced by 9-month-old pullets increased with the amt. of oil contained in the rations, none of the pullets showed signs of vitamin A deficiency. High-producing flocks fed rations rich in vitamin A maintained an adequate body store of vitamin A throughout the reproduction period. Thirty-one references. K. D. Jacob

The nutritive value of proteins for maintenance. Samuel Morris and Norman C. Wright *J. Dairy Research* 6, 283-302(1935).—When minimal quantities of protein are fed in the maintenance ration of steers, a deficiency of lysine will lead to a marked increase in the urinary N output. A deficiency of cystine had no effect. The catabolism of body tissue is shown by the high creatine excretion and $\frac{1}{2}$ N ratio of the excess S and N excreted. This is thought to be the result of excessive deamination with the production of mild acidosis. As regards urinary partition of N, there is some indication that a lysine-deficient diet causes a decreased percentage excretion of urea N and an increase of ammonia N. Biol. values were calculated with maize-germ meal, wheat gluten, rye flour and blood meal as the sources of protein in the ration. The only marked difference in biol. value was in the case of wheat gluten, which is very deficient in lysine. An approx. value for the lysine requirements for maintenance has been calculated, i.e., 0.80 g. of lysine N per 1000 lb. live wt. A. H. Johnson

The B content of foods. A. G. van Veen *Genescheek Tijdschr. Nederland. Indie* 75, 2030-61(1935).—It was found, from the study of different rations used in the tropics, that, if a normally working inhabitant of these countries with an av. wt. of 50 kg. and a daily calory supply of about 2500 assimilates less than 150 international B units a day he runs a great risk of getting beriberi. If the supply is greater than 200 units these chances are practically nil. Ricebirds and rats were in the expts. J. C. Jurgens

Present status of the vitamin B complex. C. A. Elvehjem *Am. J. Pub. Health* 25, 1334-9(1935).—The vitamin B complex consists of at least 5 factors, B₁, B₂, B₃, B₆ and B₁₂. A brief survey with 27 references. J. A. Kennedy

Vitamin content of important foods in the child's diet. Carl R. Teller *Am. J. Pub. Health* 25, 1340-5(1935).—A short summary of research findings at the Massachusetts State College. The data deal largely with vitamins C and D in milk, fruits and vegetables, with some information on other vitamins. Nineteen references. J. A. K.

Effect of ketogenic diet on the blood sugar and the respiratory quotient of children. Fritz B. Talbot and Yelma Bates *Am. J. Diseases Children* 50, 827-39(1935).—The R. Q. is reduced in children by the use of ketogenic diets, although not to as great an extent as in adults. The blood sugar is reduced, usually to 70-80 mg. %. The basal heat production is not affected by the diet. E. R. Main

Digestion of milk and of modified milk in vitro. Dorothy Letter and Frederic W. Schlutz *Am. J. Diseases Children* 50, 1101-6(1935).—Unreated milk, lactic acid milk, evapd and powd. milks are digested rapidly and completely at pH 4-5 by artificial gastric juice which contains rennin. In the absence of rennin digestion occurs only in the range of pH 1.8-3.0. I. R. Main

Digestion of milk and of modified milk in vivo. Dorothy Letter and Frederic W. Schlutz *Am. J. Diseases Children* 50, 1107-12(1935).—The time required to produce the highest concn. of sol. N in the gastric contents after ingestion of untreated milk is 1.5 hrs., buttermilk and un-treated milk with added rennin 0.5 hr., evapd. milk with

or without added rennin, lactic acid milk and protein milk 0.5-1 hr. and powd. milk with or without added rennin 0.5-1.5 hrs. E. R. Main

Prevention of rickets with a cod liver oil concentrate in milk. M. G. Peierman and Lily Epstein *Am. J. Diseases Children* 50, 1152-8(1935).—The administration of 223 units of vitamin D per day in the form of a cod-liver-oil concentrate incorporated in evapd. milk provided adequate protection against rickets in infants of the susceptible age period. The infants received in addn. 30 cc. of ripe pineapple juice which gave adequate protection against scurvy. E. R. Main

A further study of the antirachitic factor in human milk. I. A. Sabri and M. M. Fakri *Arch. Disease Childhood* 10, 377-80(1935); cf. C. A. 27, 1921.—Rickets in Egyptian infants appears to be due to an insufficient supply of provitamin D in the mother's milk as well as to the prevailing deficiency in ultraviolet radiation. L. R. M.

The calcium, phosphorus and nitrogen retention of rats on soybean-egg powder and whole milk powder diets. I. Reid *Chinese J. Physiol.* 9, 307-14(1935).—In balance expts. with growing rats further evidence was obtained that soybean-egg powder (cf. C. A. 28, 3709, 29, 4052) contains adequate amts. of vitamin D, Ca and P for normal bone development. The N retention and digestibility were greater than when whole milk powder was used. L. A. Maynard

A preliminary report on the nitrogen metabolism of preschool children. Lau Chen Kung and Wen-Yuen Fang *Chinese J. Physiol.* 9, 375-82(1935).—In expts. with 2 four-year-old children eating a freely chosen, mixed diet contg. soybean milk, the av. daily N intake ranged from 0.33 to 0.56 g. per kg. and the retention from 0.03 to 0.034 g. per kg. In expts. with 2 three-year-old children given a controlled mixed diet with either soybean milk or cow milk the N retention was too variable to reveal any differences between the 2 milks. With intakes of 0.47 to 0.53 g. per kg. retention ranged from 0.46 to 0.14 g. per kg. L. A. Maynard

Teeth and diet. Celestino Guglielmi *Semana med. (Buenos Aires)* 1935, II, 1643-4.—The importance of vitamin D, Ca and P is discussed. A. E. Meyer

Influence of calcium on carbohydrate metabolism. Taichi Harada *Bull. Chem. Soc. Japan* 10, 431-60(1935).—The little studied subject of the effect of Ca in carbohydrate metabolism has been investigated with albino rabbits. Ca lactate was used because it was found to be the most easily assimilated of the common Ca salts. The rabbits, wt. approx. 2 kg. each, were allowed to fast 24 hrs. after which the sugar in the blood and urine was detd. A soln. of 15 g. of glucose was injected into the peritoneal cavity with or without 0.5 g. Ca lactate and (or) 0.2 cc. adrenaline ($\frac{1}{100}$). The blood sugar was again detd. after 0.5-hr. and at 1-hr. intervals for 4 hrs. and finally after 24 hrs. The sugar in the urine for the 24 hr. period was also detd. Adrenaline alone or glucose or a combination of the 2 all raised the blood sugar for several hrs. and increased the sugar in the urine. Ca lactate greatly retarded this increase in both blood and urine sugar when injected with glucose or glucose and adrenaline but had little effect when injected with adrenaline alone. Conclusion. Diabetes is probably attended by imperfect Ca metabolism and this helps to account for the excess blood and urine sugar. John F. Milbery

Studies relating vitamin C deficiency to rheumatic fever and rheumatoid arthritis, experimental clinical and general considerations. II. Rheumatoid (atrophic) arthritis. James F. Rinehart *Ann. Internal Med.* 9, 671-8(1935).—Subacute or chronic vitamin C deficiency in the guinea pig produces an arthropathy with many similarities to rheumatoid arthritis. Hence it may be a factor in the etiology of the disease. John T. Myers

Chemical relationship of blood cholesterol with a summary of our present knowledge of cholesterol metabolism. Lewis M. Hurst and Hazal M. Hunt *Ann. Internal Med.* 9, 717-27(1935).—Diets of exclusive animal food-stuffs high in fat will increase blood cholesterol and may

be a factor in arteriosclerosis. Hypercholesterolemia is frequent in xanthomas, hence a cholesterol-free diet may be useful. In diabetics, more than 400 mg % indicates the imminence of serious complications. Hyperthyroidism causes a drop and hypothyroidism an increase in blood cholesterol. It is low in hypoparathyroidism, and high if there are cholesterol deposits in the body. J. T. M.

Data leading to the supposition of a general vitamin deficiency in certain regions of Spain. L. Carrasco Cadenas *Arch med exp* 37, 501 (1934). *Enferm soc hig* 23, 367. In various regions of Spain veridical thalassa and hemeralopia are encountered, indicating an insufficiency of vitamins in the diet. Similarly, deterioration of teeth and rickets are extremely prevalent in children. A. Papneau-Couture

The vitamin potency of foodstuffs in Spain. E. Carrasco Cadenas and Calmen Ornelas *Arch med exp* 37, 618 (1934). *Enferm soc hig aliment* 23, 367. Expts showed that fresh tomato juice contains 60-100 carotene units of vitamin A per g., less than 2 units of vitamin B per 2 g., and sufficient vitamin C per 15 g. to retard the appearance of otherwise fatal scurvy. A dose of 0.5 to 1 g. of Andalusian olive oil contains just sufficient vitamin A to prevent xerophthalmia, viz. 8-10 units per g. and 3 antirachitic units per cc. Egg yolk contains no antirachitic vitamin B. A. P. C.

Carotenoids and the visual cycle. Geo. Wald. *J Gen Physiol* 19, 251-77 (1935). The cone-disk pigment and choroid layer of the eye of *Rana pipiens* or *R. esculenta* contain about 17 xanthophyll and about 4 μ vitamin A. During light adaptation, xanthophyll falls 10-20%. Light-adapted retinas contain about 0.2-0.3 μ A. Dark-adapted retinas only a trace. Retinene, a hitherto undetected carotenoid, is liberated from visual purple by destruction with CHCl_3 and by bleaching to visual yellow by light. It reacts with SnCl_4 to yield a deep blue color, with a single band at about 664 m μ . Free retinene is removed from isolated retinas by treatment to visual purple and by decomposition, contain several times as much A as retinas from light-adapted frogs. The visual purple system expends A and is dependent upon the diet for its replacement. Visual purple behaves as a conjugated protein with retinene in the prosthetic group. Vitamin A is a precursor and a decomposition product of visual purple, the visual processes constitute a cycle. C. H. Richardson

The nutritive value of the proteins of corn-gluten meal, husseed meal and soybean-meal. Kenneth L. Turk, F. B. Morrison and L. A. Maynard. *J Agr Research* 51, 401-12 (1933). Cf. C. A. 28, 5359. Metabolism studies were conducted with 3 growing weanling rats to det. the digestibility, storage and bio. value of the proteins of soybean-oil, corn-gluten and husseed meals. Each of the feeds was added to a low N ration in such amounts as to furnish a protein level of 16%, with approx. 1% additional being furnished by the other ingredients of the ration. All rations were equalized in energy content. The av. coeffs. of apparent digestibility for proteins, the av. percentage of protein intake stored, and the av. of the bio. values of the protein were, resp. 67.6, 23.8 and 72.8% for soybean-oil meal, 66.3, 26.6 and 67.7% for corn-gluten meal, and 63.3, 25.7 and 67.7% for husseed meal. These data show the superiority of the proteins of soybean-oil meal over those furnished by husseed meal and corn-gluten meal. They indicate that it is possible to measure differences in quality of protein using sheep and the N-balance type of experimentation. W. H. Ross

The importance of cystine for the growth of fur rabbits. A. I. Deravlev. *Sovetskoye Dolo* 1935, Nos. 4-6, 14-17. The addition of 1-10 g. of S daily to the feed of rabbits had no effect. Addition of 0.5 to 10 g. cystine daily increased the wt. and quality of the fur. B. V. Shvartzenberg

Chemical nature of vitamins. F. G. V. Percec. *Pharm. J.* 193, 651-2; *Chemist and Druggist* 123, 730-7 (1935).—A survey of the present chem. knowledge of

vitamins, with special reference to ascorbic acid (vitamin C). S. Waldbert

The experimental production of ascorbic acid in dogs by means of a blackening-producing diet. Tom D. Speer and Alexander S. Dowling. *Am J Physiol* 114, 52-62 (1935). Cf. C. A. 27, 4565. The basic diet consisted of cornmeal 400 g., cottonseed 50 g., casein (freed from vitamin B) 95 g., coarsened oil 30 cc., cod-liver oil 15 cc. and salt mixt 25 g. This was supplemented with 2 cc. of a 50% soln. of ferric NH_4 citrate each day. The loss of wt. and development of anemia, dermatitis and blackening can be prevented by the admin. of large supplements of vitamin C and can be remedied by the admin. of small amounts of yeast. E. D. Walter

Absorption of grass and butter carotenes on aluminas. A. E. Gillam and M. S. El Ridi. *Nature* 136, 914-15 (1935). Cf. C. A. 29, 5529. When pure β -carotene from grass is twice adsorbed on aluminas, it changes partially into a substance similar to α -carotene. The process is reversible. On reabsorption the substance reverts in part to the original β form. Cryst. α -carotene is also changed under these conditions. It should be recognized that changes can be brought about by the process of chromatographic absorption itself. E. D. Walter

Ascorbic acid (vitamin C) and phytoascorbomata. László Havas. *Nature* 136, 984 (1935). Cf. C. A. 29, 8054. 8051. Injection of a viscous sol. of ascorbic acid into tomato plants increased the size of tumors produced in these plants by *Phytophthora tumefaciens*. The av. wt. of the tumors of the plants treated with ascorbic acid was about 27% greater than that of the control plants. The total amt. of ascorbic acid injected during the 14-day period was about 27 mg. per plant. E. D. Walter

Differentiation of the antidermatitis factor. Albert C. Hogan and Luther R. Richardson. *Science* 83, 17-18 (1935). Cf. C. A. 28, 7309. Rats become denuded on tetrils, and are healed by flavins. Dermatitis is healed by wheat-germ oil, but growth does not occur unless flavins are added. Wheat-germ oil has no effect on denuding, and flavins have no effect on dermatitis. Vitamin B carriers, eliminated through plate glass for 10 hrs. at a distance of 10 in. with a 1500 w. Mazda bulb, heal dermatitis but flavins in adm. must be added to support normal growth. Apparently the denuded condition and dermatitis have little or no relation to each other. E. D. Walter

I—PHYSIOLOGY

HOMER W. SMITH

Variations in the lactose content of milk. W. R. Brown, W. E. Peterson and R. A. Gortner. *J. Dairy Sci.* 19, 81-92 (1936).—A similarity was found between the lactose content of the morning and evening milk of individual cows, when the samples were taken at the regular milking periods. The lactose content showed considerable variation between successive hourly samples. Hourly variations were found in the blood sugar of milking cows. Simultaneously collected samples of blood and milk show little or no positive correlation in sugar content. In general, samples of milk collected 1 hr. later than the blood samples showed greater tendency to higher correlation in sugar content than do simultaneously collected samples. It is suggested that improved comparative studies might be obtained by first stripping the gland, taking the blood sample, then taking the milk sample by stripping 1 hr. later. Philip D. Adams.

Effect of gangliectomy on mineral composition of the bone. Alfredo Terranum. *Patologica* 27, 777-80 (1935).—In the bones of the posterior extremities of the dog, after lumbar gangliectomy, there was noted a slight decrease in the total ash (as from 63.52 to 63.41%), a decrease in the Ca content (from 26.80 to 24.11%), an increase in the Mg content (from 0.299 to 0.334%) and a slight increase in the P content (from 10.24 to 10.30%). All the data are based on the wt. of degreased dry bones. G. A. Bravo.

The glycolytic power of the human blood. N. Satam. *Fa biologia* 27, 78-84 (1935).—The expts. made in man by means of drugs (Synergine Sandoz, atropine) acting on the vegetative nervous system do not support the idea that this system would have a direct influence on glycolysis in vitro. G. A. Bravo.

Carbon monoxide intoxication and its relationship to fatigue. Ugo Bassi and Carlo Sorresina. *Rass med applicata lavoro* 6, 249-268 (1935).—Fatigued guinea pigs showed less resistance to the action of illuminating gas (15% CO₂) than quiet animals. When the toxic action of CO is prevalent, there is an increase, and when the fatigue is prevalent there is a decrease of hemoglobin and of the globular value. Fatigued and intoxicated animals decreased in wt., but those only intoxicated showed a slight increase. G. A. Bravo.

Radiation of heat from the human body. V. James D. Hardy and Carl Muehlenheim. *J. Clin. Investigation* 15, 141-145 (1936).—About 95% of infrared rays are absorbed within 2 mm. of the surface. The therapeutic effect is confined to the surface. The absorption spectrum of human wet skin is essentially that of water. Upon drying other absorption bands appear. J. B. Brown.

The effects of inhalation of helium mixed with oxygen on the mechanics of respiration. Alvan L. Barach and Morris Eckman. *J. Clin. Investigation* 15, 47-61 (1936).—Helium decreased the effort of the respiratory musculature and as a phys. function lowered intrapleural pressure. J. B. Brown.

A test for abnormally large amounts of parathyroid hormone in the blood. Bengt Hamilton and Walter J. Highman. *J. Clin. Investigation* 15, 99-100 (1936).—cf. C. A. 27, 117.—Serum from a patient is injected intramuscularly into the legs of a rabbit which has fasted for 12 hrs. Immediately afterward the rabbit is given 0.276 g. CaCl₂ in 10 cc. water by stomach tube. This dosage is repeated at 1, 3 and 5 hrs. Serum Ca detns. are made and the results are interpreted based on the Ca rise. J. B. Brown.

Filterable serum calcium in late pregnant and parturient women and in the newborn. Marie Andersch and Fred W. Oberst. *J. Clin. Investigation* 15, 131-3 (1936).—As values for filterable serum Ca are constant in nonpregnant, late pregnant and parturient women and in the newborn, reported variations are due primarily to changes in the total Ca. J. B. Brown.

Liver function as tested by the lipemic curve after

intravenous fat administration. Arthur Nachlas, G. Lyman Duff, Herbert C. Tidwell and L. Emmett Holt, Jr. *J. Clin. Investigation* 15, 143-51 (1936).—Administration of CCl₄ to dogs causes difficulty in removal of fat from the blood after intravenous injection. This is probably due to liver damage caused by CCl₄. The lipemic curve after fat injection may be of value in the study of liver function. J. B. Brown.

The lipides of human blood. Eldon M. Boyd and H. J. Tweddell. *Trans. Roy. Soc. Can.* 29, Sect. V, 113-21 (1935); cf. C. A. 29, 748⁹.—Blood samples were taken from 9 human subjects every 3 hrs. during the day and 4 hrs. during the night and analyzed for total lipide (I), total fat acids (II), phospholipides (III), total cholesterol, ester cholesterol (IV), free cholesterol (V) and neutral fats (VI). III and V remained relatively constant during the 24 hrs. on a normal balanced diet. IV began to rise slightly during the p. m., reaching a max. at 4 a. m. VI was lowest at 4 a. m. and increased to a max. plateau at 8 a. m. to 5 p. m. The curve for II closely paralleled that for I. From the changes recorded it is concluded that variations in IV and VI occur chiefly in the red blood cells. Rachel Brown.

The estrogenic activity of 1-oxo-1,2,3,4-tetrahydropheanthrene, an addition to our communication on 1-oxo-1,2,3,4-tetrahydropheanthrol. 7. Adolf Butenandt and Gerhard Schramm. *Ber.* 68B, 2303 (1935).—cf. C. A. 30, 1375⁷. Cook, Dodds and Hewett, C. A. 27, 1449, 3525.—1-Oxo-1,2,3,4-tetrahydropheanthrene is estrogenically active for castrated female mice in a single 70 mg. dose, but inactive if divided into 6 portions and administered in 3 days. W. F. Bruce.

Gases in the blood during muscle work. I. N. N. Blokhin. *J. Physiol. (U. S. S. R.)* 19, 1258-61 (1935).—Work which requires increased breathing, bordering on asphyxiation, markedly lowers the amt. of CO₂ in the blood, both in the arteries and in the veins, the muscles intensively detain O₂ and give up CO₂ to the blood. H. Cohen.

The toxicity of the air exhaled by man. M. I. Gramentzki and I. I. Sivertsev. *J. Physiol. (U. S. S. R.)* 19, 1265-70 (1935).—The action of exhaled air on an isolated frog heart was studied by an improved Straub pneumatic registration method. In most of the expts., the replacement of the ordinary room air by exhaled air caused a weakening in the heart activity. The causative agent is not merely the CO₂ of the exhaled air, some other volatile substances, probably of basic nature, are responsible. The air of old and sick persons is more toxic than that of young and healthy individuals. H. C.

General character of the unconditioned reflex activity of the two parotid glands. Ya. P. Sklyarov. *Med. eksptl. (Ukraine)* No. 2, 66-73 (1935).—The activity of the glands depended on the localization of the stimulant (food) in the mouth, when placed on the right side the right gland worked more intensively, when the stimulant was on the left side the left gland secreted more. Apparently the excitation spreads along one side of the reflex arc with very little crossing. S. A. Corson.

The aqueous and mineral fraction of saliva during continuous secretion. P. Ya. Mukhina. *Med. eksptl. (Ukraine)* No. 2, 74-89 (1935).—In acute expts. on dogs the spinal cord was cut, producing a continuous secretion from the submaxillary glands. Every 12-21 min. warm Ringer soln. was introduced intravenously to compensate for the loss of fluid. The quantity of saliva decreased regularly after 3-5 hrs. This was due to a decrease in the nervous stimulation and not to exhaustion of the aq. function of the gland because bleeding (thus stimulating the central nervous system), injection of pilocarpine (0.1 cc. of a 1% soln. per 5 kg. of body weight) or elec. stimulation of the cut nerve again increased salivation. This aq. function was practically inexhaustible because repeated stimulation of the nerve sometimes produced a greater salivation than the first stimulation. Moreover, the gland which was continuously active did not respond less intensely to pilocarpine than the gland which was inactive throughout the expt. (because of cut nerve).

The latter did give at first a greater percentage of solid residue which decreased subsequently. The rate of secretion of both sublingual glands was usually similar and had no relation to the blood pressure. The decrease in the solid residue with time (this was apparently independent of the rate of secretion) was mostly at the expense of the org. components, the salts remaining practically const.

Influence of the water vapor content of an odorous gas on the olfactory sensation H. Wierdeman *Arch. neerland. physiol.* 20, 591-5 (1935).—Fifty four of the observations showed considerable differences in the intensity of the smell of isomyl acetate when brought to the nose through the aid of dry air as compared with humid air. Dry air gave sensibly greater results. T. L. B.

The effect of high concentrations of light negative at morphine ions on the growth and activity of the embryo L. P. Herrington and Karl L. Smith *J. Ind. Hyg.* 17, 253-8 (1935).—A comparison of the weight curves and the mean values for hemoglobin through the growth period of the group with those of a comparable control group revealed no significant differences. The mean activity of the expl. group was significantly greater than that of the control group. Fifty albino rats were exposed to an atm. contg. 1.2×10^6 ions per cc.

The ions had a mobility in the order of $1 \frac{\text{cm.}}{\text{volt per sec.}}$ during the age period from 21 to 700 days. A. L. E.

Cytology of the adrenal F. J. McKenzie and Laura J. Naim *Mod. Agr. Expt. Sta. Bull.* No. 349 (4th ser. Rept. 1933), 13 (1934).—Changes were found in the fat and mitochondria content of cortical cells during the estral cycle. In the zona glomerulosa these changes involved a variation in the number and size of the fat droplets. The changes in fat content were continuous throughout the cycle showing an increase in proestrus and early estrus and reaching a height in early metestrus. This was followed by a decrease throughout diestrus. Changes in the fat content of the cells of the zona fasciculata and reticularis closely paralleled those of the zona glomerulosa. C. R. Tellers

Effect of alkalinization of drinking water on the pu of the jugular blood of feeder cattle Paul Gerlaugh, C. H. Hunt and B. H. Edgington *Ohio Agr. Expt. Sta. Bull.* No. 548 (3rd Ann. Rept.), 78 (1935).—1 or 2 cattle receiving approx. 3 gal. daily of water contg. 1% NaHCO_3 , the pu of the jugular blood was 7.68 compared to a value of 7.84 for the controls. In another shipment of cattle these resp. values for pu were 8.01 and 7.84. There was no difference in the occurrence of disease in the untreated and alkalinized cattle. R. Tellers

Basal metabolism of women over 35 years of age J. Hingham McKay and Mary Brown Patton *Ohio Agr. Expt. Sta. Bull.* No. 548 (3rd Ann. Rept.), 82 (1935).—The basal metabolism of women above 35 years of age remains at a fairly uniform level until the age of 50 is reached, after which the basal metabolic index declines to a definitely lower figure per unit of wt. or surface area. The heat production at ages 25-50 averaged $21 \frac{1}{2}$ cal. per kg. per 24 hrs. At age 50-60 this value averaged 19.5, at age 61-18 yrs., the value was 25.4 cal. C. R. Tellers

Osteostrophy and hormone influence Josef Marx *Osteostroph. Rev.* 12, 1-4 (1935).—Expts. on guinea pigs with "Thymol" (cf. Labopharma at Berlin) and "Verhen" (of Richter at Budapest) proved that not only the secondary thyroid gland but also the thymus and spleen take part in the control of Ca metabolism. An increased calcification caused by an artificial hyperfunction of secondary thyroid could not be prevented by simultaneous administration of thymus and spleen preps. Curing of osteostrophy by means of such hormones seems to be successful. S. S. de Finis

Butyric acid content of normal urine Lashby King *Bull. soc. chim. biol.* 17, 1540-5 (1935); cf. C. d. 29, 7057.— PrCO_2H does not occur in normal human urine. About 4-8 mg. wet butyric acid is excreted in the urine in 24 hrs. Butyric acid of feces *Ibid.* 1546-8.—The micro-

num and the feces of healthy young infants contain no PrCO_2H . Feces of adults contain 40-130 mg. per 100 g. fresh material. L. F. Gibson

A characteristic of the normal physiological state The bromine index of the urine N. Bessendorf, A. Vallette and R. Sauerz *Bull. soc. chim. biol.* 17, 1573-98 (1935). The Br index or Br no. of the urine is the no. of mg. of free Br fixed by 1 cc. of urine under specified conditions. The method is described. The Br no. for the urine of healthy infants aged 1 month is 0.5-1.5, age 6 months, 0.9-1.4, 1 yr., 1.2 and 2 yrs., 1.2-1.4. In pathological states it may exceed 7. The Br no. for adults is 0.8-4.7, av. about 2.6. It is increased in fat bile diuresis and in rickets. It is not dependent on the mineral salts, or the total C of the urine. It depends partly on the phenols and indazole derivs., and probably the indole derivs. of the urine, hence it is related to the protein metabolism. In avitaminosis C the Br no. increases, indicating a possible connection between vitamin C and protein metabolism. L. F. Gibson

Doses of folliculin required to produce intersexes and limits of stage of intervention Etienne Wolff and Albert Gangelinger *Compt. rend. soc. biol.* 120, 114-16 (1935). A drop of oil soln. of folliculin benzoate contg. 2500-5000 mouse units introduced into the abdominal sac of a chick embryo on the 4th or 5th day of incubation converts it to an intersexual form. Structure of the genital glands of different types of intersexes obtained by injecting folliculin into male chick embryos *Ibid.* 116-18.

Development of the male intersexes obtained by injecting folliculin into the embryo Morphological changes in the external organs after hatching. Histological changes in the genital organs after hatching. Etienne Wolff *Ibid.* 904-5.—Action of male hormone (androsterone) injected into the chick embryo. Production of intersexes *Ibid.* 1312-14.—Discussion of results obtained with male hormone *Ibid.* 1314-16.

Sexual inversion of the ovarian esauche in the chick embryo [by injection of sex hormones] Vera Danachakov. *Compt. rend. soc. biol.* 120, 277-9 (1935).—Mechanism of the action of folliculin injected into a male chick embryo *Ibid.* 950-3.

Azotemia and chloremia in vitro J. Loslever *Compt. rend. soc. biol.* 120, 605-7 (1935).—The addition of N compounds to blood *in vitro* modifies the Cl content of the corpuscles in a sense which depends on the permeability of the corpuscles for the compounds added. Thus, urea, which readily enters the cells, causes a decrease in cell Cl, while glycerol, which does not enter, causes an increase. The effect in either case equalizes osmotic pressure. Azotemia and chloremia during hystolysis *Ibid.* 675-8.—In tissue destruction *in vivo* each of the various waste N compounds entering the blood stream affects the corpuscle Cl in one or the other of the above-mentioned ways.

Changes in the epithelium of the bladders of mice during urine retention after injections of estrone L. C. Lashby *Compt. rend. soc. biol.* 120, 813-5 (1935).—Estrone was repeatedly injected into young mice. Retention of the urine occurred in some of the mice after several injections. In such cases the epithelial cells of the bladder showed a marked proliferation. Probably the result of the prolonged contact with this hormone in the bladder contents. L. C. Gibson

Presence in the urine of certain women of a substance antagonistic to estrous hormone D. L. Lashby and P. Dragoon *Compt. rend. soc. biol.* 120, 852-3 (1935).—When the urine of a certain woman, age 30, with symptoms of ovarian insufficiency, was injected into young female mice either before or during the same time that injections of urine from pregnant women were made the Aschheim reaction was neg. in every case. The presence of an antagonistic substance is postulated.

Absorption of creatine and creatinine by red corpuscles. K. Kael *Compt. rend. soc. biol.* 120, 916-17 (1935).—Washed beef erythrocytes did not adsorb creatine from

dal solns in Locke soln Under the same conditions they adsorbed considerable creatinine, the proportion increasing with the temp throughout the range 7-44°. Effect of pH on the adsorption of creatinine by red blood corpuscles. *Ibid* 918-20.—The pH range 6.4-8.3 was used. Max. adsorption occurred at 7.3. L E Gilson.

Folliculitis during nursing Giuseppe Tata *Rass. clin terap sci affini* 34, 265-70 (1935), cf C A 29, 7428.—During the period of amenorrhea nursing women showed very low or no folliculitis while with return of menstruation the titer rose to the normal values of the sexual cycle. Helen Lee Gruel.

Recent advances in science agricultural physiology Arthur Walton *Science Progress* 30, 510-13 (1935).—A review devoted chiefly to endocrine studies. J S H.

The chemistry and physiology of the androsterone group Kurt Tscherning *Angew Chem* 49, 11-16 (1936).—The following subjects are discussed: (1) the natural representative of the androsterone group, (2) the specificity of the androsterone action, (a) the capon comb test, (b) the vesicular gland test, (3) the relation between the androsterone group and the estrone group. Data and twenty-five references are given. Karl Kammermeyer.

Chemical studies on the adrenal cortex I. Fractionation studies on hormone concentrates J J Pfaffner, Oskar Wintersterner and Harry M Vars *J Biol Chem* 111, 585-97 (1935). II. Isolation of several physiologically inactive crystalline compounds from active extracts Oskar Wintersterner and J J Pfaffner *Ibid* 599-612, cf. C A 28, 6814.—The permittive purified fraction (11.9 g) from 100 kg of beef adrenal gland assaying 15 dog units per mg was subjected to a C_2H_4 distribution procedure and a C_2H_4 concentrate of 450 mg assaying 250 dog units per mg was obtained. This was further fractionated and a final active fraction of 153 mg assaying 400 dog units per mg isolated. It was a pale yellow sirup which would not crystallize. Evidence was obtained of the presence of an α, β -unsatd ketone and of hydroxyl groups in the hormone. In the process of fractionation of the hormone concentrates 5 physiol inactive cryst compds were isolated. Four were N -free and the 5th, $C_{17}H_{24}O_2N_2$, is in all probability leucylproline anhydride. One of the compds is probably identical with the substance regarded by Kendall, et al *Proc Staff Meetings Mayo Clin* 10, 245 (1935) as the life-maintenance hormone. The discrepancy between the findings of these investigators and the authors' results regarding the physiol activity of this compd is discussed. Preliminary analytical characterization of the compds is given but larger quantities are necessary to establish with certainty their compn.

The biological activity of theelin Roland C Meyer, Lloyd C Miller and Geo F Cartland *J Biol Chem* 112, 597-604 (1936).—Theelin has little biol activity as regards the adult spayed rat but much when detd in the immature rat. The quant relationship between theelin and theelin differs with different methods of assay. When administered in oil and measured by the vaginal smear method international standard theelin is approx 90 times more active than theelin and 250 times more active when injected in aq 10% alc contg 0.5% Na_2CO_3 . Theelin is 4 times as active as standard theelin when detd by the opening of the vagina in immature rats.

The influence of feeding amino acids and other compounds on the excretion of creatine and creatinine. Meyer Bodansky with the technical assistance of Virginia B Duff *J Biol Chem* 112, 615-24 (1936).—Arginine, aspartic acid, glutamic acid, cystine, histidine, tyrosine, choline, betaine, sarcosine and the salts of guanidine administered in comparatively large doses by stomach tube produced no effect on the excretion of creatine or creatinine in young adult rats. The output of creatine was definitely increased and that of creatinine was not influenced by glycine. Alanine produced similar though less striking or const changes. Increased elimination of creatine following ingestion of guanidine-acetic acid suggests its probable conversion into creatine but at best this is

only presumptive evidence of extra creatine formation. Creatine given in doses varying from 35 to 120 mg was recovered in the urine within 48 hrs in amts varying from 30 to 80%. The oxidation product, creatone, produced no significant change in either the creatine or creatinine output. A P Lohrop.

The composition and action upon calcium metabolism of Ah-chiao (donkey skin glue) and commercial gelatin T G Ni *Chinese J Physiol* 9, 329-38 (1935).—Donkey skin glue, derived mainly from collagen, resembles gelatin in contg the essential amino acids, lysine, arginine and histidine. Though contg only very small amts of Ca both the glue and gelatin markedly increased Ca retention as shown by limited balance expts with 2 dogs. The possibility of a Ca-carrying action by glycine is suggested. L A Maynard.

The hematopoietic action of Ah-chiao (donkey skin glue). T G Ni *Chinese J Physiol* 9, 383-94 (1935).—In dogs the drug possesses a hematopoietic action comparable to gelatin, which is not dependent upon the Fe and Cu contents. L A Maynard.

Blood indican in normal conditions Luigi Pinelli *Biochim lerap sper* 22, 563-7 (1935).—The indican in the blood of normal persons varies between 0.20 and 0.72 mg per 1000 cc. It is found exclusively in the plasma, not in the corpuscles. A E Meyer.

Ketogenesis in liver tissue and its autoregulation. S Leites and A I Odinov. *Biochem Z* 282, 345-61 (1935).—Rabbit liver pulp incubated for 24 hrs produces, apparently through autooxidation, β -hydroxybutyric and acetoacetic acids. This ketogenic process is much more pronounced in livers from rabbits which had fasted 48 hrs. The optimum conditions for acetoacetic acid formation in liver from nonfasting rabbits is pH 5.6, and for β -hydroxybutyric acid formation pH 7.0, but in liver from fasting rabbits the optimum pH is 5.6 for both. The amt. of ketogenesis in 24 hrs depends to a degree upon the original acetone body content of the liver, the lower the preformed content the more intense is the production of new acetone bodies. Likewise the ketogenesis from added butyric acid depends upon the content of the liver in preformed acetone bodies, with a low preformed level β -hydroxybutyric acid is formed, but with a high level the amt. of β -hydroxybutyric acid after incubation for 24 hrs may actually diminish. Added to the liver of fasting rabbits, butyric acid stimulates more intensive ketogenesis than in livers of nonfasting rabbits, and only when the preformed ketogenesis is very extensive does it actually exert a depressing effect. Neither $AcONa$ nor pyruvic acid has any influence on the ketogenesis in the incubated liver pulp. S Morgulis.

Influence of the cortical hormone on the glycogen content of the liver Herbert A Hochfeld *Biochem Z* 282, 392-8 (1935).—The liver glycogen of the rat on a pure fat diet is somewhat higher than on a normal diet, if the glycogen is detd following one fast day. Likewise in rats, after one day of fasting, the liver glycogen is greater if the animals, 3 days previously, have been fed pure fat and injected with cortical hormone than if they have been fed a mixed diet and treated with the hormone. The glycogen content of the liver is much higher if the cortical treatment is given also during the fast day. This seems to indicate sugar formation from the fat depots under cortical hormone influence. S Morgulis.

Transformation of fat to sugar. Walter Haarmann *Biochem Z* 282, 406-18 (1935).—The lactic acid formation in surviving organs is increased by the addn of butyric and of β -hydroxybutyric acids. This increase is not covered by the loss of carbohydrate, therefore, the fat acids must serve as the source of the lactic acid formed, and thus of sugar since lactic acid is converted to sugar. S Morgulis.

Comparative studies on lactic acid formation and carbohydrate loss in tissues under aerobic and anaerobic conditions. Walter Haarmann and Hans Brunk. *Biochem Z* 282, 419-33 (1935).—Considerable differences were observed in the lactic acid formation and carbohydrate diminution in various organs and animals in the presence or absence

of O_2 . O_2 does not cause a rise in lactic acid in the heart muscle (beef, dog) or in skeletal muscles of beef or brain tissue of dog. In O_2 , on the addition of glucose or glycogen, the lactic acid is unchanged. In the muscles of rabbits, however, the lactic acid formation on the addition of glucose or glycogen is less in O_2 than in its absence. In brain tissue (dog) lactic acid is formed from glucose both aerobically and anaerobically, just like in tumor tissue. The decrease in carbohydrate in the absence of O_2 is usually much greater than the corresponding increase in lactic acid. The carbohydrate of beef muscle decreases less aerobically than anaerobically, but in rabbit or dog muscle this difference is not observed. In the beef heart the glucose diminishes much more under aerobic conditions than under anaerobic, but in the dog heart the reverse is the case. In the brain glucose disappears more rapidly aerobically than anaerobically. Glycogenolysis in beef muscle is greater under aerobic than under anaerobic conditions, but in rabbit muscles or in beef heart there is no such difference. O_2 does not inhibit lactic acid formation from pyruvic acid, methylglyoxal, fumaric or succinic acid. Succinic acid is not transferred to lactic acid at all under anaerobic conditions.

S Morgulis

Disappearance of lactic acid in tissues under aerobic and anaerobic conditions. Walter Haarmann and Hans Brunk *Biochem. Z.* 232, 434-441 (1933).—Lactate added to tissues disappears equally well both under aerobic and anaerobic conditions.

S Morgulis

Calcium metabolism in the first phase of coagulation. III. Mechanism of thrombin formation. H. Fessenden *Biochem. Z.* 233, 111 (1935), of *C. A.* 29, 5093. The reaction of Ca^{++} with prothrombin, which initiates the thrombin formation, obeys the mass-action law. The inhibiting effect of Ca^{++} prothrombin excess is attributable to the formation of other inactive substances besides thrombin. Under the influence of thromboplastin more neg. Ca complex is formed (thrombin- Ca) depending upon the thrombin present in the serum. The reaction likewise follows the law of mass action. Thus, prothrombin + Ca^{++} \rightleftharpoons thrombin + thromboplastin \rightleftharpoons thrombin, or thrombin/(thrombin/prothrombin) \times Ca^{++} \rightleftharpoons thrombin. Normal dog serum contains the optimum amt. of Ca^{++} for the prothrombin content, but an excess of prothrombin for the amt. of thromboplastin.

S Morgulis

Cleavage, oxidation and energy metabolism in the dog. IV. Absorption of fructose by the organs of the dog in vivo. M. Wierzbuchowski and H. Fessenden *Biochem. Z.* 283, 30-44 (1935); of *C. A.* 30, 10904.—Fructose administered by continuous intravenous injection is absorbed with remarkable constancy by the various organs, in the following order: liver 21 mg. per g. per hr., of the portal vein 3.5 mg. and the motor system 0.4 mg. (for muscles alone 0.8 mg.), the head organs 0.39 mg., and all other organs 2 mg. The formation and absorption of glucose pass the usual cycle observed in the fasting state while the fructose is intensively metabolized. The liver produces 6.1 mg. glucose per g. and per hr. which is taken up as follows: head organs 1.3 mg. and portal vein organs 1.0 mg., motor system 0.02 mg. and the other organs 0.32 mg. per g. and per hr. One-fifth of the fructose absorbed by the liver is discharged into the blood as lactic acid. On the other hand, in the organs of the head and of the portal vein the lactic acid is discharged into the blood is independent of the fructose absorption and is related to the glucose absorption, just as in the fasting state. Only in the motor system part of the lactic acid may be derived from the fructose. The administration of inositol, $C_4H_9O_6Na$ or AcH has no effect on the glucose formation in the liver.

S Morgulis

The principal path of lactic acid formation in muscles. O. Meyrath and W. Kessling *Biochem. Z.* 283, 83-113 (1935).—In addition to the 2 mols. lactic acid resulting from the interaction of α -glycerophosphate and pyruvic acid, with the primary phosphorylation product of hexose, whereby 1 mol. inosophosphate is oxidized to phospho-

glyceric acid and 1 mol. pyruvic acid is reduced to lactic acid. The second process is much more rapid. The glucolysis of the muscle, like the fermentation process, can be split into partial reactions either by means of NaP or CH_3CO_2H , the pyruvic acid being the biol. equiv. of the AcH and lactic acid of the alc. The phosphorylation and dephosphorylation proceed stoichiometrically through the adenylic acid system. The glucolysis, as fermentation in that hexosediphosphate reacts in muscle ext. with pyruvic acid reducing it to lactic acid and becoming oxidized to phosphoglyceric acid. This reaction does not involve recarbonation, so that it may progress even when the adenylic acid system has been very much attenuated. The function of methylglyoxal as an intermediate phase is entirely denied.

S Morgulis

Synthesis of creatine phosphate in organ extracts and in living spermatozoa. Isabella Torrey, *Biochem. Z.* 283, 129-33 (1935).—The transformation of phosphopyruvic acid to phosphocreatine proceeds best, next to muscle ext., in expts from testes. This is apparently a function of the live sperm, because considerable synthesis is secured also with spermatozoa washed in serum.

S M

The part played by the myogen volume in the muscle fiber volume. Wilhelmine Haumann and Hans H. Weber *Biochem. Z.* 283, 146-52 (1935).—Lactate added to about 35% of the vol. cut mammalian muscle, but in uncut single fibers it probably does not take up quite 20% of the vol.

Influence of thyroparathyroidectomy and of bile acids on the bile acid excretion and the pH of fasting bile. Shunsaku Tsujioka *J. Biochem. (Japan)* 22, 307-74 (1935).—Before parathyroidectomy 0-71 cc. bile was secreted in 6 hrs. of sp. gr. 1010-1025, pH 6.81-7.02 and a taurocholic acid content of 144-890 mg., or 0.213-0.329% concn. Two or 3 days after thyroparathyroidectomy the bile excretion decreased on the av. 48.4% with a 39.2% smaller taurocholic acid content (the relative concn. increased 32%) and a pH 7.03-8.42. On feeding taurocholic acid, 3-5 days after the operation, the secretion of bile increased on the av. 21% and that of taurocholic acid 37.8%, while the pH decreased to 6.70-7.88. Thyroparathyroidectomy thus leads to a thickening of the bile and greater alkali, which is a reflection of the general alkalosis.

S Morgulis

The composition of the nitrogenous components of dog stomach wall. Kozo Ikeyama *J. Biochem. (Japan)* 22, 337-407 (1935).—The fundus, cardiac and pyloric of dog stomach were analyzed. The muscular and mucous layers were analyzed separately. The material was cut into small pieces and preserved in 0.4% alc. then it was extd. 3 days in an alc.-ether mixt. and filtered off. The total in these sep. portions varied from 0.14 to 0.15 g. The various amino acid fractions were detd. in the HCl hydrolyzate and the results of this analysis are tabulated. Likewise hydrolysis was carried out with H_2SO_4 . The original alc. ext. was analyzed for volume of which the highest content was found in the fundus muscles, then in the pylorus (muscle and mucous layers).

S M

The mechanism of origin of alimentary hyperglycemia. Yoshikatsu Fukui *Biochem. (Japan)* 22, 447-50 (1935).—The stimulation theory of alimentary hyperglycemia assumes that the resorption of sugar from the small intestine is not quick enough to account for the rapid rise in glucemia. However, it has been shown that the absorption actually proceeds rapidly and, furthermore, levulose administered by mouth very quickly appears in the peripheral blood. The claim of the adherents of this theory that mere contact of the sugar soln. with the intestinal mucosa acts as a releasing stimulus is likewise denied as not fitting the facts. On the basis of this theory also the sugar level in the hepatic vein should be higher than in the portal vein, thus, however, is not the case. Were the alimentary hyperglycemia due to a sugar mobilization from the liver it might be expected to be dependent upon the liver glycogen store, but in fasting the hyperglycemia response is even greater than in the nourished state, and definite alimentary hyperglycemia occurs in other condi-

tions, where the glycogen is low, whereas the mobilization hyperglycemia (pique, adrenaline, pilocarpine) is definitely dependent on the glycogen depots. Another argument for this theory is the inhibition of the alimentary hyperglycemia by ergotamine or atropine. This is experimentally corroborated, but it is shown that these drugs actually slow up the absorption of the glucose from the intestines. On the contrary, phenobarbital narcosis which paralyzes the vegetative nerve centers, has no effect at all on the alimentary hyperglycemia. The very rapid rise in blood glucose does not contradict the absorption theory because the absorption is really very rapid. In favor of this theory is also the fact that there is no noticeable difference in the glucemia level of the hepatic and portal blood, thus showing that sugar is mobilized from the liver. The inhibitory effect of the vegetative nervous system poisons has been shown to depend upon the inhibition of the absorption of sugar from the intestine. Sectioning of the splanchnics and of the vagus causes a flattening of the glucemia curve of the peripheral blood in alimentary hyperglycemia. Sectioning of the splanchnics also flattens the sugar level in the portal vein, but sectioning the vagus, or both the splanchnic and vagus, causes actually a rise in the level. These effects are attributed to effects on the sugar absorption from the intestines. The fact that levulose administration causes chiefly a rise in the blood glucose loses its significance for the stimulation theory, since it fails to produce any difference in the sugar content of the hepatic portal and the sugar level in the hepatic vein. The increase in glucose after the feeding of glucose must be attributed to its conversion to glucose in the liver. The diseased liver has this ability in a more limited degree, which indirectly speaks for such a conversion. S Morgulis

Internal exchange in the glandular tissues A M Uteviski, E I Kovtun and K M Shleifer *Med. expil.* (Ukraine) No. 1, 32-7(1934)—The glucolysis in the glandular tissues is different from that in the muscles. Glucose is a better generator of lactic acid than glycogen. The formation of lactic acid is increased by the presence of pyrotartaric acid salts. The presence of alanine also stimulates the generators of lactic acid. L N

Liver and glutathione Léon Binet and G Weller *Compt. rend.* 201, 992-3(1935)—Detrit of total glutathione (I) in arterial, portal and hepatic blood by the method described (*C A* 28, 4095⁷, 29, 6933⁹) demonstrates that I is taken from the liver by blood during periods of fasting, but is absorbed from blood by the liver during periods of digestion. W Gordon Rose

The diffusible calcium in the serum of laying and non-laying hens Milton W Taylor and Walter C Russell *J. Agr. Research* 51, 663-7(1935)—By the use of collodion membranes, the diffusible Ca of the serum of non-laying hens was found to be 5.4 ± 0.42 and that of the same hens in the laying condition 5.3 ± 0.17 mg per 100 cc of serum. No difference was observed in the level of diffusible Ca when the birds changed from a non-laying to a laying condition or vice versa. The nondiffusible Ca in the serum rose from a value of 6.4 ± 0.53 mg per 100 cc for non-laying birds to a value of 16.1 ± 1.17 mg per 100 cc for the same birds in the laying condition. W H Ross

Purified growth hormone from beef anterior pituitary II Dialyzable growth hormone E Dugemans and J Freud *Acta Brevia Neerland. Physiol., Pharmacol., Microbiol.* 5, 109-11(1935), cf *C A* 29, 6294⁷—Preps capable of promoting growth in hypophysectomized rats and of low N content were obtained from the dialyzate of crude or purified exts. of the anterior pituitary. E W S

The physicochemical state of the adrenalinic hormone in the blood David Broun and H Scheiner *Compt. rend.* 201, 794-5(1935), cf *C A* 29, 8084⁷—Fresh suprarenal glands were suspended in serum, distd. H₂O and H₂O acidified to pH 3.5-4.0. Injections of these solns produced hypertension. The serum soln lost this property upon ultrafiltration. The others did not. Addn of CaCl₂, distd. H₂O or acid (to give pH 4.0-4.5) to the

serum soln released the adrenaline (I). Conclusions I in the blood is fixed on the nonultrafilterable constituents of the serum from which it is released by dial., addn of acid or of Ca ion. E W Scott

Nitrogen metabolism in protein starvation Gilberte Mourot *Compt. rend.* 201, 1044-6(1935); cf *C A* 29, 1872¹—A discussion. E. D. Walter

The physicochemical state of acetylcholine in the blood David Broun and Hermann Scheiner *Compt. rend.* 201, 1046-8(1935)—Acetylcholine appears to exist in the tissues or in the blood as a physiologically inactive complex. The nervous influx liberates acetylcholine from this complex in proportion to the intensity of the stimulus. E D Walter

Chemistry of estrogenic substances J W Cook, E C Dodds and F L Warren *Nature* 136, 912-13 (1935), cf *C A* 29, 5899⁷—Subcutaneous injections of 300 mg of Na benzylidene pyruvate, in 3 cc of H₂O, into ovariectomized rats did not produce any estrogenic activity. Subcutaneous injections of 8 mg of either Na benzylidene pyruvate or Na furylidene pyruvate into mice, at 24-hr. intervals for 3 days, did not produce any estrus response. E D Walter

The occurrence of creatinuria in adult Chinese males Lu Gwei Djen and B S Platt *Trans. 9th Congr. Far East Assoc. Trop. Med.* 1, 379-86(1931)—The percentage occurrence of creatinuria for the following age groups is: 21-32 yrs, 90.2%, 18-30 yrs, 60.9%, 23-58 yrs, 30.0%; 21-58 yrs, 52.3%. There is no difference due to sex. I S Yun

G—PATHOLOGY

H GIDEON WELLS

Cholesterol content of whole blood in patients with arterial hypertension A H Elliot and F R Nuzum *Arch. Internal Med.* 57, 63-72(1936)—Uncomplicated arterial hypertension is not accompanied by hypercholes-

terolemia. Further, the cholesterol level is not increased when vascular degeneration or renal impairment accompanies the hypertension. Higher values for cholesterol are more frequently found in underweight persons than in obese.

Adrenal insufficiency. Jules Stahl, Dana W. Atchley and Robert F. Loeb. *J. Clin. Investigation* 15, 41-49 (1936).—The decrease in Na content and increase in blood urea in adrenal insufficiency are not interdependent although they sometimes occur simultaneously. Withdrawal of NaCl from the diet of an adrenalectomized dog maintained on cortical extract results in increase in urea and decrease in Na, as did also the withdrawal of extract. If an universally potent test was employed, no change in Na and urea was observed on a low-salt diet. Withdrawal of salt or cortical extract decreased renal function. NH_4Cl excretion was decreased by decrease in dosage of extract. Striking improvement in well-being was observed following large doses of extract before consistent changes in blood Na, K or urea were observed. Likewise, heavy dosage inhibited appearance of decreased renal function. Standardization of cortical extract based on its effect on blood urea in the adrenalectomized dog is unreliable, unless rigid control of the salt content of the diet is maintained. J. B. Brown.

The effect of drugs in the production of agranulocytosis with particular reference to amadopyrine hypersensitivity. Wm. Dameshek and Abraham Colones. *J. Clin. Investigation* 15, 53-57 (1936).

Plasma lipids in chronic hemorrhagic nephritis. Irvine H. Pace, Euben Kirk and Donald D. Van Slyke. *J. Clin. Investigation* 15, 101-110 (1936).—Of 41, 30, 140.—Total lipids in nephritic as well as normal plasma can be estimated as 1.3 times the total C, with an error of less than 1%. Details of the different lipide fractions by the gravimetric method (C. A. 29, 6149) were made on 32 patients with chronic hemorrhagic nephritis, the degree of renal damage being slight to almost complete. In the chronic active stage (urea clearance over 20% normal) there is a tendency to lipemia, the plasma lipides being near or above the upper limits of normal, 1.0-2.0 g./100 cc. Near the terminal stage the lipemia decreases and toward the end may fall below normal. Free cholesterol, cholesterol esters, phosphatides and neutral fat fractions rise and fall together, the percentage of the total of each deviating essentially from the normal. The high N/P ratio (3-15) in the terminal lipides is evidence that the N was present in the form of petroleum ether-sol substances other than phosphatides. The severity of the lipemia does not parallel the plasma protein deficit. Plasma lipides in essential hypertension. *Ibid.* 109-112.—Of 16 cases of uncomplicated essential hypertension in none was the concentration of total lipides or any of the lipide fractions outside the usual range of normal values. There seems to be no basis for associating the arterial changes in essential hypertension with hypercholesterolemia or elevation of the cholesterol/phosphatide ratio. In 2 cases of malignant sclerosis the lipide contents were in or above the normal range. J. B. Brown.

The problem of an antidiuretic substance in the blood of patients with eclampsia and other hypertensive diseases with observations on spinal fluid. Geo. Levitt. *J. Clin. Investigation* 15, 135-141 (1936).—The methods employed were unable to detect an increased amount of diuretic substance (presence of the posterior pituitary lobe) in the blood of patients with eclampsia and related disturbances.

Vitamins, hormones and disease. T. Swan Harding. *Am. Med.* 41, 835-9 (1935).

Serum proteins in cancer. Wladislaw Kopaewsky. *Comp. rend.* 201, 1263-5 (1935).—Of C. A. 29, 4979.—In cancer the total of the serum globulin and albumin decreases while the myxoprotein may increase as much as 100%. There is a gradual parallelism between the total of the hydrophobic proteins and the rapidity of the lactose sedimentation of the serum. Not only the amount but the phys. state of the hydrophobic colloids affects the acceleration of the lactose sedimentation of serum in cancer. R. B. Phosphoric esters in normal and malignant tissues

E. L. Outhouse. *Trans. Roy. Soc. Can.* 29, Sect. V, 77-84 (1935).—The total, free and org. P of the CaCl_2COOH extract of tumors was determined together with the fractionation of the org. P into Ba-sol and insol and Pb-sol and insol fractions. The org. P was lower in benign than in malignant tumors, the highest value for the former being 14 mg. % and the lowest for the latter 2.7 mg. %. The mean value for malignant tumors was 5.0 mg. %. No hexose phosphates were present. A phosphoric ester was isolated from the alc-insol. Ba fraction of the Pb-precipitable phosphates. The formula $\text{C}_4\text{H}_{10}\text{O}_8\text{P}_2$ suggests that it may be either hexaacetamorphosphate or the phosphoric ester of an ambohexathyl diol. The phosphoric ester of thiohexamine was isolated from the Ba fractions pptd. in 70% alc at pH 10. Rachel Brown.

Pneumococcus immunity after gold treatment. W. A. Collier. *Z. Hyg. Infektionskrankh.* 117, 476-60 (1935).—Of C. A. 29, 7484.—Intrapertoneal or pulmonary treatment of mice with killed pneumococci confers less immunity than when the mice are treated simultaneously with the Au prep. Auto-Detoxin (Type 70). In the latter case dead or living pneumococci can be used. Pulmonary immunization appears to be more effective than intraperitoneal immunization against a pulmonary infection but less so against an intraperitoneal infection.

Cerebrouse cysts in the frontal skull cysts. Carl Trepp and Bruno Eckardt. *Z. Psychiat.* 128, 318-42 (1936).—The contents of a frontal cyst of 300 cc. vol. showed no spectroscopic evidence of blood pigments and only traces of Fe, but gave a strong reaction for sugar. Such high sugar values are not observed in cholesterol and P values neg., protein was pos. The main constituent of the dry residue was a cerebrouse mist. Contg. cerobron and kerobron in about equal proportions. For this type of cyst the name *cerebrouse* is proposed.

The structure of cystine calculi. Endre Sold. *Oron. Hídep.* 79, 1196-7 (1935).—Of C. A. 29, 7451.—X-ray photographs of cystine calculi show that they consist of 3 layers, the center being a phosphate material of small but well-developed crystals. Then there is a semi amorphous phosphate layer of fine structure; it does not show the same symmetry in all directions. The surface cystine layer covers both of the others. Thus shows the fine crystal phosphate was formed first.

Physicochemical properties of tissues with respect to the normal or pathological state of the organism. XXI Effects of darkness and light on the development of tar cancer. Fred Viles, A. de Coulon and J. A. J. J. *Arch. phys.* *ibid.* 12, 235-277 (1935).—Of C. A. 29, 6644.—Strong illumination (with ordinary incandescent lamps) seemed to accelerate the development of papilloma and cancer in mice treated with tar.

Asotemia and increase in alkali reserve in animals. René Hurvéniz, R. Truhaut and C. Samet. *Comp. rend. soc. biol.* 120, 715-18 (1935).—A woman with complete anuria due to compression of the ureters by a tumor was given enough NaHCO_3 daily to keep the alkali reserve normal or a little above. She lived 20 days. Blood urea gradually increased to 0.5%. L. E. Gilson.

Nature of the tuberculous antibodies. Albert Meyer and André Pic. *Comp. rend. soc. biol.* 120, 772-4 (1935).—There are 2 antibodies. One is specific for the lipides of the tubercle bacillus and the other for the protein. They were prep. from each other by the method of D'Alessandro and Soňa (C. A. 29, 8116). Tuberculous antibodies. *Ibid.* 940-5.—Serums from animals treated with tubercle bacilli contain the 2 antibodies mentioned above. They do not contain any antibody capable of reacting with both lipide and protein. L. E. Gilson.

Oxalic acid content of the blood in cancer. E. Aysalon, F. H. Colombes and A. Montaut. *Comp. rend. soc. biol.* 120, 934-5 (1935).—In 64 of 90 cases examined the blood oxalic acid was within the normal range. In the others it was somewhat above normal. No correlation

between oxalemia and the stage of the disease was found

Exanthema from picric acid and quinine bisulfate Passive transfer of hypersensitivity by the Prausnitz-Kuestner method Alberto Midana and Filippo Franchi *Minerva med* 1935, II, 641-6 — In 1 case each of picric acid and quinine hypersensitivity a pos Bloch-Jaeger reaction was obtained in the allergic individual and the sensitivity was locally transferred to the skin of normal persons by the Prausnitz-Kuestner method H L G

Lipides in the liver of the cat during bile stasis and biliary decompression A Cantarow, H L Stewart and M M Lieber *Arch Pathol* 20, 535-47(1935) — Studies were made of the quantity and distribution of stainable lipid and doubly refractive material in the liver in 39 cats with uncomplicated total bile stasis of from 10 hrs to 42 days' duration and in 21 cats following biliary decompression of from 1 hr to 21 days' duration The quantity of stainable lipid decreased markedly in both hepatic and Kupffer cells during stasis and was practically absent in the majority of animals after the 7th day A return of large quantities of stainable lipid was noted in animals several days after relief from prolonged total stasis Doubly refractive material was present in the Kupffer cells in large quantities through the entire period of total stasis, differing markedly from the stainable lipid in this respect Although necrotic lesions frequently contained large quantities of fat, observations during the early and late stages of stasis indicate that the stainable lipids distributed indiscriminately throughout the lobule are not necessarily dependent on regressive changes in the affected cells Stainable lipid was not observed in the epithelium of the bile ducts, except in the later period of stasis at a time when the ducts were undergoing destruction as a result of organization of areas of hyaline necrosis It is suggested that the consistently large amount of doubly refractive material in the Kupffer cells and the relatively small quantity in the hepatic cells during stasis are dependent on a delay in the transfer of this material from the former to the latter under the experimental conditions H F H

V H Moon
Mechanism of acute inflammation *Arch Pathol* 20, 561-70(1935) — The local vascular and cellular phenomena of acute inflammation result from the liberation of substances from injured cells One such substance, which apparently is some combination of histamine, produces the vascular reactions resulting in congestion, capillary dilatation and permeability, edema and local elevation of temp Systemic leucocytosis results from the injection of histamine phosphate into animals Histamine released from extensive areas of injured tissue is probably a factor in producing the resulting leucocytosis A substance released from injured cells attracts leucocytes to the

area of injury. This same substance may also be effective in systemic leucocytosis Apparently this substance is not histamine There is evidence that increase in the metabolic rate and in the rapidity of circulation follows the injection of histamine This may be a factor in the systemic reactions which accompany extensive inflammation. Harriet F Holmes

E F Hirsch *Arch Pathol* 20, 665 82(1935) — The radial inclusions of giant cells observed in tubercle-like granulation tissues are crystal forms of fats solid at body temp, such as palmitin or stearin, sep'd from an oil system contg cholesterol or substances with the phys properties of cholesterol The formation of these crystals in a liquid fat system is according to the usual laws governing crystals, and the factors accomplishing the supersatn of the system are mainly the abstraction of the liquid portion faster than the combustion of the dissolved solid fat. Certain chem changes take place in the compn of the crystals in the tissues so that they become insol in fat solvents Further changes or addns in the tissues produce the elastin-staining qualities Harriet F Holmes

Analysis of Type I pneumococcus specific precipitate Herbert O Calvery, *J Biol Chem* 112, 167-9(1935). — Analysis has been made of the purified ppt. from type I pneumococcus specific hapten and antisera and the following av values (N fractions expressed in percentage of total N) for Type I and Type II ppts, resp (*Proc Soc Exptl Biol Med* 32, 1099(1935)) were obtained ash 0.27, 0.17, moisture 4.85, 6.1, total N 15.85, 16.0, amide N 4.5, 3.7, humin N 0.6, 0.6, amino N 75.2, 75.0, S 1.25, 1.3, tyrosine 5.5, 5.5, tryptophan 2.05, 2.2, cystine 2.55, 3.1, arginine 4.95, 5.5, histidine 0.95, 1.1, lysine 5.37, 4.8, aspartic acid 4.6, 4.4 and glutamic acid 6.55, 6.3 Attention is called to the differences between the values for cystine which are beyond exptl error. In general the values agree with those reported for serum globulins A F. Lothrop

The effect of cysteine on tetanus toxin Philip B Cowles *Yale J Biol and Med* 8, 265-8(1936) — Cysteine in the presence of O₂ is able to detoxify tetanus toxin; the resulting product is a toxoid which can stimulate antitoxin production and is able to unite with antitoxin The reaction does not appear to be of the same nature as is that of cysteine with Cu G H W. Lucas
Post hemorrhagic uremia L. Meyler *Acta Med Scand* 87, 313-25(1935) — Both experimentally and clinically, extrarenal uremia occurs after severe hemorrhage. By maintaining the water supply with subcutaneous fluid administration it is possible to prevent the onset of uremia in the exptl animals The advisability of large quantities of water together with sufficient food in cases of large losses of blood is discussed S Morgulis

Distribution of isoagglutinins in blood serum fractionated through electrophoresis Anders Grönwall *Biochem Z* 282, 257-62(1935) — Human serum of type O was thoroughly fractionated by electrophoresis, and in each fraction the agglutinin titer, total N and pptn by (NH₄)₂SO₄ were detd The isoagglutinins are always found in one of two fractions pptd by 30% (NH₄)₂SO₄, both the α- and β forms being present there. S M

Hypeninsulinemia associated with congenital atresia of the pancreatic duct Walther Benoit. *Endocrinol* 16, 313-27(1935) S Morgulis

The lipid content of immune aggregates Frank L Horsfall, Jr and Kenneth Goodner *J Biol* 31, 69 (1936) — Ppts formed by the interaction of antipneumococcus horse or rabbit serums with Type I pneumococcus capsular polysaccharide contain lipids characteristic of the species origin of the antibody. John T. Myers

The serological flocculation rate in the region of considerable antibody excess Sanford B Hooker and Wm C Boyd *J Gen Physiol* 19, 373-8(1935) — Antigen antibody reactions in test tubes can be divided into 2 phases (1) combination, (2) secondary aggregation resulting in flocculation or agglutination Strong concns of the reactants make the second phase immediately visible, under these conditions the first phase must be almost

instantaneous. The second phase can be explored by a current technique if suitable dials are used. II and II have observed in several simple precipitin-antigen systems that in regions of considerable antibody excess flocculation time varies inversely and in the same ratio as the change in coagulum. A physicochemical interpretation of this observation is given based upon the theory of van Schmelowchowski (*C A* 11, 3140) for the velocity of colloidal flocculation.

C. H. Richardson
The immunological specificity of the euglobulin and pseudoglobulin fractions of horse and human serum. *Trans. Harris and Harry Lacle. J. Gen. Physiol.* 10, 393-90 (1935).—Euglobulin was isolated from horse and human serum by pptn. with $(\text{NH}_4)_2\text{SO}_4$ (1 : 1 satn) and pptn. on subsequent dialysis. Pseudoglobulin from the same source was isolated by pptn. with $(\text{NH}_4)_2\text{SO}_4$ ($1/2$: $1/2$ satn) and then taken, the fraction which remained in soln. on subsequent dialysis. The serum of rabbits injected with either of these anti-antigens gave pptn. with both. However, two antigenically distinct albumins (globulins I and II) were found in the serum. They were largely averted with so-called euglobulin and pseudoglobulin, resp. Ordinary methods of pptn. do not completely remove the other antigen from a globulin fraction. Antisera to these euglobulin and pseudoglobulin fractions therefore contain antibodies to both antigens. Each protein soln. gives all the antibody sp. for its antigen and in addn. gives a portion only of the antibody sp. for the other antigen. This immunological specificity is an inherent property of the two globulins present in the serum. It is not destroyed by an antigen induced by their pptn. and purification nor by lipoids assoc. with the protein. C. H. Richardson

The connecting links between immunology and chemistry. L. E. den Dooren de Jong. *Chem. Weekblad* 32, 294-601 (1935).—discusses W. Gordon, E. C. R. E. C.

The proteins of the cancerous cell. Charles Achard and Maurice Dietrich. *Compt. rend.* 201, 731-61 (1935).—Exts. of beef and equine tumors were fractionated into 2 fractions. One, dispersible in H_2O , contained a globulin and products of cellular metabolism, i. e., peptides. The other, not dispersible in H_2O , contained a myxoprotein and a phosphoprotein contg. 0.35% P. The albumin isolated was similar to serum albumin except it was of much lower mol. wt. This property may be due to the repulsive of protein synthesis in cancerous tissues. E. W. Scott

Immunological studies on lymph I. The complement content of lymph. J. Murakami. *Japen. J. Microbiol.* 1, 2, 136-47 (1935).—M. found complement in normal rabbit lymph. I. S. Yun

Relationship of vitamins to diphtheria toxin and antitoxin. M. Aino. *Japen. J. Microbiol.* 1, 2, 138-52 (1935).—M. investigated the relationship between the resistance to diphtheria toxin and the production of diphtheria antitoxin in guinea pigs which were fed with vitamins A, B, C or D. He found that the resistance to diphtheria toxin was strong in guinea pigs fed vitamin C. I. S. Yun

Pathological creatinuria. Lu Gwei Dien. *Trans. 9th Cong. Far East. Assoc. Trop. Med.* 1, 160-176 (1934).—Creatinuria was found in pseudopyretic fever, muscular dystrophy, amyotonia congenita and generalized osteitis fibrosa cystica, so B. maintains that there is undoubtedly some connection between the activity of the endocrine system and creatine metabolism. C. Y. Yun

H—PHARMACOLOGY

A. V. RICHARDS

Chemical studies of acute poisoning from mercury dichloride. Torald Sollmann and Nora E. Schreiber. *Arch. Internal Med.* 57, 46-62 (1936).—Elimination of HgCl_2 was studied in 4 cases of HgCl_2 poisoning which were fatal. Considerable amt. of Hg were removed only by early emesis. Not over 1.5-3.25% of the Hg taken was removed by gastric lavage and colonic irrigations. Urinary elimination was negligible, there being anuria in the fatal cases. Hg concn. in vomitus, feces and urine ran level after the 1st, 2nd or 3rd day. In 3 autopsies ca. 5% the concn. of Hg was highest in the kidney (3.5 mg. 100 g. moist organ), liver was 2nd with $1/2$ - 1 the kidney, colon, spleen, intestines $1/2$, skeletal muscle and lungs $1/4$, brain $1/8$, blood $1/16$, gastric fluid lower than blood, bile variable between the liver and blood. Three times as much Hg was found in the liver as was found in both kidneys. J. B. Brown

Chlorophyll and regeneration of blood. Effect of administration of chlorophyll derivatives to patients with chronic hypochromic anemia. Arthur J. Feterik. *Arch. Internal Med.* 57, 72-84 (1936).—The administration of chlorophyll products after a period of medication with Fe was followed by a significant increase in the concn. of hemoglobin. The body can apparently use pyrrrole substances for the building of hemoglobin. J. B. Brown

Potassium permanganate poisoning. Stanley G. Williston and Mark L. Newman. *Biol. Med.* 1, 58-9. A review with report of a fatal case following administration of 29 g. of KMnO_4 through the urethral canal. J. B. Brown

Pantolaine in spinal anesthesia. David C. Bull and Caldwell B. Twiss. *Ann. Surgery* 103, 27-34 (1936).—Rachel Brown

The toxicity of bromoform (Gutierrezia macrocephala) for sheep, cattle and goats. Frank P. Matthews. *J. Am. Vet. Med. Assoc.* 41, 55-61 (1936).—Rachel Brown

Initial impressions of atropine-pilocarpin in the treatment of malaria in Uganda. A. Forbes Brown. *J. Trop. Med. Hyg.* 38, 501-4 (1935).—Atropine treatment of malaria seems to be quicker and more efficacious than quinine treatment. Rachel Brown

The calcium content of the blood during experimental poisoning with sodium fluoride. T. A. Stutesell. *J. Physiol. (U. S. S. R.)* 19, 1259-64 (1935).—Rabbits and dogs were fed for several months a diet which contained a daily dose of 0.02 g. of NaF per g. of body wt. The amt. of the blood Ca of the animals remained unchanged. H. Cohen

Resorption, distribution and elimination of fluorides during the poisoning of an animal with sodium fluoride. S. D. Gadvalina and T. A. Stutesell. *J. Physiol. (U. S. S. R.)* 19, 1245-56 (1935).—About 90% of the fluorides fed to dogs was retained in the organism, and 10% was excreted with the urine and feces. When NaF was injected intravenously, the elimination was effected not only through the kidneys, but also through the intestines. The F content of the blood of dogs poisoned by the oral administration of NaF did not change during the 1st 4-5 months. Later on, the blood F content increased somewhat. The F content of tissues of rabbits poisoned by NaF increased to about twice the normal value in the course of 3-5 months, the F content of the bone increased 5 times during the same period. H. Cohen

The breakdown of mesalene and mesalene-like substances in the organism. K. H. Johnson and Johannes Müller. *Z. physiol. Chem.* 235, 11-22 (1936).—Rabbits are 70 times as tolerant to mesalene, $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$, the chief alkali of pyrolysis, as human

beings. The most striking effect in rabbits and dogs is a strong retention of urine, lasting as long as 48 hrs. After feeding 400 mg of the HCl salt to rabbits some 40-50% was excreted as 3,4,5-(MeO)₃C₆H₂CH₂CO₂H (I). This acid, however, is relatively nontoxic, and a dose of 800 mg. fed to a rabbit was excreted to the extent of 60% without retention of urine or evidence of physiol. changes. Closely related substances, e. g., 3,4,5-(MeO)₃C₆H₂CHO and 3,4,5-(MeO)₃C₆H₂CH₂CH₂OH (II) were decidedly more toxic, the former being excreted as 3,4,5-(MeO)₃C₆H₂CO₂H and the latter as a nitrogenous substance contg. MeO. In human beings, on the other hand, mescaline was not excreted as I, and I itself was excreted to 75% without causing drunkenness or urine retention. An excretory product of mescaline was an oil which on hydrogenation took up 3 H₂ and formed a satd. crystalline substance of the formula C₁₁H₁₇O₃N, contg. 1 MeO and incapable of forming a picrate, chloroaurate or chloroplatinate, in contrast to the hydrogenation product of mescaline. Mescaline has a more powerful action on normal persons than on schizophrenics, whereas the reverse is true of the 2,3,4 isomer I, m 121°, was prep'd by coupling of 3,4,5-(MeO)₃C₆H₂COCl with CH₃N₃ to trimethoxy- α -diazoacetophenone, m 103°, conversion of the latter by NH₄OH + AgNO₃ to trimethoxyphenylacetamide, m 125°, and hydrolysis of the amide with KOH in MeOH. II, an oil, was obtained by treatment of mescaline with HNO₃ and purified by sapon of the *p*-nitrobenzoyl deriv., m 100°. A. W. Dux

The breakdown of dimethylamine and dimethylamine oxide in the animal body. Fritz Horn. *Z. physiol. Chem.* 238, 84-90 (1936).—After subcutaneous injection in dogs PhNMe₂, unlike NMe₃ and NEt₃, is not eliminated as the oxide. Both PhNMe₂ and PhMe₂NO are broken down at least as far as o H₂NCH₂OH. Poisoning by PhNMe₂ leads to formation of methemoglobin.

Evaluation of the relative toxic effects of large doses of calciferol and the crystalline antirachitic preparation substance L. J. van Niekerk. *Arch. nederl. physiol.* 20, 559-61 (1935).—Conclusion. The ratio of toxic to antirachitic activity of the substance L is identical with that of calciferol. The min. toxic dose of calciferol was found to be the same as that de'd by Askev (*C. A.* 26, 3284) and Windaus (*C. A.* 26, 2217). F. L. D.

The relation between the chemical constitution and pharmacological action of phenylhydrazine derivatives. W. F. v. Oettingen and W. Deichmann-Greubler. *J. Ind. Hyg. Toxicol.* 18, 1-15 (1936).—PhNHNH₂ and 11 derivs. of it were studied with regard to their toxicity on subcutaneous injection, their effect on the skin, their anemogenic action, their effect on the blood pigment, and their effect on the blood pressure and respiration at elevated temps. Mice and rats were used as exptl. animals. Comparative min. fatal doses are recorded. Toxicity depended largely on soly in water. Substitution of 1 H of the hydrazine group reduced toxicity. Surface applications indicated that PhNHNH₂ was most irritating, probably owing to the C=S group. A. L. F.

Pathological studies on the organic effects of various hydrazine derivatives. W. C. Hueper. *J. Ind. Hyg. Toxicol.* 18, 17-36 (1936).—Rats injected with lethal or slightly sublethal doses of benzylphenylhydrazine, α -ethyl β -propylacrolein phenylhydrazine, butylphenylhydrazine and formylphenylhydrazine developed lesions in the liver, heart, pancreas, spleen, kidney, testis and brain in addn. to hemorrhage, edema, hyperemia and infarcts. The acrolein deriv. was most toxic. A. L. F.

Urine sulfate determinations as a measure of benzene exposure. W. P. Yant, H. H. Schrenk, R. R. Sayers, A. A. Horvath and W. H. Reinhardt. *J. Ind. Hyg. Toxicol.* 18, 69-88 (1936).—Seventy-nine dogs were subjected to a variety of conditions of exposure to benzene vapor in air. Analysis of urine specimens showed that a rapid and marked decrease occurred in the percentage of inorg. sulfates of the total sulfates in the urine. It is believed to be due to the oxidation of benzene to phenol or phenolic derivs. which are conjugated in the liver

with sulfate ions to form ethereal sulfates. The change in inorg. sulfates is proportional to the severity of benzene exposure. This procedure may be an invaluable aid in the control and prevention of chronic benzene poisoning.

A. L. Elder

Nicotinized drinking water as a preventive against ascariid and coccidial invasions of chickens. R. E. Rebrasser. Ohio Agr. Expt. Sta., *Bull.* No. 548 (53rd Ann. Rept.), 77 (1935), cf. *C. A.* 28, 3789¹.—No appreciable difference was observed from the use of nicotinized drinking water in the prevention of either ascariid or coccidial invasions in chicks. Over 700 chicks were used. The concn. of nicotine varied from 1 teaspoonful of 40% soln. of nicotine sulfate to 5-50 gal. of water.

C. R. Fellers

Clinical experiences with sulfarsenol. Ferenc Foldvart. *Orvosi Hetilap* 79, 1300-9 (1935). S. S. de F.

The pharmacology of myrrh, krameria and enodictyon. David I. Macht and Hilda F. Bryan. *Am. J. Pharm.* 107, 500-11 (1935).—The local effect of these 3 vegetable astringents was studied on the mucous membranes of the mouth, tongue and pharynx and compared with that of tannic acid alone. Tannic acid markedly delayed the absorption through the mucous membrane of the powerful alkaloid nicotine subsequently applied, while the vegetable astringents did not. This was true of the mucous membranes of the pharynx, of the tongue and of the cheeks.

Expts. on surviving intestinal segments in oxygenated Locke soln. revealed that tannic acid alone produces a slight inhibition of the amplitude and the rate of rhythmic contractions without injuring the prep'n. The 3 vegetable astringents, however, produced paralysis and death of the intestinal muscle, as indicated by its failure to respond to subsequent treatment with such powerful stimulants as pilocarpine, etc. Conclusion. In respect to their local effect on the intestines, myrrh, krameria and enodictyon act differently from pure tannic acid solns. This difference must be ascribed to the presence of volatile oils or some other constituent of the 3 vegetable astringents.

W. G. Gaessler

Repeated injections of a gold derivative of a sulfur compound. Tolerance and localization. A. Leulier and G. Bérnard. *Compt. rend. soc. biol.* 120, 651-4 (1935).—Sr aurothiopropanol sulfonate, prep'd from Na alloxhydrin and SrCH₃, is a white salt contg. 41-2% Au and sol. in about 100 parts water at 20°. Repeated intramuscular injections of an oil suspension are well tolerated by guinea pigs. Growth is not interfered with. One guinea pig received a total equiv. to 1 g. Au in 9 months. Au was found in all tissues exam'd but was much more abundant in the kidneys than in any other organ.

L. E. Gilson

Pharmacology of some hydroxyphenoxethylalkylamines. D. Bovet, A. Simon and J. Druey. *Compt. rend. soc. biol.* 120, 690-3 (1935).—A preliminary note on 9 comp'ds. In general those of the type HOCH₂OCH₂CH₂NR₂ (R = Me or Et) are adrenergic and non-nicotinic in their action and those of the type HOCH₂OCH₂CH₂NR₂ are nicotinic and nonadrenergic.

L. E. Gilson

The continuous injection of insulin into dogs. Minimum dose when injected into a peripheral vein. A. Baudouin, E. Azrad and J. Lewin. *Compt. rend. soc. biol.* 120, 769-71 (1935).—When injected into a leg vein of dogs (with or without chloralose anesthesia) the min. dose of insulin causing an appreciable decrease in glucemia was about 0.05 unit/kg./hr. Minimum dose when injected into an artery or a mesenteric vein. *Ibid.* 805-6. In both cases the min. dose affecting glucemia was about 0.01 unit/kg./hr.

L. E. Gilson

Effects of zinc salts on blood. G. Protrowski. *Compt. rend. soc. biol.* 120, 830-2 (1935).—ZnSO₄ retards the clotting of blood *in vitro* but not *in vivo* (rabbits). Changes produced in the corpuscles are described. L. E. Gilson

Analyses of bloods treated with moranyl or liquoide (to prevent coagulation). R. Nattan-Larrier and P. Tchermakofsky. *Compt. rend. soc. biol.* 120, 857-9 (1935).—Neither anticoagulant affected the pH, alkali

reserin or urea, cholesterol, glucose, Ca or K content of the blood. L. E. Gilson

Effect of continuous intravenous injection of adrenaline on the ketone bodies of the urine. A. Baidoun, H. Binard, J. Levin and J. Sallet. *Compt rend soc Biol* 120, 840-2 (1935), cf. C. A. 30, 1120. A small increase in urinary ketone bodies was produced in dogs.

Changes in serum phosphatase after ingestion of chloroform. H. Metzger, P. Barthelme and M. Urban. *Compt rend soc Biol* 120, 206-7 (1935). Dogs were given 2 cc. of CHCl_3 dissolved with olive oil by stomach tube daily or 2-3 times a week for several weeks. During the treatment serum phosphatase fluctuated between 5 and 10 times the normal value. It slowly returned to normal when treatment was stopped. Bile secretion was normal throughout. No jaundice occurred.

Effect of lecithin on cardiac activity. J. Karsak. *Compt rend soc Biol* 120, 920-2 (1935), cf. C. A. 29, 511. Lecithin, 0.1-0.5%, added to the Ringer's solution used for perfusing the isolated frog heart increases the frequency and amplitude of the contractions. It acts directly on the myocardium and has no effect on the activity of the cardiac nervous. Influence of lecithin and other compounds decreases the tension on the arteries of vagomimetic substances. *Ibid* 922-4. The isolated frog heart was perfused with Ringer's solution and the response to acetylcholine died before and after the addition of very small quantities. No effect of lecithin, Na taurocholate and caprylate. Each compound decreased the action of the acetylcholine, the effectiveness decreasing in the order given.

Action of gonorrhea on the virus of lymphogranuloma. R. Schoen and L. Rempe. *Compt rend soc Biol* 120, 959-60 (1935). Gonorrhea kills the virus *in vitro* but is ineffective in live infected guinea pigs.

Distribution of chloride in the tissues of rabbits after intravenous injection of sodium chloride. T. Svedoloff and René S. March. *Compt rend soc Biol* 120, 941-2 (1935).

Influence of colchicine on the cardiac inhibiting effects of faradization of the pneumogastric nerve. Raymond-Haust. *Compt rend soc Biol* 120, 951-3 (1935). In dogs large doses of colchicine slightly decreased the sensitivity to the electric stimulations.

Mechanism of the curative and preventive action of rubulose and similar compounds in experimental streptococcus infection in mice. C. Lévaditi and A. Yusef. *Compt rend soc Biol* 120, 1077-9 (1935), cf. C. A. 29, 7140. The compounds prevent the encapsulation of the streptococcus and neutralize the leucocidin and hemolysin which it secretes.

Permeability of the placenta to medicinal and toxic substances. Quinine. M. T. Régner. *Compt rend soc Biol* 120, 1089 (1935). Quinine passes from the mother into the fetus.

Comparison of the toxicity of some local anesthetics on amphibian heart. Leonardo Donatelli. *Arch farmacol sper*, 60, 485-96 (1935). Tests on frog heart *in situ* showed increased toxicity in the order given for identical doses of procaine, stovaine, cocaine, parocaine and perraine.

Synthetic animalia. W. O. Kermack. *Science Progress* 30, 407-9 (1935). Plasmagum (a quinine derivative) is not suitable for the general treatment of malaria and is rather toxic. Aeternin (an acridine derivative) is almost as effective as quinine and is superior to the latter in reducing the size of relapses.

The efficacy of carbon tetrachloride in roundworm (Ascaridia hystrix) control. J. T. Ackert and G. L. Graham. *Poultry Sci*, 14, 225-31 (1935). A dosage of 4 cc. CCl_4 per kg. of body wt. gave complete removal of the worms from chickens 10 weeks old and had practically no toxic effect on the chickens. A dosage of 10 cc/kg. caused a 25% mortality of the chickens. The egg production of pullets was materially reduced for a

period of 7-10 days after administration of CCl_4 at the rate of 4 cc/kg.

Absorption and excretion of aeternin. N. D. Kehat. *Records Malaria Survey India* 5, 393-404 (1935). Aeternin is given orally to human beings in three 0.1-g doses at intervals of 3 hrs. It appears in the urine 75-90 min after the first dose, but if the intervals are reduced to 1 hr it appears in about 60 min. Aeternin may continue to be excreted from the body up to 60 days after the administration of a total of 0.3 g. of the drug at intervals or in a single dose. The duration of the drug in the urine appears to be influenced by the extent of its excretion. At least 50-70% of the administered dose is excreted in the urine. The slow excretion of the drug may be due to its retention in the body tissues either in a complex form or colloidal combination, when the concentration in the fluids decreases, the absorbed drug diffuses slowly from the tissues and is finally excreted by the kidneys. The protection afforded by aeternin against malaria seems to be due to its prolonged retention in the body tissues. There seems to be little or no advantage in administering aeternin either intravenously or intramuscularly.

The influence of food in the stomach on the absorption and excretion of aeternin. N. D. Kehat. *Records Malaria Survey India* 5, 405-11 (1935). Food delays absorption and lessens the fraction of the dose of aeternin which is excreted in the urine, not only during the first 24 hrs, but also during the following 3 days. Equiv doses of the hydrochloride and the muscarine were given orally. More of the latter was excreted in 3 days than of the former. A protein-rich diet seemed to retard the excretion of aeternin.

The influence of ovary lyrate on egg production in hens. V. Link and S. Volkovskiy. *Arch farmacol sper* 60, 485-96 (1935). (U. S. S. R.) 1935, No. 3, 86-98 (in English 98). Lays on 4500 laying hens showed that injection of ovary lyrate had a positive effect on egg production. Although the egg production decreased during the molting period it was still 15-20% above the controls. The suggestion that ovary lyrate is a sex agent, exerting an organotropic influence upon the organs from which it has been prepared, was not confirmed. Ovary lyrate exerts a stimulating action upon all functions in the sense of a "common protein effect." There is an increase in the amount of hemoglobin and erythrocytes, and a more intense functioning of the gastric organs. Studies on the chemical composition of ovary lyrate showed that the greater effect of the injections depends to a certain extent on the amount of N introduced.

Biochemical aspects of anesthesia. Ivan Maxwell. *J. Med. J. Australia* 2, 841-5 (1935). Review.

Sources and pharmacology of impurities in anesthetics. Byron L. Stanton. *Med. J. Australia* 2, 845-9 (1935). A review.

The total calcium and phosphorus in rats treated with small doses of parathion. Marie Perle. *Arch sci med* 58, 659-63 (1934). The total ash of rats treated with small doses of parathion hormone shows no noticeable changes. The P content is considerably increased, Ca shows only an insignificant change.

Quinquerant arsenicals in the treatment of congenital syphilis. Raúl Cibulski Aguirre and Jorge de las Carreras. *Revista med* (Buenos Aires) 1935, II, 1973-83.

Influence of low molecular animal organ hydrolyzates on the reticuloendothelium and on phagocytosis. A. Leroy and M. Laptewa-Popova. *Acta Med. Scand* 87, 347-57 (1935). Acidosis resulting from injection of NH_4Cl invariably lowers the ability of the reticuloendothelial system to absorb Congo red and decreases the phagocytic ability of neutrophils and monocytes. Simultaneous administration, however, of organ hydrolyzates (consisting chiefly of polypeptides and amino acids) has the opposite effect.

Phosphate metabolism and the influence of thyroidin.

Lydia Pasternak and Irvine H. Page *Biochem Z* 282, 282-92 (1935).—Phosphatides injected intraperitoneally into mice are completely metabolized. Furthermore, under the influence of thyroxine the phosphatide content of rat muscles may be nearly doubled. This is not due to damage of the phosphatide metabolism, since phosphatide injected intraperitoneally into mice treated with thyroxine is completely metabolized just as in the untreated mice. The increase in the phosphatide content in the muscles is not due to an infiltration from other locations, inasmuch as the total phosphatide content of the animal is about 40% higher. Thyroid feeding also causes a rise in the cholesterol content of the entire organism and not of the muscles alone. Since the increase in phosphatide content is abs., not merely relative, it is actually formed under the influence of the thyroxine. S. Morgulis

Comment on Traube's critique of our theory of narcosis. Kurt H. Meyer and H. Hemmi *Biochem Z* 282, 444 (1935), cf. C. A. 29, 8143.—Reply I. Traube *Ibid* 445-6.—Conclusion Kurt H. Meyer *Ibid* 447. S. Morgulis

Histological changes in the adrenal cortex of the rabbit after prolonged insulin treatment. F. Schenk and H. Langecker *Endokrinol* 16, 305-11 (1935).—Treatment with small doses of insulin extending over 4-12 weeks causes an enlargement of the adrenals with loss of differentiation of the various regions. S. Morgulis

Effect of bile acids on calcium metabolism. XII. Thyroparathyroid tetany and the state of the calcium in blood of dogs receiving bile acids. Tadao Hoshijima *J. Biochem. (Japan)* 22, 375-83 (1935).—The daily administration of cholic acid to thyroparathyroidectomized dogs either decreases the severity or entirely abolishes the attacks of tetany, it greatly prolongs the life of the operated animals but does not affect the hypocalcemia. S. M.

Intravenous manganese in the treatment of psoriasis. John Barr *J. Med. Soc. New Jersey* 32, 376-9 (1935).—Intravenous injection of 20 mg. $MnCl_2 \cdot 4H_2O$ + 9.5 mg. $CaCl_2$ in 5 cc. of normal saline solution produced marked improvement in 68% and some improvement in an additional 21% of 93 patients. Review of chemical literature on Mn. James C. Munch

Action of Soviet ephedrine on the blood vessels. N. G. Polyakov and Stankevich *Khim. Farm. Prom.* 1934, No. 6, 28.—No difference was found in comparing domestic and imported samples. L. Nasarevich

Pharmacology of convolvul. Ya. Kh. Nolle *Khim. Farm. Prom.* 1934, No. 6, 35, 7, cf. C. A. 29, 1885.—Convolvul is a powerful stimulant for the central nervous system, producing convulsions and death due to respiratory failure. Convolvul is a good local anesthetic just as lasting as cocaine. L. Nasarevich

Testing of bile stimulants. V. V. Zverev *Khim. Farm. Prom.* 1935, No. 2, 126-8 (1935).—Rabbits tested by Strinsky's method showed that high bile stimulation is produced by hexamethylenetetramine and decholin. L. Nasarevich

The sensitivity of the organism to drugs in acid and alkaline conditions. E. S. Rosovska and A. I. Cherkas *Med. eksptl. (Ukraine)* No. 1, 50-61 (1934).—Sodium salicylate (20% soln.) was introduced subcutaneously, 0.2 g. per kg., and the salicylic acid detd. in the blood and urine at intervals during 48 hrs. During the administration of mixed food the max. salicylic acid content in the blood is reached in 1-2 hrs., then it drops and in 24 hrs. the blood is free from it. In urine the salicylates are eliminated in 24 hrs. in 50% of cases. The total amt. eliminated is 12-20% of that injected. During the administration of acid foods the rise in concn. is much slower and the max. is reached later than in the previous case. The elimination is similar. In case of alk. foods the max. concn. is reached in 1 hr., in 4-5 hrs. only traces of salicylates are found, and the total elimination is 35-70%. L. Nasarevich

The cardiac activity in the fetal rat. E. L. Cory *J. Exptl. Zool.* 72, 127-45 (1935).—Lactic acid soln. (0.1%) applied directly to rat fetuses (3.5-5.0 g. wt.) or injected

into the maternal circulation produced an irregularity of heart rate similar to that in asphyxia. Alk. solns. (NH_4OH , $NaHCO_3$, in Locke soln.) had no effect on the heart rate. The fetal rat heart does not react to adrenaline or to adrenergic secretion. C. H. Richardson

Röntgenographic findings in lead poisoning. A. van der Plaats-Keyzer *Mededeel. Dienst Volksgezondheid Nederland-Indië* 24, 127-9 (1935).—Lead poisoning causes an increased absorption of Röntgen rays at points where bone growth is fastest, this is attributed to deposition of Ca, rather than a concn. of Pb at these points, since an amt. of Pb 10 times that found in the joint of a patient that died of Pb poisoning cast a barely visible shadow when a soln. of a Pb salt was absorbed on a filter paper, and a Röntgen picture made of this paper around the bone of an apc. Pb poisoning is believed to be congenital, since it was found in a baby 36 days old. Eight Röntgen pictures are reproduced. W. Gordon Rose

The effect of 2,4-dinitrophenol upon calcium, creatine and creatinine excretion in the rat. Leonard I. Pugsley *Biochem. J.* 29, 2247-50 (1935).—The feeding of 2,4-dinitrophenol in daily doses of 25 mg. to rats resulted in increased Ca excretion (fecal), marked creatinuria and increased creatinine excretion. E. W. Scott

A quantitative study of the phenomena of synergism. Potentiation of hypnotic action in mice. Laia Olszyska *Compt. rend.* 201, 796-7 (1935).—By injecting together inactive doses of EtOH and ethylbutylbarbiturate, sleep of 2-78-min. duration was produced, depending upon the proportions used. A mixt. of effective doses of the 2 hypnotics produced sleep of only slightly longer duration than that produced by each compd. separately. E. W. Scott

A new true sympathicolytic: the rauwolfine of Koepfli. Raymond Hamet. *Compt. rend.* 201, 1050-3 (1935).—An alkaloid, rauwolfine, was extd. by Koepfli from the *Tabernaemontana ventricosa*, which reversed the action of adrenaline in dogs. E. D. Walter

Contractive effect of coumarin. A. de Moura Campos *Rev. flora med.* 1, 639-46 (1935), cf. C. A. 29, 7502.—The intensity and duration of the contractive effect of coumarin on the muscles of the frog are proportional to the concn. of the drug. Action of coumarin on chronaxie of the heart. *Ibid* 647-57.—Fluext of coumarin (Silva Araujo) depresses the tonicity, chronicity and bathmotropism of the frog heart, the bathmotropic property is the last to recover. Action of coumarin on the arteries. *Ibid* 658-61.—Fluext of coumarin acts as a vasodilator, the effect is, in general, proportional to the dose. Action of coumarin on the smooth muscles of the digestive apparatus. *Ibid* 662-70.—Fluext of coumarin and ext. of tonka bean increase the tonicity and often the contraction of the stomach, duodenum and small intestine of the frog, inhibit the cecum, increase the tonicity of the crop muscles and intestinal contraction of quiescent birds, and inhibit the *quiescent* birds. O. W. Wilcox

The effect of arsenobenzene preparations on mice infected with *Trypanosoma cruzi*. T. Minaguchi and Z. Rin *Japan Z. Mikrobiol. Path.* 29, 1495-1502 (1935).—Neither arsenobenzene sodium nor neoarsobenzene have preventive or healing actions on *Trypanosoma cruzi* infections. I. S. Yun

The influence of acridine derivatives on blood picture and its relation to sterilizing action. Yanosuke Hirakawa *J. Med. Coll. Kyoto* 5, 338-49 (1935).—The relationship between blood picture in animals and sterilizing action *in vitro* was investigated. Administration of 0.5% rivanol, 0.5% trypaflavin, 0.5% panseptin or 0.5% trypasol increased the no. of white blood cells. Sterilizing action *in vitro* was observed. Trypaflavin was the most powerful then panseptin, trypasol and rivanol. I. S. Yun

Factors related to increased absorption produced by the Chinese drug ah-chiao. T. G. Ni *Trans. 9th Congr. Far East Assoc. Trop. Med.* 1, 648-57 (1934).—The Ca content in blood serum and cholic acid in intestinal contents were increased in animals fed ah-chiao. I. S. Yun

Effect of morphine injection on the blood cells in normal individuals and in opium addicts. C. L. Cheng and W. C. Ma. *Trans. 5th Congr. Far East Assoc. Trop. Med.* 1, 659-73 (1934).—Change found in the blood of morphine-addicted rats, morphine-injected normal individuals and in human opium addicts were polikocytosis, reticulocytosis, leucocytosis, mononucleosis and thrombocytopenia. I. S. Yun

I—ZOOLOGY

R. A. GORTNER

Chemical and physical characters of silkworms fed with mulberry and with *Melastoma aurantiaca* leaves. Guido Colombo. *Boll. ufficiale staz. sper. seta* 5, 52 (1935).—Silkworms fed with mulberry and with *Melastoma aurantiaca* leaves gave cocoons with very similar characters, the decrease in wt. by degumming the silk was, resp., 19.50 and 19.29%, and the av. wts. of the cocoons were 0.40 and 0.34 g., resp. G. A. Bravo

The phosphatide content of the flies of *Bombyx mori*. Bianca Jona. *Boll. ufficiale staz. sper. seta* 5, 50.8 (1935).—The lecithin content in the Et_2O and EtOH exts. of the air-dried butterflies was 1.04-1.36%. G. A. Bravo

Embryo chemistry of the cephalopods. Tatsunori Katsuchi. *Z. physiol. Chem.* 238, 91-5 (1936).—The eggs from 1000 squids collected on the Japanese coast were analyzed at 2 stages of incubation. As development progressed the embryos increased while the jelly decreased in wt. Likewise the mineral constituents (CaO , MgO , SO_3 , Cl) increased in the embryos with corresponding decrease in the jelly, and the same was true of total N, amino N and N precipitable by phosphotungstic acid. During the first 5 days amylase, esterase, tributyrinase, nuclease, glycerophosphatase and urase were demonstrated. After 16-18 days incubation amylase, nuclease and urase showed greater activity, and arginase, naphthalenesulfatase and protease became demonstrable. The enzyme actions in cephalopod eggs are similar to those in avian, reptilian and amphibian eggs. A. W. D.

Carbohydrate and fat metabolism in the incubation of the *Hynobius* egg. Makoto Takamatsu. *Z. physiol. Chem.* 238, 96-8 (1936), cf. C. A. 30, 122. During 3 successive incubation periods of 2 weeks each the eggs of *Hynobius* showed a progressive loss of glycogen and fat, while the total cholesterol remained practically constant. A. W. D.

The chemistry of *By* larvae. Masaji Tomita and Teki Kume. *Z. physiol. Chem.* 238, 101-4 (1936).—Analyses are reported of larvae of the meat fly, *Sarcophaga carnaria*. The main constituent of the ash was NaH_2PO_4 , as shown by 39.41% Na_2O and 22.65% P_2O_5 . Amino acid depts. showed histidine 0.149, arginine 0.543, lysine 0.438, proline 1.545, phenylalanine 2.248 and glutamic acid 0.885%. The presence of a large no. of enzymes was demonstrated. A. W. D.

Silica of the siluroderms. E. Kahane. *Bull. sci. chim.* 17, 1354-8 (1935).—The dry tissues of *Onchidium asurum*, *Paraperonia pseudocane* and *Onchidium asurum* contained 0.17-0.97% SiO_2 , partly as mineral silicates. L. F. Gilson

Vitamin C in invertebrates. A. Grouard and R. Rattmann. *Compt. rend. sci. Biol.* 120, 743-53 (1935).—Values are given in mg. per g. fresh tissue: earthworm intestine 0.1, muscle 0.010; sea urchin, digestive tract 0.2, genital organs 0.4; mollusks, 6 species, various tissues 0.02-0.3; various crustaceans, muscles 0.02-0.06, other organs 0.05-0.5. L. E. Gilson

Metabolism studies on the egg of the frog (*Rana fusca*). IV. Glycogen content of the egg from segmentation to hatching. Jean Brachet and Joseph Needham. *Arch. Biol.* 46, 821-35 (1935), cf. C. A. 28, 7369; 29, 3406. —There was no diminution in egg glycogen during the first 24 hrs. of development. With the beginning of gastrulation glycogen diminishes, the proportion of glycogen increasing to almost 100% at the tadpole stage. Helen Lee Gruehl

Content of glycogen in tapeworms (cestodes). I. A. Smorodintzev and K. V. Bebeshin. *Compt. rend. acad. sci. U. R. S. S. [N. S.]* 3, 413-14 (1935).—Glycogen depts. were made on *Taenia saginata*, *T. solium* and *Diphyllobothrium latum*. The freshly expelled worms were washed, heated in 60% NaOH , 2 parts EtOH was added, then the material washed with abs. alc. and finally Et_2O . After hydrolysis with HCl the sugar was detd. with 3, 5 dihydroxybenzoic acid. *T. saginata* contains 60% of glycogen in the dry residue, which is twice the protein and 5 times the lipid content. The other 2 contain 1/3 the amt. of the protein, but still a greater amt. than the lipids. C. E. P. Jeffreys

Artificial mutations under the combined influence of x rays and salts of heavy metals in *Drosophila melanogaster*. N. N. Medvedev. *Bull. Inst. Genetics (U. S. S. R.)* 1935, No. 10, 211-22.—The action of x-rays on *Drosophila* cultured on a medium contg. 1% $\text{Pb}(\text{OAc})_2$ yielded a higher frequency of mutations than the action of x-rays alone, the ratio of mutations in the 2 series being $1.98 = 0.580\%$. S. A. Karjala

The effect of high-frequency alternating potentials on the production of mutations in *Drosophila melanogaster*. Yul Kerkis. *Bull. Inst. Genetics (U. S. S. R.)* 1935, No. 10, 223-6 (in English 226).—The mutational effect of h.f.-frequency alternating potentials on flies placed between the plates of a condenser was studied. The wave lengths, time of exposure, and the percentage of lethals and semilethals obtained were: 12.8 m., 70 sec., no lethals, 0.58% semilethals; 2-3 m., 32 sec., 0.23 and 0.94%, resp.; 6 m., 45 sec., 0.76 and 0.76%, resp. The control showed no lethals and 0.21% semilethals. The effects are too small to be reliable. Little tendency toward sterility in males was observed with the sublethal doses. S. A. Karjala

The influence of sex on the lipides of certain marine mollusks. J. Timon-David and G. Ceresola. *Compt. rend.* 201, 833-4 (1935).—The females of the 3 classes of mollusks studied, *Eledone moschata*, *Murex brardaris* and *Mytilus galloprovincialis*, were distinguished from the males by a greater fat content and a greater unsat. in their fats. L. W. Scott

Acid formation in frozen and thawed *Arbacia punctulata* eggs and its possible bearing on the problem of activation. John Runnström. *Biol. Bull.* 69, 345-50 (1935); cf. C. A. 27, 2300.—Eggs of *Arbacia punctulata* were frozen at -80° in CO_2 snow and ether. After a period of time the eggs were thawed at room temp. During the thawing considerable acid is formed, as measured by the Warburg manometric method. $\text{CH}_3\text{ICOO}_2\text{Na}$, NaF and CuCl_2 in concns. of 0.03 M, 0.06 M and 0.004%, resp., had no inhibiting effect on the acid formation. Addn. of hexosemonophosphate does not enhance the acid formation. Pyruvate has no influence on the amt. of acid formed. Apparently this acid formation has nothing to do with lactic acid formation. Influence of iodacetate on activation and development of the eggs of *Arbacia punctulata*. *Ibid.* 69, 351-5; cf. Ellis, C. A. 28, 3483.— CH_3ICOO^- does not inhibit the fertilization of the *Arbacia* egg. This enzyme or other activities in which SH groups are involved do not play an essential role in the fertilization process. CH_3ICOO^- (0.03 M) is harmful to the development of fertilized eggs. The addn. of pyruvate or lactate restores respiration but does not inhibit the injury to the fertilized egg. A carbohydrate breakdown is probably a necessary condition for the morphological differentiation of the anterior part of the larva. E. D. Walter

Change in rate of respiratory metabolism in a teleost

fish induced by acclimatization to high and low temperature Nelson A Wells *Biol Bull* 69, 361-7 (1933) — O metabolism of *Gillichthys mirabilis* ("mud suckers") acclimatized to high and low temps was studied. Fishes acclimatized to a high temp have a much lower rate of metabolism at a common intermediate temp than do those acclimatized to a low temp. The magnitude of this difference is a function of the difference between the acclimatization temps E D Walter

Some relations between respiratory metabolism in fishes and susceptibility to certain anesthetics and lethal agents F B Sumner and N A Wells *Biol Bull* 69, 364-78 (1935), cf preceding abstr — Two species of teleost fishes, *Fundulus parvipinnis* and *Gillichthys mirabilis* were kept at widely different temps. When tested at these temps, they were found to differ markedly in the rate of their respiratory movements. These rates were higher at higher temps than at lower ones. Susceptibility to urethan was also higher at the higher temps. When fishes acclimatized to high and low temps were transferred to a medium temp, those from the warmer temp displayed a lower respiratory rate and a lower susceptibility to anesthetics (urethan, chloroform and ether) and lethal agents (NaCN, KCN, asphyxiation and excessive temp) than those from the colder water E D Walter

Insect metabolism at temperatures below zero I V Kozhanchikov *Compt rend acad sci U. R. S. S. [N. S.]*, 3, 373-6 (1935) — An app is described for detn of O consumption of insects at low temps. In the larvae of *Pyrausta nubilalis* a decrease in temp from 6° to 0° caused a 2.25 fold decrease of O consumption, while a decrease in temp. from 0° to -6° caused a 1.38 fold decrease of O consumption. Larvae of *Loxostege sticticalis* showed no decrease of O consumption in a temp decrease from 0° to -6°. The R Q at 0° (0.90-1.00) shows the important role of carbohydrates, while the R Q at -6° (0.71-0.82) and at 20° (0.68-0.79) shows the prevalent role of fats or proteins in larval metabolism E D W

The visual purple system in marine fishes George Wald *Nature* 136, 913 (1935), cf C. A. 28, 6473* — The chemistry of the visual purple system of the sea robin (*Prionotus carolinus*), the black sea bass (*Centropristis striatus*) and the porgy or scup (*Stenotritus chrysops*) is identical with that of frogs. In the retina the following cycle occurs: visual purple → retine → vitamin A → visual purple F D Wal er

Nature of crystals found in ameba R H Luce and A W Pohl *Science* 82, 595-6 (1935) Evidence adduced by crystal angles, in p and chem tests indicate that the crystals are possibly Ca chlorophosphate

J. J. Willaman

12—FOODS

F C BLANCHARD and H A LEPPER

The freezing of foodstuffs R Heiss *Angew Chem* 49, 17-21 (1936) — A math evaluation of the most favorable freezing conditions is presented. Freezing and cold-storage expts were carried out with meat and milk under varying conditions. Conclusions: (1) Meat (a) Freezing is to take place as soon as possible after the kill, as the pH value influences freezing changes, and oxidative changes are accelerated by decreasing pH values. (b) Freezing is to be carried out as fast as possible, the freezing temp should not be higher than -17° to -20°, the former view that the freezing changes become particularly great if freezing is carried below a certain temp was found to be wrong and the crit. interval was found to be between -4° and -9°. (c) If long storage periods are to be used, the storage temp must not be higher than -17° to -20°, and in order to obtain as few freezing changes as possible it is necessary both to freeze fast at low temp and store at the lowest possible temp. (2) Milk. In contrast to meat, the freezing changes play only a subordinate role compared with changes due to storage, the temp interval of -10° to -12° is to be avoided and storage is to take place in air- and vapor-tight containers after preliminary removal of the dissolved O₂. Exptl data and nre references are given Karl Kammermeyer

Determination of available and total carbon dioxide in baking powders and self rising flours F W Edwards, F B Parkes and H R Nann *Analyst* 60, 814-17 (1935) — To det the available CO₂ the sample is weighed into a test tube which is provided with a 2-hole stopper carrying a tube for the introduction of water and another for the escape of the gas. The tube is suspended in a larger bottle-shaped vessel which is likewise provided with a 2-hole stopper carrying the same tube that leads to the test tube and another which can be connected to a suction pump. At the start the sample is in the inner test tube and the outer vessel contains a measured vol of standard Ba(OH)₂ soln. The vessel is evacuated and thereupon water is allowed to run into the test tube and the CO₂ liberated is drawn through the Ba(OH)₂ soln by the suction. Finally the excess Ba(OH)₂ is titrated with 0.1 N oxalic acid to an end point with phenolphthalein. In a fresh sample, the total CO₂ is detd. similarly but with acid instead of water to accomplish the decompn of the alkali carbonate. The results of 13 analyses of a sample contg 41.52% CO₂ ranged from 39.96 to 41.52% W T H

The composition of crude fiber A G. Norman *J Agr Sci* 25, 529-40 (1935) — Detailed analyses were made on various agricultural products, on the crude-fiber fraction from these materials and also on the residue at the end of 1.25% acid treatment before final 1.25% NaOH extn. The crude-fiber detn is misleading because the fraction obtained bears no definite relationship to the structural constituents of the material. The cellulose is partially attacked and lignin extensively removed. Considerable variation is found in the lignin content of crude-fiber fractions. Highly lignified materials do not necessarily yield a crude fiber high in lignin. Since the presence of lignin exercises a direct effect on the digestibility of the material, any empirical method should include all the lignin, and alk treatment must be avoided. Acid hydrolysis may be a possible alternative method if a correction for protein be made in the case of materials high in N and a detn of the lignin content made. I C F

A method for determining *Escherichia coli* in milk, buttermilk and cheese M Lerner *Lact* 15, 831-53 (1935) — The indole method is recommended because it gives clear results, is easy to carry out and enables one to judge the sanitary quality of the products tested even in those cases where acidity and reductase tests have given favorable results. A H Johnson

Manufacture of noodles from green beans Chia Wei Ou and Pin Yen Wu *Golden Sea Research Inst Chem Ind. (China) Bull* No 15, 56 pp (March, 1935) (in Chinese) — The production of noodles from green beans (*Phaseolus aureus* Roxb.), which has been for a long time an important agricultural industry in China, is subjected to scientific study. These beans contain starch, cellulose, hemicelluloses and proteins, the starch being enclosed in cellulose. The beans are first soaked in water, crushed and ground with water. The mixt is then treated with "acid liquor" obtained by fermentation of these beans. The enzymic action of this liquor causes a portion of the protein material to dissolve and thus enables the starch to be isolated. After sepn, washing and drying, a small portion of the purified starch is mixed with hot water to form a paste, then raw starch (from green beans) is stirred in to form a very thick liquid which is allowed to drip through a perforated ladle to form noodles. After cooking in boiling water the noodles are soaked in cold water, treated again with the "acid liquor," dried and preserved. The "acid liquor" used in these treatments

can be used over again, or it can be used as pig or cattle feed, or as fertilizer.

C. L. Tseng
Methods of analysis of sodium glutamate condiments
Ting-Yih Chow *Chenistry* (China) 2, 693-8(1935).—
The following details in the analysis of mono-Na *d*-glutamate condiments are outlined: (1) moisture, detd by drying at 100° to const wt., (2) H₂O of crystn, detd by heating at 125-8° (after removal of moisture) to const wt (usually about 1 H₂O to 1 mol of the salt), (3) Na *d*-glutamate content, detd by (a) Kjeldahl method (total N), (b) Van Slyke's method (amino N), (c) Sørensen's method (adding HCHO and then titrating with 0.1 N NaOH), (d) ignition to Na₂CO₃ and titration with 0.25 N HCl, or (e) isolation as *d*-glutamic acid HCl, the last method being considered the best, (4) NaCl, detd by titration with AgNO₃, (5) H-ion concn, detd by means of the quinhydrone electrode, (6) sulfate radical, detd by pptn as BaSO₄, (7) Millon's reaction, (8) size of crystals, measured by means of a micrometer, (9) heavy metals.

C. L. Tseng
Ascorbic acid (vitamin C) content of some Indian plant materials M. Damodaran and M. Srinivasan *Proc Indian Acad. Sci.* B27, 377-84(1935), cf *C. A.* 29, 6317.
—As a preliminary to a study of ascorbic acid, D and S have tested various Indian plants to find a source for a supply of the acid. The acid content of various parts of the plants was detd by the Tullmans-Harris method (cf *C. A.* 23, 3277), that is, by the reduction of 2,4-dichlorophenolindophenol by plant exts in 5% CCl₄CO₂H and by titration with I₂. The leaves of *Sesbania grandiflora* and the leaves and pods of *Moringa pterygosperma* contain about 2 mg ascorbic acid per g of fresh material. These, especially the latter, are exceptionally free from interfering substances and are suggested as a source for ascorbic acid. The Indian gooseberry gives the highest titration values (3-4.7 mg/g pulp) but apparently this is due in part to interfering substances. The juice of this gooseberry and of the cashew apple exhibit great stability and may contain some mechanism that protects ascorbic acid from oxidation. Among the citrus fruits the *Santur* orange (0.4-0.63 mg./cc of juice) and the pumelo (0.50-0.62 mg./cc.) were the richest in ascorbic acid. The ascorbic acid contents of the other plants tested were tabulated.

John D. Milbery

The state of water in tissues Bound water of colloids
T. Moran *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 25-6(1935).—In detg the state of water in tissues by the "pressure" method (Lloyd and M., *C. A.* 28, 3957), the activity of the water (a) remaining in the colloid under a pressure *P* is given by the equation $(\Delta n a / \Delta P) T = V / RT$, in which *V* is the molal vol of the water in the system. At activities of water down to about 0.7 the method gives results almost identical with the freezing method both for gelatin and for egg albumin. At high pressure, corresponding to low activities of water, a pseudo-plateau is reached in the curve for the hydration-activity of water quite unlike the vapor-pressure isotherm for either gelatin or albumin. It is probable that at low H₂O contents a considerable resistance is offered by the framework or collection of micelles, and this resistance reaches a limiting value when the micelles of hydrated colloid are all touching, at which point the water is all intramolecular in type. Such an explanation fits in with the results of Moran (*C. A.* 26, 4744), Sørensen (*Compt. rend. lab. Carlsberg* 12, 164(1917)) and A. S. Turby and Lomax (*J. Soc. Chem. Ind.* 53, 979(1934)). Adsorption of salts by proteins
T. Moran. *Ibid.* 26-7.—An attempt to measure the adsorption of salts by proteins by making use of the fact that at high pressures none of the water bound to the protein is free to dissolve salts indicated a max. adsorption of Na-ion by isoelec. gelatin of 0.031 g., or 1.35 mg. ions, per g. of gelatin. The actual adsorption will depend upon the initial ratio of NaCl to gelatin. Bound water of muscle T. Moran. *Ibid.* 27.—A reasonably exact figure for the firmly bound water of a protein or tissue can probably be obtained by detg the H₂O content of the protein in equi. with a pressure of approx. 10,000-40,000 lb. per sq. in., the figures obtained by this method being of

the same order as those obtained by other methods.
The eutectic of muscle T. Moran. *Ibid.* 27-8.—
Direct measurement of the eutectic of muscle (or muscle-plasma) by a cond. method indicated that it is approx. -37.5°. The uptake of water by gelatin. J. Brooks and T. Moran. *Ibid.* 28-0.—Preliminary expts. carried out to det. whether there is any marked change in the relative proportions of the isotopes of water in the liquid or gel phase during the swelling of gelatin indicated that greater accuracy in the expts. would be necessary to det. quantitatively any "isotopic discrimination," but the results (based on *d* measurements accurate to within 20 p. p. m.) were sufficient to show that, if present, it is small. Bound water or hydration of egg albumin and hemoglobin in saturated solutions of sodium and potassium chlorides G. S. Adair and T. Moran. *Ibid.* 29-30.—
The hydration of egg albumin and of hemoglobin in NaCl and in KCl was detd by (a) gravimetric analysis of the satd. soln. in terms of protein, salt and water, (b) measurements of *d*, and (c) *n* measurements. For both proteins the hydration in both solvents and at 1° and 20° was found to be approx. 0.13 g. per g. of dry protein.

A. Papineau-Couture

Graphical or numerical evaluation of farnograms?
I. Kopetz *Muhlenlab.* 5, 97-102(1935).—The "Hungarian" and "Viennese" methods of evaluating farnograms, both of which involve the use of a planimeter, are described, and the advantages of the latter are pointed out.

Clinton L. Brooke

The aleurone layer and its utilization I. Morphological comparisons of the aleurone cells of wheat and rye L. Grunstedt, I. Fromm and F. Bauer. *Muhlenlab.* 5, 81-90(1935).—The aleurone cells of Austrian wheats have walls averaging 4.5 μ in thickness. In Austrian ryes the walls average 4.5-5.5 μ in thickness. The transverse walls of the aleurone cells are somewhat thinner than the longitudinal walls. The thickness of the aleurone cell wall is principally dependent on the variety, but is also influenced by climatic conditions. The possible influence of cell-wall thickness upon the utilization of the proteins is discussed.

Clinton L. Brooke

Improving the baking quality of German wheat by conditioning Ernst Berliner. *Muhlenlab.* 5, 81-2(1935); cf. *C. A.* 30, 1683.—Wheat with weak gluten can be improved by conditioning, but no further improvement is effected in wheat with strong gluten. Low gassing power is never increased, but high gassing power may be lowered. The danger of weakening the gluten through proteolytic action during conditioning has been exaggerated. There is no proof that proteolytic activity can be inhibited and diastatic activity stimulated by suitable treatment. Excessive diastatic activity can be reduced by heat treatment, but diastatic activity cannot be increased, even by tempering for several days, unless the moisture content of the wheat exceeds 25%.

Clinton L. Brooke

The baking quality of wheat flour Hugo Kuhl. *Muhlenlab.* 5, 89-94(1935), cf. *C. A.* 29, 75083.—A review with 16 references.

Clinton L. Brooke

Recent entomological investigations Hardness of rice F. A. Squire. *Agr. J. British Guiana* 6, 84-8(1935).—When rice was stored at 90% relative humidity the samples gained in wt. and decreased in hardness; the reverse was true of samples stored at 50% relative humidity. The hardness of rice was permanently increased by parboiling.

K. D. Jacob

Chemical factors influencing the quality of wheat and flour F. B. Working. *Kan. Agr. Expt. Sta., Rept.* 1932-4, 51-2(1934); cf. *C. A.* 29, 2343.—In the centrifugal method of detg. flour absorption, a 30-min. period of soaking was more satisfactory than the 5-min. period previously used. The larger errors were limited to varieties unsuited for bread production. In baking where malt wheat flour was added, sugar production or strictly diastatic activity was of little importance. The chief improvement was due to the proteolytic enzymes and other undetd. factors. Even the purest diastase contains considerable quantities of proteoses and other substances. Oxidizing agents in the amts. normally used in flour

bleaching and dough prepn greatly increased the amt of water sol phosphate in the flour. Some evidence was found that lecithin was partly transformed into cephalin by the oxidizing agents. C R Fellers

Biennial reviews of the progress of dairy science. Section B. Bacteriology and mycology applied to dairying. A T R Mattick, L R Hixcox and J G Davis. *J Dairy Research* 6, 422-53 (1935).—A review is given in which technic is discussed under the headings of the plate count and the methylene blue reduction test. Milk production and pasteurization are discussed in relation to cleaners and disinfectants, mastitis, colon aerogenes organisms and milk faults. The lactic acid and other bacteria of significance in dairying are considered in relation to biology, respiration, fermentation, protein metabolism, fat metabolism and fermented milks. Recent work on cheese is discussed under the headings of pasteurization, starters, ripening processes and faults. Butter is reviewed in relation to starters, churn sterilization and keeping quality during storage. Eleven references are given on technic, 69 on milk production, 55 on pasteurization, 74 on lactic acid bacteria, 62 on cheese and 25 on butter. A H Johnson

Economic methods of equipping the [milk testing] laboratory. F F A Smith. *Proc Intern Assoc Milk Dealers, Lab Sect 29th Ann Convention*, Oct, 1935, 3-19. E. H.

Judgment of the quality of milk from a bacteriological standpoint. W Majowski. *Chem Hekblad* 32, 713-15 (1935).—Polemics with Filippo (C A 30, 1448). M claims that the redutase test alone is not a criterion for the quality of milk. J C Jurjens

Germinical property of milk. B W Hammer. *IA Agr Expt Sta, Rept Agr Research* 1934, 85 (1934).—Inhibition of acid development by butter cultures is probably caused by a filtrable form of life gaining entrance to the cultures from the air, although there is a possibility that the slow acid production is due to some sudden change taking place in the bacterial cultures which results in the production of an inhibitory substance. The restraining action of the bacteria free filtrates of butter cultures was destroyed by heating to 60° for 10 min. C R Fellers

Mastitis streptococci in bulk milk. I J Pullinger. *J Dairy Research* 6, 369-82 (1935).—A technic for examg bulk milk by cultural and microscopical means, for evidence of mastitis among cows is described. To demonstrate a slight contamination with hemolytic streptococci, cultural exam of gravity cream is advocated, while if much significance is to be attached to the actual count, whole milk should be cultured. Microscopical exam of gravity cream or of centrifuge deposit for streptococci or leucocytes is a useful addnl test and may give information that is not obtainable by cultural methods, but it does not serve as a substitute for cultural exam. The data indicated the high wile spread incidence of chronic streptococcus mastitis. A H Johnson

The sequence of bacterial and chemical changes occurring in acidified milk. L A Burky, C P Sanders and J F Cone. *J Bact* 31, 188 (1936).—The leucocyte count may reach millions, and streptococci may be present for a considerable time before phys and chem changes occur in the milk. John T Myers

The effect of process of manufacture on the vitamin G content of dried skim milk. H J Davis and L C Norris. *J Dairy Sci* 19, 110 (1936).—There was no significant destruction of the growth promoting component of the vitamin G complex contained in skim milk when dried by the Merrell-Soule or the Gray-Jensen spray process or the open roller process. No measurable destruction occurred as a result of holding liquid skim milk in storage tanks at 170° F for 18 to 21 hrs previous to drying, or of slightly scorching the milk powder during drying, or of neutralizing sour skim milk previous to drying. At a pH of approx 9.5 (titratable alkalinity of 0.15%) a slight destruction appeared to occur. P D A

The surface tension of cow milk. G Belle. *Lat* 16, 13-20 (1936).—The surface tension of 70 mixed milks of the Casablanca region varied between 55.1 and 48.9 dynes

at 18°. The av surface tension was about 50.4 dynes. The surface tension of milk was highest immediately after milking and decreased about 3 dynes after 2-3 hrs. On further holding for 24 hrs, the surface tension continued to decrease slightly. At 20° milk had about the same surface tension as at 18°. However, when the milk was cooled to 10° and to 0°, a lowering of surface tension resulted. A run surface tension was obtained at 0° which was about 3 dynes lower than that obtained at 18°. A H Johnson

A test for the freshness and the coagulating intensity of milk. E Pijanowski. *Lat* 16, 1-13 (1936).—The general basis of the test is that milk will form a curd due to the decompn of the Ca-casein complex when the acidity reaches a certain point (on the av, 27° Soxhlet-Henkel). If the quantity of acid required for curdling a sample of milk is less than that calcd, it may be assumed that the capacity to form this curd prematurely is due in part to coagulating enzymes that have been produced by microorganisms in the milk, e g, *Bacillus subtilis* and others. The higher the quantity of acid required for curdling, the higher may the degree of freshness of the milk be considered. A formula is given for calcg the degree of freshness of milk. Correction values are given for converting values obtained at several temps to 15°, to which temp the degree of freshness is calcd. 0.1 N H₂SO₄, HCl, lactic and formic acids were used in detg the degree of freshness, H₂SO₄ was the most satisfactory. In detg the degree of freshness, the acid is allowed to flow very slowly into milk at the same temp. The flask contg 30 cc of milk is carefully and constantly agitated until curdling occurs. A H Johnson

A comparison of the methods of determining the fat content of milk. I Stankevics. *Acta Univ Latvensis, Lauksamniecības Fakultat Ser. I*, 551-75 (in German 575-6) (1931).—Comparative data obtained by various methods with various types of samples are presented in numerous tables. Just as satisfactory results can be obtained with normal milk by the methods of Morsin and of Høyberg as by the H₂SO₄ method of Gerber. Samples of milk which have been preserved with K₂Cr₂O₇ and formalin cannot be analyzed by the first 2 methods, as the percentage of fat so obtained is too low. These 2 methods are likewise unsuitable for milk samples which have been kept a long time without preservatives, as the results obtained show considerable variation when compared with those by the methods of Gottlieb-Röse and Gerber. Milk samples which have become somewhat acid can be analyzed with good results by the methods of H and M. Both fresh and old milk can be satisfactorily analyzed by the method of H if the time is increased about 6 min. With the method of M the fat does not sep in the allotted time. In order to prevent sapon of the fat in the butyrometer, the percentage of fat must be read after not more than 30 min in the method of H and not more than 1 hr in the method of M. From the standpoint of simplicity, cheapness and sufficient precision for practical purposes, as good results are obtained by the method of H as by that of Gerber. M G Moore

Lipoid phosphorus and the phosphatides of cow milk. J E Lobstein and M Flatter. *Lat* 15, 946-54 (1935).—By the use of several analytical procedures, the phosphatides in cow milk were found to be about 300 mg per l. The procedures used were such as to eliminate the inclusion of protein and inorg phosphates in the exts; this probably accounts for the low results obtained in this work as compared with the higher results obtained by other investigators. For the purification of lipoid P, the method used was to ppt the casein with AcOH, to remove the fat from the coagulum with ether and to ext the phosphatides from the residual coagulum with alc. The alc ext was then subjected to fractional pptn with acetone and MgCl₂. In this manner about 150 mg of phosphatides per l of milk was obtained. This procedure yielded about 50% of the phosphatides known to be in the milk and gave a product contg about 20% impurities. The phosphatides of milk form a colloidal complex with the proteins or are united with the proteins by loose chem ties to give

combinations in sol. in ether but capable of dissolving in alc and acetone.

Soft-curd character induced in milk by intense sonic vibration. Leslie A. Chambers *J Dairy Sci* 19, 29-47 (1936).—The curd reducing effectiveness of oscillators operating at 1100, 1200, 2100, 3000, 610 and 360 cycles was studied in relation to original curd tension, temp., velocity of flow, acoustic energy output and variations in the mech. features of the app. The percentage reduction in curd tension was greatest in hard-curd (60 g and more) milks, the final values approaching a const. level in the soft-curd range irrespective of the original curd tension. No reduction occurred in milk treated below 18° and very little at temps below the m. p. of butter fat. The 360-cycle oscillator was most efficient at a milk flow of 250 gal per hr. With a sound output of about 900 w, more than 50% reduction was obtained. The degree of reduction in curd tension bore a linear relationship to power input up to 2000 w. This represents about 18 w per 1% decrease in tension. Differences in frequency were found to be negligible within the range explored. A direct relation was found to exist between degree of fat dispersion and curd-tension reduction. Increasing no. of fat particles weakened the curd matrix and provided increased adsorptive area on which protein was fixed. Since but a small proportion of the total fat in milk need be finely subdivided to reduce the curd tension, a method was devised for producing soft-curd milk by vibration without impairing the final cream vol. Philip D. Adams

The electrical decalcification of milk. J. Pien and J. Bause *Lait* 16, 20-6 (1936).—The elec. decalcification of milk by passing it between Al electrodes has the disadvantage of producing much foam and a ppt. of casein on the electrodes and on the floor of the decalcifying vessel. The amt. of casein pptd. depends on the degree of decalcification of the milk. On reduction of the acidity from 24° to 18° Dornic, 3 g. of casein per l. of milk was pptd. 1 at and solids-not-fat were also removed from the milk as a result of elec. decalcification, but the quantities removed were not as great as the quantities of casein removed. The lactic acid which disappears as a result of elec. decalcification is not destroyed but is found in the pptd. curd and neutralized by basic salts which are formed at the electrodes. Milk which has been neutralized electrically does not show any decrease in lactate ion (as it is still present bound in the protein and as neutral lactate). Milk which has never been allowed to sour can be rendered alk. owing to the basic salts which are liberated as a result of the elec. decalcification procedure. Mild treatment by the decalcification procedure does not have any effect on the flavor or odor of the milk except as the flavor of acidity is concerned, while strong treatment gives rise to off-fishy odors which cannot be removed by aeration. The off-flavors and -odors are increased by subsequent pasteurization. Elec. decalcification has no effect on the bacterial content of the milk. Electrically neutralized milks were not considered suitable for sale. A. H. Johnson

The age-thickening of sweetened condensed milk. III Effect of reaction and changes in the electrical conductivity during manufacture and aging. V. C. Stebnitz and H. H. Sommer *J Dairy Sci* 19, 55-65 (1936).—Increasing the acidity of raw milk causes the sweetened condensed milk to thicken more rapidly during storage, while decreasing the acidity makes a more stable product. With unstable milk a change of 0.1 pH exerts a marked effect; with stable milk the effect is not so great. During the storage of sweetened condensed milk at 37° there is at first a slight decrease in pH and then a gradual rise of about 0.2 pH after which it remains fairly const. during the aging period regardless of rate of thickening. During the spring of the year the unstable milk may be stabilized by adding 60 to 125 g. of NaHCO₃ per 1000 lb. of raw milk, being more effective when added to the raw milk than when added to the finished product. Increase in acidity during forewarming cannot be considered an important factor. Changes in elec. cond. cannot be correlated with the stability toward age-thickening. Philip D. Adams

Rancid flavor in milk. Earl Weaver, F. L. Fouts and Ruth Reder *Oklahoma Agr. Expt. Sta. Rept.* 1932-4, 149-50 (1934).—Preliminary data indicate there is a direct correlation between rancid fresh milk and high fat content. The latter often occurs as an accompaniment of cystic ovaries and breeding abnormalities. Aborted cows often produced rancid milk. Rancid milk was found as often in early as in late lactation. C. R. Fellers

Effect of cottonseed meal upon the dairy products. K. I. Keith, A. H. Kuhlman, Earl Weaver and W. D. Gallup *Oklahoma Agr. Expt. Sta. Rept.* 1932-4, 164-6 (1934).—There was no significant difference in the fat content of the milk from cows fed cottonseed meal and the controls. The cottonseed meal butter was somewhat lacking in flavor and color and had an objectionable gummy body. The cream took an abnormally long time to churn. C. R. Fellers

Detergents employed in the dairy industry. G. Ginn. *Lait* 15, 848-70 (1935). The various alkalies employed as detergents in the dairy industry are discussed and the mechanism of their action is reviewed. A. H. Johnson

The use of tribasic sodium phosphate in cleaning dairy equipment. L. A. Rogers and Fred C. Evans *J. Bact.* 31, 87-8 (1936).—A 5% soln. of Na₃PO₄ is an excellent detergent and has a distinct bactericidal action. The corrosive action can be eliminated by the addition of 3% of Na₂CO₃ to the phosphate crystals. John T. Myers

Crystalline structure of different ice creams. W. H. E. Reid *Mo. Agr. Expt. Sta. Bull.* 340 (Ann. Rept. 1933), 41 2 (1933), 41 C 28, 737-9. As the butterfat content was increased from 8 to 15%, there was an increasingly fine texture. Additional increments of fat made the texture "chalky". There was a direct relation between serum solids (varied from 8 to 15%) and fineness in texture. Increase in sugar content from 8 to 14% gave a finer crystal structure. The addition of nuts, cocoa, fruits, etc., increased coarseness. Heat shocking and rehardening of ice cream samples decidedly improved the texture by a fusion of ice crystals. Photomicrographs showed that when the mix was altered, the structure of the ice cream was decidedly modified as related to no., shape and size of the ice crystals and air cells comprising the resultant ice cream. C. R. Fellers

Effect of heat on the colloidal, physical and chemical changes occurring in milk. E. R. Garrison and Hans Jenny *Mo. Agr. Expt. Sta. Bull.* 340 (Ann. Rept. 1933), 40 1 (1933).—In a refined electrolysis method, the temp. of the milk in the cell had a pronounced effect on rate of dialysis. All experiments were conducted at 30°. The dial. of the milk with distd. water increased the rate at which cations were removed during the 1st 30 min., but afterward the effect was not measurable. The rate of anion release was not affected by dial. The amt. of cations removed during 5 min. intervals was not proportional to the dial. factor and electrolysis was of no value in detg. the watering of milk. Aging the milk at 2° for 96 hrs. had no effect on the rate of cation removal. Souring affected the rate of release of the anions more than the cations. There was no difference in Holstein and Jersey milks or in raw and pasteurized milks. C. R. Fellers

Kind of acids in butter and the distribution of these acids between the water and the fat phases of the butter. B. W. Bird *Idaho Agr. Expt. Sta. Rept. Agr. Research* 1934, 88—A method for detg. the wt., the av. mol. wt. and the I value of the acids sol. in the fat phase of the butter was developed. The method involves the titration of the acids with alc. KOH in fat, petroleum ether and abs. alc. solns.; the removal of soaps from the fat-petroleum ether soln. with 50% alc.; the liberation of the acids with 1.4 H₂SO₄, the extn. of these acids with petroleum ether; the removal of the solvent; the weighing of the acids and the detn. of their I values. *A semimicro Hanus I method* was developed as follows: Add 2 cc. of CHCl₃ and 6 cc. of Hanus I soln. (from a specially constructed automatic pipet) to 0.01 to 0.1 g. fat or fat acids in an E. flask. Let the reaction proceed for 30 min. Add 2 cc. of 15% KI soln. and immediately 30 cc. of recently boiled and

cooled distd water Titrate the excess I with 0.025 N $\text{Na}_2\text{S}_2\text{O}_3$ soln C R Fellers

Causes of the tallowy flavor in strawberry ice cream E W Bird Ia Agr Lxpt. Sta, *Rept Agr Research* 1934, 90-1—There was no correlation between the oxidase values of the ice cream and the development of flavor defects There was no consistent change in fat contents from the beginning to the end of the storage period Fe played no part in the development of the defect Samples prepd with condensed milk showed a marked tendency for more rapid and more pronounced flavor defect than did samples prepd with dry skim milk There was a marked correlation between Cu content and flavor defect Conclusion The factors causing the flavor defect are the presence of Cu and the oxidation of the small amts of fat in skim condensed milk or in whole condensed milk C R Fellers

The correlation between the spoilage of butter and the presence of fat splitting and casein digesting bacteria C N Stark and B J Scheib *J Bact* 31, 87(1936)—In the absence of other spoilage factors there seems to be a direct correlation between the no. of fat-splitting and casein digesting bacteria and the keeping qualities of butter John T Myers

Bacteriological analysis of butter from the region of Brest Biology of the typhoid bacillus in butter J Brisou *Lait* 15, 804-8(1935), cf *C A* 29, 8043—About 5 g. of butter is first emulsified in 15 cc of sterile bile Five cc of the bile butter emulsion is then added to a flask contg 50 cc of physiol salt soln, 50 cc of 6% peptone soln and 2 cc of malachite green (1:200) The flask and contents are then incubated at 37° for 24-36 hrs (or a shorter period if the medium decolorizes too rapidly) After incubation, the material is inoculated on freshly prepd Pb acetate-agar plates After growth on this medium the colonies are identified in the usual way The vitality of the organisms in butter was studied and considered to be related to the pH and not to the free acidity At pH values below 6 the vitality was reduced A H Johnson

Factors affecting milk and butter fat secretion I Variations in fat weight, fat percentage and the amount of fat in the milk required to make a given weight of butter Elizabeth O Whetham and John Hammond *J Dairy Research* 6, 320 39(1935)—The amt of fat in the milk required to make 1 lb. of butter has been taken to indicate the size of the fat globules in the milk and hence the type of "cream line" produced With a const milk yield the fat percentage varies between breeds, but not to the same extent as it does when no account is taken of the differences in av yield of the different breeds The same generalization applies to the fat butter ratio, i. e., size of fat globules The effect of equal increases of milk yield on the butter fat ratio is much greater between breeds than it is within any one breed It is suggested that the size of the fat globule is detd by two factors (a) the rate of butter-fat formation by the cell, which varies with breed and stage of lactation and (b) the rate of milk secretion, which affects the size of the globules by the rate at which they are washed out of the cell Regression lines of fat yield, fat percentage and fat butter ratio on milk yield have been plotted under different circumstances affecting milk yield—between breeds, within breeds, with age and period of lactation The changes in milk yield during the lactation period may be due for the most part to changes in the rate of secretion of the cells, and changes due to age are caused chiefly by changes in the no. of cells secreting In accordance with this idea, it follows that when the yield of milk is increased by increased rate of secretion of the gland cell, the percentage of fat in the milk will decrease (period of lactation), but when the yield of milk is increased by the no. of cells secreting, the fat percentage in the milk will remain unchanged (age) This may explain why sires can effect an improvement or otherwise in milk yield in conjunction with or independently of fat yield II The color of butter fat *Ibid* 341-51—The colors of the butter from individual cows were measured on a color scale of

yellow shades on cellulose strips and the results analyzed statistically The mean values and the variability curves of the ranges of butter color in the different breeds of dairy cattle are given Circumstances which may affect these values are given The color of butter from milk of the various breeds decreased in the following order South Devon, Guernsey, Jersey, North Devon, Friesian, Short-horn, Ayrshire, Dexter, Red Poll and Kerry The color of the butter fat was not related to its vitamin A potency 2 Thus goat butter of a chalky white color may have just as great a vitamin A activity as yellow butter The two most important factors affecting butter color are the genetic characters of the cow and the method of feeding A slight increase in the shade of color of the fat occurs under most of the various conditions which give rise to increased milk yield This may be due to increased intake of coloring matter (assocd with greater food intake) in proportion to butter fat produced The color of the fat is high in the 1st few weeks of lactation and falls gradually as more fat is required from the body in addn to that from the food After about 180 days' lactation, the color rises again as the butter yield falls and more of the fat is supplied by the food intake It is suggested that butter fat derived from body fat will be paler than that from food fat when the latter is sufficiently provided with plant pigments A H Johnson

Soil reaction and suitability of milk for cheese making J P Hussmann *Milchwirtschaft Zentr* 64, 438-42 (1935)—It is known that feed rich in nutrients produces a milk of high mineral content and that such a milk is highly suitable for making cheese Acid soils produce poor feed Hence acid soil may be the ultimate reason for poor cheese It has observed such correlation E O Whittier

The function of pepsin and rennet in the ripening of Cheddar cheese I R Sherwood *J Dairy Research* 6, 407-21(1935), cf *C A* 29, 7513—The use of pepsin resulted in cheeses in which the extent of protein degradation was considerably smaller than in control rennet cheeses The type of N partition was influenced to some extent by the proteolytic action characteristic of the particular enzyme employed The use of an increased proportion of rennet led to an anticipated greater extent of protein breakdown, the type of N partition not being appreciably affected No direct correlation was observed between the com quality of these cheeses and the extent or type of protein breakdown which occurred The fact that an increase in the proportions of rennet or the replacement of rennet by pepsin influenced so greatly the extent of the protein breakdown taking place during the ripening process and yet neither brought about dissimilarity in the form of the curve for sol N and nonprotein N nor altered appreciably the type of N partition affords evidence for the role in attacking cheese protein played by the proteolytic enzymes contained in these milk coagulants It is suggested that a rough guide for the comparative protein breakdown that will occur in cheeses is given by the measurement of the degradation brought about in milk by the resp coagulating enzymes, although a marked increase in the content of rennet or pepsin alters the type of protein breakdown in milk in the direction of more complete degradation With cheese, secondary reactions (due probably to bacterial action) among the nonprotein constituents lead to relative increases in subpeptone N With most of the samples of rennet examd, it was found that previous heating of the soln to 34° at pH 7.25 for 10 min, and to 70° at pH 5 for 2 min, to destroy the rennin or pepsin exerted but little influence on the proteolytic activity With a few samples of rennet, the extent of the breakdown induced in milk was diminished and a small alteration occurred in the type of proteolysis Similar heating of 5% pepsin soln was shown to have no effect on the proteolytic action of the enzymes upon milk Since the coagulating power of pepsin was reduced enormously ($1/10$ to $1/100$) by the heating, it appeared that coagulating action and proteolytic activity are due to sep enzymes Heat treatment at pH 5 and 7.25 was accordingly not effective in destroying rennin

and pepsin. Accordingly, the measurements of the N partition in cheeses manifold, by the use of such heat-treated prepn. without detn. of the comparative proteolytic action of the samples on milk do not furnish reliable evidence of the role of rennin or pepsin in cheese making.

A. H. Johnson

Effect of various phases in the manufacture of casein by the natural sour method on its physical and chemical properties. D. R. Thorpe, H. C. Hansen, R. S. Snyder, R. F. Wood and R. L. Olmstead. *Ida Agr. Expt. Sta., Bull. 212, 3 10(1935)*. Approx. 220 sample lots of casein were manifold and examined chemically for odor, color, soly, yield, moisture, fat, N, pH, ash, cond., total and free acidity and viscosity. Thoroughness of washing was the most important factor of all the various changes made from the standard method. Either increasing or decreasing the acidity of the milk from 0.64% at the time of coagulation resulted in a lower color and odor score. A fat content of the skim milk above 0.1% and insufficient pressure on the green curd adversely affected both color and odor. Both a setting temp. higher than 40° and a cooking temp. higher than 49° decreased the soly due to the formation of a tough curd. The viscosity of the casein increased with increased temp. in prepn. Increasing the original acidity of the skim milk resulted in a higher viscosity but decreased the odor score and increased the acidity of the casein. Yield of casein was detd. by completeness of pptn., loss of curd in draining and washing, loss of impurities in washing and pressing and loss of moisture in drying. Low ash content depended on the use of an acidity of 0.64% at time of coagulation of the skim milk to obtain complete pptn. and thorough washing. At cooking temps. above 49° the curd was tough, rubbery and difficult to wash. High fat content in the finished casein was undesirable. Washing increased the N content of the casein. If the N content falls below 11%, the quality should be questioned. Ash content is also a fair criterion of purity. The only important consideration found in producing casein of low acid content was thorough washing of the curd. Of the various tests studied those which gave the best index of quality were color, odor, soly, viscosity, N, pH and cond. A uniform high-quality casein was produced by the following standard method of manuf.: Use skim milk contg. 0.01% fat or less and a titratable acidity of 0.18% or less. Use sufficient whey starter to raise the acidity of the skim milk to 0.3% at a temp. of not below 21° and with an acidity of the starter not below 1.15 or above 1.35%. Set at a temp. of 40° until an acidity of 0.64 has developed. Coagulate by heating to 10° with const. stirring. Drain off the whey and break the curd into pieces about the size of an egg. Wash the curd with cold water, using 1/4 as much water as original skim milk. Allow to stand in cold water for 15 min. with frequent stirring. Drain the wash water from the curd. Press continuously at not less than 500 lb. pressure for 16 hrs. Dry at 49° for 8 to 10 hrs. in a drying tunnel equipped with accurate temp. controls and good air circulation. C. R. Fellers

Viscosity of the white and of the yolk. A. J. M. Smith. *Dept. Sci. Ind. Research, Rept. Food Investigation Board 1934, 53 6(1935)*, cf. C 30, 175*.—Relative values for the viscosity of yolk at different H₂O contents were obtained by measuring the time for 30 g. of yolk to pass through a capillary 30 cm. long by 1.04 bore under a head of 45 cm. of Hg. The H₂O contents were detd. by drying 4 hrs. at 112°. Addn. of 1 part H₂O for 10 of initial yolk reduces the viscosity to 10% of its original value, addn. of 2 parts H₂O for 10 of initial yolk reduces it to 1/10. Comparison of the data with the uptake of water by the yolk from the white during storage (C 25, 5459) indicates that the uptake of water may be the chief cause of the decrease in viscosity of the yolks of stored eggs. If an attempt is made to measure the relative viscosity of thick white by a capillary-tube method, successive shearings produce a progressive change in the direction of greater fluidity, until an approx. steady value is reached, which is of the same order as the value obtained for thin white. On forcing thick white through a small orifice under a

moderate pressure-head (e.g., 30 cm. of Hg), the structure is largely destroyed; if forced through rapidly (e.g., under a head of 71 cm.), the structure is to a great extent retained, even after several repetitions. When the complete white is dried to const. wt. over H₂O, and then reconstituted by adding to the dry material an amt. of H₂O equal to that lost, the thick and thin parts reappear in approx. their initial proportions, and the whole white appears similar to that of a fresh egg, but the viscosity is much reduced. A similar result is obtained when the white is frozen (at -5°) and thawed again. The changes in the fluidity of whites and yolks were measured in samples stored for 6 months or more at 0° in air, pure CO₂, pure N, and mixts. of CO₂, O and N, and in air after waxing the shells. The fluidity of the yolk increased steadily in every case, but most in the eggs stored in N, where the development of anaerobic bacteria was serious; the change was least in the eggs stored in CO₂, and, from the standpoint of fluidity of the yolk, 20% CO₂ was as effective as 100% N. The viscosity of complete white decreased very little in eggs stored in air. Waxed eggs showed a greater increase in fluidity than unwaxed eggs stored in air at the same temp. and relative humidity. A. Papineau-Conture

Yolk color of eggs produced by hens fed various feeds and pigments. R. B. Thompson and W. P. Allbright. *Okl. Agr. Expt. Sta., Rept. 1932-3, 114-17(1934)*.—The character or amt. of green feed included in the hens' ration had no influence on the color of the egg yolks before storage. Both alfalfa meal and yellow corn meal gave yolks of very uniform moderately yellow color after storage. Hens fed Sudan II dye in capsules produced deep orange eggs. C. R. Fellers

Effect on egg quality of five different vegetable proteins. R. B. Thompson. *Okl. Agr. Expt. Sta., Rept. 1932-4, 117 18(1934)*.—Hens having access to wild onions produced eggs entirely normal in color and flavor both before and after storage. Hens which had access to manure heaps, stagnant water or decomposed materials produced eggs of very poor storage life. Cottonseed meal, when included in the ration, gave eggs yolks of an olive color. Alfalfa-fed hens produced eggs of good yolk quality both before and after storage. Smutty wheat had a very bad effect on egg quality. C. R. Fellers

Changes in the quality of the proteins of meat as determined by digestion with pepsin. I. A. Smorodintzev and I. N. Liskovskaya. *Bull. soc. chim. biol. 17, 1519-53 (1935)*, cf. C 30, 515*, 778*.—Lean beef reaches its max. digestibility in 96-120 hrs. after killing when stored at 1-3°, or in 6-24 hrs. when kept at 36°. L. E. G.

Changes in the solubility of the calcium compounds during autolysis of muscle tissue. I. A. Smorodintzev and I. N. Liskovskaya. *Bull. soc. chim. biol. 17, 1814-21 (1935)*.—Lean beef from the hind quarters of cows 5-7 yrs. old contained 4.2-6.7 mg. % Ca. One hr. after killing 30% of the Ca was extd. by water, after storage for 24 hrs. at 1-4° 57% was extd., and after 72-120 hrs. 62%. The increase in the soly. of the Ca parallels the formation of lactic acid in the muscle. The soly. of the inorg. P showed practically no change during the first 72 hrs. L. E. Gilson

Vitamin B and B₁₂(G) content of South Dakota tailless lamb (muscle, liver, pancreas, thymus) and vitamin C content of liver. I. dith. Peterson. *S. Dak. Agr. Expt. Sta., Ann. Rept. 1931, 31-5(1931)*.—The amt. of lean lamb muscle required to give a gain of 25 g. in 8 weeks (Sherman-Chase unit of vitamin B) was less than 1 g.; liver, less than 0.5 g.; tongue, 1 g.; brain, less than 1 g.; kidney, less than 1 g.; heart, 0.5 g.; pancreas, 1 g. The lamb was richer in vitamin B than beef. The work is being continued. C. R. Fellers

Note on the effect of "condition" on the color of body fat in rabbits. R. Hurrell. *J. Agr. Sci. 25, 541-4(1935)*.—Fat color is of importance in beef produced by English markets because of discrimination against deep yellow fat. Data were collected to ascertain the extent of difference in fat color between lean and fat animals. A tentative conclusion is that in fattening a proportion of the ingested pigment is laid down in the fat but that when such fat is

used for body maintenance the pigment is not wholly reabsorbed but coned in the fatty tissue, thus deepens the color. The results suggest an explanation for the fact that fat color in old cows and steers which have undergone seasonal fluctuation in condition is usually a darker tint than in young heifers and steers which have fattened steadily, and that animals once fat and killed in poor condition are usually darker in color than fat ones.

I C Feustel

Effect of interior temperatures of beef muscle upon the press fluid and cooking losses. Alice M Child and J. Agnes Fogarty. *J Agr Research* 51, 655-62 (1935).—The ratio of press fluid to dry matter is greater in muscle heated to 58° than in that heated to 75°. The moisture content of press fluid varies directly and the total N content varies indirectly with the interior temp of the muscle. The coagulable N in press fluid varies inversely with the interior temp, but there is comparatively little difference in the noncoagulable N in press fluid from muscles heated to 58° and to 75°. An inverse relationship exists between the percentage of press fluid and the total cooking losses in muscle heated to 75°. No relationship of this kind is indicated in muscle heated to 58°.

W H Ross

Effect of hydrogenated lard, storage lard and heated lard on the destruction of vitamin A in foods. V E Nelson, P Mable Nelson and Belle Lowe. *Ida Agr Expt Sta*, *Rept Agr Research* 1934, 81 (1934), cf *C A* 29, 2614.—Unheated fats when mixed with butterfat did not cause destruction of the vitamin A content of the latter. On the other hand, heated fats did cause definite destruction of vitamin A. Three cow brands of oleomargarine similarly did not cause loss of vitamin A when mixed with butterfat. It is believed all these brands contained coconut fat which acted as a protective agent. When lard was heated to 80° instead of 120° and mixed with butterfat there was little loss of vitamin A and a retardation of rancidity.

C R Fellers

Methods for determining pentoses as furfural in citrus fruits. Walton B Sinclair and E T Bartholomew. *Am J Botany* 22, 829-42 (1935).—In the expts described, practically theoretical yields were obtained from known samples of furfural by the bromate method. Theoretical yields of pentoses as furfural were not obtained from *d* xylose and *L*-arabinose. Steam distn did not give higher yields than ordinary distn. In testing citrus fruit juice and tissues, other substances distd over with the furfural and subsequently reacted with the Br, this causes an error with the bromate method. These substances were extd from the tissues with 95% EtOH and Et₂O, after which comparable results were obtained by the phloroglucinol and bromate methods, the latter giving slightly higher values. Mature Valencia orange peel distd with 12% HCl yielded 15.86% (based on dry wt.) of furfural by the modified bromate method and 14.98 by the phloroglucinol method. The corresponding values for lemon peel were 17.45 and 16.55. Navel and Valencia orange juice sac tissues yielded 12-14%.

L E Gilson

Aguate (Persea gratissima, Gaertn.) Ernesto Parodi. *Italia agricola* No 11 (1935). *Agr coloniale* 29, 578.—This subtropical plant can be cultivated in Italy, in the regions with temperate winter temps. The best fertilizer is ammonia N 5, P₂O₅ 7 and K₂O 2%. The av compn of the fresh fruits is H₂O 68.51, proteins 1.59, fats 21.54, carbohydrates 7.14 and ashes 1.22%, 450 g of aguate pulp may give an av of 1036 cal.

G A Bravo

Acid and pH variations in Ananas comosus Merr in relation to swells caused by Clostridium spp. C H Spiegelberg. *J Bact* 31, 85 (1936).—Com swells may result from a too high pH (above 4.4) in cans during and after processing of pineapples.

John T Myers

Culinary quality in white potatoes. J S Cobb. *Am Potato J* 12, 335-46 (1935).—The results of cooking tests and chem analyses indicated that good cooking quality (a mealy, flaky, white fleshed cooked potato) is closely associated with high starch and dry-matter contents and low N content of the tuber. There was no relation between the

fertilizer treatment of the plant and the cooking quality of the tuber. There was a definite tendency for baked potatoes to give higher quality scores than boiled ones of the same lot, apparently because of the higher proportion of starch to water in the baked potatoes. There was a 25% loss of wt due to loss of water during baking while boiling gave no loss nor gain of wt. Twenty three references.

K D Jacob

Sugar feeding-stuff experiments. S Koch. *Centr. Zuckerind* 43, 890-1, 951 (1935).—The feeding values of plain beet pulp, Steffens pulp and dried cosettes were tested. With milk cows the results with Steffens pulp and dried cosettes were equal, but definitely superior to plain pulp. With pigs Steffens pulp and dried cosettes could advantageously be substituted for about 50% of the usual barley ration and very appreciably reduce the cost of production of 1 kg of meat.

F R Bachler

Influence of an increase of excess of base in a food ration on the acid base equilibrium, condition of health and yield of milk cows. E Brouwer. *Biedermann's Zentr. B Tierernahr* 7, 463-95 (1935), cf *C A* 29, 3001.—Experiments were conducted on 2 groups of 13 cows each which were fed a practical ration, but with an increase in excess of base, produced by the addn of carbonates and bicarbonates, to test if there was a favorable or unfavorable influence on the health, the milk and fat production and on the composition of the butter fat.

The "base" mixt was composed of Na and K bicarbonate and magnesite (plus some CaHPO₄). The mutual ratios of the elements Na, K, Ca, Mg and P in the ration were practically unaltered by the addn of the mixt so that only the pure function was studied. In this and in former expts with ordinary Netherlands rations, composed of grass hay, Netherlands grass silage and concentrates, the urine was found to have $pH = 7.5-8.0$, total CO₂ = 200 vol %, organic acids = 100 mg equivalents per l and NH₃ usually lower than 5 mg equivalents per l.

On the same ration (without chalk) the total CO₂ content of the blood plasma was 61.3 = 3.8 vol %. In increasing, in one of the groups, the quantity of the base mixt, to nearly 900 g per cow per day, the base excess was increased by more than 7.7 g equivalents, so that the total base excess in the ration was 12.6 g equivalents per day per cow. The urine pH rose from an av of 8.10 in the control group to 8.27 in the exptl group and the CO₂ content from 236 to 555 vol %, while the org acid content fell from 123 to 52 mg equivalents per l.

This last-mentioned fact was not caused by a considerable reduction in the daily production of org. acid, but wholly or at least for the most part by a considerable increase of the quantity of urine. In feeding rations giving rise to either alk or acid end products of metabolism, the secretion of org acids per day does not, in B's opinion, considerably increase or decrease.

The total CO₂ of the blood plasma increased only to a small extent, namely from 61.4 to 67.9 vol %. The live wt and the health of the 2 groups were practically the same. There were only small differences in the daily milk output, fat and fat free dry substance. Neither was there any influence on the fat percentage, percentage of fat free dry substance of the milk, or on the I no or Reichert-Meissl value of the butter fat.

These expts show that a healthy cow, with sound kidneys, can tolerate, at least for some time, a very large base excess without unfavorable consequences. It may also be concluded that it is not to be feared that on a mineral acid silage the addn of too large an amt of chalk or soda might produce alkalosis. One hundred eighteen references.

F L Dunlap

Comparison of the chemical analyses of carpet grass and Bermuda grass. E C Cling, J P LaMaster and J H Mitchell. *S Car Agr. Expt Sta*, 47th Ann Rept 51-3 (1934).—From Apr 5 to Oct 25, 8 clippings of grass plots were made, weighed and analyzed. There is a higher dry-matter content and higher protein in Bermuda grass than in carpet grass. Carbohydrates are higher in the latter. The ash content of Bermuda grass averaged 6.5% as compared with 7.9% for the carpet grass, the resp percentages of crude protein were 10 and 14.7.

C R Fellers

The botanical and chemical compositions and the feeding values of hays imported from Italy and France (into Switzerland). H. Gutknecht. *Landw. Jahrb. Schweiz* 49, 789-804 (1935).—Sixteen samples of Italian and 13 of French origin were examd. The Italian samples were quite similar to av. Swiss hays, but the French samples in general contained less digestible protein, less utilizable starch (Kellner coeff.) and less P_2O_5 . F. O. Whittier

Nutritive value of lucerne. IV. The leaf-stem ratio. H. E. Woodman and R. E. Evans. *J. Agr. Sci.* 25, 578-97 (1935), cf. C. A. 29, 5890.—Sep. analyses of the leaf and stem fractions of lucerne cuts showed that at all stages of growth the leaves are richer in protein and poorer in fiber than the stems. Nearly 50% of the dry matter of the stems in the flower stage consists of fiber. Leaves display a much higher degree of uniformity in protein and fiber content and are also very definitely richer in ether ext. and slightly richer in N-free extractives than the stems. Both leaves and stems show a decrease in K_2O content with advancing maturity although the stems continue to be richer than the leaves. The stems suffer considerable reduction in ash content with increasing growth. The flowers tend to follow the leaves in org. compn. and the stems in mineral content. I. C. Feustel

The chemical treatment of straw by means of sodium hydroxide solution. N. D. Pryanishnikov and E. A. Nesterova. *Problems of Animal Husbandry* (U. S. S. R.) 1935, No. 4-5, 209-17.—The nutritive value of straw is greatly increased by 8 extras with 1.5% NaOH soln. The percentages of org. matter, N-free material, and crude cellulose before treatment were 48.71%, 43.90%, and 58.28%, resp. After treatment the values were 67.70%, 52.15%, and 82.27%, resp. The starch equiv. (Kellner) changed from 10.22 to 32.77. S. A. Karjala
Feed value of whey. E. C. Damrow. *Natl. Butter and Cheese J.* 26, No. 22, 24 (1935). A. H. Johnson

Preserving wheat germ. Peter J. Donk and Alexander R. MacDonald (to Cerobrix Ltd.). Brit. 436,765, Oct. 17, 1935. To stabilize the germ against rancidity and improve its keeping qualities, it is ground to about the fineness of flour, NaCl being mixed therewith prior or subsequent to or during the grinding to absorb moisture and inhibit too rapid diastatic action of yeast in baking, and an inert non fatty filler, e. g., potato, rice or corn flour or rice polishings, is added, the product being dried before or after addn. of the filler by heating without free access of air or in a current of CO_2 , N or other inert gas.

Germinial substance suitable for use in foods from seed kernels. Moritz Hienstock. U. S. 2,028,132, Jan. 21, 1935. For recovering germinal substance from a mixt. obtained on mechanically degerminating seed kernels such as those of *Ceratonia siliqua* and related plants of the families of the Caesalpiniaceae and Mimosaceae, the main portion of the endosperm is removed from the mixt. and the remaining mixt. contg. the germinal substance and other constituents of the kernels is introduced into a liquid medium such as C_2H_5Cl and CaH_2 which dissolves fatty substances and has a sp. gr. under working conditions intermediate the sp. grs. of the germinal substance and of the associated substances and which is indifferent to gluten-forming proteins of the germinal substance, so that the mixt. seps into 2 layers, the upper of which contains the germinal substance, the temp. is reduced to give required sp. gr. and the layers are sepd. Cf. C. A. 30, 1142.

Food for diabetics. Karl Wille and Eugen Fritsch. Brit. 435,978, Oct. 2, 1935, F. 788,864, Oct. 18, 1935.

Baked goods poor in carbohydrates are prepd. by treating wheat or rye germ, freed from oil, for a day at about 30° and then for several days at room temp., with yeast and lactic acid, mixing the product with fresh germ and fermenting again for several hrs. with yeast, adding further germ and yeast and fermenting again and finally working up to baked goods.

Bakers' yeast. Alfred Schultz (to Standard Brands Inc.). U. S. 2,029,592, Feb. 4. A high-protein stock yeast having a protein content of over 50% on the dry basis is added to a yeast nutrient soln. such as one prepd. with use of molasses, NH_4 phosphate or phosphoric acid and $(NH_4)_2SO_4$, and the P nutriment is restricted to 1.25-2.0% (preferably about 1.6%), expressed as $NH_4H_2PO_4$, and based on the wt. of the molasses, in order to produce a yeast, by propagation with aeration, which contains less than 50% protein on a dry basis and which has high baking quality and keeping quality.

Bakers' yeast of low protein content. George W. Kirby and Charles N. Frey (to Standard Brands Inc.). U. S. 2,029,572, Feb. 4. A high-protein type of stock yeast (having a protein content of over 50% on a dry basis) is added, in a proportion of at least 30% of the total sugar, as molasses, to a nutrient soln. contg. yeast-assimilable sugar (such as that of molasses) and a yeast-assimilable inorg. N compd. such as NH_4 sulfate and phosphate, yeast propagation is effected with aeration while

limiting the yeast-assimilable inorg. N nutrient to about 4 to 12%, expressed as NH_4 sulfate and based upon the total sugar calcd. as molasses, so that there is produced a high yield of yeast of good baking and keeping qualities having a protein content substantially less than that of the stock yeast added. Aq. NH_3 may be added during the process to regulate the pH and supply a portion of the N for the yeast growth (suitably instead of NH_4 sulfate as a N source for the yeast).

Starch preparations Hermann Luthje Brit. 437,028, Oct. 3, 1935. A baking aid or bread improver is prep'd by blending a neutral cold-setting starch that contains no chemicals with so much raw untreated starch, e. g., potato starch, that the H_2O -binding capacity of the product does not exceed the ratio 1:8.

Flour Otto H. Jock Brit. 436,030, Oct. 3, 1935. To improve the baking qualities and so to enable an increased percentage of European wheat to be used in the flour mixt. prep'd for dough-making, a vegetable phosphate-vegetable oil mixt. contg. about 35% oil is mixed with flour in the proportion of 1 of mixt. to 4 of flour to produce an intermediate product which is subsequently mixed with the bulk of the flour. The phosphatides are obtained as lecithin by the extrn. of soybeans.

Fermented milk foods Marcelle Mignard (see Devaux) Fr. 788,801, Oct. 18, 1935. Foods made from fermented milk, e. g., yogurt, have their nutritive and digestive properties improved by adding during the fermentation a soln. obtained from a culture of active bacilli after the bacilli are killed.

Sterilizing milk E. I. du Pont de Nemours & Co. Inc. Fr. 784,208, Oct. 25, 1935. Milk or products made therefrom or contg. milk are sterilized by adding at a temp. below 50°, preferably in the cold, 0.0075-0.004% by wt. of H_2O_2 before or after heating to a temp. below 61°. For a high concn. of microbes the heating may be carried to 63°.

Stabilizing compound for chocolate mixtures David E. Lunn (to International Patents Development Co.) Can. 354,430, Nov. 20, 1935. As a stabilizing agent, powd. starch is intimately mixed with a small quantity of finely ground agar-agar in quantity from 1 to 10% by wt. of the starch on the dry basis. The mixt. has substantially uniform distribution.

Stable chocolate syrup David E. Lunn (to International Patents Development Co.) Can. 354,431, Nov. 20, 1935. The ingredients of the syrup are incorporated in a protective colloidal suspension contg. swelled starch and agar-agar in quantity 1.0-10.0% by wt. of the starch on the dry basis. The starch prevents the chocolate fibers and fats from sepp. The agar-agar prevents the starch particles from being ppt'd from the suspension.

Stable chocolate syrup David E. Lunn (to International Patents Development Co.) Can. 354,432, Nov. 20, 1935.—The syrup contains 0.7-1.2% by wt. of the finished syrup of swelled starch and agar-agar, in which the proportion of agar-agar to starch is 1.0-10.0% by wt. of the starch on the dry basis. Cf. preceding abstr.

Cream cooling and aerating device Edward Franklin and Thorsten Nelson U. S. 2,029,021, Jan. 29, Various structural details.

Freezing ice cream with solid carbon dioxide Clarence I. Justheim U. S. 2,029,025, Jan. 28. A mixt. formed of powdered gelatin, powdered egg, powdered skim milk, cream, sugar and flavoring is stirred with powdered solid CO_2 .

Butter, cream, fats, etc. "Elact" Gesellschaft für elektrische Apparate G. m. b. H. Brit. 436,372, Oct. 4, 1935. This corresponds to Fr. 770,814 (C. A. 29, 832), the skimmed or unskimmed milk or liquid dairy residues used for the washing are first treated electrically by the process of Brit. 433,576 (C. A. 30, 522).

Margarine Harburger Oelwerke Bruckman & Merckel (Frans. Blomem, inventor) Ger. 629,988, Oct. 31, 1935 (Cl. 554, 1,031). MEL or a synthetic nutritive medium is fermented with lactic acid bacteria and is added to margarine. EtOH or its derivs., such as alcoholates or esters, is then added. In an example, rühl acidified by bacteria is added to margarine. EtOH is then added, and the mass is mixed and churned. Cf. C. A. 29, 4831.

Pectin W. W. Cowgill (to Sargik, Inc.) Brit. 437,683, Nov. 4, 1935. See U. S. 1,973,113 (C. A. 28, 6879). Any adherence-retarding agent may be used in place of the glycerol, e. g., olive oil, lemon oil, cod-liver oil, refined mineral oil, waxes, paraffins, sugars.

Gelatin Carl Freudenberg G. m. b. H. Fr. 789,602, Nov. 4, 1935. Gelatin is improved by subjecting it to a swelling by means of a noma swelling agent, e. g., glycerol, and if necessary to a heat treatment, then incorporating in the gelatin softening agents insol. in water, such as castor oil or fish oils, after having eliminated to a large measure or completely the swelling agent.

Preserving animal tissues such as cured meats, etc. Sidney Musber. U. S. 2,029,249, Jan. 29. The surface of meats, fish, poultry or the like is dusted with an antioxidative material such as pulverized oats, which may be mixed with salt.

Meat preserving salt P. Genu and D. Blanckert. Belg. 479,602, April 30, 1935. KNO_3 is mixed with NH_4Cl , and Na biphosphate and salt are added to the mixt.

Preparing artificial sausage casings for shipment and handling Bernard H. Schenk (to Viking Corp.) U. S. 2,028,691, Jan. 21. Various details.

Preserving fruit Alexander Gerner-Rasmussen. Brit. 435,618, Sept. 24, 1935. Divided on and added to 435,587 (C. A. 30, 1143). The process of 435,587 is modified by adding to the coating liquid a small amt., e. g., up to 2%, of gum sandarac.

Preserving fruits and vegetables Will H. Ewell U. S. 2,029,970, Jan. 29. Apples, pears, apricots, peaches, etc., are sliced and the slices are immersed in aq. CO_2 soln., removed, drained and packed (suitably in boxes lined with oiled paper) and may be placed in cold storage until desired for use.

Preservation of foodstuffs J. Foulon. Belg. 406,902, Jan. 31, 1935. The foodstuffs are placed in tightly closing steel cells in which a small piece of S is burned just before the cells are closed. The SO_2 thus formed is subsequently replaced by an atm. of CO_2 under slight pressure. The process is especially applicable to eggs.

Preserving food, fabrics, etc. Wilhelm J. H. Hinrichs. Brit. 435,394, Sept. 16, 1935. See Ger. 610,018 (C. A. 29, 4067).

Coffee substitutes Eduard Jalowetz and Max Hamburg. Brit. 436,116, Oct. 4, 1935. See Fr. 784,172 (C. A. 30, 1869).

Coffee substitute Franz Pracht. Fr. 789,618, Nov. 4, 1935. Simple or complex albuminous material of vegetable or animal origin, preferably contg. P, is dissolved into its elementary components in the presence of water, under pressure and at temps. of 100-220° and above, decomposition of the amines or aminophosphoric acid being avoided; then the ext. is evap'd to dryness under vacuum and roasted, if necessary after decomposition of the albumins and in the absence of air. Decomposition to fatty acids, NH_3 , mercaptans, etc., during roasting is avoided.

Apparatus for making yogurt under controlled temperature Soc. générale de constructions électriques et mécaniques (Alsthom) Fr. 789,792, Oct. 16, 1935.

Sterilizing and canning foods Charles O. Ball (to American Can Co.) U. S. 2,029,303, Feb. 4. App. and various operative details are described.

The preparation of oil soluble resins from polyhydric alcohol and polybasic acid Jen Chuan Wee *J Chinese Chem Soc* 3, 321-4(1935) Oil sol resins are prep'd (1) by heating castor oil soap with 2,3-dichloropropanol and then cooking the product with phthalic anhydride and (2) by heating together raw castor oil and glycerol in the presence of NaOH as catalyst, and then adding phthalic anhydride and heating again. The resin prep'd by the 2nd method is suitable for varnish blending Wu H Adolph

The synthesis of oil-soluble artificial phenol resins of the type of albertol S N Ushakov and V M Zel'tzer *Narodnui Komissariat Tsvetel Prom S S R, Leningrad, Plastmassy* 1, 233 46(1936) — Albertol can be prep'd from 60 parts of 40% CH₂O soln, 100 parts of cresol and 10 parts of abietic acid heated together for 5 hrs, and then esterified with 8.5 parts of 28% glycerol for 7.8 hrs, at 240-60°. These amts can be varied in wide limits without greatly affecting the product, but if more than 125 parts of CH₂O soln is used, the product is insol in oils. Albertol can also be prep'd by heating 100 parts of iditol with 200 parts of natural resin at 200° for 21-5 hrs. Addn of 1.00H to CaH, or 11.0H of soln of albertol raises the acid no H M Leikster

The use of furfural in the production of synthetic resins,

insulating forms and plastic compounds G S Petrov and A Ya Hasilov *Narodnui Komissariat Tsvetel Prom S S R, Leningrad, Plastmassy* 1, 245 13(1935) — Condensation of PhOH and furfural with further condensation of this product with CH₂O, gives resins suitable for a wide variety of uses. Standards for tech. furfural are suggested H M Leikster

The conditions for the condensation of different portions of shale tars with formaldehyde to form products similar to rezol S N Ushakov and G S Brodskii, *Narodnui Komissariat Tsvetel Prom S S R, Leningrad, Plastmassy* 1, 241 30(1935) — The PhOH portion from shale oil, b 170-320°, gives satisfactory resins with CH₂O when NaOH or K₂CO₃ is used as catalyst. Residual high boiling, neutral oil in the resin acts as a plasticizer, but tends to decompose at high temp, and pressure H M Leikster

Testing and evaluation of thermal insulation Walter Schuler *Gas u Wasserfach* 78, 160 42(1935) — Methods of testing thermal insulation, using the Schmidt heat-flow meter, are discussed. Theoretical and actually det'd heat transmission data and calcs for most economical thickness of covering are given for steam pipe insulating materials such as kieselguhr, magnesia and in insulations built up from metal foil and glass wool. Metal-foil insulation requires careful installation and the use of a protective sheet iron cover, and is of use where light weight and freedom from dust are essential. Glass-wool insulation can be protected by a gypsum cement coating, it can be applied in insulating large gas and steam pipes where other insulations would be too heavy, and for other special purposes. Of the coverings tested, the kieselguhr is believed to be best adapted for ordinary steam pipe insulation R W Ryan

Adhesives for "Rubberoid" roofing material for high and low temperatures A V Ikhonin *Stroitel Material* 1935, No 8, 10 31 — Oil-bitumen adhesives must have different softening points according to the latitude of the place where they are used and to the angle of inclination of the roofing. Directions as to their prep'n for different conditions are given. R. K. Stefanovsky

The mechanism of the condensation of phenol with formaldehyde A Vanshel't, T Irlukova, A Itenberg, M Babus' and A. Igel *Narodnui Komissariat Tsvetel Prom S S R, Leningrad, Plastmassy* 1, 181-20(1935); cf. C. A. 29, 1178 — PhOH and CH₂O can be steam-dist'd from the polymerized residue of their condensation, even in the presence of 1% H₂PO₄, and det'd. by standard methods, each in the presence of the other. The reaction rate of their condensation shows that at 60° in the presence of H₂PO₄, equimol. amts. react. At higher temps, or in more acid media, a larger amt. of PhOH reacts, an indication of a secondary reaction. In alk. media PhOH and CH₂O react in the proportions 2:3. These facts agree with the mechanism of Raschig (C. A. 7, 887), but do not agree with that of Baekel and Bender (C. A. 19, 1352). H. M. Leikster

The condensation of phenol and cresol with acetaldehyde to form plastic compounds and insulating materials. G S Petrov and A. A. Pichugin, *Narodnui Komissariat Tsvetel Prom S S R, Leningrad, Plastmassy* 1, 216 61(1935) — The prep'n. of many forms of PhOH-CH₂O resins shows that they are as useful as PhOH-CH₂O resins. H. M. Leikster

Recent investigations on emulsions, with special emphasis on the mechanics of formation, Wu, Chiyton, *Int. Chemist* 12, 15-10(1936); cf. C. A. 29, 4478.

The recovery of solvents in the manufacture of joint diaphragms Hans Diegmann, *Rev. gen. caoutchouc* 12, No 117, 24 6(1935). — A discussion. C. C. Davis

Effects of metals on fly sprays David G. Hoey,

Soap (Sanitary Products Sect.) 12, No 1, 105, 107 1
(1936)—H states that the presence of perfume contg. terpenes or reducing substances caused a deterioration of pyrethrum (pyrs) and toxicity. Samples of standardized pyrethrum fly sprays in flint glass bottles were treated with 1% by wt of confectioner's glaze, flux, tinsplate and combinations of these, and stored for 10 months in darkness. All samples were shaken at intervals and later analyzed by the Seal method for pyr I and II (cf C A, 28, 4531¹) and tested on house flies by the Peet-Grady method (cf C A 22, 4731). Confectioner's glaze or combinations of it with other materials caused considerable changes in color and about one-third loss of pyrs and toxicity. H found some metal contaminants contaminated with more glaze than used in his tests. Flux caused a small loss, tinsplate scarcely any. The effect of small strips of Cu, Zn, Sn, Al, Pb and Fe on the pyr fly sprays was also tried in a 2 weeks' storage test. Cu and Pb both lost some wt and caused 8-13% losses in pyrs. There was little change with the other materials but these are being tested for longer periods. Two references.

Purifying gases I G Farbemnd A-G (Hans Bahr and Wilhelm Wenzel, inventors). Ger 620,932, Oct 30, 1935 (Cl 26d 9 04) Weak gaseous acids are removed from gases by washing with org bases and regenerating the bases by heating Bases contg at least 2 N atoms in the mol are used, the general formula being $A^1A^2N-B-NA^1A^2$, B being an aliphatic hydrocarbon residue and at least one of the A groups being an alkyl, aryl, NH_2 or substituted NH_2 group Thus, a gas stream contg H_2S and CO_2 is washed with a 10% soln of dihydroxyethylenediamine in oil to remove the CO_2 Other washing bases are monohydroxy methyl diethylenetriamine, and monomethyl monohydroxy ethyl diethylenetriamine

Recovering acidic gases Gerald J Horvitz Brit 436,220, Oct 3, 1935 Weakly acidic gases that yield dibasic or polybasic acids, e g, CO_2 , SO_2 , H_2S , are sep'd and recovered from gaseous mixts by scrubbing with a soln of a double alkali metal NH_4 salt of a tribasic or polybasic acid, e g, $Na(NH_4)_2PO_4$, $Na(NH_4)_2AsO_4$, $Na_2(NH_4)_2P_2O_7$, $Na_2(NH_4)_2P_2O_8$, $Na(NH_4)_2C_2H_3O_7$, to form an acid salt of the acid gas, e g, NH_4HCO_3 , and a double alkali metal NH_4 acid salt, e g, $NaNH_4HPO_4$, the resulting liquor being heated to recover the acid gas and regenerate the scrubbing soln App is described In 436,369, Oct 3, 1935, weakly acidic gases, e g, CO_2 , HCN , are removed and recovered from gas mixts by treating with NH_3 in the gaseous phase, dissolving the NH_3 , acid gas and NH_3 salts formed in H_2O , neutralizing the soln with a soln of NaH_2PO_4 or other salt of a comparatively strong acid still having more than 1 replaceable H atom, the acid gas being thereby expelled and, e g, $NaNH_4HPO_4$ being formed, which is heated to regenerate NaH_2PO_4 , NH_3 and residual acid gas The gases together with H_2O -vapor at least equal in vol to the NH_3 are returned to the acid gas absorber and the regenerated NaH_2PO_4 soln is conc'd, the cooled soln being recycled, and the H_2O driven off being condensed and returned to the absorber. App is described.

Purifying ammoniacal cuprous solutions containing carbon oxides Axel Christensen (to Chemical Construction Corp.). U. S. 2,029,411, Feb 4. A soln such as one which has been used for gas purification is heated to expel CO and CO_2 together with some NH_3 , the mixt. of gases is scrubbed while still hot in counterflow with cold water to absorb the NH_3 , while escape of CO and CO_2 is permitted through the scrubbing water, the scrubbing water is heated to expel the NH_3 , and the NH_3 is reabsorbed in the ammoniacal cuprous soln, gases and vapors from the heated scrubbing water which are not absorbed by the ammoniacal cuprous soln. being returned to the gases and vapors undergoing scrubbing with water App is described

Alginate Arthur H Gruart Fr 789,302, Oct 31, 1935. Marine algae are practically completely demineralized by luvitation with an acid such as H_2SO_4 , and the product is converted to a crude alkali alginate, from which cellulosic material is sep'd Alginic acid is ppt'd by treatment with a dil. acid and sep'd. and is then converted to the desired alginate The alginates are preserved against fermentation by the addn. of CH_3O .

Heat recovery from steam and vapors from paper-mill digesters, etc. Dion K. Dean (to Foster Wheeler Corp.) U. S. 2,029,360, Feb 4. App is described for producing low-pressure steam from the recovered heat

Thermal insulator. Edward R Powell (to Johns-Manville Corp.). Can 354,494, Dec. 24, 1935. A suspension of mineral fibers is mixed in a gaseous atm with finely divided binding material, such as linseed oil, Na silicate and asphaltic fluxes and deposited in successive

increments on a moving support. A current of air is passed through the binder to harden it.

Thermal insulator. M. I. Pekshibaev and A. N. Atlashkin. Russ. 35,991, April 30, 1934. Wood pulp in water is mixed with powd brown clay, poured onto a gauze and pressed The product is dried at 80-100°.

Heat insulation Franz W Seving, Abel Bergqvist and Karl F. Olsson (to Kooperativa Forbundet Forening u. p. a.) U. S. 2,029,679, Feb 4 See Brit. 432,019 (C. A. 30, 538⁹)

Heat-insulating material suitable for partitions, refrigerators, etc Nathaniel M Elias U. S. 2,029,311, Feb 4 A mass of cellular insulating material such as one contg "mineral wool," etc., having a sp gr. less than 1.0 is associated with metal such as Al or an Al alloy serving as a binder and forming a coating or lining to give the product a finished surface

Dielectric materials The Telegraph Condenser Co Ltd and Francis C Stephan Brit 435,323, Sept. 1st, 1935 A material of high dielec const comprises a mixt. of $PhNO_2$, a wax or waxes and an ingredient comprising 1 of the following chlorinated rubber, the mixed halogenated compds described in Brit 410,008 (C. A. 28, 6218⁹), polymerized styrene or vinyl halides and esters, cellulose esters or ethers A preferred compn comprises $PhNO_2$, 70, carnauba wax 14 and chlorinated rubber 5 parts Paper for elec condensers may be impregnated with the compn

Dielectric materials and impregnating agents for electric insulators I G Farbemnd A-G Fr 789,691, Nov. 4, 1935 Nonliquid chlorinated phenanthrenes are used

Insulated electric conductor Rudolph A Schatzel (to General Cable Corp.) U. S. 2,029,540, Feb 4 A conductor such as a metal wire is wrapped with a plurality of layers of helically wound paper tape the adjacent layers of which are sep'd by thin layers of viscous sealing material such as a rubber-oil-rosin mixt and a continuous relatively thick layer of non-hardening, oxidized, moisture-resistant, plastic compn such as stearin pitch and asbestine and an outer braid covering are placed over the paper layers. Cf. C. A. 29, 5950⁷.

Fire-resistant covered electrical-conducting wire. Myron E. Delaney (to Halowax Corp.). U. S. 2,028,716, Jan. 21. Covering material on a wire such as a fabric insulation is impregnated with a halogenated cyclic compd, such as tri- and tetra-chloro-naphthalenes together with a plasticizer such as chlorinated diphenyl and an inert pore-filling substance such as fuller's earth or finely divided asbestos.

Oil-insulated electrical transformers, etc. Frank M. Clark (to General Elec. Co.). U. S. 2,028,589, Jan. 21. A mineral insulating oil in a casing such as that of a transformer is protected from undue deterioration by restricting passage of light to it to wave lengths in excess of 600 millimicrons, as by use of an amber or red glass

Molding electrical insulating materials from plastic masses and fibrous fillers. A. I. Goldshtein Russ 37,752, July 31, 1935 Mechanical features

Apparatus for storing gases under pressure or vacuum for heat-insulation purposes. Carl G. Munters. Brit 435,997, Sept. 30, 1935. Addn to 415,457 (C. A. 29, 856⁹).

Apparatus for making sheet insulating material from "rock wool," etc Oliver F. Mottweiler. U. S. 2,029,081, Jan. 23 Structural, mech and operative details

Electric cable. Thomas R. Scott and Thomas E. D. Menzies (to International Standard Elec Corp.) U. S. 2,029,088, Jan. 28. An elec power cable has a fluid impregnated dielectric such as oil-impregnated material the changes in volume of which, with changing temps, are compensated by placing in the cable a device such as a bimetallic strip of Al and brass having a negative temp coeff. of cubical expansion

Rubber-insulated cables held in a casing containing water under pressure Robert J Wiseman (to Okonite Co.) U. S. 2,028,178, Jan. 21. Various structural de-

tails are described of a cable adapted for use with high-tension currents

Insulating cables Gabriel Fodor Brit 435,060, Oct 2, 1935 Cables having MgO insulation are produced by applying to the single or stranded conductor Mg in any convenient form, e.g., tube, tape, surrounding the assembly with a covering or braiding of textile or other fibrous material and converting the Mg into MgO in any suitable known manner, e.g., in an autoclave by treatment with superheated steam at not over 400°

Insulating cables, etc I G Farbenindustrie A-G Brit 435,557, Sept 23, 1935 Wires or other longitudinally extended elec conductors are insulated by winding with sheets or bands of polyvinyl chloride, which may have been further chlorinated, the sheets or bands being free from residues of solvent, and subjecting the wound conductors to heat treatment sufficient to cause fusing of the overlapping edges of the sheets or bands

Insulating cables Pirelli-General Cable Works Ltd and Robert F Horley Brit 435,451, Sept 18, 1935. The metallic conductors of elec cables are provided with waterproof paper insulation consisting of paper tapes that have been previously dried and then vacuum impregnated with a flexible waterproof insulating compd of such high m.p. as not to melt at the working temp. of the cable. The compd. should not melt below 60° and may consist of bitumen, wax, petroleum jelly or a mixt thereof, with or without oil and (or) resin, e.g., medium hard bitumen 80, paraffin 20 or hard petroleum jelly 75 and gum rosin 25%

Adhesive K P Sammel Russ 39,276, Aug 31, 1934 A mixt of fine sawdust, gelatin, cellulose and $\text{Ca}(\text{ClO})_2$ is heated

Adhesive suitable for attaching masks to surfaces to be lacquered Ralph A Wilson (one-half to George A. Chrillon) U S 2,029,008, Jan 28 Rubber cement 30, latex 5, a heavy mineral oil such as a lubricating oil 5 and a volatile solvent such as gasoline 55% are used together with a deodorant such as Me salicylate 5%

Use of thermoplastic adhesives in shoe manufacture Charles F Pym (to United Shoe Machinery Corp.) U S 2,028,245, Jan 21 Various operative details are described relating to the use of a thermoplastic adhesive for fastening uppers to shoe soles. App is described

Linoleum cement Imperial Chemical Industries Ltd and Edwin B Robinson Brit 435,992, Sept 27, 1935 Drying oils treated as in Brit 422,941 (C A 29, 4610*) or fish oils treated similarly are subjected to an air-oxidation process with addn of driers and the treated oil is fused with resins, gums or other usual addns. In examples, linseed or Japanese sardine oil bodied by heating in CO_2 , or linseed oil bodied by blowing air through the heated oil, is passed through a continuous still as in 422,941 and then mixed with PbO. The oil is oxidized by flowing it over an inclined tray in an oven heated to 40-45°, through which a stream of air is passed. The oxidized oil is fused with rosin and kauri gum to give a cement which may be mixed with wood meal and pigment to give a linoleum mixt

Cements, etc I G Farbenindustrie A-G Brit 435,867, Oct 18, 1935 In the process of Fr 723,008 (C A 26, 4142), the neutral metal oxides, sulfochlorides or neutral salts, are replaced by esters having a neutral action toward water and formed by the combination of aromatic-aliphatic alcs and mineral acids, e.g., phenylchloroform, benzylidene chloride, *p*-xylylene chloride, dichloromethyl *m*-xylene or dibenzyl sulfate. Emollients, such as benzyl alc., as well as various fillers may also be added

Cementing surfaces I G Farbenindustrie A-G Brit 435,941, Sept 12, 1935 Adhesion of 2 surfaces is effected by applying separately to the surfaces or to 1 of them an aldehyde-urea condensation product and a substance exerting a hardening influence thereon, e.g., HCl , AlCl_3 , H_2PO_4 , NaHSO_4 , $\text{NH}_4\text{H}_2\text{PO}_4$, AlCl_3 and NH_4Cl . Starch, potato flour, fillers, etc., may be incorporated in the adhesives. The cementing is completed by pressure with or without heating

Phenol-aldehyde condensation products Howroyd,

McArthur and Co Ltd and Robin H Croad Brit 436,308, Oct 9, 1935 Addn to 411,828 (C. A. 28, 7044*) Oil sol resins are prep'd by condensing 2 mol proportions of a phenolic substance with 1 of CH_2O in the presence of $(\text{AcO})_2\text{Zn}$, basic Al acetate or $(\text{AcO})_2\text{Mg}$ as catalysts and then heating the product with an oil. The acetates may be formed *in situ*. Among examples, cresylic acid or xylenol is heated with Al and the product condensed with CH_2O and AcOH , with or without the addn of $(\text{AcO})_2\text{Zn}$, and then heated with castor oil

Condensing phenols with wood fiber S N. Ushakov Russ. 37,782, July 31, 1931 The condensation is effected by first dissolving a phenolic aldehyde resin of a "Novolok" type in phenol, or by adding it in the condensation reaction with wood fiber Cf C A 29, 2257

Condensation products of thiourea, urea and formaldehyde suitable for making molded articles Kurt Ripper U S 2,029,836, Feb 4 Urea, thiourea and CH_2O in the mol proportions of 1, 1 and 1.5, resp., are reacted together in an acid soln of a pH of 3.0 by heating the mixt until there is effected the formation of a hydrophobic mixed condensation product which seps from a sample of the reaction mixt. on cooling

Reaction product of thiourea with formaldehyde suitable for injection-molding or die-casting Kurt Ripper U S 2,029,891, Feb 4 Thiourea is reacted with less than 2 mol proportions of formaldehyde without the addition of external heat, in an aq medium having a pH of about 3 to 5 to prevent formation of insol thiourea methylene compds., the resulting liquid product is mixed with a fibrous material such as paper strips and the mixt is dried to a point where it is practically dry but still contains enough moisture to be flowable under pressure

Hydrophobic urea thiourea formaldehyde reaction products suitable for use in molding compositions, etc Kurt Ripper U S 2,029,893, Feb 4 A mixt of urea with thiourea is reacted with less than 2 mol proportions of formaldehyde without addition of external heat, in an aq medium having a pH of about 3, the amount of thiourea used being sufficient to prevent formation of white insol formaldehyde urea products. The resulting product may be used in coating, impregnating or molding compns

Polymerization products suitable for molded articles, coatings, etc Wallace H Carothers, Arnold M Collins and James E Kirby (to E I du Pont de Nemours & Co.) U S 2,029,410, Feb 4 Chloro 2 butadiene-1,3 is polymerized in the presence of a film forming material which may include natural or synthetic resins, cellulose derivatives or polymerizable materials having at least 2 C atoms in an open-chain joined by more than one bond such as China wood oil. Numerous examples are given

Synthetic resins Ya I Chulkov Russ 38,310, Aug 31, 1934 Phenols, thiophenols, their homologs or waste products obtained in the carbonization of coal sapropel, peat or shale are treated with solns of Na or K sulfites or NaOH , KOH and $\text{Ca}(\text{OH})_2$, then with excess of Cl_2 and finally are filtered, dried and worked up in the usual manner

Synthetic resins Theodor Sutter (to Soc pour l'ind chim et Bâle) U S 2,029,954, Feb 4 An aldehydic substance such as furfural or formaldehyde is reacted (singly or by heating together) with a polynuclear aromatic amine base the nuclei of which are linked together by less than 2 mols of methylene groups for each 2 mols of aromatic radical and which contains at least as many amine groups as linked nuclei, such as aminobenzylaniline to produce a product for making molded articles, etc. Numerous examples are given

Synthetic resins Beckacite Kunstharzfabrik G.m.b.H. Ir 789,643, Nov 4, 1935 Resinous plastifiers are made from aliphatic acids of short chain not containing more than 4 C atoms between the COOH groups, e.g., succinic and maleic acids, polyatomic alcs such as glycerols and oils having an I index below 100°, e.g., nondrying oils, the amt of oil in the formula being 50-85% by wt. Thus, castor oil is heated with glycerol to 235° in the presence of a small amt of litharge, maleic acid and more glycerol are added, and the mixt is heated to

170-190° until a liquid resin is obtained. Other examples are given.

Urea resins. *Bakelite Corp.* Fr. 789,533, Oct. 30, 1935. Urea is condensed with an aldehyde (1.5-2.5 mol of aldehyde per mol of urea) in the presence of 1-5 g. for each mol of urea of a compd. contg. N chosen from the group comprising hydroxylated amines, monosubstituted amines and diamines and aromatic amines. The reaction is stopped when re-sulfonation is complete by adding a neutralizing agent forming an inactive addn. product with the compd. contg. N. Suitable N compounds are MeNH_2 , AmNH_2 , $\text{C}_2\text{H}_5(\text{NH})_2$, NH_2OH , PhNH_2 , and phenylmethanamine.

Vinyl resins. *Rohm & Haas A-G* Fr. 789,166, Oct. 21, 1935. Stable dispersions capable of being highly concd. of vinyl resins insol. in water are prep'd by introducing hydrophobic groups (COONa , COOK and COONH_4) into the polymer mol. Thus acrylate ester is polymerized in an emulsion in the presence of Na acrylate to form a polyacrylic ester which contains a COONa group. Examples are given.

Resins for varnishes and plastic masses. *B. V. Makarov and P. A. Kremlyuk* Russ. 37,785, July 11, 1934. The chitin-contg. material obtained by alkali treatment of crab shells is treated, directly or after the action of lime, with benzyl chloride in the presence of alkali.

Varnishes, agglutinants, etc. *Isoline Tenger* (to Johann Tenger) Brit. 435,270, Sept. 16, 1935. See Fr. 770,201 (C. A. 29, 5309).

Insoluble and insoluble resins and varnishes. *G. S. Petrov* Russ. 37,815, July 11, 1934. High molecular sulfonic acids obtained in sulfonating mineral oils or distillates from shale, peat, etc., are condensed with aldehydes in the presence of aromatic amines in an acid, neutral or alk. medium.

Artificial resins from polyhydric alcohols and polybasic acid anhydrides. *Gilbert F. Hoffmann* (to Pittsburgh Plate Glass Co.) U. S. 2,028,908, Jan. 28. A hard sol. resin suitable for use in lacquers, etc., is produced by heating together a polyhydric alc. such as glycerol and an anhydride of a dicarboxylic acid such as phthalic anhydride to form a viscous product capable of further esterification, incorporating an anhydride of a "monobasic" aliphatic acid such as Ac_2O and heating the mixt.

Plastic masses. *B. V. Mikorov* Russ. 37,847, July 11, 1934. Sawdust, corn stalks, etc. are heated above 250° in a current of inert gas or superheated steam before being mixed with synthetic resin.

Plastic masses from lignin. *A. M. Nastukov, M. P. Polyakov and Kh. G. Finkova* Russ. 38,322, Aug. 31, 1934. Lignin obtained by incomplete hydrolysis of lignocellulose with acids is mixed with 6-10% of plasticizer, such as latex or benzylalcohol.

Plastic resins from petroleum residuums. *Urie B. Bray* (to Union Oil Co. of Calif.) U. S. 2,021,288, Feb. 4. A cracked residuum is sep'd into fractions by means of a solvent having a low solvent power for the asphaltic materials present in the residuum, asphaltic materials are sep'd. from the soln., and the dissolved cracked materials are ext'd. with a selective solvent for the more aromatic substances, the soln. of these latter is sep'd. and dist'd. to produce as a distillate a plastic resin of sp. gr. about 1.084-1.126, m. approx. 35-65° and of ductility in excess of 100 cm. at a temp. of 25°. Various details and modifications of procedure are described.

Synthetic resin-like products. *W. A. Noves and Gilbert F. Hoffmann* (to Pittsburgh Plate Glass Co.) U. S. 2,028,914, Jan. 28. An ester, capable of further esterification and formed from a polyhydric alc. such as glycerol, and an aliphatic "monobasic" acid, such as monoacetic, is further reacted with an anhydride of an org. "dicarboxylic" acid such as phthalic anhydride.

Dispersion of resins. *John A. Kenney* (to Barrett Co.) Can. 354,904, Dec. 24, 1935. An unsaponifiable resin of the paracoumarone type is dispersed by mixing in solid comminuted form with a soln. contg. Na silicate that has a ratio of at least 3 parts by wt. of SiO_2 to 1 part of Na-O. The mixt. is then agitated.

Dispersion of resins. *John A. Kenney* (to Barrett Co.) Can. 354,905, Dec. 24, 1935. An unsaponifiable resin, such as paracoumarone or paraindene, is dispersed, e. g., by dissolving 50 parts of paracoumarone resin, m. 110°, in 50 parts by wt. toluene, whipping into 200 parts by wt. of H_2O contg. 1 part by wt. of oleic acid and 5 parts by wt. of Na silicate soln. having a sp. gr. of about 42.5°. Baumé. This mixt. may be carried out at atm. pressure. The dispersion is not inflammable. Other solvents may be used, such as CCl_4 , petroleum derivs., liquid org. esters and ethers or terpene derivs. The product is used for sizing of papers.

Composite hollow articles. *Lauchlin M. Currie* (to Canadian National Carbon Co. Ltd.) Can. 354,915, Dec. 24, 1935. This relates to the manuf. of articles composed wholly or in part of vinyl resins. 1 g. vinyl acetate and vinyl chloride are conjointly polymerized in the proportions of 80% by wt. of vinyl chloride, in the presence of acetone and 1% by wt. of Br_2O_5 as a catalyst at 40°. After removal of unpolymerized material and catalytic residues, this is compounded with 3% by wt. of carnauba wax and about 2% by wt. of alk. Ca stearate. This is made into a preform and placed within a matrix, and subjected to fluid pressure applied internally until it assumes the matrix form, and then subjected to heat to make it heat stable.

Solvent esters. *Carbide & Carbon Chemicals Corp.* Fr. 788,550, Oct. 18, 1935. 1-esters formed by the reaction of aromatic monocarboxylic acid such as salicylic acid and a monoalkyl ether of glycol are used as solvents and plasticizers for cellulose derivs. and natural and synthetic gums and resins and for increasing the flexibility of films. Examples are given of the prep'n of *butoxyethyl-* (b-11 139-437) and *butoxyethoxyethylsalicylate*, b. 175°.

Use of glycerol dipropionate and dipropionate-monoacetate as plasticizers for cellulose esters such as cellulose acetate. *David C. Hull* (to Eastman Kodak Co.) U. S. 2,021,925, Feb. 4.

Putty. *Yu. S. Bakst* Russ. 37,781, July 31, 1934. A putty is prep'd from oil, lime and the residue left after treating glycerol with H_2SO_4 .

Moistureproofed molded article. *Robert G. Lemmerman* (to Ferro Engineering Co.) Can. 355,194, Jan. 7, 1936. An aggregate, such as fine silica sand, is mixed with 5-6% of a sol. silicate. E. g., in a 1000 lb. batch the wts. may be aggregate 849, water glass 120, H_2O 25 and $\text{Al}_2(\text{SO}_4)_3$ 6 lbs. This is molded and dried at 212° in an atm. free from CO and CO_2 .

Transparent articles. *L. Bronzi* Belg. 407,197, Feb. 28, 1935. A transparent mass obtained by urea-formaldehyde polymerization is dried in an autoclave and is hardened superficially by treating with a dehydrating agent such as dry CH_3O gas.

Molded products. *Irancous Cédre*. Fr. 788,704, Oct. 16, 1935. To a mixt. of sand-tine agglomerated by a binder such as glue or gelatin, is added MgO to prevent the molded product becoming brittle on drying, and lactic acid to prevent putrefaction and too rapid drying. The mold is smeared with a mixt. of stearin and lighting oil.

Press for molding plastic materials such as synthetic resin mixtures. *Rudolph J. Kauls* (to General I. Lee, Co. Ltd.) U. S. 2,021,026, Jan. 28. Various structural, mech. and operative details.

Laminated sheets. *John A. Kenney* (to Barrett Co.) Can. 354,906, Dec. 24, 1935. A dispersion of solid comminuted resin of the coumarone-indene type, m. above 100°, in an alc. soln. of Na silicate is mixed with fibrous pulp in proportions of about 25% resin to the dry wt. of the fiber. The resin is ppt'd. on the fiber by adding sufficient alum to the pulp to produce a pH value of about 4.6. The pulp is formed into a sheet, dried and pressed at a temp. above 150° with the sheets to form a laminated product.

Impregnated sheet material. *E. I. du Pont de Nemours & Co.* Brit. 435,728, Sept. 26, 1935. A pulp of cellulose fibers is treated with a mercerizing soln. to cause only superficial mercerization of the fibers and then formed

into an absorbent felt which is impregnated with a bituminous material or a mixt thereof and drying oil. A finishing coat, e. g., pigmented rubber, pyroxylin, which may be preceded by a suitable sizing coat, may be applied.

Compound sheet materials Edward W. Aldridge Brit 435,396, Sept 16, 1935 Laminated, decorative, glass-surfaced sheets consist of a sheet of glass decorated by paints, enamels, etc., on its interior surface united to a rear sheet of glass, decorated or not, or of asbestos cement by means of an adhesive consisting of coned latex mixed with powd., H_2O -reactive substances, e. g., anhyd. $CaSO_4$, Portland cement, and, if desired, vulcanizing agents, gums or resins, bitumen, pitch, etc. An intermediate non brittle layer, e. g., cardboard, cloth, may be provided.

Compound sheet materials Diedrich Haack and Richard Schmidt Brit 435,088, Sept 13, 1935 A gas-proof and fireproof material is made by uniting a layer of rubber or rubber mix with an outer layer consisting essentially of Kieselguhr. The kieselguhr may be treated with Na silicate and degreasing chemicals, e. g., H_2SO_4 , NH_4OH , KOH , to form a flaky mass which may be rolled onto the rubber or spun and made into a fabric which is vulcanized to the rubber. This fabric may incorporate another material, e. g., cotton, and may be impregnated with, e. g., $Al_2(SO_4)_3$, to render it fireproof and non-hygroscopic.

Paper metal sheets Aluminiumwerk Tscheln G m b H and Carl Craemer Fr 788,987, Oct 21, 1935 Metal sheets and paper are united by a mixt of α adhesives and α dispersions of polymerized compds., particularly polyvinyl esters. Examples contain latex, casein and polyvinyl esters, or gum arabic, glycerol and acrylic acid esters.

Decorative sheet material suitable for floor coverings James J. Jackson (to Sandura Co.) U S 2,028,781, Jan 28 A liquid backing compn. such as an oil or lacquer compn. is applied to one side of a porous sheet material such as a felt in a regulated amount to effect penetration into the body of the sheet while avoiding filling the spaces between the fibers within the body of the sheet, and thereafter decorative coloring material is applied to the opposite side of the porous sheet to effect penetration of the coloring material well down into the body of the sheet. U S 2,028,782 relates to impregnation of porous fibrous sheet material with a molten saturant formed of ester gum, China wood oil and chlorinated naphthalene.

Castling belts for various transparent sheet materials I douard M. Kratz and Erich Gebauer-Luelnegg (to Marbo Products Corp.) U S 2,028,936, Jan 28 A laminated fabric web carries a pigmented layer of a cellulose ester compn. on which are superposed a plurality of layers of soft plasticized clear nitrocellulose compn. to form a smooth, brilliant top surface, and an inert barrier film is used on the surface to protect the under coatings from the action of solvents in the film forming soln. to be cast on the belt. Various examples are given.

Uniting layers of material such as jar cap liners by use of an adhesive John T. Heckel and Ralph S. Walker (to Gold Dust Corp.) U S 2,029,422, Feb 4 Various structural, mech. and operative details.

Glued plywood and veneered products W. F. Leicester U S 2,023,287, Jan 21 Various operative details of assembly, glue treatment, drying and hot pressing.

Laminated sound insulated panels suitable for dash panels of automobiles, etc. Meredith S. Randall (to Woodall Industries Inc.) U S 2,028,950, Jan 28 Various structural details of composite panels which may be formed of laminations such as metal and asphalt impregnated fibrous material.

Laminated sound insulated panels suitable for dash panels of automobiles, etc. Herbert J. Woodall and Meredith S. Randall (to Woodall Industries Inc.) U S 2,028,962, Jan 28 Structural details of panels which may be formed of laminations of sheet metal, "Masonite," etc. Cf. C. A. 29, 4105 and preceding abstr.

Wetting agents, etc. Henkel & Cie G m b H Fr

1 789,578, Oct 31, 1935 Org. compds. contg. at least 1 lipophile group and at least 1 group causing solv. in water (the lipophile group being joined to the group causing solv. in water by means of a chain of C atoms interrupted by at least 2 groups of amides of acids), are used as agents having capillary activity, alone or with other cleaning, etc., agents. Examples are given of the use of β -[(3-lauroyl-lambobenzene)sulfonylmethylamino]ethanesulfonic acid and β -[(3-oleylaminobenzoyl)methylamino]ethanesulfonic acid.

Detergents Henkel & Cie G m b H Brit 436,213, Sept 27, 1935 These are made by mixing H_2O -sol. pyrophosphates with water glass or other non-oxidizing alk., H_2O -sol. inorg. alk. metal salts, other than alkali carbonates, known as cleansing agents. Abrasives may be added.

Detergents Julius P. Hansel Brit 436,332, Oct 9, 1935 These are composed of 1 mol. Na_3PO_4 to 1.5 mols. of alkali metal salts of inorg. or low aliphatic acids less strongly dissolved in H_2O than is H_2PO_4 , e. g., acetates, borates, carbonates, molybdates, silicates, arsenates.

Detergents Denis Lacy-Hulbert Brit. 436,866, Oct 16, 1935 These consist of soap and sulfonated lauryl and oleyl alcs. or salts or esters thereof in such proportion that the soap is more than 25% of the whole.

Sulfonated derivatives of carboxylic esters. Benjamin R. Harris U S 2,029,168, Jan 28 Materials such as oleostearin, lard, partially hydrogenated cottonseed or peanut oil, cocoa butter or coconut oil, contg. carbon-to-carbon double bonds, are sulfated (suitably with coned H_2SO_4 under suitably controlled conditions) to produce normally solid products which may be used as wetting, penetrating, detergent, foaming or lubricating agents, etc., in the textile, paper, pharmaceutical, soap, cosmetic, dyeing, food or other industries.

Nonadecyl oxygen compounds Carbide & Carbon Chemicals Corp. Fr 789,406, Oct 29, 1935 A compd. of the formula $BuCH_2CH(CHCOCH_2CH_2(OH)CH_2CH_2Bu$, is prep'd by condensing 5-ethyl-3-nonen-2-one and ethylhexaldehyde. This compd. easily loses its elements of water to form an unsat'd nonadecyl ketone, by 169-73°, of the probable formula $BuCH_2CH(CHCOCH_2CH_2CHCH_2Bu$, which is hydrogenated to a bis(ethylheptyl)-ketone of the probable formula $(BuCH_2CH_2CH_2CH_2)_2CO$, and a secondary nonadecyl alc., by 175-7°, indicated as 5,11-diethyl-8-pentadecanol. The alc. and its sulfate ester have valuable wetting, emulsifying and frothing properties.

Quaternary ammonium salts Soc. pour l'ind. chim. à Bale Fr 788,898, Oct 18, 1935 Quaternary NH_4 salts are prep'd by causing compds. of the formula $(X)_nRCOR'$ (X is active halogen, n is a whole no. below 7, R is an aliphatic, cycloaliphatic or cycloaliphatic aliphatic radical having at least 8 C atoms, R' is OH, OR', or $NHPR^2$, R² being any org. radical having less than 6 C atoms, R¹ and R² are H or any org. radicals) to react with tertiary amines which can only react with one of the mobile halogen atoms. The products are wetting, cleansing and emulsifying agents. Thus, Et α -bromostearate, α -bromolaurate and α -bromopalmitate and the anilides of the acids are converted to the quaternary pyridinium salts.

Sulfonic acids Richard Huttenlocher and Richard Hess U S 2,029,073, Jan 23 In the production of a sulfonic acid such as an emulsifying and wetting agent, a compd. contg. an alkyl-disulfonic acid radical such as methane-disulfonic acid is reacted with an org. compd. contg. an alcoholic hydroxyl group such as hexadecanol. Various examples are given.

Sulfonic acid soap Otto Diepenbruck (to Shell Development Co.) Can 354,565, Dec 3, 1935 Alkali metal sulfonates obtained from mineral oils which ordinarily form turbid mixts. with hot H_2O are made to produce clear solns. by addn. of 5-25% of a highly refined cylinder oil or spindle oil.

Sulfonated oil Philip Kaplan (to Richards Chemical Works Ltd.) Can 354,961, Dec 21, 1935 In sulfonation of oils a low temp. is maintained by immersing sol

CO₂ in the mist. The oil is then washed, the H₂O sep'd., and the product neutralized at not higher than about 15°.

Disk for sound recording V. A. Zaikin, V. A. Trovostolov and L. P. Abramovich Russ 37,979, July 31, 1934. A wax disk is cooled to about 4° and sprayed with a dil. soln. of NH₄OH of the same temp. to neutralize the acid reaction of the wax and to remove air from the sound path. Ag is then pptd. on the disk in the usual manner.

Sound records Samuel Whyte (to Electric and Musical Industries Ltd.) U. S. 2,028,854, Jan. 28. A sound-record material comprises a phenol condensation product having incorporated with it a small proportion of a soft water-sol soap Cf. C. A. 29, 3730.

Gramophone records Guy Hillhouse (to Trusloud Ltd.) U. S. 2,029,102, Jan. 28. Superposed thin flexible transparent disks of celluloid are placed together with an intermediate co-extensive sheet of fibrous material such as paper in a heated press in which they are pressed together to cause the surfaces of the celluloid disks in contact with the paper to be extruded into the pores of the paper to effect a permanent union of the materials.

Phonograph records Hal T. Beans, George H. Walden, Jr., and Louis P. Hammett U. S. 2,029,012, Jan. 28. A record material is prepd. by heating a mixt. of rosinol, alc., and p. nitroaniline at 70° to form a soln., adding 40% formaldehyde and further heating at about 70° until the ppt. formed is dissolved and a viscous liquid is formed, adding alc., cooling the soln. to 30° and adding Turkey-red oil.

Sound and like records N. V. Philips' Gloeilampenfabriek Brit. 435,515 Sept. 24, 1935. In mixing materials on which records of sound, etc., may be made mechanically, particularly gelatin layers on which records adapted to optical reproduction may be formed, a layer on which a clearly defined, "unfrosted" track may be formed is provided by making it of gelatin produced from a soln. of μ less than 4 or more than 7. Thus a purified isoelec. gelatin is soaked in H₂O and dissolved at 45°, the soln. is shaken with neutral Turkey-red oil, e. g., "Turkolon A," and, after being filtered, if necessary, N. HCl is added, the soln. being then poured as a thin layer onto a carrier, e. g., celluloid film, and the layer allowed to dry. Cf. C. A. 30, 977.

Fire extinguishers I. G. Farben und A.-G. Ir. 789,327, Oct. 29, 1935. Water-sol. salts of aliphatic amines contg. an aliphatic chain of more than 10 C atoms attached to N are useful for making froth with air. Examples are dodecylmethylamine formate, benzylmethyl-(or diethyl)dodecylammonium chloride dodecylmethylbetaine or the corresponding phenolbetaines and salts of N'-dodecylmethylthylenediamine Cf. C. A. 29, 6336.

Fire-extinguishing liquid Albert C. Malzac Ir. 789,402, Oct. 29, 1935. The liquid contains 2 or more halogenated org. derivs., 1 being, e. g., MeBr and the other CCl₄ or trichloroethylene, alone with constituents having a vapor tension sufficiently low to permit manipulation in air at ordinary temp., and a stabilizer, e. g., PhNH₂, to prevent formation of COCl₂ or HCl. The constituents may be emulsified in water or fireproofing salts Cf. C. A. 29, 6941.

Use of foaming agents and water in fire extinguishers. Bror Falson U. S. 2,029,330, Feb. 4. Various details of app. and operation.

Fire extinguisher J. Breny and P. Delvaux, Belg. 407,668, March 30, 1935. A pulverized alkali metal salt product is mixed with refrigerating products.

Foam fire extinguisher V. N. Shymirun, Russ. 32,302, Sept. 30, 1933. Construction details. Addn. Russ. 34,320, Jan. 31, 1934.

Leather substitute Albert J. Hanley (to Respro Inc.) U. S. 2,029,172, Jan. 28. A rubber compn. is applied to a textile fabric base having attached loops of thread projecting from it in an uncut state, the rubber compn. is dried and vulcanized, and during the process the uncut loops of thread are pressed into flattened condition in the applied compn. substantially parallel to the general plane of the fabric to provide a smooth fibrous surface.

Coated fabrics. Johnson & Johnson Brit. 435,782,

Sep. 27, 1935. See Can. 353,366 (C. A. 29, 83614). Normally tacky adhesive tapes having a fabric or paper backing are provided on the non-adhesive side with a thin film of rubber and, superimposed thereon, a coating of a cellulose deriv. applied in a solvent medium comprising a solvent for rubber. In an example, the final coating consists of a soln. of 1% cellulose in a mixt. of PhMe and MeOH or AcOPt.

Impermeabilizing surfaces such as those of cellulose or its derivatives Harold Hibbert (to Celanese Corp. of America) U. S. 2,024,770, Jan. 24. The surfaces are exposed to vapors of a substantially unpolymerized vinyl compd. such as divinyl ether or of a glycide and the polymerizable material deposited on the surface is polymerized to form a surface coating.

Moistureproof material John H. Collins (to du Pont Cellophane Co. Inc.) Can. 354,404, Nov. 26, 1935. A sheet of regenerated cellulose is coated with a compn. comprising, e. g., 5 parts of a film-forming substance, 5 parts of a moistureproofing wax such as high-melting paraffin, and 5 parts carnauba wax dissolved in a solvent. The film-forming substance is selected from natural rubber, gutta-percha, balata and synthetic rubbers. The solvent is evaporated at a temp. at least equal to the m. p. of the wax in the compn. Cf. C. A. 29, 8163.

Impregnating fibrous materials United Shoe Machinery Co. de France Fr. 789,294, Oct. 25, 1935. Bands of fibrous material, such as parts of shoes, are stiffened by dissolving a cellulose acetate having an acetyl index between 48 and 54.5, preferably 50-4, in a hot liquid (e. g., EtOH contg. 25-55% of water) which is capable of dissolving the acetate in the hot and pptg. it in the cold, impregnating the fibers with the hot soln. and cooling.

Bituminous aqueous emulsions for impregnating roofing paper, artificial leather, paper tubes, preparing varnishes, etc. G. D. Kreitzer Russ. 18,109, Aug. 31, 1934. Emulsions are prepd. from molten, or finely disintegrated or dissolved bitumens or pitches or their mixts. with emulsifiers by using for stabilizer mineral oils of high viscosity or petroleum derivs. with the addn. of electrolytes such as CaCl₂.

Applying lining material such as asphalt and wax composition to the inside of cans by spraying. John H. Murch (to American Can Co.) U. S. 2,028,798, Jan. 24. Various operative details for coating the inside of cans for holding beer, etc.

Apparatus for lining internal walls of, or molding, hollow bodies such as a tube, with thermoplastic material such as bitumen. Vereinigte Stahlwerke A.-G. Brit. 435,000, Sept. 12, 1935.

Protecting pipe lines, etc. Stuart P. Miller and Leslie T. Sutherland (to The Barrett Co.) Brit. 435,325,

Sept. 19, 1935. Objects such as pipe lines are protected by placing about them a flexible shield comprising fibrous material, e. g., felt, paper, wood veneer, impregnated with a synthetic resin that is cured before the shield is applied. Unimpregnated reinforcing material may be treated with preservatives, e. g., creosote. Pipes may be coated with bituminous enamels before application of the shield, which may be secured by adhesives, e. g., asphalt, tar, plastic cement.

Films, etc. Celluloid Corp. Brit. 435,784, Oct. 17, 1935. In producing films or foils by depositing a film-forming soln. on a support, evap. the volatile solvent and stripping the film, etc., from the support, the tendency of the film, etc., to curl is reduced by subjecting to the action of heat applied only to or in greater quantity to the air side, i. e., the side not in contact with the support. Suitable film-forming compns. are given and app. is described.

Film-forming compositions containing chlorinated rubber, etc. Leo Rosenthal and Reinhard Hebermehl (to I. G. Farben und A.-G.) U. S. 2,029,688, Feb. 4. Chlorinated rubber material is used together with a S-contg. reaction product made from S and toluene, xylene or ethylbenzene in the presence of AlCl₃ for mixing compns. suitable for coating metals and for other uses.

Soybean phosphatides. Wells W. Ginn (to Chemical

Novelties Corp.) U S 2,020,261, Jan 23 A product suitable for various uses similar to many of those of lecithin is produced by hot pressing soybeans to obtain soybean oil, scgp sludge from the expressed oil, blowing the sludge with air to remove odor, filtering it, further scgp oil by settling or centrifuging (suitably at a temp of 55-70°)

Separating albuminous substances from the castor oil palat I M Zolotnitskii Russ 37,785, July 31, 1934 Husks of the castor-oil plant are treated with hot alkalis and the albuminous substances are scpd from the alk soln by treatment with waste liquors of gelatin manuf

Decalcomania James F McNutt (to American Decal Corp.) U S reissue 10,839, Jan 23 A reissue of 1,996,519 (C A 29, 3481)

Transfer paper Louis C Antrim (to Autographic Register Co.) Can 354,229, Nov 19, 1935 A sheet of paper, such as waterleaf, is impregnated with oil and ink soln One side is coated with pyroxlin to make it nontransferable, and the other side coated with Al powder to retard the ink transfer. Cf C A 28, 75341

Fireproofing compositions Grete Kindermann (nee Huesmann) Brit 435,240, Sept 17, 1935, divided on 429,857 A compn for fireproofing fabrics consists of an aq soln of $(\text{NH}_4)_2\text{SO}_4$, NH_4Cl , H_3BO_3 and borax, to which is added a small amt. of a urea- CH_2O condensation product

Rendering textile materials flame resistant Ernest R Hanson (to Halowax Corp.) U S 2,028,715, Jan 21 Cloth, paper or the like is treated with a material such as halogenated acenaphthene or halogenated phenanthrene which may be plasticized with a chlorinated diphenyl

Etching agent for printing plates P L Kalman Russ 37,721, July 31, 1934 A mixt of Al salts, phosphates, alkali metal salts, HPO_4 , and NH_4Cl is specified

Printing plates Hylton Swan and Sigfried Higgins (to Bakelite Corp.) U S 2,028,707, Jan 21 Printing plates, the body of which may be formed of rubber, have a facing of regenerated cellulose and may have a metal backing plate, etc U S 2,028,710 relates to plates with a body of rubber and a facing of cellulose acetate 0.001-0.005 in thick U S 2,028,711 relates to plates with a body of resinous material such as a phenolic resin and a thin cellulose acetate facing U S 2,028,712 relates to printing plates with a vinyl resin facing and a body of another material such as a rubber compn

Product for intensifying combustion and improving metallurgical products M H M van den Heuvel Belg 407,586, Feb 23, 1935 The product is a mixt of oxides of Mn (or other metals which have several degrees of oxidation) with salts or bases of alkali or alk earth metals, the ratio being preferably 2.35-2.4 atoms of Mn per atom of alkali or alk earth metal

Chemical heating composition Raymond F Reed (to Kendall Co.) Can 354,263, Nov 26, 1935 A compn for use in heat pads contains an active metal, and electrolyte that forms an acid soln and a compd, insol in water but sol in the soln of the electrolyte, of a metal that is replaceable from soln by the active metal, e g, 10 g oxalic acid, 21 g BaCl_2 , 25 g cupric carbonate and 600 g Fe filings

Friction material for brake lining or clutch facing Phillip D Cannon (to Johns-Manville Corp.) Brit 435,101, Sept 4, 1935 The material is made by interweaving fibrous warp and weft strands around preformed, self-sustaining, plastic strips of friction compd, binder strands being simultaneously inserted between the strips to connect together the flat faces of the woven tube, applying addnl friction compd to the outside of the tube, compressing and shaping the tube into a flat band and hardening the friction compd, e g, rubber with usual vulcanizing agents, fillers, etc, or, alternatively or in addn, a PhOH-aldehyde resin or a drying oil, e g,

linseed, China wood oil Incompletely polymerized isoprene may also be used Cf C A 30, 11561

Coloring aluminum oxide surfaces Aluminum Colors Inc Ger. 620,793, Oct. 26, 1935 (Cl 494, 4 02) The surfaces are treated at 40° with salts of weak metal bases with a pH value of 4-5-7 measured at 25°. Insol compds are formed by hydrolysis to give a colored effect Cf C A 30, 754

Spark plug materials Armen A Kasarjian U S 2,029,570, Feb 4 A mixt of finely divided conductive and non-conductive materials such as "duraluminum" and mica which are of about the same sp. gr. is used in a pocket of a spark plug so that the mixt is included in the ignition circuit and serves to improve the efficiency and life of the plug

Metallic packing Sidney L Palmer (to American Smelting and Refining Co.) U S 2,029,240, Jan. 21 A soft metal such as Pb, Sb or Pb-Sb alloy in admixt with other packing material such as graphite and oil is extruded through a die under sufficient pressure to weld the metallic components of the mixt adjacent the die walls into a form retaining skin on the surface of the material being extruded

Fingerprints Justin J McCarthy. U S 2,028,619, Jan 21 A powdered mixt. of gum acacia with a larger proportion of hydroquinone (the proportions suitably being about 1 and 8 parts, resp) is placed on a fingerprint, a scuzzed sheet which has been wet with an aq soln of NaOH and Na_2SO_4 is placed on the powdered fingerprint, and the sheet is removed and treated with an acid fixing bath

Sanitary-pipe making machine feeders and pug mills for molding plastic substances Alfred Farmer and Bertram A Farmer Brit 435,210, Sept. 17, 1935

Puncture sealing compositions Henri Bertrand Brit 435,967, Oct. 2, 1935 These comprise mixts of starch and borax, or starch, sugar and H_2O , together with mica particles and rubber and cork in pulverulent form.

Cork compositions Bond Manufacturing Corp. Brit. 436,452, Oct. 10, 1935 See Fr 771,759 (C A 29, 15414)

Decolorizing substances John J Naugle Can 354,360, Nov 26, 1935 Residues obtained by carbonizing and leaching the cooking liquors from the alkali wood-pulp process are washed, dried and heated to produce a carbonaceous material consisting of approx 97-100% of pure C, and not more than 2-4% of ash

Catalytic filters for the exhaust gases of an internal combustion engine Degea A-G (Auergesellschaft) Brit 435,050, Sept. 25, 1935, and 436,331, Oct. 9, 1935

Protection of metal or wood surfaces Frank L. McLaughlin (to International Latex Processes, Ltd.) Can 354,285, Nov. 19, 1935 A thin coating of nontacky rubber from an aq dispersion of rubber is deposited on the surface and this is covered with paper

Use of balsam wood for ink pads for rubber stamps Leland A. Phillips U S 2,028,842, Jan 28. Balsam wood cut across the grain is used

Ink remover Peter A Geller Can 354,185, Nov. 19, 1935 A mixt of toluene 65, anisole 31, aniline 15, sassafras oil 5 part is specified

Inking ribbon Louis C Antrim (to Autographic Register Co.) Can 354,228, Nov. 19, 1935 An inking ribbon is made of woven textile fabric impregnated with an ink soln On each side of the ribbon is an Al powder coating that retards the transfer of the ink soln to the worksheet

Treating bristles W Kedzie Teller (to Western Bottle Manufacturing Co.) Can 354,575, Dec 3, 1935 Bristles for brushes, such as tooth brushes, are made more water-repellant by soaking them in a soln contg 1-3% by wt of an Al salt, such as Al acetate, then placing them in a 4% soln of any suitable soap, such as castile soap, draining and drying Cf C A 29, 59574

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

A review of waterworks and sewerage activities A. E. Berry. *Eng. Contract Record* 49, 1102-4(1935)—Projected works in Ontario are outlined R. E. T.

What are the trends in the treatment of water and sewage? Norman J. Howard *Eng. Contract Record* 49, 1105-7(1935)—A review R. E. Thompson

Pioneering in the waterworks field Morgan D. Hayes *J. Am. Water Works Assoc.* 28, 22-9(1936)—Among the earlier practices described is the method used for applying I through the Rochester, Minn., water supply D. K. French

Mechanical control in waterworks operation A. H. R. Thomas *J. Am. Water Works Assoc.* 28, 6-21(1936)—Devices are described for the control of pressure, effluent and wash water, also automatic controls for the feeding of chemicals and introduction of chlorine C. F. C. A. 29, 5937 D. K. French

The development of the Premerton, Washington, water system Cliff C. Casad *J. Am. Water Works Assoc.* 28, 97-105(1936)—Surface water from 2 creeks is used All water is chlorinated, and when necessary ammonia is added D. K. French

Providence water treatment Elwood L. Bean *J. New Engl. Water Works Assoc.* 49, 406-18(1935); *Water Works Eng.* 89, 79-83(1936)—The treatment has consisted of the addn. of copperas, aeration, lime treatment, mixing, coagulation and sedimentation, filtration and secondary aeration, the copperas was later chlorinated and finally replaced by $\text{Fe}_2(\text{SO}_4)_3$, at last commercially available. The pH is raised by $\text{Ca}(\text{OH})_2$ to about 9.6 to reduce corrosion Specifications for Ferrisul and hydrated lime are given D. K. French

Domestic water supplies of Idaho W. V. Leonard *J. Am. Water Works Assoc.* 28, 106-7(1936)—Hardness averages from 50 p. p. m. in the northern lakes to 250 p. p. m. in Snake River. Certain deep wells carry F. D. K. French

Ground-water problems south of Budapest E. R. Schmidt. *Banyász. Kohász. Lapok* 68, 369-76(1935)—Several factories in the southern environment of Budapest tried to find usable soil waters instead of the expensive drinking water of the waterworks. Test borings showed that water originating from the Pleistocene gravel was very hard (54° German hardness), that of Mediterranean layers contained 12 g. NaCl per l. and Oligocene layers had no water at all. A thermal water contg. much Ca and S probably can be found at a depth of 1000 meters. Conditions were much the same on the other bank of the Danube. The factories are now trying to use purified Danube water. S. S. de Findly

French Indo-China supply secured through American methods H. O. Beauchemin *Water Works Eng.* 89, 67-71(1935)—Twenty-four wells furnishing more than 30 m. g. d. are used as a source of supply. The lime and alum treatment is used, followed by treatment with Ca hypochlorite for sterilization purposes. The Fe content, which is often as high as 80 p. p. m., is reduced to less than 0.3 p. p. m. by the use of pressure Fe-removal units W. A. Moore

Sulfur bacteria in the "pink" waters of the Surukhani oil fields and their significance in the geochemistry of water. V. T. Malushevsk and A. A. Malanov. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1321-4(1935)—Waters from wells 1300-1700 m. deep were found to contain both purple and thio acid bacteria in addn. to *Microspira desulfuricans*. This points to the possibility of a process of oxidation of sulfide ion to sulfate, opposite to the predominating process of sulfate reduction. These waters are unusually high in sulfates M. F.

The mineral waters of Harrogate A. Woodmansey *Analyst* 61, 23-6(1936)—Artificial solns. do not have the same therapeutic value as natural waters of the same compo. The Harrogate waters are best explained by the magmatic theory of Suess. Some of them contain con-

siderable sulfide and others considerable Fe. The compo. is discussed but no analytical data are given. W. T. H.

Physicochemical analysis of the Mondovì Luriso mineral waters Presence of lithium in besimaudite, a quartziferous, porphyritic rock in the same locality. Luigi Francesconi and Renato Bruna. *Ann. chim. applicata* 25, 460-9(1935)—Analyses of the Mondovì waters in Luriso show the presence of 0.01-0.048 mg. Li_2O per l. The waters are also radioactive. The Li is derived from the quartzitic besimaudite, which contains an av. of 0.05 mg. $\text{Li}_2\text{O/g}$ of the mineral. A. W. C.

Difference in the behavior of water of total and of permanent hardness in the presence of soap Ed. Justin Mueller *J. pharm. chim.* 22, 563-5(1935).—Calcereous water of permanent hardness gives with small quantities of soap a perfect dispersoid or emulsoid system, provided no disturbing electrolyte is present. Water of total hardness, under the same conditions, is flocculated. S. W.

The residual hardness and the excess of chemicals in the soda-lime softening process (for water). Nils Westberg. *Tek. Tid. Uppf. C, Kemt.* 65, 89-92(1935)—Methods of calcg. the amts. of Na_2CO_3 and $\text{Ca}(\text{OH})_2$ to be introduced into hard waters to effect a max. removal of HCO_3^- , CO_3 , Mg and Ca are outlined. These are based on analytical results as well as influential factors, such as the ion concns., temp. and the reaction eqn. D. Thuesen

Prechlorination with ammonia in a turbid water supply Geo. F. Gilmison. *Water Works Eng.* 89, 102(1936).—The addn. of $(\text{NH}_4)_2\text{SO}_4$ in conjunction with $\text{Al}_2(\text{SO}_4)_3$ to the water as it entered the mixing tank, followed by the addn. of Cl as the water passed the coagulating basin, greatly reduced the bacterial count of the water entering the filters. This treatment was also effective in combating algal growth in the basin. Equal parts of Cl and $(\text{NH}_4)_2\text{SO}_4$ were used W. A. Moore

Preparation and conditioning of aluminum sulfate solution before applying to water. Carl Leopold *J. Am. Water Works Assoc.* 28, 74-96(1936).—It is demonstrated that agitation in dissolving is more important than soln. strength in floc formation with an alum soln. High-speed mech. agitation in a cylindrical-shaped dissolving tank is recommended D. K. French

Primary treatment plant includes magnetite filter. Water S. Bemis. *Eng. News-Record* 115, 852-5(1935).—The treatment plant constructed at Goshen, Ind., as the initial step in remedying the pollution of the watershed of the Elkhart and St. Joseph Rivers consists of a comminutor, mech. grit remover, settling tank provided with a magnetite filter and rotary sludge scraper, sludge digestion tank and open sludge beds. Complete treatment can be provided with a min. of new construction. The filter consists of a trough around the perimeter of the tank contg. 3 in. of magnetite sand supported on a phosphor-bronze screen, which in turn is supported on a steel grating. The settled liquor flows upward through the filter at an av. rate of 2.1 gallons per sq. ft. per min. Cleaning is automatically effected by a mechanism mounted on a car which travels on rails over the filter, operation of which is controlled by the head of liquid in the tank. It is expected that the filter will increase the removal of suspended solids approx. 25%. The av. detention period in the tank will be 1.5 hrs. The digestion tank has a capacity of 2 cu. ft. per capita, and the drying beds an area of 1.2 sq. ft. per capita. The sludge gas will be utilized for heating the digestion tank and buildings. The cost of the treatment plant and main pumping station, which have capacities of about 7 million gallons per day, was \$105,000 R. E. Thompson

Treatment of water for domestic purposes in a Trinidad oil field A. H. Richard. *J. Inst. Petroleum Tech.* 21, 871-86(1935).—For a domestic H_2O supply in isolated oil camps coagulation is important. Alum is preferable as a coagulating agent to FeSO_4 , and basic alum is still

better. The dose need not be detd. by chem. analysis. The "jar test," consisting in adding varying amts. of chemical to samples of the H_2O in glass jars, will give the desired information. Designs are shown for a chem dosing chamber and a circular coagulation basin. E. E. C.

Use of activated carbon in the purification of water in the tropics (Madras city water supply). T. N. S. Raghavacari and P. V. Seetharama Iyer. *Proc. Indian Acad. Sci.* 2B, 237-53 (1935).—Small-scale expts over a 2-yr. period using (a) powder and (b) granular activated C in conjunction with slow sand filtration gave the following results: (1) Both powder and granular activated C are effective in removing tastes, odors and colors; greater reduction in colloidal org. matter results with the granular form. (2) Better overall effluents result when $1\frac{1}{2}$ in. of granulated C is sandwiched in a slow sand filter than with sand filtration alone. (3) The C is particularly effective in reducing H_2S production in the sandwiched filter even at filtration rates as low as 4 in. v. p. h. (vertical per hr.) where slow sand filtration is conducive to H_2S production. (4) H_2S production falls off with increased filtration rates, and in a sandwiched filter operating at 8-12 in. v. p. h. no H_2S could be detd. (5) Best overall results are obtained by passing the effluent from the ordinary slow sand filters through an 18-in. bed of granulated C with 36 min. contact time, final effluents are colorless, odorless and tasteless, and show approx. 75% reduction in org. matter. (6) Granular activated C used continuously for 23 months showed no deterioration in sorbing ability. G. H. Young.

The present status of water sterilization by means of the catadyn process. A. Salmony-Karsten. *Gesundh.-Ing.* 58, 736-9 (1935).—Various types of equipment used for both the contact and electrocatadyn processes are described, including a pocket electrocatadyn device for sterilizing a few cc. to 1 l. in 1 min. M. G. Moore.

Municipal water-filtration plants in Canada. A. E. Berry. *Can. Eng.* 69, No. 20, 8-9 (1935).—A list of municipal water-purification plants in various provinces of Canada gives the location, type of filter, date installed, population served and source of water supply.

Ann. Nicholson Hird.
The water-filtration plant of Hamilton, Ontario. W. L. McFaul. *J. Am. Water Works Assoc.* 28, 57-64 (1936), cf. C. A. 30, 1475.—Alum is dissolved in flash-mixing units and mixed with the raw water. The mixing chambers are equipped with flocculators. After a 30-min. detention period the water goes to settling basins and then to the filters. Chlorine is finally added. D. K. French.

Recent taste and odor tests of paints for water tanks. Geo. L. Hall. *Eng. News-Record* 115, 639 (1935).—Brief data are given regarding addnl. tests (cf. C. A. 25, 3418) of paints made by the Maryland State Dept. of Health. The procedure employed consisted of allowing distd., tap and chlorinated water contg. 0.2 to 2.0 p. p. m. residual Cl to remain in metal vessels coated with the various paints for 15 min. and then testing the waters for taste and odor in the hot and cold. Nine paints were found satisfactory. The one paint found satisfactory in the previous tests and one found suitable in this series have been successfully used in practice. R. E. T.

Recent progress in supplying less corrosive water (soft water). Malcolm Purdie. *J. New Eng. Water Works Assoc.* 49, 419-27 (1935).—The greatest stability and absence of corrosive properties is brought about when the pu value is over 9.6, Fe less than 0.05 p. p. m., Mn absent and Al less than 0.03 p. p. m. Temp. should be low and a residual Cl of 0.02 p. p. m. should exist to inhibit bacterial activity in the mains. D. K. French.

Materials available for water pipes. R. Schmel. *Gas u. Wasserfach* 78, 971-4 (1935).—Better asphalt coatings can be secured on cast-iron pipes by preheating the pipe before dipping. Steel pipe larger than 2 in. can be coated centrifugally with a hot mixt. of petroleum asphalt with a filler such as rock dust and a softener such as paraffin wax. Pipes from 1 in. to 2 in. can be coated by rotating the pipes and using an asphalt mixt. contg. softener but no filler, but smaller pipes cannot be coated (inter-

nally) with any satisfaction, as dipping gives very uneven coatings. External coatings should be protected with heavy paper or jute wrappings. All cut pipe surfaces must be dipped in hot bitumen or otherwise protected. R. W. Ryan.

Aluminate treating for field boilers. Eugene Vige. *Petroleum World* 32, No. 8, 46, 49, 51-2 (1935), cf. C. A. 29, 7537.—A description of types of H_2O and their distinguishing tests is given. Methods of internal and external treatment are considered from a cost and operation viewpoint. Chas. Wirth, III.

Cause and prevention of turbine-blade deposits. Frederick G. Straub. *Trans. Am. Soc. Mech. Engrs.* 57, 447-54 (1935); *Combustion* 7, No. 6, 23-7 (1935).—Lab. and plant-scale expts show that turbine-blade deposits result from contamination of the steam by boiler H_2O . Lab. studies indicate that NaOH is responsible for scale adhesion; when it is converted to Na_2CO_3 , scale does not adhere, the presence of sufficient amts. of neutral salts, such as Na_2SO_4 , also prevents scale adhesion. Deposition of water-sol. salts carried into the turbine by mech. entrainment is thus a major problem. For lab. expts. condensed steam from a steam heating system was passed through a deaerating heater and then pumped to an electrically heated boiler to generate steam; the steam was passed through a chamber contg. the test solns. of various dissolved salts, bubbling up through the solns. and entering an electrically heated preheater; it then passed through a suitable orifice and impinged on a single immovable turbine blade, and then through a copper-cool condenser to the condensate storage bottle. Steam pressure and superheater temps. were maintained const. by potentiometric regulators. Tests were run at 40 and 45 lb. per sq. in. abs. and 400-700°F., with a pressure of 0.8 lb. in the blade chamber. The orifice was $\frac{1}{16}$ in. in diam. and the blade was set at a 30° angle to the line of steam flow. Conclusions: (1) The amt. of deposit is not proportional to the carry-over from the boiler, but depends upon the relationship of the various salts dissolved in the boiler H_2O , (2) salts which form a dry powder in superheated steam will not adhere to turbine blades, and the application of such salts (sulfates, chlorides and carbonates) to boiler feed water will reduce deposits by coating the particles of NaOH and allowing them to be carried on through the turbine, (3) concns. of 4-5 times the concn. of NaOH are required for effective scale prevention if Na_2SO_4 is used as the added salt. Cost of treatment is less than \$500 per yr., based on expts. in a large central power plant. G. H. Young.

Sewage collection, treatment and disposal. J. Clark Keith. *Eng. Contract Record* 49, 979-80 (1935).

R. E. Thompson.
Sewage disposal and the supply of domestic raw materials. V. Methane from sewage-disposal plants as a motor fuel. Adolf Heilmann. *Gesundh.-Ing.* 58, 764-0, 784-8 (1935), cf. C. A. 29, 5367.—General discussion. A table gives the type of disposal system and quantity of CH_4 produced for 74 German cities. M. G. Moore.

Varied methods of public cleansing reviewed at International Congress. Harrison P. Eddy, Jr. *Eng. News-Record* 115, 507-10 (1935).—The proceedings of the 2nd International Congress for Public Cleansing, held in Frankfurt am Main, Germany, are reviewed.

R. E. Thompson.
Laboratory tests and equipment for sewage works. Ralph E. Lührman. *Am. City* 51, No. 1, 17 (1936), cf. C. A. 30, 551.—Routine sewage tests are described and discussed. G. H. Young.

Factors in the design of sewage-disposal works. H. C. Whitehead and F. R. O'Shaughnessy. *Surveyor* 88, 403-7, 423-9 (1935), cf. C. A. 28, 2085.—Twelve diagrams are given showing B. O. D. as a function of the type of sewage treated. A. L. Elder.

Research with sewage filters at the Wupper Valley Buchenhofen clarification plant. Mahr and Lerner. *Gesundh.-Ing.* 59, 8-11 (1936), cf. C. A. 29, 2263.—Since during some seasons a diln. of only 1:4 is available in the receiving stream, and as the changing character of

defined as the p p m. of Cl_2 as chlorine water (10 g. of Cl_2 per l.) required to be added to 250 cc. of sewage so as to produce less than 0.1 p p m. of Cl_2 . The Cl_2 demand of raw sewage ranges from 5 to 40 p p m. Excellent control of *Psychoda* flies has been obtained by the use of Cl_2 . The use of 0.5-1% has been used to prevent ponding. A. L. Elder

Chlorination as applied to sewage treatment. L. H. Enslow. *Eng. Contract Record* 49, 931-2 (1935).—The use of Cl_2 and "chlorinated Fe ," prep'd by dissolving scrap Fe in Cl_2 water, is discussed. R. T. Thompson

Chemical precipitation at Glasgow. Alexander Hunter. *Surveyor* 88, 353-4 (1935).—Lime and Al sulfate are used as coagulants at Dalmarnock works. Forty % of the chemically treated effluent is filtered. Nearly one million tons of the crude sludge ext'd was sent to sea. A. L. E.

The revival and present status of chemical precipitation. M. N. Baker. *Eng. News-Record* 115, 748-50 (1935).—Because of the lower cost of precipitants and the development of mech. devices, there has been a revival of chem. pptn. as a method of sewage treatment since 1924, at which time the process had been largely abandoned. Thirty-four of the 3500 municipalities treating their sewage employ this method, 11 plants are under construction, and 25 have been more or less definitely projected. Tabulations are given showing the distribution of chem. pptn. plants by states and the chemicals employed. A striking feature is the general use of Fe compds. as precipitants and the subordinate role of lime. FeCl_3 , prep'd in most cases from Cl_2 and scrap Fe , is the most commonly employed chemical. R. E. Thompson

The permanganate number in the evaluation of pulp-mill waste water. H. Haupt-Bautzen. *Zellstoff u. Papier* 15, 436-8 (1935).—The org. impurities of industrial sewage water cannot be est'd by the permanganate no. alone, since impurities of different chem. character and constitution require varying amts. of permanganate. The permanganate requirements for 1 g. of the following substances are: phenol 9660, dextrin 840, albumin 644, HOAc 5, sulfite waste liquor residue 2300-3000 and boric acids 3200 mg. Natural purification, due to bacterial cleavage and decomposition processes, goes on fairly rapidly for ordinary domestic sewage, while about 70% of the org. materials in pulp-mill sewage is not affected in this way. The biochem. O demand of domestic sewage water decreases rapidly under these conditions, but that of the pulp-mill waste water, very small to start with, is hardly affected. Ordinary sewage waters and pulp-mill waste waters of equal permanganate no. have very different biochem. O demands and O economies. The permanganate no. is not a satisfactory measure for the org. impurities in waters which contain slowly decomposing compds. of high mol. wt. S. I. Aronovsky

The dispersion of Anopheles larvae by the flow of streams and the effect of larvicides in preventing this. J. A. Sutton and Syed Abdul Majid. *Records Malaya Survey India* 5, 3-17 (1935).—The drifting of mosquito larvae into controlled areas of streams was greatly diminished by a continuous application of lubricating oil by means of oil-soaked sacks contg. sand or fiber and anchored in the streams above suitable booms. Paris green had a rapid kiling action on larvae in the area dusted but its effect was of comparatively short duration, when it was used in routine fashion every day or so it was relatively ineffective against drifting larvae. K. D. Jacob

Spring water. Gustav Offe. *Ger.* 620,990, Oct. 31, 1935 (Cl. 85b. 1 07). Mineral spring water free from living organisms and contg. CO_2 is freed from Fe by treating it with Cl_2 and filtering through a catalytic filter. Only sufficient Cl_2 to oxidize the Fe is used. The water is passed through a mech. filter after the catalytic filter, with exclusion of air. App. is described.

Water purification. Oliver M. Urban and William R. Stemen (to Charles H. Lewis). U. S. 2,029,966, Feb. 4. For purifying water to remove dyes, etc., a reagent is used such as one prep'd from bituminous coal, lignite, cannel coal, peat or coke by treating it with HNO_3 , HNO_2 , and H_2SO_4 or H_3PO_4 or NO or NO_2 .

Water purification. Oliver M. Urban (to Charles H. Lewis). U. S. 2,029,959, Feb. 4. A reagent of the isocyanate group such as 3,5-dichlorophenyl isothiocyanate is used for eliminating amines and hydroxy compds. from water at a pH of 6.5-7.5. U. S. 2,029,960 relates to a similar use of a reagent of the acidic phenol group such as 2,4,6-trinitrophenol. U. S. 2,029,961 relates to the elimination of carboxylic acids such as propionic acid, etc., from water by use of a reagent of the acidic amine salt group such as Na 3-amino-1-propanesulfonate.

Purifying potable and polluted waters. Oliver M. Urban and William R. Stemen (to Charles H. Lewis). U. S. 2,029,962, Feb. 4. Chlorinated coal is used as a water-purifying agent and serves to remove phenols and cresols and their chloro derivs. U. S. 2,029,963 relates to the similar use of hydroxylated chlorinated coal such as that prep'd by various described methods. U. S. 2,029,964 relates to a like use of "etherated chlorinated coal" such as that prep'd by reaction of an alc. with chlorinated coal.

Water filter. S. V. Moussev. Russ. 38,051, July 31, 1934. Construction details.

Clarifying water. Marius P. Otto. Fr. 789,102, Oct. 23, 1935. The mixt. of water to be treated and the coagulating agent, e. g., $\text{Al}_2(\text{SO}_4)_3$, are divided into very fine streams, this assures the intimate mixt. of the 2 elements and allows the max. amt. of impurities to be eliminated during the decantation, the yield of the filter is thus increased. Fr. 789,103. The nozzles by which compressed air is blown through the filtering mass are disposed in the mass itself at a suitable depth, this assures regularity of distribution of the air through the upper part of the filter.

ing material. Fr. 789,104. The mixt. of water and coagulating agent are caused to pass in a broken up and down path through the decantation vessel; this favors deposition.

Zeolite water-softening apparatus Harry M Marsh Brit. 435,589, Sept. 24, 1935 Means responsive to changes in the wt. of a const. vol. of the used brine passing through a counterbalanced bucket and normally flowing to waste during regeneration of the zeolite is used to divert part of the used brine to a tank where it is retained for use in a subsequent regeneration.

Softening water A E Ruikovsky and N P Nase-lenko Russ 38,048, July 31, 1934 Glaucopite for use in water softening is stabilized and made suitable for a base-exchange material by first heating under ordinary or increased pressure in the presence or absence of air to 400-600°

Closure-members for base-exchange water softeners or filters Catherine Jenkins Brit 435,425, Sept. 20, 1935

Apparatus for neutralizing acidic waters N P Sokolov Russ 38,052, July 31, 1934 Construction details are given of an app. in which CaO is used for neutralization

Sewage-treating apparatus James Hopwood and Adams-Hydraulics Ltd Brit 435,862, Sept. 23, 1935 To promote coagulation and flocculation in sewage and like waste liquid, it is treated in a tank provided with 1 or more paddles supported by arms to which an oscillatory or pendulum motion is imparted

Spraying sewage sludge and burning it in suspension Max H Kuhner (to Riley Stoker Corp.) U S 2,029,725, Feb. 4 App and various operative details are described

Simultaneous biological purification of waste waters and their sludges R A Henry Belg 408,348, April 30, 1935 The waste waters are treated with a suspension of clay in an aq. soln. of lime, and ultimately with other inert

materials, before they are sent to the decantation tanks. The sludges are subsequently conveyed to a heated surface and treated with steam. Cf. C. A. 30, 1164⁴.

Treating putrifiable organic wastes George H. Earp-Thomas. Brit 435,380, Sept. 16, 1935 See U. S. 1,938,647 (C. A. 28, 1459⁹).

Treating foul waters Ernst Nolte, Hans J. Meyer and Erich Fromke. Brit. 435,363, Sept. 19, 1935. A small quantity of sol. phosphate or other sol. P compd. is added to industrial waste water, e. g., that contg. POH or from sugar manuf., to render effective subsequent treatment by the activated-sludge or other biol. process

Treating fat-containing waste waters A de Vreese. Belg 407,624, April 30, 1935. The waste waters are treated with a Ca salt (preferably CaCl₂ or CaSO₄) together with sufficient lime to ensure the presence throughout the treatment of an excess of Ca salt and an excess of oxidizing Ca(OH)₂. Cf. C. A. 29, 3440⁹.

Oxidizing putrescible organic matter in water. Oliver M Urban (to Charles H Lewis) U S 2,029,958, Feb. 4. Diffused air is passed through water contg. org. matter to be oxidized such as that in sewage or industrial wastes in the presence of a lower salt or oxide of Cr, Mn, Os, Sn, V, Sb, Bi, Mo or Se serving as a catalyst, until at least a substantial portion of the catalyst has been oxidized through 2 units of valence

Treating industrial wastes such as those from distilleries, breweries, starch works, canneries, etc. Arthur M Buswell and Clair S. Boruff U S 2,029,702, Feb. 4. In an anaerobic bacterial digestion of fermentable liquid org. wastes having a non-settleable solid content substantially in excess of 0.3% by the action of CH₄-producing bacteria at a suitable *pH*, the total free and combined volatile org. acid content of the liquid undergoing treatment is maintained below 0.3%, calcd. as HOAc, a high rate of gas production being thus effected. Examples with details of procedure are given.

Soil porosity as an index of structure. L. D. Bayer, C. M. Woodruff and J. F. Lutz. Mo. Agr. Expt. Sta., Bull. 340 (Ann. Rept. 1933) 75 (1934).—Soil structure is considered as the arrangement of primary and secondary particles constituting the soil mass. Aggregation, permeability and porosity are the only indices of structure. The pore-space content of soils is made up of small capillary pores and large noncapillary pores. The former are responsible for the water-holding capacity of the soil, the latter for the air capacity. Normally, permeability is dependent on the content of noncapillary pores. Chernozem soils have a relatively low noncapillary porosity. The low hydration of the numerous small pores of a laterite is probably responsible for its permeability to water.

C. R. Fellers

Physical and chemical properties of the Iredell and Davidson soils affecting erosion. L. D. Bayer, C. M. Woodruff and J. F. Lutz. Mo. Agr. Expt. Sta., Bull. 340 (Ann. Rept. 1933), 75 (1934).—A soil in good phys. condition has aggregates larger than 0.1 mm. in diam. and is rather porous. The Davidson soil had a larger and

much more porous type of aggregate, factors which contribute to its non-erosive properties. C. R. Fellers

Effects of different soil treatments, long continued, upon bacterial activity in the soil. W. A. Albrecht. Mo. Agr. Expt. Sta., Bull. 340 (Ann. Rept. 1933), 76-7 (1934).—On fertilized soil CaCO₃ did not affect nitrate formation, but on soils which had not been fertilized the addn. of lime greatly increased nitrate formation from green manures

C. R. Fellers

The influence of artificial and natural factors upon soil structure. J. Apsits. Z. Pflanzenernähr., Dungung Bodenkd. 42, 1-35 (1936).—Capillary porosity is a natural property dependent upon phys. and chem. characteristics of the individual soil, and little affected by variations in cultural practice. Noncapillary porosity is more affected by the latter, and is increased to the greatest extent by plowing. The extent to which these larger voids supply O₂ to roots may be a critical factor in crop growth. Twenty-six references

"Single value" soil properties. A study of the significance of certain soil constants. VIII. Relationships between the sticky point and the nature of the exchangeable ions in the soil. J. R. H. Coutts. J. Agr. Sci. 25, 523-8 (1935); cf. C. A. 23, 5261¹.—The variations in the sticky point of homionic soils, as detd. by kneading with electrolytic solns., were examd. With Na solns., a well-marked max. was found in the sticky point-electrolytic concn. curve, and the form shows parallelism with the extent of flocculation produced by varying electrolytic concns. of NaCl, Na₂CO₃, NaHCO₃, and CaCl₂ solns.

Irvin C. Feustel

Technical studies of the physical and physicochemical properties and processes in soils. D. S. Jennings, Willard Gardner and O. W. Israelsen Utah Agr. Expt. Sta., Bull. 250, 60 (1934); cf. C. A. 28, 7394⁹.—The minute

quantities of Cl retained by the soil colloids are measured by means of a Ag-AgCl electrode. Ca enters the soil 10-15 times as readily as does Na; hence a Ca salt even in the presence of large quantities of a Na salt will remove replaceable Na from the soil. K also enters the soil 4 or 5 times faster than Na. Ca enters the soil 1.5 to 2 times as readily as K. If the exchange complex is high in Ca, the soil is in much better phys. condition than if the exchange complex is mainly Na. Friability is greater for Ca colloids than for Na colloids. C. R. Fellers

An examination of methods for determining organic carbon and nitrogen in soils. Allan Walkley. *J. Agr. Sci.* 25, 508-509 (1935).—The details of the Dumas direct combustion method for detg. C in soils are described and some simplifications suggested. The Bangor Kjeldahl method for C and N requires carefully standardized heating. Errors may arise from contamination of sandy soils by material abraded during grinding in iron or porcelain mills. For heavy alk. soils with little org. matter it is advisable to grind the soil very fine and to add water. The rapid dichromate titration method of Walkley and Black (cf. *C. A.* 28, 2823) for soil C gave satisfactory approx. results. The technic was improved and methods were devised for overcoming disturbances due to chlorides including addn. of Ag_2SO_4 . The hypobromite method gave much more irregular results for C than the Bangor or dichromate methods. The latter was only slightly inferior to the Bangor method. I. C. Feustel

Measurements of acidification or alkalinization of soil suspensions with the glass electrode. E. Pfeil. *Angew. Chem.* 49, 57-9 (1936).—The measurements were carried out with the glass electrode before and after addn. of quinhidrone, and comparative measurements were made with the quinhidrone electrode. Exptl. data are reported on 27 suspensions. The measurements with the glass electrode showed considerably greater constancy with time (up to 60 min.) than those made with the quinhidrone electrode. Seven references. K. K.

An improved method for the determination of the soil reaction. W. Moore. *J. Board Greenkeeping Research* 4, 134-8 (1935).—Beginning from the bottom of the tube, graduate a test tube of the bacteriol. type, 6 in. long and $\frac{1}{8}$ in. bore, as follows: $\frac{1}{8}$ in. (I), $\frac{1}{8}$ in. (II), 0.5 in. (III), 0.5 in. (IV), 2.5 in. (V) and 0.5 in. (VI). Other tubes of convenient size can be used, but all tubes in a set must be of approx. the same size. For sandy soils, loamy soils and heavy soils fill the tube with BaSO_4 to mark I, II and III, resp.; add soil to mark IV, dist. H_2O to mark V and indicator soln. (bromocresol green, bromocresol purple or phenol red) to mark VI. Close the tube with a rubber stopper and shake until the contents are thoroughly mixed. Allow the tube to stand until the liquid clears, which should not take more than 1-2 min., and est. the pH from the color of the supernatant liquid. No difficulty should be experienced in reading to 0.5 pH by visual observation of the color or to 0.2 pH by comparison with color standards. For the purpose of this test, most cultivated soils can be regarded as loamy soils and most lawns as sandy soils. The amt. of BaSO_4 should be increased with very heavy clay soils and soils with pH values over 8.0. K. D. Jacob

Solubilization of organic phosphorus. II. J. Alvarino and A. Bonazzi. *Proc. Assoc. Tec. Azucareros Cuba* 8, 115-18 (1934); cf. *C. A.* 29, 2233.—Fresh stable manure was mixed with ground bone (I) and left to ferment 8 months along with similar manure without bone (II). Analysis of II before and after fermentation showed 0.423 and 0.726% of P_2O_5 , resp. sol. in 0.2% HCl, and 0.621 and 0.814% P_2O_5 sol. in NH_4 citrate, the corresponding figures for I are 3.587 and 4.834 sol. in 0.2% HCl and 1.882 and 1.817% sol. in NH_4 citrate. It is evident that composting bone meal with manure does not increase the H_2O -sol. or citrate-sol. P_2O_5 , whereas it does increase that sol. in dil. HCl. O. W. Willcox

Arsenic solubility in soils. W. B. Albert. *S. Car. Agr. Expt. Sta., 47th Ann. Rept.* 45-C (1934). cf. *C. A.* 28, 7395.—The use of heavy applications of Ca arsenate for boll-weevil control on cotton increased the As content of

some sandy soils sufficiently to cause As toxicity to crops. In the presence of Fe compds. in the soil, the As became insol. The use of P fertilizers increased the soly. of As in the soil. Two hundred lb. of superphosphate produced the same amt. of sol. As in the soil as 30,000 lb. of $\text{Ca}(\text{PO}_3)_2$. When 30,000 lb. of ferric arsenate-pptd. $\text{Fe}(\text{OH})_3$ mixt. (1:2) was added to soil, the sol. As content of the soil was 0.8 p. p. m. NaNO_3 , and KCl did not increase the soly. of As in the soil. C. R. Fellers

The present condition of a previously limed soil. R. H. Ganssen. *Fortschr. 11*, 365-71 (1935).—Distinct differences were found after 20-30 years on limed sandy soil plots as compared with unlimed soil. Humus showed a greater lasting effect with respect to CaO content and pH than did the underlying mineral soil. Trees on plots that had been limed and deeply plowed made a greater growth than under either unlimed or limed conditions without plowing. I. C. Feustel

Relation of lime application to availability of potash in soil. H. P. Cooper. *S. Car. Agr. Expt. Sta., 47th Ann. Rept.* 29 (1934), cf. *C. A.* 28, 7402.—Heavy applications of lime reduced the availability of the soil K. Following alfalfa, K deficiency was often observed in the cotton crop. Where the rate of application of limestone ranges from 1500 to 3000 lb. per acre there is little danger of having serious K deficiency in S. Carolina on better soil types. C. R. Fellers

Studies on the heavy limestone soils of Cuba. A. Bonazzi. *Proc. Assoc. Tec. Azucareros Cuba* 8, 47-75 (1934).—The heavy limestone soils studied are characterized by extreme impenetrability to H_2O and gases and excessive retention of H_2O once they have been wet. Residual H_2O at the permanent wilting point for sugar cane in an Oriente soil was found to be 48.7% on the basis of the oven-dry soil. The permanent wilting point and the sticky modulus of these soils coincide. The Fe minerals in these dense clays are often in the ferrous condition, an index of pronounced deaeration. O. W. Willcox

Nitrification in acid soils. M. M. Alicante. *Philippine J. Sci.* 58, 163-71 (1935).—Tests on a brown silt loam show that in soil having an acid concn. of over 0.5% the activity of nitrifying bacteria is inhibited. Nitrification in the soil increased as the acidity of the soil decreased until at an acidity of 0.009, 90.70% of the added N was converted into nitrate. During nitrification the soil acidity decreased. Tests in nutrient soln. show that nitrate production is not obtained in all cultures having an acid reaction, while a very slight degree of nitrification was observed in cultures of neutral reaction. Normal nitrate production occurred in these last when CaCO_3 was added. A certain degree of nitrification can take place in an acid soil when both acid and carbonate radicals are present. The degree of nitrification depends on the amt. of carbonates present. J. R. Adams

The sulfur in seaweed, sea mud and rain waters in Brittany. Vincent, Sarazin and Hervieux. *Compt. rend. acad. agr. France* 21, 1032-4 (1935), cf. *C. A.* 29, 6689.—Along the coast, the rains, which have been enriched in sulfates and chlorides from the sea by wind-blown spray, may add sufficient S for crop requirements. Both marine plants and mud contain large quantities of S and can be used advantageously as fertilizer. The use of the mud should be preceded by sufficient liming in order to increase the speed of oxidation. J. R. Adams

The alkaline soil problem in China. Yih Hsiung. *Chemistry (China)* 2, 763-78 (1935).—A general survey of the distribution and qualities of alk. soils (or more accurately, soils rich in inorg. salts) in China, together with soil analyses and their suitability for the growth of agricultural products, is given. C. L. Tseng

Some chemical and biological changes produced in a For sandy loam by certain soil-management practices. L. S. Carter. *Soil Sci.* 40, 223-36 (1935).—Soils from 8 plots of For sandy loam were used for study. The soil was strongly acid and all plots were treated with CaCO_3 before the beginning of field expts. Limestone plus complete fertilizer and lime plus phosphate and potash were the most effective in increasing the content of volatile

matter and N of the soil. Other fertilizer treatments decreased the N content. All treatments increased the pH value and the availability of P. All soil treatments increased crop yield and all increased the nos. of bacteria and fungi. The rate of nitrification of urea, several NH_4 salts and cottonseed meal by one of the soils was studied. The rate varied widely for the different N compounds but in general the soils having a high content of available P had a high nitrifying power and gave increased crop yields. Production of CO_2 from cellulose by the various untreated soils was decreased by the addn. of CaCl_2 or KCl but was increased by Na_2HPO_4 or NaNO_3 . With fertilized soils the order was, in some cases, reversed. Yields of sweet clover, rye and soybeans grown in jars of the different soils in the greenhouse correlated well with crop yields under field conditions. When the crop material grown on each jar was ground and an aliquot returned to a portion of the soil from the jar, CO_2 production correlated in general with crop yield.

Soil fertility in the Sudan Gezira N W Barritt *Empire Cotton Growing Rev.* 12, 111-16(1935) —A review of investigations relating to aeration, respiration and nitrate formation in Gezira cotton soils. K D J

Preliminary investigations on the phosphoric acid supply in the soils of the Bahim permanent experiments Ahmed Mahmoud *Roy Agr. Soc. (Cairo) Bull.* No 20, Chem Sect. 47 pp (1934)(available in English) —Comparison of the Dyer method (soly in 1% citric acid soln without neutralizing the CaCO_3) with the method of Sigmund (soly in weak HNO_3 after neutralizing CaCO_3) showed that the latter gave much higher results for available P_2O_5 but no significant difference between soils fertilized by phosphate and those not so treated. Available P_2O_5 detd. by Dyer's method in 3 soils receiving no fertilizer since 1912 was 0.018, 0.016 and 0.018%, in 3 receiving nitrate only since 1912, 0.018, 0.016 and 0.020%; in 2 receiving nitrate and phosphate over the same period, 0.031 and 0.027%, and in 3 receiving nitrate, phosphate and potash since 1912, 0.032, 0.032 and 0.030% fm , sol. salts, and exchangeable bases were detd. on these same soils and mech. analyses were made on one receiving no treatment, one receiving NaNO_3 and one receiving nitrate plus phosphate. The amt. of available P_2O_5 sol. in 1% citric acid which denotes phosphate deficiency was 0.02% or less. A soil receiving all 3 fertilizers gave the highest available P_2O_5 when sampled before cotton, while one soil receiving only nitrate and one no treatment gave highest results after harvest. These differences were slight. Dyer's method can be used where the CaCO_3 content is 3-5%, as in most Egyptian soils. Pot tests by the Mitscherlich method were made on various soils each receiving continuously (in the field) the same treatment from 1912 to 1930. Bahim soils, originally rich in phosphate become deficient after several years without phosphate application. These show a rapid recovery after dressing with superphosphate. Soil rich in N behave the same as unfertilized soils in respect to P_2O_5 . Soil low in N recover rapidly on including bersim in the soln and allowing 4 months fallow. Application of these results to farm practice is discussed. Colin W. Whitaker

The function of cellulose and lignin in the preservation of nitrogen in soils and in composts Selman A Waksman and L. J. Hutchings *Trans. 3rd Intern. Congr. Soil Sci., Oxford, 1935* 1, 163-7(1935) —Sand cultures with addns. of cellulose from filter paper, alk. lignin from straw, or ground straw, the usual mineral elements, and N in $(\text{NH}_4)_2\text{HPO}_4$ or casein, and inoculated with fresh soil infusion, were incubated at 25-28° for 6 months. Org. matter and residual cellulose, fn and N (NH_4 , nitrate and total) were detd. Conclusions: The preservation of N in a sand medium depends largely upon the form of N added and the nature of the org. humus-forming substances. The function of carbohydrates in plant residues is to furnish energy for microbial activity in synthesis of cell substance, and transformation of N compounds, to protein. Lignin acts as a buffer for absorption of NH_4 and direct fixation of some protein in resistant humus. Casein favored development of bacteria, $(\text{NH}_4)_2\text{HPO}_4$ favored

filamentous fungi. Less humus was formed and more N lost from the former.

Penetration of fertilizers J R Cooper. *Ark. Agr. Expt. Sta., Bull.* 312, 46(1934) —After 4 months, N from NaNO_3 , $(\text{NH}_4)_2\text{SO}_4$, Ammophoska and Nitrophoska was found in increased amts over check to a depth of 2 ft, the limit of the sampling. K was found in increased amts, to practically the same depth in most cases. P showed very little penetration in any form. Superphosphoska gave only a penetration of 1 in in 4 months; when used with sol. nitrates or lime, the penetration was even less. Ammophoska and Nitrophoska showed a penetration of 2 in in 4 months. On Ruston fine sandy loam at Hope, Ark., there was 1 in greater penetration for superphosphoska with NaNO_3 , and with $(\text{NH}_4)_2\text{SO}_4$ with and without lime, and 1 in less for Nitrophoska, than at Fayetteville.

Micropopulations correlated with decomposition processes Charles Thom *Trans. 3rd Intern. Congr. Soil Sci., Oxford, 1935* 1, 160-3(1935) —Microbial decompos. of plant residues in soil is discussed in the light of recent investigations. C J Schollenberger

Short period fluctuations in bacterial numbers in soil H G Thornton and C B Taylor *Trans. 3rd Intern. Congr. Soil Sci., Oxford, 1935* 1, 175-9(1935) —Studies on Rothamsted soils have revealed no simple relation between bacterial nos and moisture or temp. Even under const. environment and absence of protozoa there are fluctuations which cannot be explained. C J S.

The effect of different media on soil-protozoan counts Annie Dixon *Trans. 3rd Intern. Congr. Soil Sci., Oxford, 1935* 1, 179-80(1935) —Soil-ext. agar is superior to peptone agar as a medium for the study of the soil protozoan fauna. C J Schollenberger

Influence of the absolute reaction of the soil solution upon the growth and activity of Azotobacter P. L. Ganev. *Kan. Agr. Expt. Sta., Rept.* 1932-4, 28-30 (1934), cf. C. A. 28, 2006. —Continued studies show that "spots" in wheat fields produce greater growth of wheat contg. 1 00% more N than wheat from other parts of the fields. These nitrate spots contain few *Azotobacter*; hence the accumulation of N cannot be attributed to these organisms. Artificial "spots" can be reproduced by the addn. to the soil in the spring of urea, CaCN_2 , and other sol. N compds. C R Feller.

Some observations on the Aspergillus niger method. A M Smith *Trans. 3rd Intern. Congr. Soil Sci., Oxford, 1935* 1, 171-3(1935) —Details in technique and interpretation of the biochem. test for soil fertility by *A. niger* (Nakhrs., et al., C. A. 24, 5915), its advantages and disadvantages are discuss. C J Schollenberger

Antagonistic action of soil microbes with special reference to plant hygiene. Iwao Hino. *Trans. 3rd Intern. Congr. Soil Sci., Oxford, 1935* 1, 173-4(1935). —Expts. on antagonism toward plant pathogens by soil microorganisms are reviewed, and practical applications discussed. C J Schollenberger

The decomposition of pentosans by soil and manure microorganisms. Jadwiga Ziemińska. *Trans. 3rd Intern. Congr. Soil Sci., Oxford, 1935* 1, 167-8(1935) —Plant residues contain 10-30% pentosans and other hemicelluloses. Their decompos. is by a specific microflora of bacteria and molds, the process may result in denitrification and loss of N, and therefore be unfavorable to the N balance in soils and manures. C J Schollenberger

Occurrence and activities of fungi in Iowa soils. F. B. Smith. *Ia. Agr. Expt. Sta., Rept. Agr. Research* 1934, 129(1934); cf. C. A. 29, 3000. —*Aspergillus terreus*, *Trichoderma lignorum* and *Penicillium ranuncum* utilized xylan and cellulose but not lignin as sources of C. The presence of lignin in the culture medium decreased the amt. of CO_2 produced by these fungi. *Aspergillus niger* decomposd. xylan readily in a sand culture medium but to a much lesser extent in a culture soln. This organism attacked cellulose in soil cultures. A soil infusion slowly decomposd. lignin in both sand and soln. cultures.

Report on agricultural conditions in the Rupununi C R Feller

district and Pakarama Mountains R R Foltett-Smith and A de K Frampton *Agr J British Guiana* 6, 155-84(1935) —Analyses of the soils and pasture grasses are given K D Jacob

Plant nutrition investigations H H King and A T Perkins *Kan Agr Expt Sta, Rept* 1932-4, 28(1934), cf *C A* 27, 1701 —Large amts of Fe in the soil decidedly reduced the percentage of P in the wheat plant P applications increased the amt of P absorbed by wheat plants on Fe treated soils, but such applications did not increase absorption on untreated soils CaCO_3 appreciably decreased the soil acidity but had no consistent effect on the available P content of either acid or alk soils CaCO_3 applied to the soils decreased the percentage of ash in the plants grown on the acid soils but increased it in plants grown on the basic soils CaCO_3 decreased the percentage of N, K and P in the dry matter of lettuce and lima beans The Ca content of plants grown on basic soil was increased by the addn of superphosphate, this was not true for acid soils C R Tellers

Fertilizer reaction, soil amendments and crop production H B Mann and J J Skinner *Trans 3rd Intern Congr Soil Sci, Oxford, 1935* 1, 196-8(1935) —The trend of fertilizer use is toward materials leaving an acid residue in the soil and contg little Ca or Mg For soils naturally acid and deficient in Ca and Mg, neutralization of potential acidity of the fertilizer by the addn of dolomite is important C J Schollenberger

Humus investigations The formation of humus and the decomposition of organic matter in the soil F B Smith *la Agr Expt Sta, Rept Agr Research* 1934, 132-4 (1934), cf *C A* 29, 1201¹ —Significant differences were found in the concns of CO_2 in the soil air under different crops In some cases plants exert a stimulating effect on soil microbial action as measured by CO_2 formation Legumes produce no more CO_2 than do other crops There was a slight depressing action from blue grass *Aq* exts, 1, 5, were prepd from 9 typical *la* soils and examd for colloidal matter, P, N, K, Ca, Na and other constituents There was a direct correlation between P, N and C in all 9 soils, i. e., when the N was high, C and P were also high and when 1 of the elements was low, the other 2 were also low There was an inverse relationship between SiO_2 and the sesquioxides When the SiO_2 was high, the sesquioxides were low and vice versa The water sol minerals were not present in the soil ext in the same proportions that exist in the soil itself Exchangeable bases were directly related to loss on ignition in Webster clay silty loam The exchangeable bases Na, K and Ca were unrelated to the amts of the same constituents found in the soils or soil exts The C/N ratio followed the same trend as the loss on ignition and the exchange capacity of the same soils The pH values of both soils and soil exts were practically the same The soil colloids, when used in various proportions as bacterial nutrients, stimulated *Azotobacter*, *Rhizobium* and *Radiorhizobium* Conclusion Colloids may play an important role as nutrients and as a habitat for the soil microflora C R Tellers

The effect of ammonium calcium balance on plant nutrition A H Lewis *Trans 3rd Intern Congr Soil Sci, Oxford, 1935* 1, 195-6(1935) —The recently increased use of concd fertilizers contg no Ca, e. g., $\text{NH}_4\text{H}_2\text{PO}_4$, has caused germination trouble on acid soils Addn of a little CaSO_4 , or better CaCO_3 , has obviated damage Mangold and cereal seeds have sufficiently large reserves of carbohydrates not to be affected by physiol toxicity due to excess of NH_4^+ C J Schollenberger

Some physiological studies with calcium cyanamide and certain of its decomposition products R M Smock *Ohio Agr Expt Sta, Bull* 555 46 pp (1935) —From 2 to 5 days following com CaCN_2 treatments the NH_4 contents of the roots of both tomato plants and peach trees in soil cultures increased The greater the colloidal or org contents of the growing medium, the more quickly did an increase of NH_4 appear in the roots The persistence of this increase continued for 15 to 25 days Following the increase in NH_4 nitrogen content by 1 or more days, there was an increased amt of nitrate It is unlikely that urea

serves as a direct source of N for plants in soil cultures following treatments with CaCN_2 Tomato plants treated with CaCN_2 had more NH_4 , total sol, and nitrate- and NH_4 free sol N than untreated plants in 2 soil types The utilization of CaCN_2 is essentially an NH_4 and nitrate phenomenon Injury by such decomn products as CNNH_2 , $(\text{CNNH}_2)_2$, $\text{NH}_4\text{C}(\text{NH}_2)_2$ and $\text{H}_2\text{C}_2\text{N}_2\text{O}$ (guanlyl urea) on the peach, apple and tomato was detd Injury by CNNH_2 to the tomato was accentuated by the addn of nitrate to the nutrient soln The presence of nitrate N did not increase injury due to $(\text{CNNH}_2)_2$, with the tomato CNNH_2 is a potential source of injury to the peach, apple and tomato with com cyanamide applications on soils devoid of colloidal or org matter The $(\text{CNNH}_2)_2$ is injurious only with extremely heavy applications or on alk soils Ca bentonite was an effective catalyst of the CNNH_2 to $\text{OC}(\text{NH}_2)_2$ change in sand-colloid mixts, but it was slightly inferior to animal charcoal in this capacity Guanidine and guanlylurea are unlikely sources of injury when com cyanamide is applied to the soil Three years' expts show com cyanamide is a satisfactory source of N for the apple tree when properly used Fifty-two references C R Tellers

Effect of fertilizers on various properties of a highly calcareous soil and on the yield and quality of crops produced D W Pittman *Utah Agr Expt Sta, Bull* 250, 17(1934), cf *C A* 28, 5164⁴ —Treble superphosphate gave marked increased yields on sugar beets, barley and wheat while $\text{Ca}_3(\text{PO}_4)_2$ showed no residual effect $(\text{NH}_4)_2\text{SO}_4$ gave considerable increases in yields of wheat and barley Neither S nor CaSO_4 showed any beneficial effect on crops P, nitrate and org matter increased appreciably in the surface soil as a result of a long-continued annual application of fertilizer and manure The soil reaction remained at approx 7.5 throughout the expt C R Tellers

Analysis of the factors responsible for loss of nitrogen and organic matter from dry-lands A F. Bracken and J E Greaves *Utah Agr Expt Sta, Bull* 250, 21 (1934) —When results from virgin areas were compared to adjacent cropped fields, it was found that approx 20% of the N and org matter had been lost from the tilled soil Only 1/4 of this loss has been removed by the crops, leaving the balance unaccounted for Legumes maintained the N of dry land at approx the same level as that found in uncropped soil The study is being continued in an effort to det the factor responsible for these losses in nutrients C R Tellers

Soil acidity and liming and fertilizer recommendations for various crops H P Cooper and W. R. Paden *S Car Agr Expt Sta, 47th Ann. Rept* 19-24(1934), cf *C A* 29, 5673¹ —The av equiv acidity of av. mixed fertilizers used in S Carolina is approx 150 lb of limestone per ton The use of such fertilizers is a potent factor in the increased soil acidities of the South Heavy liming is unnecessary and may cause serious Mn deficiencies The soils are classified as to pH C R Tellers

Fluorine, its effect as plant growth and its relation to the availability to plants of phosphorus in phosphate rocks R P Bartholomew *Soil Sci* 40, 203-17(1935) —Concs of F as high as 50 p p m had very little influence upon the germination of seeds of Sudan grass, cowpea, soybean or red clover The germination of white Dutch clover was greatly enhanced by the presence of F in the form of CaF_2 and Na_2SiF_6 The addn of sol fluorides up to 10 p p m in culture soln produced no consistent decrease in the amts of dry matter of cowpeas The variations were attributed to differences in the plants F in plants was found largely in the roots, only when the amts of F in the roots were relatively large was any present in the tops Considerable F was taken up by the roots of cowpeas grown in culture solns contg as little as 0.25 p p m of F in the form of NaF , while no F was taken up from solns contg as much as 0.50 p p m of F in the form of CaF_2 The presence of 10 p p m of F in the form of Na_2SiF_6 in the solns produced roots with as much as 1970 p p m of F The presence of chemically combined F in phosphate rocks greatly affected the availability of the

P to plants. The availability of P decreased as P content increased. The effect was most apparent in the first crop. There was a definite relation between P content of the various phosphate rocks and of basic slags and the total amt of dry matter produced. Evidence substantiated the theory that the availability of P in rock phosphate is largely a matter of the rate of soln of the rock phosphate.

M. S. Anderson

Effect of fluorine content on availability of rock phosphates. R. P. Bartholomew. *Ark Agr Expt Sta. Bull. 312*, 20-1 (1934), cf. *C. A.* 29, 5577. The yields of Sudan grass produced from applications of these phosphates showed a definite correlation between the percentage of F in the rock phosphate and the amt of dry matter produced in the 1st cutting. Data for the 2nd cutting were not significant. There was a significant correlation between the amt of P absorbed by the plants and the amt added in the rock phosphate. Availability of rock phosphates depends to a considerable extent on their F contents. In concns. up to 50 p. p. m. F as CaF_2 , NaF or Na_2SiF_6 had no effect upon the germination of Sudan grass, cowpeas, soybeans, red clover or Dutch white clover. Ten p. p. m. of F as NaF, CaF_2 or Na_2SiF_6 did not depress the yield of cowpeas. C. R. Teller

The exchangeable manganese in Danish soils and its relation to plant growth. I. Steenbjerg. *Trans. 3rd Intern. Congr. Soil Sci., Oxford, 1935*, 1, 198-201 (1935), cf. *C. A.* 29, 7549. Gray speck disease of oats, associated with Mn deficiency, is serious on the sandy soils of Denmark, especially when they are limed to excessive pH values, which reduces the availability of Mn. Recommendations for liming are therefore based upon a detn. of M_n , "manganese value," mg Mn displaceable from 1 kg dry soil by $M\text{g}(\text{NO}_3)_2$, calcd. from the Mn content of successive leachings of a sample. Expts. have shown that not only M_n is important, but also q , a measure of the retention of exchangeable Mn by soil colloids. M_n is decreased by liming to high pH , excessive aeration and deficiency of moisture, and is increased by chem. reducing agents and readily decomp. org. matter, e. g., starch, and by water-logging. q is decreased by the latter factors. The heavier soils tend to high values for M_n and low for q ; hence gray-speck disease is almost unknown on them. Field and lab. studies have shown a high degree of correlation between M_n , q and incidence of gray speck of oats on soils liable to the trouble. A quant. relation between M_n and q has been demonstrated and may be formulated for a particular soil, but the math. const. are different for other soil types. C. J. Schollenberger

Are plants able to separate the isotopes of potassium from soils? Oskar Eckstein. *Trans. 3rd Intern. Congr. Soil Sci., Oxford, 1935*, 1, 186-9 (1935) (in German). Pots of sand were repeatedly cropped to oats and rye, with complete fertilization for each crop except with respect to K_2O , which was supplied by an initial heavy application of K_2O salts derived from molasses. The at. wt. of the K in the successive crops was detd. and compared with that of K from sylvinite. Owing to analytical difficulties, the values obtained, 39.15-39.18, were all too high, but the differences were insignificant, the possibility of Rh being present was excluded. Seven references.

C. J. Schollenberger

The effect of manganese deficiency on oats, in relation to soil bacteria. F. C. Gerretsen. *Trans. 3rd Intern. Congr. Soil Sci., Oxford, 1935*, 1, 189-91 (1935). Evidence that gray speck disease of oats is not due solely to Mn deficiency is reviewed. G. believes that the disease is bacterial; plants with abnormal metabolism due to lack of available Mn are unable to synthesize org. acids sufficiently to neutralize NH_3 produced by the bacteria in the roots; hence the severity of the symptoms and fatal outcome. Lack of carbohydrates in the leaves weakens them so that they bend in the characteristic manner. Vigorous plants growing under normal conditions are little affected by the bacteria. C. J. Schollenberger

Phosphatic fertilizers, comparative trials on immediate and residual effects. Ahmed Mahmoud, *Roy. Agr. Soc. (Cairo) Bull.* No. 21, Chem. Sect. 30 pp (1931) (available

in English).—Details are given of a comprehensive series of field expts. testing the relative merits of superphosphate (16% available P_2O_5), concd. superphosphate (40% P_2O_5), basic slag (10% P_2O_5), Pphos (30% total P_2O_5 , a mineral phosphate), Thiophosphate (17% total P_2O_5 , a mixt. of ground rock phosphate, gypsum and S), Sulphurophosphate (16% total P_2O_5 , a French product consisting of mineral phosphate and S) and bone meal (29% total P_2O_5) on bersum, bersum fahl, cotton, wheat and maize. The soil used contained, before application of the fertilizers, 0.23% P_2O_5 sol in 1% citric acid without neutralization. CaCO_3 present was 2.55-2.61% and pH of the soil about 7.0. The rate of application was 32 kg P_2O_5 per 4200 sq m. The 2 superphosphates were the most effective. Basic slag was the next most effective. Phosphates contg. their P_2O_5 in insol. form showed no immediate effect or even a residual one over a period of 5 years. Such phosphates are not suited for Egyptian soils. Pot tests confirmed the above findings. Recommendations for phosphate application are given. Colin W. Whittaker

Phosphate rock as filler substitute in fertilizer mixtures. R. L. Smith. *Com. Fertilizer* 51, No. 5, 11, 16, 18, 20, 22, 44 (1935).—In pot tests with barley, turnips, soybeans and corn on Norfolk sandy loam and Cecil sandy loam soils, there were no significant differences either in crop yields, soil reaction or compn. of plant material (Ca, Mg and P contents) when ground phosphate rock and dolomite, resp., were used as fillers in the prepn. of neutral fertilizer mixts. Only a small increase in the available P content occurred when a 4-8-4 fertilizer (contg. KCl, superphosphate, $(\text{NH}_4)_2\text{SO}_4$ and phosphate rock filler) was stored under temp., pressure and moisture conditions simulating those occurring in a fertilizer curing pile, but the available P_2O_5 content increased 1.00-2.45% when the mixt. was held for 7 days at 80° under a pressure of 80 lb./sq in. The amt of phosphate rock dissolved by buffered solns. increased with the acidity of the solns. Solns. of pH 4.5-6.0 dissolved appreciable amts. of phosphate rock. In pot tests on Norfolk sandy loam soil of approx. pH 5.0, phosphate rock supplemented with CaSO_4 produced yields of turnips and soybeans that compared favorably with those obtained by the use of superphosphate.

K. D. Jacob

More on the question of the most suitable nutrient ratio in Nitrophoska (containing lime). E. Blanck and H. S. Horstner. *J. Landw.* 83, 327-33 (1935).—Previously reported expts. (*C. A.* 30, 210⁹) were repeated on Börsinghauser soil and showed the most favorable nutrient ratio to be $\text{N} : \text{P}_2\text{O}_5 : \text{K}_2\text{O} = 1.1 : 1.75$. John O. Hardesty

Zinc sulfate studies in the soil. Owen E. Gall. *Citrus Ind.* 17, No. 1, 20-1 (1936).—When ZnSO_4 was applied to different types of soils absorption of Zn ions was highest in soils of a high colloidal content, high Ca content or contg. large amts of org. matter. In pot tests with corn and cowpeas on Norfolk fine sand an application of ZnSO_4 equiv. to 500 lb. Zn per acre was markedly toxic to cowpeas, but corn was not affected until the concn. reached about 700 lb. Zn per acre. The toxicity of large applications of ZnSO_4 was reduced by the application of either CaCO_3 or $\text{Ca}(\text{H}_2\text{PO}_4)_2$. Samples of soil were taken at depths of 0-3 and 3-6 in. from Zn-treated citrus groves at intervals of 1 week, 11 weeks and 7 months after application of the ZnSO_4 . After 1 week, during which time no rain fell, most of the Zn was recovered in the H_2O -sol. condition. 14 out of 15 in. of rain fell before the next sampling and very little H_2O -sol. Zn was found in the 1st 6 in. of soil; a portion of the Zn was converted into the replaceable condition and the rest was leached from the soil. After 7 months comparatively little Zn was found in either horizon; there was a small but definite accumulation of replaceable Zn in the 3-6 in. layer of soil. K. D. Jacob

The effect of the digestion of sludge on the germinating power of weed seeds. K. Viehl. *Gesundh.-Ing.* 59, 35 (1936).—Anaerobically digested sludge possesses many advantages over fresh sludge as a fertilizer. Loss of N is much less during anaerobic digestion than during the decompn. of the fresh sludge after it is on the land. Two l. of raw sludge from the Leipzig plant was mixed with 1 l.

of digested Imhoff tank sludge, known amts. of various kinds of seeds were added and the whole was anaerobically incubated at room temps., the pH being maintained at 6.5-7.5 by the addition of small amts. of lime. Before incubation and at intervals thereafter 2.0 g. of the mixt. was spread on sterile soil and covered with a thin layer of the latter. The no. of the various kinds of plants growing was recorded. With the exception of tomato seed, which was practically unaffected after 10 weeks' digestion, the germinating power of the seeds rapidly decreased. The nos. of plants growing before incubation, after 4 weeks and after 10 weeks were: tomato 32, 25, 25, rape 38, 17, 0; *Phalaris* 43, 16, 0; millet 29, 3, 1; head lettuce 24, 0, 0; *Stellaria* 34, 4, 0; grass 4, 1, 0. M. G. Moore

Composts and fertilizers in relation to greenkeeping. VI. Miscellaneous fertilizers [poultry manure and sewage sludge]. T. W. Evans. *J. Board Greenkeeping Research* 4, 104-7 (1935), cf. *C. A.* 30, 2129. Dried sewage sludge from Bradford, England, contains mineral matter 52.7, org. matter 46.3, total N 2.51, P_2O_5 0.30 and K_2O trace. Sludges from other English cities usually contain about 1% less N. The Bradford sludge owes its high N content to waste waters from the wool-scouring industry.

K. D. Jacob
The effects of sodium chloride on some turf plants and soils. V. T. Stoutemyer and F. B. Smith. *J. Am. Soc. Agron.* 28, 16-23 (1936). P_2O_5 stimulated the growth of 4 grasses and a white clover, while NaCl in the concns. used was toxic in some cases and stimulative in others. When applied with P_2O_5 , the NaCl toxicity was decreased. The total exchangeable base content of the soil was decreased by the treatment with NaCl. It appears that NaCl alone or in combination with P_2O_5 fertilizers may be used on sandy soils for metropolitan and seaside belt grasses.

J. R. Adams
Minerals in pasture grasses in India. A. Viswanatha Iyer. *Indian J. Vet. Sci.* 5, 184-90 (1935).—The factors affecting the contents of P, Ca, Mg, Na, K and N in *Andropogon contortus*, *Cynodon dactylon* and *Pennisetum cenchroides* were investigated. Plants grown on highly calcareous soil that was low in available P always contained more Ca and less P than the av. value; for the species, those grown on a red laterite soil that was deficient in Ca and tended to be acidic contained the normal amt. of P but were low in Ca. Each species of grass showed a tendency toward a mineral make-up peculiar to itself. *C. dactylon* invariably showed a considerable excess of Ca over P_2O_5 , while in *P. cenchroides* the tendency was for P_2O_5 to exceed CaO. The N and K contents of the grasses decreased markedly with advance in maturity, P decreased to a smaller extent, while the degree of maturity had only a minor effect on the Ca and Mg. There were indications that cultivation is likely to affect the mineral content of herbage.

K. D. Jacob
The growth of pasture in the spring, and its relation to available nitrogen supply and temperature. G. E. Blackman and A. H. Lewis. *Trans. 3rd Intern. Congr. Soil Sci.*, Oxford, 1935, 1, 291-3 (1935).—From 5 years' yields of grass cut from pasture plots fertilized with $(NH_4)_2SO_4$ and a variety of common N carriers, it is concluded that about 25 lb. N per acre hastened the growth to the grazing stage by 3-13 days in different years. These comparisons were rather favorable to NH_4 salts. The N content of the herbage indicated that N was absorbed by the roots and translocated to the leaves when the soil temp. at 4 in. was not below 5°. The herbage reached its max. N content 7-10 days after active growth began. Soil analyses indicated marked fluctuations in the NH_4 and nitrate content of the upper 3 in., especially when the soil temp. was less than 5°. In general, a few days after the application of fertilizers less of the added N could be found in these forms than later. Lab. expts. along the same line indicated that the temporary disappearance of inorg. N was due to microbial fixation, and that urea accelerates the breakdown of org. N by the soil microflora. When the soil temp. at 4 in. reached 10°, growth became so rapid on all plots that the effect of fertilizer N was no longer visible. The "degree of earliness" to be expected from N fertilization

varies directly with the length of time the soil temp. is 5-10°.

C. J. Schollenberger
Studies on paddy cultivation. V. The effect of time of application of the fertilizer. The effect of the form of phosphoric acid applied. J. C. Haugh and A. W. R. Joachim. *Trop. Agr. (Ceylon)* 83, 269-77 (1935), cf. *C. A.* 29, 2641. NH_4 -phosphate was applied to 0.01-acre plots of transplanted paddy at the rate of 1 cwt. per acre. The yield from the plots which received the fertilizer at the beginning of the season was the same as that from plots which received equiv. amts. in several small applications throughout the growing period. Amts. of N and P removed from the soil by the crop were approx. the same for both methods of treatment. Whether the P_2O_5 was applied as NH_4 phosphate or steamed bone meal made no appreciable difference in yield or in available P_2O_5 in the soil. John O. Hardesty

The relative rates of uptake of ammonium and nitrate nitrogen by perennial ryegrass. A. H. Lewis. *Trans. 3rd Intern. Congr. Soil Sci.*, Oxford, 1935, 1, 204-5 (1935).—Pot expts. with grass were conducted with artificial soil composed of 94% sand and 6% Ca bentonite, with fertilizers, to avoid complications from nitrification, almost nil in this medium. The growth and compn. of grass at different stages from pots fertilized with $(NH_4)_2SO_4$, $NaNO_3$ and $Ca(NO_3)_2$ were compared. The results indicated greatest uptake of N from $(NH_4)_2SO_4$; the effect upon yields depended upon the age of the grass. P_2O_5 in the herbage was highest with $(NH_4)_2SO_4$; possibly this explains the superior growth. The rates of uptake of NH_4 and P_2O_5 are related. L. believes that direct absorption of NH_4^+ by grass roots is the normal process, especially in early spring.

C. J. Schollenberger
The influence of rainfall on the yield of cereals in relation to fertilizer treatment. W. G. Cochran. *J. Agr. Sci.* 25, 510-22 (1935).—A statistical study indicated that rainfall and other meteorological effects on the seasonal variations in yield of wheat and barley are closely associated with fertilizer treatment. The fertilizers used include farmyard manure, ammonium salts and superphosphate.

Irvin C. Feustel
Lysimeter experiments with barley, tea and rice. S. Osugi. *Trans. 3rd Intern. Congr. Soil Sci.*, Oxford, 1935, 1, 205-7 (1935).—A brief review of results from many years' expts. Losses of N were mainly as nitrate, very little NH_4 , and were greater under a summer crop than in winter. A single heavy application of fertilizer resulted in much greater loss than the same in 3 portions. The N of mineral fertilizers was lost to the greatest extent, that of animal fertilizers least. Liming increased loss of N applied as $(NH_4)_2SO_4$, previous composting with the fertilizer decreased loss. Losses under tea were greater than under barley or land rice, and at a max. during the warmer seasons, other similarities to previous observations were noted. There was practically no loss of N in an expt. with paddy rice.

C. J. Schollenberger
Manganese deficiency of cereals. Plot experiments and a new hypothesis. G. W. Leeper. *Proc. Roy. Soc. Victoria* 47, Pt. II, 225-61 (May 8, 1935); cf. *C. A.* 29, 1561. Wheat plants growing on a heavily limed soil suffered from lack of available Mn. This condition was improved by (1) acidification of the soil, most conveniently by S, to a pH of at least 6.5 or (2) heavy applications of $MnSO_4$ to the soil. The final yield of grain averaged the best on the sulfured soil. Lab. tests on various soils showed that the crucial test among soils of pH greater than 7 is to leach the soil with a soln. of quinol at pH 7, with N $(NH_4)_2SO_4$ as the reagent. Deficient soils yielded less than 15 parts of Mn per million of soil to this soln., while 2 typical healthy soils tested gave over 130 p. p. m. The theory of this test is discussed in connection with the oxidation-reduction potential of the system $MnO_2-H^+-Mn^{++}$. It is suggested that the plant uses MnO_2 as its source of Mn, whether directly in the colloidal state or by reduction at the root-soil interface, and it is only the MnO_2 dissolved by quinol at pH 7 which can be used by plants, and not the more copious supply that may sometimes be dissolved with or without quinol at low pH value (1 and 2).

The amt of Mn dissolved by quinol at pH 7 may be taken as an indication of whether a given soil is liable to develop a Mn deficiency after liming. If sulfering is impractical, as, e. g., on a very calcareous soil, an "active" MnO_2 should theoretically be as good as $MnSO_4$, especially if finely divided and worked well into the soil. The state and translocation of Mn in the soil can be studied by leaching with a series of solns buffered to a const pH and poised to steady ranges of pH by a series of ingredients such as quinol. Addnl pot tests confirmed the evidence that the failure of surface application of Mn salts is due to "positional" unavailability, which may be overcome by thorough mixing. It also makes it more reasonable to expect that large applications of $MnSO_4$ will bring about a permanent cure on any soil, if thorough mixing is possible. In all of this work, which is described with full details, the Mn was analyzed colorimetrically as the permanganate with a Duboseq colorimeter. The color was developed by $NaOCl$, usually in H_2SO_4 , but sometimes in H_3PO_4 soln if it was necessary to avoid the formation of large amts of $CaSO_4$. The plant ash was treated with HF to avoid loss of Mn as insol silicate and the remaining HF removed with H_2SO_4 . The NH_4 acetate solns were treated by first concg them, then destroying org matter and NH_4 ions with aqua regia and finally destroying chlorides with H_2SO_4 or H_3PO_4 . Leopold Scheffan

The influence of fertilizing on the yield and quality of flax F Alten and G Goetze *Ernahr Pflanze* 32, 1 14 (1936).—Culture expts were carried out in pots conig 10 kg of glass sand, 1 5% purified peat mull and a const amt. of P_2O_5 . The quality of the fiber improved with increasing amts of K_2O up to 2 g in conjunction with 0.4 g. of N per pot. Increasing applications of N from 0.2 to 1 g. increased the yield but impaired the quality of the fiber. A satisfactory yield of good quality fiber was obtained from pots receiving 1 g. of N and 3 g. of K_2O .

Manganese deficiency in oats at Florence [S Carolina] W. B. Albert S Car Agr Expt Sta, 47th Ann Rept 45(1934).—Mn deficiency is becoming more prevalent in S Carolina Coastal Plains soils. In oats there is a breaking down of the basal portion of the leaves with the tips remaining green and alive for some time after the slow discoloring and death of the basal part occurs.

Rice nutrition. L. C. Kapp Ark. Agr Expt Sta, Bull 312, 22-4(1934); cf. C. A. 29, 7400*.—When grown in nutrient solns, vegetative and root growth were retarded at Fe concns of 6.25 p p m. The toxic effect of Fe was greater in the presence of $(NH_4)_2SO_4$ than of $NaNO_3$. The $(NH_4)_2SO_4$ soln depressed root growth and produced more stubby roots than $NaNO_3$. Mn was not as toxic to rice as Fe. Of the various fertilizer treatments used on submerged Clarksville and Crowley soils, only N carriers increased the yield of straw and grain as well as the N content of the plant. Addns of carbonaceous materials to submerged soils decreased NH_4 accumulation and decompn. of nitrogenous materials. The sol ammonium and nitrate N are lost from soils on submergence in proportion to the carbonaceous materials present.

The effect of potassium supply on the composition and quality of wheat II. A. G. McCalla and E. K. Woodford *Can J Research* 13, C, 339-54(1935), cf. C. A. 28, 13832*, cf. C. A. 29, 1463*.—Limiting the supply of K to wheat plants resulted in a decreased N content and a markedly increased Ca and Mg content of the dry matter. It retarded growth, reduced the total amt of individual nutrients absorbed per plant and resulted in an increase in the proportion of grain to total yield. It had an adverse effect on the quality of the grain as detd by gluten and baking tests. Neither Na nor Ca was effective in replacing K, but Na was better in this respect.

Etiology and control of seedling blights and boll rots of cotton in Arkansas V. H. Young Ark. Agr Expt Sta, Bull. 312, 49-50(1934); cf. C. A. 29, 2289*.—Sore shin disease, due to damping-off fungi, and angular-

spot disease caused by *Phytophthora malvacearum* were best controlled by early planting of seed treated with Ceresan, new improved Ceresan of $CuSO_4 \cdot H_2O$. However, the latter had an unfavorable effect on stand of seedlings. Less and less benefit was obtained by seed treatment as the planting season advanced.

Experiments with potash fertilizer for cotton H. P. Cooper, W. B. Rogers and R. W. Wallace S Car Agr. Expt Sta, 47th Ann Rept. 16-18(1934), cf. C. A. 28, 7404*.—When K was applied in amts less than 45 lb. per acre, the time of application had no effect on yield, however, above 45 lb. per acre better results were obtained if some of the K was applied before the crop was planted. Approx 15 lb. of seed cotton results from 1 lb. of K added to the soil. Cotton rust is due largely to K deficiency and can be corrected by the use of K. Rust is worse in dry years. Mg deficiency is usually more prevalent than K deficiency when the rainfall is heavy. Sol. sulfates, nitrates or chlorides increase the soly of Mg in the soil and enhance the loss of Mg in drainage water.

Effect of manganese sulfate on the yields of Irish potatoes H. P. Cooper, W. D. Moore and R. W. Wallace. S Car Agr Expt Sta, 47th Ann Rept 141-2(1934).—Soils of the trucking areas of Charleston and Beaufort are often deficient in Mn and the addn of 50-100 lb per acre of $MnSO_4$ gave greatly increased yields of potatoes. Basic slag contains sufficient Mn to serve as a good carrier of this element.

Influence of fertilizer on the quality of wheat II. F. Murphy Okla Agr Expt Sta, Rept 1932-4, 25 (1934).—P was the principal element lacking in Kirkland sandy loam. The addn of superphosphate to this soil resulted in plumper kernels, lighter berries and a lower protein content. Baking tests showed the bread baked from the wheat was not inferior. The P increased the ash and P content of the wheat berries over that produced on unfertilized plots.

The response of different varieties of potatoes to different amounts of copper in a modified spray program E. O. Mader and F. M. Blodgett *Am Potato J*, 12, 325-34(1935), cf. C. A. 29, 7567*, 30, 218*.—The Irish Cobbler, Rural Russet and Green Mountain varieties responded to Cu treatments in the form of Bordeaux mixt to approx the same extent in final increases in yields. With a Bordeaux mixt composed of the equiv. of half as much quicklime as $CuSO_4$, and when most of the Cu was applied early in the season, there appeared to be no advantage in using more than a total of 60 lb $CuSO_4$ /acre during the season. All Cu-sprayed plants retained more tubers per plant than did unsprayed plants of the same variety. All varieties showed evidence of a retardation in tuber development due to spraying. The retardation was less pronounced with the Cobblers and most pronounced with the Green Mountains; the unsprayed plants of the latter yielded more than the sprayed until after Sept. 21.

Effect of fertilizers on the handling qualities of strawberries and tomatoes I. C. Haut Okla Agr. Expt Sta, Rept 1932-4, 245-7(1934).—Chem analyses do not detect differences in compn due to normal fertilizer treatments on strawberries. Applications of 500-1000 lb per acre of fertilizers of the general compn 10-5-5, had no effect on firmness or compn.

Sugar-cane physiology. V. Contents of nitrogen, phosphorus and potassium in crude chlorophyll and in the leaf skeleton and their relationships with fertilizers C. E. Beauchamp, F. Lazo and A. Bonazzi. *Proc. Assoc. Tec. Azucareros Cuba* 8, 82-114(1934); cf. C. A. 28, 4102*.—Among 10 fertilizer formulas used in growing sugar cane in a clay similar to Matanzas clay, those producing the largest growth in the field were 4-4-8, 4-4-12 and 8-8-12. These formulas produced the highest chlorophyll content, and this in turn the highest total N, P and K. As K was increased in the fertilizer it was also increased in the chlorophyll, and the growth was increased. The ratio K_2O to N + P in the chlorophyll, in percentage of skeleton, was 2.1. Increasing N in the fertilizer P and K in the chlorophyll, resulting in reduced

Analysis of the leaf skeleton bore no relationship with growth, only the compn of the chlorophyll being of significance in this connection

O W. Wilcox

Copper deficiency in sugar beets D A Van Schreven Meded Inst Suikerbeteenteelt 6, 37-57(1936)—Sugar beets grown in Cu-free nutrient solns showed pronounced chlorosis of the outer leaves and were $1/4$ as large as the controls The Sachs I-KI test showed very little starch in the leaves of the diseased plants, whereas leaves of plants grown with Cu showed abundant starch There is now no doubt that Cu is essential in photosynthesis

O W. Wilcox

Heart rot disease of sugar beets E Brandenburg Centr Zuckerind 43, 837-8(1935), Mededel Inst Suikerbeteenteelt 4, 81-102(1935)—B, preferably in the form of borax, gives protection to beets even in the following crop year Addns of 0.40 kg per hectare reduced infestation from 65.7 to 0.1%, increased the yields of roots 28%, tops 51% and sugar 40% Even better results were obtained with B-fertilizer mixts Until the question is decided whether B is a mere stimulant, or a fertilizer, or probably both, large scale field use of B is not encouraged

F R Bachler

The influence of forest agriculture on the physical and chemical properties of soil Antonin Nemeš Forstwiss Centr 57, 656-68(1935)—Comparisons were made of the properties of alluvial sand soils supporting trees without cultivation and those cultivated with potatoes between rows of trees Less P_2O_5 , K_2O and CaO sol in 20% HCl was found in the cultivated profile The content of Na_2O , MgO , N and sesquioxides was greater in the latter than in the uncultivated plot Ibid 701-8—The compn of pine needles showed a higher content of N (1.299%) in the cultivated plots than in the uncultivated plots (0.862%) Little differences were found in P_2O_5 and K_2O whereas the CaO content was less in the needles from cultivated plots Conclusion The 2-year cultivation with growing of potatoes did not appreciably impoverish the soil of P_2O_5 and K_2O

I C Feustel

Water and mineral requirements of tree seedlings L M Turner Ark Agr Expt Sta, Bull. 312, 47-8 (1934)—Seedlings of *Pinus echinata* and *P. taeda* can grow satisfactorily in pure sand cultures with as little as $1/2$ of the amt found satisfactory for seedling apple trees in sand cultures High N applications have a toxic effect on young pine trees The optimum water requirement for germination and growth the 1st year was 1.6 to 2 times the mean rainfall for the region

C R Fellers

Leaf analysis as a means of diagnosing nutrient requirements of tropical orchard crops F Hardy, J A McDonald and G Rodriguez J Agr Sci 25, 610-37 (1935)—The compn of the leaf ash of cacao is entirely different from that of grapefruit growing on alluvial soils in Trinidad Although the lime content of the cacao soil is somewhat higher than that of the grapefruit soil the lime content of the cacao leaf ash is much less than that of grapefruit Leaf lime content bears a strict and highly significant reciprocal relationship with leaf potash content Fertilization considerably increased the content of leaf ash but results indicate greater changes in leaf compn of grapefruit compared with cacao Statistical evidence shows that a close relationship holds between leaf compn and yield of cacao The best indices of yield appear to be the leaf nutrient ratios, particularly, a low N/ K_2O ratio, a high K_2O/P_2O_5 ratio and a high N/ P_2O_5 ratio By comparing given analytical data with those of leaf material produced by "ideal" trees the particular fertilizer treatment which should confer most benefit may readily be identified

I C Feustel

Fertilizers for tobacco J M Carr Ca Coastal Plain Expt Sta, 14th Ann Rept 94-8(1934), cf C A 28, 5577—Standard fertilizer mixts for the Coastal Plains areas are 8-3-5 and 8-3-8 applied at the rate of 800-1200 lb per acre P deficiency in tobacco is shown by a small abnormally green plant which never ripens properly Excessive P causes premature ripening or firing in the field Superphosphate is a satisfactory source of P Tobacco fertilizers should carry 3-4% of NH_3 Horse

manure gives good results as a sole source of NH_3 for tobacco When com sources are used, $1/4$ should be from high-grade org. materials and either $1/4$ $NaNO_3$ or $1/4$ $NaNO_2$ and $1/4$ urea or $Ca(NO_3)_2$ The fertilizer should contain from 5 to 8% K_2O The K recommendation includes 2% K_2O per ton from high-grade KCl and the remainder from K_2SO_4 The functions of Ca, Mg and S to quality are discussed

C R Fellers

Sodium arsenite as a weedicide G R W. Meady J Dept Agr Western Australia 11, 521-3(1934)—A mixt suitable for killing green timber is prep'd by dissolving 1 lb washing soda in a convenient amt of water and adding to it slowly and with const. stirring 1 lb As_2O_3 made into a paste with water The mixt. is boiled until the As_2O_3 is dissolved, a thin paste of 0.5 lb whiting in water is added and the mixt is dild to 4 gal The best results are obtained by applying the prep'n to dormant trees in a "frill ring" cut into the trunk as near the ground as possible A tree 4 ft in diam requires approx 1 quart of soln.

K D Jacob

Insecticides and insect toxicology C H Richardson Ia Agr Expt Sta, Rept Agr. Research 1934, 96-7 (1934), cf C A 29, 26521—Paris green was most toxic, Pb arsenate second, and Ca arsenate least toxic to the larvae of the imported cabbage worm, *Pieris rapae* L. Toxicity was det'd as the dosage which kills 50% of the population (median lethal dose). Pb arsenate was somewhat more toxic to *Dalania ministra* (an apple moth) than to its close relative *D. perspicua* The toxicities of Pb arsenate, Zn_3P_2 and diphenylene oxide were in the ratio of 20.7:1 *Dihydrorotenone* is more stable than rotenone, and while it possesses considerable toxicity to some insects, it is less toxic to *D. ministra* than Pb arsenate. Zn_3P_2 was toxic to the differential grasshopper, *Melanoplus differentialis* Thomas, but was much less toxic to *D. perspicua* A synthetically prep'd nicotine comp'd was highly toxic to *Aphis rumicis*, the bean aphid

C R Fellers

Seed investigations, barley-blight control R. H. Porter, E O Brown and C. M. King Ia Agr. Expt Sta, Rept Agr. Research 1934, 71-2(1934)—Barley blight, *Helminthosporium sativum*, was well controlled by the use of org. Hg compds such as Et Hg phosphate and sulfate These dusts may be used for treating the seed in 5% strength or dild with talc or gypsum to a 1% concn The seed is kept in contact with the powder for 1.5 hrs at 40°

C R Fellers

The spray-residue problem in Kansas Geo A Flinger Biennial Rept Kansas State Hort Soc 42, 126-9(1932-33)—The arsenical residue on apples was higher when Pb arsenate alone was used in the entire spray schedule than when Pb arsenate was used in the early sprays and Mn arsenate, Ca arsenate, $BaSiF_6$, Na_2AlF_6 , nicotine tannate or oil emulsion was used in the late sprays The use of oil emulsions in the late sprays hindered the removal of arsenical residues with 1% HCl

K D Jacob

A chemical method for determining the safeness to foliage of commercial calcium arsenates G W Pearce, L B Norton and P. J. Chapman N Y. Agr. Expt Sta, Tech Bull 234, 2-15(1935)—Com Ca arsenates vary in safeness to foliage when tested under the same conditions, consequently, the tendency to burn is a characteristic of the prep'n The results of gross analyses of com prepns cannot be correlated with their safeness Water-sol As, as det'd by the official method, is not a true index to injury A tentative method was developed for detg the safeness to foliage of Ca arsenates based on the facts that (1) Water sol As det'd after carbonation of the material shows a definite relation to degree of injury (2) If the free lime normally occurring in Ca arsenates is first removed by any means, then water-sol As is a true index to injury (3) Removal of the free lime by means of CO_2 under sp. conditions with the subsequent detn of water-sol As gives reproducible and concordant results Water-sol As in representative com prepns varies from 0.20 to 11.50% As_2O_3 by this procedure A safe brand should contain less than 0.75% water-sol As_2O_3 A correlation between water-sol lime, "reserve alkali" and degree of injury was observed

if such detns were made after carbonation of the free lime. The water-sol. As responsible for injury is apparently derived primarily from the more sol. compds of Ca and As likely to be present rather than by decomposition of the material as a whole by CO_2 . C. R. Fellers

Seed disinfection 1 An outline of an investigation on disinfectant dusts containing mercury. W. A. R. Dillon, Weston and J. R. Booser. *J. Agr. Sci.* 25, 628-69 (1935). The combined result of lab. and field work suggested that there was a close relationship between compn. and fungicidal power of a seed disinfectant. In the series R-11g-X, where R is a hydrocarbon and X an acidic radical, the fungicidal power appeared to decrease with the increase in size of R. The majority of the inorg. Hg salts are of little value. No evidence of stimulation by the disinfectants was found in the case of toxic effect, but better germination and crop yields are believed to be due to control of seed-borne organisms and to the preservation of seed food reserves from attack of soil organisms. I. C. Iensted

The origin of pine red rot. Georg Prehauser. *Forstwiss. Centr.* 57, 649-55 (1935).—Red rot attacks the roots of pine trees when unable to penetrate a compact acid humus layer (pH 3.2-3.4) into the mineral soil beneath. Development of the roots is good in a moist litter but if the latter is composed of dry mosses the mycorrhiza are poorly developed and rotting takes place. I. C. I.

A cooperative study in earthworm control in Rhode Island. H. I. A. North. *J. Board Greenkeeping Research* 4, 101-3 (1935).—Pb arsenate, applied dry at the rate of 5-10 lb/1000 sq. ft. in mixt. with 6 quarts of screened soil, gave more than 90% control of earthworms in golf greens and fairways. Poor control was obtained with HgCl₂, mowah meal and tobacco dust. K. D. Jacob

Control of the codling moth by use of oil sprays. A. J. Ackerman. *Biennial Rept. Kansas State Hort. Soc.* 42, 17-23 (1932-33).—In expts. over a period of 2 years, satisfactory control of the codling moth was not obtained by spraying the trees with Pb arsenate alone. The results were not improved by adding either lubricating oil emulsion or miscible oil emulsion to the Pb arsenate. The effectiveness of Pb arsenate sprays was considerably improved by addn. of white oil emulsion at 1% dosages in the 3 early cover sprays. The arsenical residue on apples sprayed with Pb arsenate-oil combinations was not removed satisfactorily by washing the fruit with 1.5% HCl soln. K. D. Jacob

Arsenical compound substitutes for lead arsenate in the control of codling moth. P. G. Lamerson and Ralph L. Parker. *Biennial Rept. Kansas State Hort. Soc.* 42, 63-8 (1932-33).—Promising results were obtained with the arsenates of Ca, Zn and Mn. None of the sprays caused serious burning of fruit or foliage. Zn arsenate covered the leaves and adhered as well as did Pb arsenate but Mn arsenate seemed to be washed off more readily than Zn arsenate or Pb arsenate during heavy rainfall. Suspensions of Pb arsenate in water settled out 33% faster than did those of Zn arsenate, Mn arsenate settled out 4 times faster than Pb arsenate. K. D. Jacob

The effect of flies and fly sprays on certain physiological processes of the dairy cow. W. M. Regan and S. B. Freeborn. *J. Dairy Sci.* 19, 11-28 (1936), cf. C. A. 20, 2555, 22, 4198, 26, 3606, 28, 5782.—Fly sprays of petroleum oils with pyrethrum or pine oil or both were tested. All had the same repellent efficiency for the first hr. but differed at subsequent intervals. Pine oil increased their efficiency in proportion to the amt. added. The loss in milk production caused by extremely heavy infestations of house and horn flies was negligible; that caused by stable flies was slightly less than 10%. Petroleum oil increased the loss in milk yield to 22%. The extreme effect was evident when high producing cows were sprayed during hot weather. Milk production was diminished and body temp. and respiration rate were elevated, but dry cows were not thus affected. Burning of the skin followed the use of oils having a viscosity lower than 40 sec. irrespective of unsulfonated residues; oils with unsulfonated

residues below 90% were dangerous when used in oils of higher viscosity than 65 sec. The application of oil impairs the ability of the skin to add in maintaining body temp. The hourly water loss through the skin of the unsprayed cow at 41° and 60% relative humidity was 113 g. while for the unsprayed cow it was 223 g. This represents a loss of 46% in cooling. When 40 cc. of conc. spray was applied at an environmental temp. of 80°F., the upper crit. temp. or "pyrexial point" was lowered approx. 5°F. A water emulsion of pyrethrum and pine oils with a small amt. of petroleum was as efficient in repelling flies as petroleum sprays and was less detrimental to the cows. Philip D. Adams

Spraying experiments for the control of fruit fly in the Stanthorpe districts. Hubert Jarvis. *Queensland Agr. J.* 44, 560-3 (1935), cf. C. A. 29, 1570.—Sprays composed of (1) white oil emulsion 1 gal. and nicotine sulfate 1 pint per 80 gal. water and (2) colloidal S 1 oz. per 4 gal. water, resp., were approx. equally effective in controlling the insect. White oil emulsion alone was much less effective. K. D. Jacob

Control of fruit fly [Chaetodacus tryoni Fogg.] Experiments with white oil nicotine sulfate spray. J. A. Wright. *Agr. Gaz. N. S. Wales* 46, 649 (1935).—Promising results were obtained by the use of a spray composed of emulsified white oil 1 gal. and nicotine sulfate 1 pint per 80 gal. water. The spray had no adverse effects on the tree and fruit. K. D. Jacob

Experiments for the control of frog eye [of apple leaves], 1932. Wm. I. Pickett. *Biennial Rept. Kansas State Hort. Soc.* 42, 60-3 (1932-33).—The disease, which is caused by the fungus *Phyllostora cydoniae* Arnaud, was best controlled by the application of summer-strength lime-S soln. as the 1st or pink spray, summer-strength lime-S plus 1.33 lb. Pb arsenate per 50 gal. as the petal-fall spray, 3.6-5.0 Bordeaux mixt. plus 1.33 lb. Pb arsenate per 50 gal. as the 1st cover spray, and 1.5-3.50 Bordeaux mixt. plus 1.5 lb. Pb arsenate as the 2nd cover spray. K. D. Jacob

Bacterial leaf spot of peach. Geo. A. Filinger. *Biennial Rept. Kansas State Hort. Soc.* 42, 118-20 (1932-33).—The disease was best controlled by 3 applications of a spray composed of hydrated lime 4 and ZnSO_4 4 lb./50 gal. Promising results were also obtained with dry-mix lime-S and Oxobordeaux (a conc. colloidal dry Bordeaux mixt.). K. D. Jacob

Control of the red scale [of citrus] in Palestine. M. H. Sachs. *Hadar* 8, 107-8, 201-4, 234-40 (1935).—A study of the distn. ranges of spray oils sold in Palestine showed that the oils are entirely too heavy for safe use on citrus trees at the concn. (about 3.5%) necessary for the control of severe attacks of red scale. Better control of the scale, with less damage to the trees was obtained with lower concns. of lighter oils. Factors affecting damage to citrus trees by oil sprays are discussed. K. D. Jacob

The Florida wax-scale [Ceroplastes floridensis, Comst.] in Palestine. F. S. Bodenheimer. *Hadar* 8, 187-91, 193, 223-4, 227-8 (1935).—When citrus trees were sprayed with Volck white oil emulsions at 2.5, 2.0 and 1.5% concns., the av. kills of larvae were 89, 81 and 32%, resp. The sprays had comparatively little effect on vigorous adults. K. D. Jacob

Report on experimental control of wheat rusts in 1935 [in Italy]. Cesare Sibilia. *Boll. staz. patol. vegetale* 15, 481-9 (1935).—The results of expts. with crude S are given. G. A. Bravo

Petroleum summer oil sprays. Geo. A. Dean. *Biennial Rept. Kansas State Hort. Soc.* 42, 20-32 (1932-33).—A review of the prepn., properties and use of the sprays. K. D. Jacob

Manuf. of noddles from green beans [production of fertilizer] (Ou, Wu) 12. Soil reaction and suitability of milk for cheese making (Hussmann) 12. - Irrigating and fertilizing plants. William O. Sweek (one fifth each to Wm. T. McGeorge, Julius S. Benroth, James A. Saunders and Herbert H. Porter). U. S. 2,028,172, Jan. 21. Water is stored at a level above that of soil to be irrigated, part of the energy of the stored water is used to generate electricity, the electricity is used to produce N oxides, the N oxides are absorbed in the water, and the charged water is applied to the soil.
- Fertilizers. Bamag-Meguain A.-G. Fr. 788,931, Oct. 21, 1935. A fertilizer which is easy to spread is obtained by leaching hot superphosphates with solid salts such as finely cryst. $(\text{NH}_4)_2\text{SO}_4$, and subjecting the lumps obtained to an agitation to get a granulated product.
- Fertilizer. A. J. Marin. Belg. 407,096, Jan. 31, 1935. Crystd. urea nitrate is mixed with CaH_2PO_4 and $\text{Ca}_3(\text{PO}_4)_2$. It may also be mixed with Ca cyanamide.
- Fertilizer from sewage. Oliver V. Austin. U. S. 2,029,648, Feb. 4. Cond. sewage is subjected to the action of steam under high pressure and at a high temp. for a few min. and then suddenly released to cause the explosive disintegration of the cell structure of the sewage.
- Stable humus products. Joost Hudg. Dutch 35,466, May 15, 1935. Insol. humus products beneficial to the soil are prep'd by mixing humic products, as peat, straw or wood waste, with readily hydrolyzable aluminosilicates (pulverized slag) and oxidizing the moist mixt. in a mixt. of steam and air at temps. below 130° , e. g., at 70° . Addn. of up to 10% NH_3 to the vapors serves to regulate the acidity of the product and gives a valuable N content of the product. The oxidation can be promoted by addn. of Fe or Mn compds.
- Lime nitrogen. Nikodem Caro and Albert R. Frank. Ger. 620,888, Oct. 29, 1933 (Cl. 124 9). Addn. to 609,730 (C. A. 29, 5230). The method of 609,730 is modified by replacing the $\text{Ca}_3(\text{PO}_4)_2$ by CaCO_3 . CaCl_2 is formed as an intermediate product which reacts with atm. N to form CaCN_2 .
- Insecticides and fungicides. The Grasselli Chemical Co. Brit. 436,327, Sept. 30, 1935. These comprise as the active ingredient a lauryl deriv. of formula $\text{C}_n\text{H}_{2n}\text{X}$, where X is halogen, OR or SR, R being H or an org. radical, CN, CNO or an amino or substituted amino group in which the N of the substituted amino group does not form part of a heterocyclic ring. Suitable derivs. are lauryl alc. and its ethers and org. esters, lauryl mercaptan and its thioethers, lauryl cyanide, lauryl cyanate, laurylamine, lauryl urea, lauryl bromide, dialauryldithiocarbamates, triaurylamine, lauryl diethyldithiocarbamate and lauryl xanthate.
- Parasiticide. Max L. Tower and Harry W. Dye (to Niagara Sprayer & Chemical Co. Inc.). Can. 355,216, Jan. 7, 1936. The particles of a parasiticide contg. S as the principal toxic agent are covered with a coating of the same color as the foliage to be treated.
- Calcium arsenate insecticides. Simon Klosky (to American Agricultural Chemical Co.). U. S. 2,029,264, Jan. 28. Ca arsenate is associated with combined F (suitably in the form of CaF_2 formed in the mixt. and amounting to not more than about 4% of the total As_2O_3 content) which serves to stabilize the arsenate against deterioration by liberation of sol. As under the action of CO_2 . Cf. C. A. 29, 3452.
- Treating plants with volatile materials such as dust-form nicotine compositions. Guy S. Hales. U. S. 2,029,166, Jan. 28. Various operative details.

16—THE FERMENTATION INDUSTRIES

C N FREY

Adaptation and development of the method of partition between solvents for the determination of fermentation products. C. H. Werkman. Ia. Agr. Expt. Sta., Rept. Agr. Research 1934, 63 (1931), cf. C. A. 28, 4167. The partition method of sepp. the lower fatty acids is based on the fact that fatty acids show marked differences in their ability to dissolve in 2 immiscible liquids such as H_2O and Et_4O . Advantage is taken of these differences by partitioning the aq. mixt. of acids with an ether such as isopropyl. From the fraction of total acid remaining in the water, a detn. of each acid can be made from a nomogram. Satisfactory detns. can be made on a mixt. of 3 acids. The method has been extended to the detn. of the alcs.

such as EtOH and BuOH which oxidize to the fatty acids. Isopropyl alc., acetone and EtOH and BuOH are det'd by a modification of the partition method. C. R. Fellers.

Hydrogenation of freshly distilled spirits. Carroll A. Hochwalt, Charles A. Thomas and Ernest C. Dyball. *Trans. Am. Inst. Chem. Engrs.* 31, No. 4, 686-97 (1935), cf. C. A. 30, 1174. The hydrogenation process offers a distinctly new and advantageous method for removing greenness from freshly distilled spirits, and by this removal considerably accelerates the natural aging process.

C. L. Mantell

Alcoholic fermentation of sorghum grain in the solid state. Ke-Chung Chang and Tien-Fsun Kang. J.

Chem. Eng. (China) 2, 102-5(1935).—The old-fashioned Chinese process for the manuf. of ale liquor by fermentation of sorghum grain in the solid state can be improved by using mold and yeast cultures, by 1st cooking the grain at a pressure of 50-60 lb. per sq. in., and by allowing the mixt. to ferment at 35°. Under such optimum conditions the lab. yield is as high as 90% and the semicom. yield about 80%. The com. possibility of the improved process depends much upon the solution of engineering difficulties.

C. L. Tseng

Manufacture of alcohol from kaoliang and corn. Teh-Kuan Shih and Shing Chien Chow *Ind. Center (China)* 2, 227-34(1937).—The main difficulty in the manuf. of alc. from kaoliang and corn lies in the conversion of the starch into sugar. This process is best carried out as follows: (1) Select the raw material, crush, soak in H_2O overnight, and then mix with 4.5 vols H_2O and the appropriate amt. of inorg. acid (0.5% for kaoliang and 0.8% for corn) as hydrolytic catalyst; (2) cook the material under 40-50-lb. pressure for 1.5-2 hrs. to convert it into dextrin; (3) neutralize excess acid with $Ca(OH)_2$ until it is just slightly pinkish to both litmus and methyl orange; (4) add 10% (of the wt. of raw material) of green malt or 5% green malt + 5% *Aspergillus oryzae*, and keep at about 60° for 2 hrs. to complete the conversion to sugar. Carry out the fermentation of this material with yeast.

C. L. Tseng

Significance of the formol-protein number in judging malt. O. Menzel *Wochschr. Brau* 52, 105-9(1935), cf. *Ibid.* 44, 490(1927).—The importance of formol N is elucidated. Results show that beer from malt with high formol N tastes flat and has poor head retention. M. shows that there is no correlation between the amt. of total sol. N in wort and the amt. of formol N. The sol. of the proteins and their degradation are 2 different problems, as shown by the detailed analysis of 2 malt samples. M. shows that there is a correlation between formol no. and modification provided the protein content of the malt is within reasonable limits. The degree of modification is influenced by the protein content. The analytical results show that in case of a high formol no. the sol. N, wort-extr. N, amide N, acidity and maltose increase and the wort has a tendency to run clear. Simultaneously the difference in ext. between finely ground and coarsely ground samples and time of conversion decrease. Analysis of malt samples originating from various crops (1931-1934) are tabulated and discussed in respect to N compds. and their correlation.

S. Jozsa

Hordein content of malts. H. Lüers and O. Geiger. *Wochschr. Brau* 52, 193-5(1935).—Earlier investigations (Bishop, *C. A.* 22, 3729, 24, 1929) indicate that the hordein content of barleys ranging from 8 to 14.0% protein varies from 29.3 to 40.2% expressed in percentage of total protein. The hordein content of 33 malt samples was detd. by the method of Kiefferle and Lintner (Dissertation, München), full details of which are given. The hordein content expressed in percentage of the total N ranged from 21.85 to 34.2%. Although it varied with the protein content of malts irregularities were found because of various degrees of modification. Figures are suggested for values representing normally modified malts.

S. Jozsa

Estimation of extract in barley by the method of Lüers and Müller. R. Otto. *Wochschr. Brau* 52, 191(1935).—The use of superclastase (a product of France) is recommended by L. and M. (*C. A.* 30, 808⁹). O. suggests trying Biofase, which is of similar character and is produced in Germany.

S. J.

The present state of the protein question. P. Kolbach. *Wochschr. Brau* 52, 209-14(1935).—The various protein materials in barley and their subsequent changes during malting, mashing and brewing are discussed.

S. Jozsa

Pectin in hops. H. Fink and J. Hartmann. *Wochschr. Brau* 52, 221(1935).—The presence of pectin was detd. by digesting hops with 10-15 times their weight of 1% H_2SO_4 at 4 atm. in an autoclave. The presence of galacturonic acid was then detd. For the estn. the material was first extd. with $EtOH$ and ether. The air-dried residual matter was boiled with 0.01 N citric acid for 24

hrs. under reflux, the filtrate concd. *in vacuo* and the pectin pptd. in the form of its Ca salt. The quantity of pectin found was about 2% of the extd. matter. The above method gave neg. results on barley and malt. The possibilities of the importance of the presence of hops are emphasized.

S. Jozsa

The flavor of soy. I. Kenjuro Shōji. *Bull. Inst. Phys.-Chem. Research (Tokyo)* 14, 872-7(1935).—In general, the aromatic substances of soy are composed of $AcOH$, $Me(C_2H_5)_2COOH$, C_2H_5COOH , $AmOH$, hexyl and higher alcs., phenolic compds., aldehydes and ketones, the phenolic compds. being the most important constituents.

K. Konda

"After-dinner" wines. I. Astruc and A. Castel. *Ann. fals.* 28, 599-604(1935).—"After-dinner" wines ("vins de café") are wines which are fermented but a short time (18-24 hrs.) in vats like red wines, and then withdrawn from the marc and allowed to ferment to completion, yielding a product having the color of red wine, but characteristics more resembling those of white wines, which might lead to the conclusion that alc. had been added if they are judged according to the usual enological rules for red wines. Analyses of 6 such wines are tabulated and discussed.

A. Papineau-Couture

Effect of the extract of wine on the distillation of the volatile acids of the wine. P. Jaulmes. *Ann. fals.* 28, 590-9(1935), cf. *C. A.* 30, 808⁹.—The constituents of wine ext. have in practice but very little effect on the distn. of volatile acids and a quite negligible effect when the steam distn. method is used. Irreversible adsorption of the volatile acids by the colloids of wine seems to be of secondary importance and difficult to prove. Tartaric acid has always shown itself capable of liberating all the $AcOH$ added to synthetic mixts. A study of the compn. of the volatile acids "liberated" by the action of lime on the ext. of old wines showed that these acids are formed very largely by the action of lime on the sugars present in the wine. Defecation with lime at the boiling temp. is therefore considered to be probably useless and certainly liable to introduce serious errors.

A. Papineau-Couture

New micro method of estimating boric acid in wines. C. Sumuleanu and Gh. Chumescu. *Ann. sci. univ. Jassy* 21, 361-8(1935).—The ash of 50 ml. beer is distd. with anhyd. $MeOH$ and concd. H_2SO_4 in a special app.; the vapors are condensed and titrated with 0.01 N $Ba(OH)_2$. Boric acid in certain Roumanian wines. *Ibid.* 369-76.—Wines from 20 districts were found to contain 17.23-93.91 mg. H_3BO_3 per l. New micro method for estimating total sulfuric acid in wine, applicable to all wines. *Ibid.* 377-83.—Five ml. of wine is distd. in a special app. with 2 ml. H_3PO_4 , the vapors being entrained in a current of H_2 , the SO_2 is absorbed in KOH soln. and detd. iodometrically. New micro method for determining free sulfuric acid in wine, applicable to all wines. *Ibid.* 384-9.—By use of the same app. which was used above the vapors are absorbed in 0.02 N I soln., which does not act on entrained sulfite-aldehyde, and back-titrated with thiosulfate. Microestimation of ash and alkalinity of ash of wine. *Ibid.* 390-2.—Ten ml. of wine is evapd., ashed and weighed, and the ash is taken up in 2-3 cc. H_2O , treated with 10 cc. 0.02 N H_2SO_4 and titrated with $Ba(OH)_2$ soln. against methyl orange.

O. W. Wilcox

Microestimation of volatile acids in wines. Gh. Chumescu. *Ann. sci. univ. Jassy* 21, 306-14(1935).—Five ml. of wine is steam-distd. in a modified Parnas-Wagner app.; the distillate is titrated with 0.01 N $Ba(OH)_2$ from a buret graduated in 0.01 ml.; SO_2 is detd. iodometrically after addn. of an excess of KOH to an aliquot of the distillate and acidification with H_2SO_4 . A micro method for estimating lactic acid in wines. *Ibid.* 315-20.—One ml. of wine (decolorized if necessary with bone char) is placed in a centrifuge tube, exactly neutralized with $Ba(OH)_2$, treated with 0.5 ml. $BaCl_2$ soln. and distd. H_2O to make a total vol. of 3 ml.; 7 ml. of 96% alc. is added. The soln. is sep'd. from the ppt., evapd. with 1 ml. K_2SO_4 soln., the residue ignited to a white ash, treated with 5 ml. 0.02 N H_2SO_4 and back-titrated with $Ba(OH)_2$, this gives the total acid; subtracting the previously detd. volatile

- acid gives the lactic acid. Microestimation of malic acid in wine. *Ibid* 321-5.—Malic acid in 5 ml wine is sepd as Ba malate (insol in 70% alc), which is dissolved in hot H_2O and converted into the K salt, from which malic acid is set free by 3 ml of Pmerua reagent (1 g β naphthol in 50 ml concd H_2SO_4) and detd colorimetrically against a standard soln of aniline brown. Microcolorimetric determination of total tartaric acid in wine. *Ibid* 326-9.—Tartaric acid in 2 ml wine is pptd as K bitartrate by the Dubuque method (C A 26, 4907) and detd colorimetrically by the Underhill metavanadate method (C A 26, 2480). A microcolorimetric method for estimation of potassium in wine. *Ibid* 333-8.—The K in 25 ml wine is pptd as cobaltinitrite, washed with a 1% soln of $Al_2(SO_4)_3$, then with a 5% soln of Na_2PO_4 to bring the NO_3 group into soln for colorimetric detn in an acid soln. of salicyrine. The precision is within 1%. A new colorimetric method of determining nitrites. *Ibid* 330-2.—A soln contg 5-50 mg nitrite is placed in a 20 ml flask with 5 ml of a 5% soln of salicyrine (in a satd soln of Na acetate) and 5 ml of glacial CH_3CO_2H , and the flask is filled to the mark, after 15-20 min the color is compared with a graded series of solns contg salicyrine and $NaNO_2$. Potassium in the native wines of Roumania. *Ibid* 339-42.—Analyses of 42 wines show K content ranging 0.39-0.947 g per l. Microcolorimetric estimation of bitartrate in wine. *Ibid* 343-5.—K bitartrate is pptd from 2 ml wine with Et_2O alc mixt (2:1) and the tartaric acid is detd colorimetrically by the metavanadate method (see above). New micro method for the colorimetric determination of glycerol in wine. *Ibid* 346-51.—One ml wine, 4 ml distd H_2O and 0.5 g CaO are evapd nearly to dryness and extd with 90% alc, the alc is evapd off and the residue contg glycerol is oxidized with Br water in a sealed tube, the liquid is treated with Zn to remove Br , made up to 20 ml and filtered, 1 ml of the filtrate is treated with 1 ml of a 5% soln of pyrocatechol and 10 ml concd H_2SO_4 , heated in a sealed tube in a H_2O bath for 5 min, made up to 20 ml and compared colorimetrically with a standard soln of glycerol similarly treated. Microdetermination of calcium in wines and its proportions in the native wines of Roumania. *Ibid* 352-5.—Using the Kramer-Tisdall method on 56 wines of different years, G finds Ca contents of 37-175 mg per l. Influence of the glass apparatus in the determination of small quantities of boric acid (in wine and beer). *Ibid* 356-60.—Numerous detns showed that when Pyrex or Jena glass is used for B detn in wine and beer by distn with H_2SO_4 , the results are much too high, K glass is preferable. Microdetermination of boric acid in beer and its proportions in certain native beers. *Ibid* 393-7.—The beer ash is washed with $MeOH$ into a special flask and distd as usual after addn of H_2SO_4 , H_2BO_3 in Roumanian beers varies from 16-14 to 47-34 mg per l. similar analyses of Polish and Czechoslovakian beers show 2.97-7.13 mg per l. O W W.
- Report on beer analysis for March and April, 1935. *I Anker Wochschr Brau* 52, 182-3(1935), cf C A 30, 808⁸.—Report on 112 beer samples. S Jozsa.

- Changes in metabolism of a pure yeast culture in case of repeated pitching. E. Schuld and R. Weber. *Wochschr Brau* 52, 161-5(1935).—Various pure yeast cultures were used in lab and practical expts. The results are tabulated showing apparent ext, apparent attenuation, pH , total and volatile acidity, esters, total N, formal N and yeast crop. The results show that the physiol condition of the yeast affects but slightly the compn of beer. The greatest deviation is noted in esters, which is, however, compensated during storage. The reason for using in the brewhouse a new pure yeast culture after 5-8 pitchings is merely a safety measure to avoid possible infection and assure uniform quality of the beer. S Jozsa.
- Food yeast from wood-sugar solutions. II Hermann Fink, Richard Lechner and Eugen Heinisch. *Biochem Z* 283, 71-82(1935), cf C A 29, 8226⁹.—Expts were carried out on the cultivation of *Torula utilis* in wood-sugar malt contg NH_4 salt as the sole N source. The synthesis of protein on this artificial medium varies with the method of culturing but also with the compn of the wood-sugar malt. Best results were obtained with wood sugar prep by the Bergius method. S Morgulis.

- Wort. Heini I. Waterman and Franciscus A. M. J. S. van Waesberghe. *Brit* 439,436, Oct 10, 1935. Wort is produced by boiling milk products, sugary substances and hops or hop substitutes, and may then be fermented by yeast to yield a beverage. In an example, skimmed milk, cane sugar, sol starch, didd malt coloring and hops are boiled with H_2O , cooled, filtered and fermented with brewer's yeast at 10° for 2 days and then at 4° for 4 days.
- Clarifying beer. Justin Erwin Pollak and Chemische Werke Marnefeld A.-G. *Brit* 435,706, Sept 19, 1935. Addn to 393,142 (C A 27, 5845). In clarifying beer as in 393,142, dry wood meal, fragments of a pitch and paraffin mixt, or two disks of pitch, about 3 mm in diam with a small central protuberance on 1 side, are introduced to the surface of the wort or beer. They sink slowly and thus clarify the liquid.
- Yeast. A M Malkov. *Russ* 37,668, July 31, 1934. Molasses is heated to boiling in the presence of Fe filings and H_2SO_4 , sepd from the ppt, treated with water, superphosphate and yeast, and after fermentation has begun (NH_4) $2SO_4$ soln is gradually added. After fermentation is complete, a current of air is introduced.

17—PHARMACEUTICALS, COSMETICS AND PERFUMES

W O SMITH

Chemical composition of sweet basil oil from Virginia F. K. Nelson and M. S. Lowman. *Am. Perfumer* 31, 69 (1935).—Oil distd. from the whole fresh flowering herb (*Ocimum basilicum* L.) gave the following results: d₄²⁰ 0.9123, n_D²⁰ 1.4875, ester value (as linyl acetate) 1.51%, alcs. (as linylal) 65.3%, methoxyl 8.05% (as methyl-chavicol 38.15%). Small amts. of cineole, eugenol and sesquiterpenes are present. A very small amt. of a d. rotatory terpene may be present. Philip D. Adams.

Materials and manufacture of hand preparations Maison G. de Navarre. *Am. Perfumer* 31, 71 (1935).

Oil of parsley Ernest S. Guenther. *Am. Perfumer* 31, 73 (1935).—Oil distd. from leaf material (without seeds) gave a yield of 0.044% and had the following consts: d₄²⁰ 0.911, [α]_D²⁰ 0°, n_D²⁰ 1.4623, acid value 1.4, ester value 8.9, ester value after acetylation 44.8. The oil is insol. in 90% EtOH, but sol. in 96% with opalescence. Presence or absence of seeds on leaf material changes the rotation from d- to leaf material to l- with seed material present. Philip D. Adams.

Chaulmoogra and related oils H. M. Langton. *Pharmaceuticals and Cosmetics* 1935, 149-50.—A brief review of early research on chaulmoogra oils and their present-day therapeutic use. Philip D. Adams.

Calamine in pharmacy and cosmetics I. J. Bolton. *Pharmaceuticals and Cosmetics* 1935, 153-4.—A discussion with formulas of the uses of calamine (ZnCO₃) in lotions, liquid face powders, liniments and ointments, mud packs and complexion clays. Philip D. Adams.

Cobalt in cosmetics H. Stanley Redgrove. *Pharmaceuticals and Cosmetics* 1935, 155-6, cf. C. A. 30, 573.—A brief review of the toxicology of Co, the use of Co blue and Co green as cosmetic pigments and Co salts as hair dyes. Philip D. Adams.

The alkaloids of Han-fang-chi H. Hanfangchin B. Chih-Fang Hsu. *J. Chinese Chem. Soc.* 3, 375-71 (1935).—The filtrate from hanfangchin A (C. A. 29, 7579) is evapd. and treated with C₆H₆ and the insol. material extd. with Me₂CO. The resulting hexagonal crystals, when recrystd. from 95% alc., yield colorless prismatic crystals, hanfangchin B, C₁₆H₁₇N₃O₄, m. 241-2°, [α]_D²⁵ +272°. Hanfangchin B is a tertiary base with no phenolic hydroxyl, nitrosoamine, methylenedioxy or carbonyl group; it appears to contain 2 double bonds, 2 -NMe groups and 4 -OMe groups. Wm. H. Adolph.

A preliminary study of cultivated Stramonium Pin-Nien Tsou and Szu-Yi Chen. *J. Chinese Chem. Soc.* 3, 372-6 (1935).—An analysis of *Stramonium* cultivated in Shanghai shows: ash 15.18, alkaloids 0.195%.

Note on the distribution of alkaloids in *Ephedra sinica* (Ma-huang). M. Tarlé. *J. Chinese Chem. Soc.* 3, 377-80 (1935).—Chinese physicians consider that different parts of the plant have different therapeutic properties. In the young herb the total ephedrine alkaloids are distributed almost evenly between pith and outer stem wall. In the ripe plant, the pith contains considerably more than the outer wall. Wm. H. Adolph.

Fermentation of cigar tobacco Ya V. Fum. *Tabac-naysa Prom.* 1935, No. 4, 27-30.—Cigar tobacco, when subjected to fermentation in stacks, shows signs of insufficient fermentation in the upper layers and it is heat-damaged in places where access of air is too limited (in the center of the stack).

The industry of essential oils and their derivatives in Italy and its recent progress Francesco La Face. *Boll. ufficiale staz. sper. ind. essenze e deriv.* 10, 127-41 (1935).—A review.

Artificial Agurumen oils. Alfons M. Burger. *Riesch-stoff-Ind.* 10, 195-6 (1935).—The artificial bergamot, lemon, orange (Portugal), mandarin and neroli oils are discussed.

The preparation of pharmaceutical sodium phosphate

[Na₂HPO₄, 12H₂O] Vincenzo Paolini. *Gazz. chim. ital.* 65, 624 (1935).—Treatises on pharmaceutical chemistry give the following reaction: Ca₃(HPO₄)₂ + 2Na₂CO₃ → 2Na₂HPO₄ + CaCO₃ + CO₂ + H₂O, whereas Leloux and Courtois (*Traité de pharmacie chimique*, 1929, C. A. 23, 1307) give the reaction 3Ca(H₂PO₄)₂ + 4Na₂CO₃ → 1Na₂HPO₄ + Ca₂(PO₄)₂ + 4H₂O + 4CO₂, and long ago Dextrin and Trebault (*Bull. soc. chim. Paris* 27, 499 (1877)) showed that no CaCO₃ is formed. Expts. by P. show that the reaction is not a double decomposition, and if Na₂CO₃ is replaced by another base, e. g., NaOH or NH₄OH, Na₂HPO₄ or (NH₄)₂HPO₄ is formed, the medium becomes alk., and Ca₂(PO₄)₂ is pptd. because the conditions necessary for the formation of Ca₂(PO₄)₂ from Na₂HPO₄ or (NH₄)₂HPO₄ and a sol. Ca salt exist. Na₂HPO₄ can be prepd. advantageously from Na₂CO₃ and CaHPO₄. Though the latter is only slightly sol. in cold water, in boiling water it decomposes: thus 4CaHPO₄ → Ca₂(PO₄)₂ + Ca(H₂PO₄)₂. Ca(H₂PO₄)₂ then reacts with Na₂CO₃. Com. CaHPO₄ can be obtained in grades of high purity, so that the resulting Na₂HPO₄, 12H₂O is a pure grade.

C. C. Davis. Anesthetics, especially cocaine and procaine, in relation to illicit traffic C. Offerhaus and C. G. Haert. *Pharm. Weekblad* 70, 506-16, 525-39, 617-31, 675-67, 826-43, 973-97, 1125-37, 1193-1201, 1278-1311, 71, 666-75, 817-23, 1070-3, 1337-42, 1361-70, 1401-8, 72, 822-40, 861-8, 1411-35, 1413-64 (1935-1935) (English summary, 1462-4).—The history, pharmacology, fluorescence, capillarity, optical rotation and photomicrographs of a large no. of local anesthetics and their salts are discussed. The most characteristic test for cocaine is the chloroplatinate, clearly recognizable at a diln. of 1/8000. No other anesthetic gives the same type of feathery crystals. Treatment with HClO₄ converts cocaine into a resin from which other substances can be washed out, then the resin is dissolved in HCl and identified with PtCl₄.

A. W. Dor. Optical crystallographic study of some derivatives of barbital and phenobarbital. Martin E. Hultquist and Charles F. Poe. *Ind. Eng. Chem., Anal. Ed.* 7, 308-9 (1935).—Chem. tests are not entirely satisfactory for the identification of some barbituric acid derivs., notably those of barbital and phenobarbital, for which optical crystallographic data are given and which can be useful in the identification of these 2 medicinal substances. The following derivs. of barbital (I) and of phenobarbital (II) have been prepd. and described: bis(o-bromobenzyl)-I, thick rods, m. 140° (tube), 141° (block); m-isomer, thin plates, m. 91°, 90°; p-isomer, flat rods and plates, m. 140°, 147°; o-chloro analog, long rods, m. 127°, 125°; m-chloro isomer, thin plates, m. 102°, 100.5°; p-chloro isomer, flat rods and plates, m. 142°, 144°; p-iodo analog, rods and thick plates, m. 122°, 123°; m-nitro analog, long needles, m. 154°, 160°; p-isomer, needles and rods, m. 102°, 103°; diphenacyl-I, flat rods and plates, m. 191°, 192°; bis(p-bromophenacyl)-I, rods, m. 191.5°, 193°; bis(o-bromobenzyl)-II, short rods, m. 116°, 113°; m-isomer, thin plates, m. 130°, 130°; p-isomer, thin plates twinned, m. 117°, 118°; m-chloro analog, thin plates, m. 111°, 111°; p-isomer, 2 forms of crystals, thin plates twinned, m. 111°, 111°, and thick plates, m. 113°, 114°; p-iodo analog, thick plates and rods, m. 127-8°, 127°; m-nitro analog, flat rods and plates, m. 149.5°, 151°; p-isomer, rods and needles, m. 182.5°, 184°; bis(p-bromophenacyl)-II, rods and needles, m. 164°, 167°. In general, these compds. were obtained by refluxing equiv. amts. of barbital or phenobarbital and K₂CO₃ or Na₂CO₃ dissolved in a little more than enough boiling H₂O to make a satd. soln., and a soln. of benzyl or phenacyl halide (2 mol. quantities) in an amt. of alc. twice as large as the amt. of H₂O used to dissolve the barbituric acid salt.

W. O. F. Effect of hot solvents on ergot—effect of storage on the activity of ergot. R. F. Corran and F. E. Rymul. *Quart. J. Pharm. Pharmacol.* 8, 377-9 (1935).—P₂O₅, C₂H₅Cl,

$C_6H_5Cl_3$ and C_6H_5 ext the major portion of the alkaloids, light petroleum does not ext them. With CH_2Cl_2 and C_6H_5 , quant. recovery of the alkaloids was effected, thus the alkaloids are extd and not destroyed by these solvents. W O E.

Properties of glycols—use of propylene glycol as a solvent in pharmaceutical preparations C L M Brown *Quart J Pharm Pharmacol* 8, 390-7(1935)—Attention is directed to the toxicity of p -dioxane and $C_6H_5(OH)_2$. In assaying $C_6H_5(OH)_2$ (I) galenicals involving the use of Et_2O or $CHCl_3$ for extn., the galenical should be diluted with at least $1/4$ its vol of H_2O . Solns of certain alkaloids in I can be freely diluted with H_2O without pptn. I tends to mask the reaction of certain alkaloidal reagents, notably picric and tannic acids. Phenolphthalein can be dispensed in soln in therapeutic doses. The halogen salts of Na and K are very sol in I, as are also dyes, I would therefore be a suitable preservative, notably for syrups. It is a solvent for most volatile oils, and may function as a suitable menstruum for tinctures (especially senega) owing to its non-volatility, its solvent powers, miscibility with H_2O and $EtOH$, and its preservative action. I considerably retards the volatilization of $EtNO_3$ and may conveniently replace $EtOH$ in sweet spirits of niter. W O E.

Assay of quinine in iron and quinine citrate and quinine salts J S Toal and A J Jones *Quart J Pharm Pharmacol* 8, 401-5(1935)—Evaluation of quinine in Fe and quinine citrate by wt differs from evaluation by titration. This difference is due in part to the loss of basicity in the quinine which is effected during the manu. of the scales. This loss of basicity in quinine may be brought about in the process of assay unless special precautions are taken. Et_2O and $CHCl_3$ are not interchangeable in the assay if the final result is to be the wt of dried residue following simple evapn of the solvent. A suggestion is made to standardize the upper limit for the assay of Fe and quinine citrate by wt, and the lower limit by titration. W O E.

Flue-cured tobacco. Natural aging of flue cured cigarette tobaccos L F Dixon, F R Darks, F A Wolf, J A Hall, E P Jones and P M Gross *Ind Eng Chem* 28, 180-9(1935), cf C A 29, 8230*—The aging, under industrial conditions, of the 6 main types of flue-cured cigarette tobacco for 3 successive crops was studied for 30 months. Environmental conditions in these tobaccos were not favorable for the activity of bacteria and molds and it is believed that these agencies played a very minor part in the aging process. Little self heating occurred. Small amts of CO_2 , $AcOH$, HCO_2H and NH_3 were evolved during aging. Decreases in sugar, total N, water-sol N, amino N, nicotine, total acids and pH took place during the 30 month period. It is probable that the aging process is essentially chem., the main reaction being that between sugars and amino compds. with the formation of melanoidins and CO_2 . L E Gibson.

New medicaments F Zernik *Deut med Wochschr* 61, 178, 247, 1004, 1288, 1816(1935)—A brief description of drugs introduced in Germany during 1935. A G.

Combined iodine in iodine ointment D Henville *Analyst* 61, 27(1936)—In making I₂ ointments much of the I₂ is lost either by volatilization or by combining with the paraffin base. Some ointments contain no free I₂. W T H.

Determination of elemental sulfur in sulfur ointment. H R. Fleck and A M Ward *Analyst* 61, 28-30(1936) McLauchlan and Mathews (*Analyst* 35, 610) have compared their method of detg. free S with that of F and W. (*Analyst* 48, 199(1922)) but it is shown here that there is the possibility of some of their values being a little too high. W T H.

Psyllium seed from Cyprus Anon. *Cyprus Agr J* 29, 98-9(1934)—The samples contained H_2O 8.3-11.5 and oil 4-7.0% and had swelling factors of 14.0-17.5. The seed compared favorably with com. Spanish and French seed. K D Jacob.

Paraldehyde and other preliminary hypnotics Albert H. Miller. *Anesthesia and Analgesia* 15, 14-21(1936)—A comparison of paraldehyde with barbitalure, avertin,

morphine, with and without atropine, as a preanesthetic.

G. H. W. Lucas.

The methyl index of some balsams, resins and drugs of animal origin. M M Janot and S Sabatay. *Bull. sci. pharmacol* 42, 529-32(1935)—The Me index is the quantity of Me expressed in mg. developed by 1 g. of substance when heated with HI. The value for balsam of Peru varies between 19.5 and 22.8, solid balsam of Peru has an index of 31.9-32.8. The index for a no. of other substances is reported. The general use of the Me index for characterization of this group of substances is recommended. A E. Meyer.

Evaluation of mercurial antiseptics in the presence of serum Dorothea E. Smith, E. J. Czarnetzky and Stuart Mudd. *J. Bact* 31, 7-8(1936)—Serum binds metaphen, merthiolate and HgCl₂ so that they are ineffective for intravenous use. John T. Myers.

A practical evaluation of antiseptics for use in oral hygiene. M A Jacobson *J. Bact* 31, 9(1935)—Depending on the antiseptic dilns of 1, 2, 1, 3, 1, 4, etc. (each 5 cc. contg. 1 cc. of sterile saliva) killing 0.5 cc. of a 24-hr. broth culture of *Staphylococcus aureus* in less than 1 min. exposure are claimed to have 2, 3 or 4 antiseptic units, resp. John T. Myers.

Bulgarian otto of roses R. Garnier and Mrs S Sabatay *Ann. fals.* 28, 585-9(1935), cf C. A. 28, 5927*—Semi-com. distns. were carried out on rose petals, segg the oil obtained directly and that obtained by redistn. of the water, and 9 analyses of the products are tabulated and discussed. Presence of $EtOH$ (in greater amts in the oil from the water than in the direct oil) was confirmed; also, that the apparent rhodinol content (detd. by hot formylation) exceeds 40 to 45%, that the rhodinol geraniol ratio is greater than 1, and that all otto of roses contains azulenogenic sesquiterpenes which are present in greater amts in direct oil than in oil from water. The following rapid method is recommended for the detn. of stearoptenes to 2-4 g. of sample in a 150-cc. Erlenmeyer flask add 50 cc. of 75% alc., heat a few min. on the water bath, immerse while stirring in an ice-water mixt., filter under suction on a Tramm funnel through a tared filter paper dried at 75°, wash with 200 cc. of 75% alc. and dry to const. wt in a crystg dish at exactly 75°, dissolve in a little $CHCl_3$ and add a few drops of a 5% soln. of Br in $CHCl_3$, there should be at most a slight green coloration showing the presence of not more than a trace of azulenogenic sesquiterpenes. A Papineau-Couture.

Opium assay Joseph Rosin and C J. Williams *J. Am. Pharm. Assoc.* 24, 1053-62(1935)—A study of the lime method of opium assay for morphine (I). Dissolving the I obtained in hot MeOH before titration eliminates (on the basis of I content) about 2% of foreign titratable substances called as I. Assays of pure I by the U S P and B P methods confirmed the "assay loss" of practically 1 mg. of I per cc. of lime-I soln. as indicated in the B. P., the "loss" fluctuating somewhat unless definite and uniform conditions are maintained in the assay. About half the loss is attributable to the soly. of I in the assay solvents, the greater part (if not all) of the balance is caused by the solvent action of the NH_4Cl on I, adsorption on the lime may be responsible for a small portion of the loss. Increasing the quantity of NH_4Cl used or the temp. during pptn. of I increases the loss. It is recommended that: (1) in the U S P assay the quantity of NH_4Cl be reduced from 1.0 to 0.5 g., which is several times the theoretical quantity required for a 15% opium, (2) the pptn. temp. (standing overnight) be restricted to about 10°. Satn. or near-satn. of the lime-I soln. with NaCl before adding NH_4Cl raises by 1-2% the quantity of I pptd., but also increases cc. pptn. of other alkaloids. The I pptd. in the U S P assay (and probably also in other assays) carries about 3% of non-phenolic by-alkaloids which is counted as I. Since opium contains also other alkali-sol. non I alkaloids, these, if present in appreciable quantity, may also produce high results for I. By coincidence of counterbalancing error factors, the U. S. P. assay seems to indicate very close to the true I content. A P-C.

The action of alkalies and alkali salts on antipyrine.

Lloyd E. Harris and Fredd D. Tebow. *J. Am. Pharm. Assoc.* 24, 1069-70 (1935).—On addn of antipyrine to concd. solns. of alkalis or alkali salts there seps an immiscible liquid, which disappears on diln of the mixt with H_2O , or which on standing gradually changes to a cryst. substance identified as antipyrine. The immiscible liquid is believed to be an isomeric form which changes to the usual cryst. form on standing. A. P. C.

Phytochemical notes CXII. The sterols of *Achillea millefolium* Ole. Givold. *J. Am. Pharm. Assoc.* 24, 1071 (1935), cf. C. A. 29, 3805³, 4196⁴.—The unidentified sterol, in 134-5°, giving an acetate m. 123-4°, found by Graham in milfoil (C. A. 28, 3185³), is shown to be a mixt. of stigmasterol and a stosterol in which the latter predominates. A. Papineau-Couture.

Comparison of spectrometric method and antimony trichloride test for estimation of vitamin A potency. W. S. Jones and W. G. Christensen. *J. Am. Pharm. Assoc.* 24, 1072-4 (1935).—Cod-liver oils which had been tested biologically for vitamin A potency were subjected to the $SbCl_3$ test in 1 lab., and to the spectrometric method in 2 labs. With one exception the $SbCl_3$ test gave values in fair agreement with those of the bio. assays. By the spectrometric method, with one exception the values for oils of high potency were in reasonable agreement with those of the bio. assays, but for oils of low potency the variations were considerably greater. A. P. C.

Compound solution of cresol—variation of phenol coefficient when different oils are used for saponaceous base. P. L. Burrin, A. G. Worlton and F. E. Bibbins. *J. Am. Pharm. Assoc.* 24, 1077 (1935).—Several oils (corn, soybean, coconut, linseed) will make a satisfactory compd. soln. of cresol. Peanut and sesame oils are not desirable for use in such a product. Coconut oil is the only one of the group that can be used to manuf. a satisfactory product which at the same time shows an increased PhOH coeff., and for this reason it may be desirable as a base for this prepn. It seems that there may be oils more desirable for this purpose than linseed oil which is now prescribed by the U. S. P. A. Papineau-Couture.

Improvement in technic in the preparation of three common products. Edward D. Davy. *J. Am. Pharm. Assoc.* 24, 1079-81 (1935).—The following changes are suggested for facilitating the prepn. and improving the following products: *Sirup of white pine compd. N.F.*—To correct the excessive sassafras oil residue in this sirup, if the oil is added to the menstrum the excess is retained by the drug and satn. is all that should be expected. *Lixir phenobarbital.*—Filtration difficulty is avoided by macerating the cudbear in alc., glycerol and H_2O in approx. the same ratio as is represented in the finished product, the phenobarbital is dissolved in a small amt. of alc. reserved for this purpose and added to the clear filtrate from the cudbear. *Sapo molles U. S. P. IX.*—Dissolve the alkali in H_2O (10% of the wt. of finished soap) and immediately add all the oil and stir well, stirring the mixt. at intervals to emulsify the unsapon oil is all that is necessary for sapon. Occasionally when working with small quantities and always when working with 500-800 lb. or more the H_2O content must be increased by about 20% as sapon. approaches completion. A. Papineau-Couture.

Advances in disinfectants in 1935. Emil Klarmann. *Soap (Sanitary Products Sect.)* 12, No. 1, 95, 97 (1936).—A review of testing methods and effectiveness of different types of materials and ultraviolet rays as disinfectants. Twenty-six references. Henry H. Richardson.

The phenol coefficient as a measure of the practical value of disinfectants. Jack C. Varley. *Soap (Sanitary Products Sect.)* 12, No. 1, 101, 103, 121 (1936).—Coal tar or cresol type disinfectants when dild. to 20 times their phenol coeff. are equally effective in killing several types of pathogenic microorganisms. V. claims the phenol coeff. when used in this way is a suitable measure of these disinfectants. Five references. Henry H. Richardson.

Hexargin. J. K. Gjaldbaek. *Arch. Pharm. Chem.* 42, 615-22 (1935).—*Hexargin* (I), a substitute for the prepn. which is distributed under the name *argolalol* (II) was prepd. from 11 g. 10% $AgNO_3$ soln. (III) and 98 g. filtered

40% $(CH_3)_4N_4$ soln. (IV) by shaking III with 20 g. IV and then adding the remaining amt. of IV; it has sp. gr. 1.01. It should be kept in properly closed bottles, protected from light. Its identity with II was established by electrometric titrations with 0.1 N NaCl and 0.1 N KI; the cell $Ag | 0.01 N AgNO_3, 0.03 N KNO_3 | 3 mol. KNO_3, 0.45 mol. NaNO_3 | I$ or $II | Ag$ was used. The results are given in tables and illustrated graphically. The therapeutic effects of I and II were also identical. The Ag ions of I are present mainly in complex combination with $(CH_3)_4N_4$ (V). The equil. between the Ag ions, V and the $Ag-V$ ions shifts and occurs instantaneously. By the consumption of Ag ions the $Ag-V$ ions therefore cleave off Ag ions and I thus acts as a Ag -ion buffer. It is noteworthy that the concn. of the Ag ion increases by diln. with water because 1 Ag ion is combined with 2 mol. V (cf. Pawelka, C. A. 18, 3553). The equil. between $Ag-V$ ion, Ag ion and V is illustrated by $AgV_1^+ = Ag^+ + 2V$, the mass action equation for which is $a_{Ag^+} a_{V_1^+}^2 / a_{AgV_1^+} = 10^{-11}$, or $a_{Ag^+} = 10^{-11} (a_{AgV_1^+} / a_{V_1^+}^2)$, the concns. (z) being considered equal to the activities (a). The latter equation shows that the concn. of Ag ion is proportional to the content of Ag because Ag is present mainly as $Ag-V$ ion, but the fact that the Ag -ion concn. also is inversely proportional to the square of the concn. of V explains that the Ag -ion concn. of I increases by diln. with water. Excepting very dil. and very concd. solns. a diln. with equal parts of water will double the Ag -ion concn. The Ag -ion concn. in I itself is very small and can be calcd. approx. according to $0.239 = 0.0577 \log(10^{-1/x})$, where 0.239 is the voltage measured by a cell consisting of the 2 half-electrodes Ag/I and $Ag/0.01 N AgNO_3$. According to this equation the Ag -ion concn. (x) in I is $10^{-4.8}$ (cf. C. A. 23, 4298). To det. the $AgNO_3$ in I weigh 25.00 g. I in an Erlenmeyer flask, dil. with 50 cc. water and acidify with 20 cc. HNO_3 . Add 5 cc. ferric NH_4 sulfate soln. and titrate with 0.1 N NH_4CNS . One cc. 0.1 N NH_4CNS corresponds to 0.01699 g. $AgNO_3$. D. Thuesen.

Peppermint oils. Ernest J. Parry and George Ferguson. *Chemist and Druggist* 124, 37 (1936).—For 23 English oils, 50 American and 6 Kenya oils, results of the detn. of sp. gr., n, [α]_D, esters as $AcOMe$, total menthol and menthone are tabulated. In 13 samples of English oils from the same plant, distd. between 1927 and 1935, menthol varied from 42 to 64%, menthone from 29 to 42% and esters from 2.3 to 6.2%. The other English oils, mostly of 1935, the American (1934-5) and the Kenya oils contained, resp., menthol 52.2-64.9, 46.8-61.7, 52.7-60.3%, menthone 22.0-32.7, 16.9-30.8 (in 17 samples), 10.0-13.7%; esters 3.1-10.1, 4.5-11.0, 24.1-33.3%.

S. Waldbott.
Determination of oxydimorphine. R. Drevon. *J. pharm. chim.* 22, 97-106 (1935); cf. Leulier and Dubreuil, C. A. 20, 1826, L. and Drevon, C. A. 26, 3839.—The reagent is pure H_2SO_4 (d. 1.830) 20 cc., with Ac_2O (98-99%), 1 cc. A mixt. of 2 cc. reagent and 0.05 mg. alkaloid (I) applied in the form of the silicotungstate ppt. gives a characteristic green color of max. intensity, with max. absorption band in the red and orange at 6355 Å. Into a 15-cc. centrifugal tube (cleaned with chromate mixt.) put 5 cc. soln. of I, add 5 drops 5% aq. silicotungstic acid soln. and 0.03 g. $KHCO_3$. Put the tube for 30 min. into melting ice, then mix with 1 drop of gelatinous $BaSO_4$ (radio-graphic type), centrifuge for 3 min. (3000 r. p. m.), again add 1 drop $BaSO_4$ mixt., rotate for 3 min. and pour off the clear liquid. Dry the inside walls with paper, cool again and add exactly 2 cc. freshly pptd. and cooled reagent. Stir up the clot with a glass rod; $BaSO_4$ and I dissolve. After 30 min. at ordinary temp. compare the tint in a Baudouin and Besnard colorimeter with standards made up either from known quantities of I, or from an adjusted scale of tints prepd. with solns. of nitrates of Cu, Ni and Co. The best conditions are obtained when 5 cc. of soln. of I contains 0.4-0.10 mg. I, but the reaction is still pos. at a concn. of 0.03 mg. I per 5 cc. The expl. error is ±5%.

S. Waldbott.
Quinidine thiocyanate; gravimetric and volumetric determination of quinidine. R. Monnet. *J. pharm.*

chim 22, 112-19(1935) —The detn of $C_{10}H_{15}N_3O_2$ (A) in cinchona preps is usually based on the low soly. of HI A in H_2O (1:1250 at 15°). M recommends in its place the HCNS A salt (B) which is less sol in H_2O (1:1477 at 20°). soly is further decreased by excess of KCNS or $(NH_4)CNS$ used in its prep. or in its detn by wt. To an aq soln of a basic salt of A, neutral to litmus and contg. not more than 0.20 g A, add excess of KCNS, filter, wash first with a little H_2O , then with a satd aq soln of B, dry at 120° and weigh. In the presence of other cinchona bases, whose HCNS salts are more sol in H_2O and in alc than B, the same method can be used if a 3rd washing with 6×1 cc 96% alc satd with B is applied. Similar ppts with KCNS are formed with emetine, papaverine, strychnine, veratrine and berberine, but none with 22 other alkaloids named, nor with digitalin, strophanthin, acetaminide, adrenaline, antipyrine, procaine, phenacetin, urea, barbital, etc. For the volumetric detn of A (use 0.15 g as nitrate or basic sulfate in aq soln neutral to litmus), evap to 20 cc, add a definite excess of 0.1 N KCNS and det this excess in an aliquot vol with 0.1 N $AgNO_3$. The gravimetric method is accurate within $\pm 1\%$, the volumetric method is rapid, but gives low results because the pptg excess of KCNS that can be used is limited S W

A new specific reaction for yohimbine M Pescz. *J pharmac chim* 22, 164-5(1935) —By warming a mixt of contg H_2SO_4 , an aq soln of chloral and a soln of yohimbine-HCl salt on the water bath, a blue color is obtained L Rossi, A del Boca and R Lobo *Ibid* 566 —The same reaction has been described before (cf C A 26, 5703) S Waldbott

Chemistry of Australian-grown tobacco N F B Hall and J C Earl *J Council Sci Ind Research* 8, 277-80 (1935) —The smoke from "good" tobaccos is slightly acid or neutral, while that from "bad" tobaccos is usually definitely alk. The N content of a good light tobacco is about 1.0-1.5% (of dry solids), that of the best samples 2.0-2.5% and that of the very bad Australian grown samples 3.0-4.5%. Analyses show that harvesting too early accounts an excessive amt of nitrogenous substances in the leaf, which are not removed during curing. About 25% of the total solids disappear during flue curing. Little of the N is eliminated, and the percentage of N in the total solids increases correspondingly. An extensive degradation of protein substance occurs during curing E D Walter

An acid ester present in the root of the Valeriana officinalis L-mil Congo *Compt rend* 201, 1152-4(1935), cf C A 29, 3770 —By fractionation of the oil obtained from the roots of the valerian, a product (I), b_p 120-22°, d_4^{20} 1.0214, $[a]_D^{20}$ 4.83°, n_D^{20} 1.43657, was obtained. Hydrolysis of I gave iso- $C_8H_{15}O_2$ and $Me_2CHCH(OH)CO_2H$, b_p 124-25°, n_D^{20} 1.43657, $[a]_D^{20}$ -1.56. Hence I must be $Me_2CHCH(CO_2H)OCOCH_2CHMe_2$ J White

Iso-Propylalcohol Council on Pharmacy and Chemistry *J Am Med Assoc* 105, 1684(1935) —Acceptance of iso-Pr alc (I) for admission to New and Nonofficial Remedies I is used for the removal of creosote from the skin as a prophylactic agent against creosote burns and has been recommended for the disinfection of the skin and of hypodermic syringes and needles and in the administration of insulin. It is not potable and should not be relied upon to destroy such spore-bearing organisms as *Clostridium tetani*, *Clostridium welchii* or *Bacillus anthracis*. Phys const and tests for aldehyde, acetone and nonvolatile content are given. A dosage form, *Saf-T-Top Iso-Propyl Alcohol*, 98%, intended solely for the removal of creosote from the skin has been prep'd C R Addnall

Barbituric acid derivatives Ernest II Volwiler and

Donalee L. Tabern (to Abbott Laboratories). Can. 354,378, Nov. 26, 1935. Barbituric acids substituted on 1 N atom and doubly substituted on the C atom by said or unsatd. alkyl groups, at least one of which is a secondary or tertiary alkyl group are prep'd by condensing the appropriate disubstituted malonic or cyanoacetic ester with the appropriate substituted urea. The products are sedative, anesthetic or soporific. Can. 354,379. Hypnotic and sedative barbituric acid derivs substituted in the 5-position by $\text{F}_y\text{CH}(\text{CH}_3)_2$, in which y is any whole no., are obtained by condensation of malonic or cyanoacetic ester derivs with urea.

Salts of organic bases Jean L. Regnier. Fr. 789,156, Oct. 24, 1935. Salts obtained by combining local anesthetic bases such as cocaine and novocaine with particular org. acids, such as phenylacetic, phenylbutyric, benzoic, salicylic, acetic, formic, phenylpropionic and cinnamic acids are found to have greatly increased action over the salts generally used.

Hydrogen peroxide products Alexander Wacker Ges. fur elektrochemische Industrie G. m. b. H. (Helmuth Muller and Franz Trinkl, inventors). Ger. 620,574, Oct. 23, 1935 (Cl. 12a 12). Solid storable H_2O_2 products are obtained by making AcONa or AcOK into a paste with aq. H_2O_2 soln and evaporating *in vacuo* at 60–70°. The product is used as a disinfectant. Examples are given. Cf. C. A. 29, 859⁴.

Cosmetics George H. H. Hardy. Fr. 789,252, Oct. 25, 1935. A cosmetic suitable for painting the lips comprises one or more aniline dyes, e. g., eosin, and a solid powder such as chalk or kieselguhr.

Massage composition U. S. Industrial Alcohol Co. Fr. 788,511, Oct. 18, 1935. A semisolid compn. contg. more than 85% by wt. of EtOH and which becomes liquid by slight friction with the skin is made by adding a gel-forming agent, such as an alkali salt of a higher fatty acid, and a normally solid wax or waxes, such as carnauba wax, to EtOH . Paraffin, lanolin and a fat glyceride may also be incorporated.

Estrogenic substances Schering-Kahlbaum A-G. Brit. 437,051, Oct. 23, 1935. These are extd. from the tubers of *Butea superba* by means of volatile solvents, e. g., FlOH , MeOH , Me_2CO . Cf. C. A. 29, 7022².

Hormone extracts Schering-Kahlbaum A-G. Ger. 620,990, Oct. 31, 1935 (Cl. 12p 17 10). Crude exts. of genital-gland hormones are refined by treatment with an acylating agent, preferably in the presence of an indifferent solvent, sepp. the esterified from the unesterified constituents, and saponifying the hormone-ester mixt. The acetylation may be carried out by means of acid halide and a HCl -binding agent. Thus, a crude ext. from male urine is dissolved in toluene and treated with a soln. of toluene-sulfonyl chloride in toluene and with pyridine. After the pyridine- HCl is filtered off, the toluene is distd. off and the residue sepd. by fractional crystn. or extn. to obtain the toluenesulfonic acid ester of the hormone, which is saponified to give an oily product. Another example is given. Cf. C. A. 30, 575⁴.

Vitamins Charles W. Hooper (to Winthrop Chemical Co.). Brit. 436,713, Oct. 16, 1935. Vitamin D preps. are produced by dissolving an antirachitic vitamin D in a propanediol, preferably 1,2-propanediol.

Ergot alkaloids Chemische Fabrik vorm. Sandoz. Fr. 788,812, Oct. 18, 1935. Ergot alkaloids are sepd. and prep'd in the pure state by subjecting solns. of ergot alkaloids to a chromatographic adsorption according to the method of Tawett in indifferent solvents. The crude exts. or solns. of alkaloids are dissolved in indifferent solvents such as C_6H_6 and its homologs, CHCl_3 or dichloroethylene, and the solns. are passed into a column contg. adsorbent insol. in the solvents used, e. g., sugar, Al_2O_3 , CaO , CaCO_3 , fibrous Al_2O_3 , etc. By diffusion of the soln. in the ad-orbent column there appears a chromatogram visible to ultraviolet light. Examples are given of the sepn. of ergotamine and ergotamine, ergotoxin and ergotamine and the constituents of sensibamine.

Insecticides Roger C. Ancelet. Fr. 789,205, Oct. 25,

1935. A compn. to be applied to the skin as a protection against mosquitos contains citronella oil, geranium oil, menthol, chloral hydrate, crystal. quassian and alc.

Antiparasitic charge for gun cartridges Otto V. Huffman. U. S. 2,029,217, Jan. 21. An explosive is formed into a unitary mass with a binder and an antiparasitic material.

Antianemia preparation William J. Horn (to McKesson & Robbins Inc.). Can. 355,214, Jan. 7, 1936. The principal ingredients of the prepn. are an Fe deriv. of protein, such as Fe peptonate, and a Cu deriv. of protein, such as Cu caseinate. The Cu deriv. acts as a catalyst for the action of the Fe in the hemoglobin regeneration.

Antianemia substance George B. Walden (to Eli Lilly and Co.). Can. 354,430, Nov. 26, 1935. To stomach and liver tissues are added Fe and vitamin B. 1 g., 10 lb. of whole stomachs are mixed with 20–100 lb. of minced livers, dried and digested under acid, e. g., HCl , at a temp. below 40°. H_2O and fats are removed from the material. To the mixt. is added 1–10 lb. of reduced Fe and 1000–30,000 vitamin B complex.

Colloidal copper-containing composition for treating anemias John Torjangan (to Drug Products Co.). U. S. 2,028,575, Jan. 21. Colloidal Cu hydroxide is carried in suspension in an aq. soln. of an org. hydroxy acid salt such as gluconic acid or Na gluconate.

Sera for treatment of malignant tumors I. G. Farbenindustrie A-G. Brit. 436,292, Oct. 4, 1935. Preps. are obtained from the organs, bone marrow or body fluids of animals that have been inoculated with fresh virulent tumor cells, or with exts. or pressed juices thereof prep'd according to Brit. 366,503 (C. A. 27, 3037), but have remained tumor-free. Exts. or pressed juices of the glands or other organs may be obtained, the exts. by means of H_2O , aq. salt solns. or org. liquids, which preferably contain H_2O . The solns. obtained may be purified by addn. of solvents, e. g., alc., Me_2CO , Et_2O , to ppt. impurities or by addn. of adsorbents, e. g., $\text{Al}(\text{OH})_3$, active charcoal, to remove ballast substances.

Therapeutic camphor-group tetrazoles Karl F. Schmidt (to E. Bilhuber, Inc.). U. S. 2,029,709, Feb. 4. By treating camphor with at least 2 mols. of hydrazole acid in the presence of a catalyst such as SbCl_5 or SnCl_4 , camphortetrazole, m. 242–3°, is obtained. Mired-a- and β -thuyones and pure β -thuyone similarly form tetrazoles m. 86° and 93–5°, resp. Purification of the products may be effected by recrystn. of their double HCl compds. and either racemic or optically active forms of the products may be produced, both having therapeutic anesthetic effects relatively free from paralyzing properties. Several examples with details and modifications of procedure are given.

Medicinal products from chlorophyll and its derivatives Syngala Fabrik fur chemisch-synthetische und galenische Arzneimittel G. m. b. H. Brit. 436,701, Oct. 14, 1935. Tonics are obtained by treating chlorophyll, porphyrins or like complex compds. derived therefrom, with reagents yielding ions of both Cu and Fe. The products may be filtered and washed, e. g., with dil. acid and alc., and then dispersed in an inert liq., e. g., H_2O or an oil, by, e. g., treatment in a colloid mill and (or) with the addn. of an emulsifying agent, e. g., gum arabic or gelatin. They may also be dispersed in fats with lecithin as dispersing agent. Alternatively, dispersions of the crude products may be made by adding an emulsifying agent to the reaction mixt. In an example, an alc. chlorophyll soln. is treated with a soln. of FeCl_3 and CuSO_4 acidified with HCl and the mixt., heated, the ppt. contg. 2% Fe and 2.5% Cu being filtered off.

Tobacco Katadyn A-G. (formerly Oligodyn A-G). Brit. 436,445, Oct. 4, 1935. This corresponds to Ir. 771,194 (C. A. 29, 879³).

Tobacco treatment Bert Lowenthal (to Federal Tobacco Corp.). U. S. 2,029,494, Feb. 4. Gum, oils, nicotine and mineral matter are removed from the leaf in an acid bath contg. HNO_3 and H_2PO_4 .

Sulfur dioxide and fresh sulfuric acid from refinery
acid sludge B A Stagner *Ind Eng Chem* 28,
171-5(1936)—The H₂SO₄ in typical gasoline and kero-
sene acid sludges is converted by moderate heating into
SO₂ in yields of 93-4%, based on the acid used in refining
S in the sludge, not expelled as SO₂, remains in the coke.
The coke is neutral and readily pulverized. The SO₂ so
produced can be easily converted into H₂SO₄ catalytically.
The rate of spontaneous decompn. of H₂SO₄ to SO₂ in
cracked gasoline acid sludge is shown E M S

A summary of the lecture of Hugo Peterson, Berlin-
Stegitz, on problems of sulfuric acid manufacture by the
nitrogen oxide process Hans Schutt *IX Congr
intern quim pura aplicada, Madrid* 3, 447-57(1934)—
A review is given of the theories of the reactions and the
design of Pb chamber plants E R Rushton

The system vanadic acid-copper oxide-silicic acid as
multiple catalyst in sulfuric acid manufacture Bernhard
Neumann, Carl Kroger and Rudolf Iwanowski *Z
Elektrochem* 41, 821-34(1935)—V₂O₅, CuO and SiO₂ and
their binary and ternary combinations were studied as
catalysts for 7% SO₂ mixts in air at temps from 400° to
680°. The app has been described by Neumann,
Pauzner and Goebel (C A 23, 1219). The activity of
V₂O₅-SiO₂ mixts is directly related to the disocn pressure
of VOSO₄, an intermediate in the catalysis. The activity
of CuO-SiO₂ mixts is detd by the position of the equil
CuO + CuO·CuSO₄ = 4CuO + SO₂. The promoter
effect of CuO on V₂O₅ in their mixts is attributed to the
formation of a new solid phase with a higher SO₂ disocn
pressure. A ternary diagram is shown, relating compn
and catalytic activity of the 11 mixts studied. The
highest activity is shown by the mixts having the molar
compsns 0.4-0.6 V₂O₅, 0.2-0.5 SiO₂, 0.1-0.25 CuO

New methods for removal of pyrite cinders from burners
N A Baranov *Bumazhnaya Prom* 14, No 7, 25-33
(1935)—Improvements in the structure and operation
of mech discharge of pyrite cinders are discussed. An
exptl device for pneumatic removal and transportation
of cinders is illustrated and described Chas Blanc

Calculating chromic acid from hydrometer readings
Nothman S *Hall Platers Guide* 32, 17-18(Jan,
1936)—A table shows oz CrO₃/gal for each 0.5° from
1.5° to 36.0°Bé W H Boynton

Modern methods of producing phosphorus and phos-
phoric acid C Matignon *IX Congr intern quim
pura aplicada, Madrid* 3, 139-68(1934)—The heat
balance of the reactions, conditions of reaction, utilization
of the slags, methods of oxidizing P and the production
of H₂ are discussed. At Bex, SiO₂ is replaced by a gneiss
contn 6% K₂O, which is cheaper than sand. The product
contains K₂O 5 and H₃PO₄ 90-93% E R R

Potash from polyhalite by reduction process I
Fraas and Fverett P Partridge *Ind Eng Chem* 28,
224-30(1936)—Polyhalite was reduced in a continuous,
rotary Lulu by a mixt of CO and H₂ made from natural
gas. A temp of 830° is best. Higher temp fuses
polyhalite, lower temp slows the reaction. No K
compsds are volatilized during the reduction at temps
up to 900°. At 830°, low S corresponds about to re-
duction of MgSO₄ to MgO. CaSO₄ is reduced to CaS,
and an excess of H₂O vapor causes further S removal,
leaving some CaO. The K₂SO₄ was reduced to K₂S under

all the conditions used. About 16,000 cu. ft. of CH₄ is
required to reduce 1 ton of polyhalite E M. S

Leucite, a potash and alumina mineral V. Charrin.
Industrie chimique 22, 739-40(1935)—Acid, alk.,
and NaCl processes for the extn of K₂O and Al₂O₃ from
leucite are outlined A Papineau-Couture

Zinc as a chemical raw material I Bruce R. Silver
Chem. Industries 38, 25-8(1936). F. H.

Burning lime with gas fuel Joseph Kahn *Western
Gas* 12, No 1, 18-19, 56(1935)—The application of
off-peak gas heat to lime burning is discussed. The
presence of H in the gas is undesirable, owing to high
flame temp, short, sharp flame and nonluminosity, which
gives severe local heating W. H. Buckner

Determining gypsum and anhydrite G. Bushinskii
Mineral'nue Udobreniya Insektifungitsidus 1, No 5,
98(1935)—The presence of gypsum and anhydrite in
their mixts can be detected by optical means. The n
of gypsum is 1.5208 to 1.5303 and of anhydrite 1.5693-
1.6138, while the double refraction (measured with a
Berek compensator) is 0.0097 for gypsum and 0.0437-
0.0428 for the anhydrite A A Boethlingk

Drying gel zeolites M G. Larian and Charles A.
Mann *Ind Eng Chem* 28, 196-200(1936)—Zeolites
were air-dried under various conditions of temp., humidity
and velocity. Zeolites of varying compn were also
prepd and dried under identical conditions. The zeolites
break up into smaller particles when thrown into cold
H₂O after complete drying. The percentage of fine sizes
(through 28 mesh) depends upon drying conditions.
The percentage of fines increases with very rapid or over-
drying. The base-exchange capacity of a gel zeolite
depends upon drying conditions. The importance of
compn in base exchange, and in obtaining a rigid, non-
brittle product, is shown. The amt. of total H₂O and
structural H₂O in zeolites dried under various conditions
was detd. Hydration also depends to some extent upon
drying conditions E M. Symmes

The possibility of producing common salt from sea
water by freezing A G Repa *Bull Far East, Branch
Acad Sci U S S R* No 13, 3-14(15-16 in German)
(1935)—In the Soviet Far East, wet and cloudy summers
make the production of NaCl by solar evapn difficult,
but in the shallow bays the concn of salt in the water
under the ice is sometimes 4 times the normal concn of
sea water. The absence of snow causes the water to
lose heat rapidly through the ice, since the heat cond of
ice is 52-56 times as great as that of snow. By freezing
in a series of 3 basins and pumping off the soln, it can be
concd sufficiently for economic evapn. E. R. R.

Improvements in the manufacture of ammonium sulfate
Ch Berthelot *Rev chim* and (Paris) 44, 307-10
(1935)—A description and discussion of the merits of
the process used at the Mines Fiscales of the Dutch State
(cf Berkhoff, C A 29, 5998⁴). A Papineau Couture

Production of ammonium sulfate from gypsum A
M Polyak and N S Blagoveshchenskaya *Mineral'nue
Udobreniya Insektifungitsidus* 1, No 5, 7-20(1935).

A review of the following procedures is presented. (a)
Semicon expts on the conversion of gypsum by gaseous
NH₃ and CO₂, (b) semicon conversion of "phospho-
gypsum" (CaSO₄ 55.00, H₂O of crystn 14.56, hygro-
scopic H₂O 28.10, insol matter 0.48, H₃PO₄ 0.68 and
R₂O P₂O₅ 1.18%) obtained in the extn of H₃PO₄ from
apatite subjected to flotation, (c) conversion of gypsum
by a soln of (NH₄)₂CO₃, and (d) concn of solns of
(NH₄)₂SO₄ (semicon scale) Nine references

Technological layout for the production of ammonium
sulfate from gypsum E. Granovskaya *Mineral'nue
Udobreniya Insektifungitsidus* 1, No 5, 20-4(1935)—A
review of the so-called gypsum and the H₂SO₄ methods
(Fauser) is presented A A Boethlingk

Preparation of ammonium sulfate and soda from

mirabilite. I. A. P. Belopolskii. *Mineral'nue Udobreniya Insektofungitsidus* 1, No. 4, 7-20, No. 5, 25-31 (1935); cf. C. A. 29, 1590'.—A detailed description of the prepn. of $(\text{NH}_4)_2\text{SO}_4$ and Na_2CO_3 on a semicom scale is presented. The combined prepn. of Na_2CO_3 and $(\text{NH}_4)_2\text{SO}_4$ from Na_2SO_4 is quite feasible by means of the NH_3 -soda method. The max. amt. of NH_3 is 0.228 tons and of H_2O 1.85 tons per ton of Na_2SO_4 , in working with 75-80% CO_2 (by-product in the prepn. of synthetic NH_3), the max. of NH_3 is 0.225 tons per ton of sulfate, when gases from lime kilns are used. The av. compn. of the mother liquor at the above concns. and a final carbonization temp. of 29-30° is $(\text{NH}_4)_2\text{SO}_4$ 21.42, Na_2SO_4 12.32, NH_4HCO_3 5.48, $(\text{NH}_4)_2\text{CO}_3$ 2.0 and H_2O 58.78%. In the liquors obtained in the carbonization of NH_3 solns of Na_2SO_4 , a considerable amt. of the latter is still present, together with $(\text{NH}_4)_2\text{SO}_4$ and $(\text{NH}_4)_2\text{CO}_3$. A sepn. of up to 70-74% of Na_2SO_4 was effected by circulating a "eutonic" mixt., which at 60° contains $(\text{NH}_4)_2\text{SO}_4$ 36.5, Na_2SO_4 16.2 and H_2O 47.3%, through the liquor. By cooling the liquor to -10°, a 93% pptn. of Na_2SO_4 is obtained, which is returned to the soda plant. In the cycle, the filtered liquor is mixed with "eutonic" soln, chilled to -10°, the mirabilite returned to the soda plant, the soln condensed by evapn. to sep. H_2O (steam), fertilizer and the "eutonic" mixt., which is used again. Various suggestions pertaining to the application of the process on a com. scale are made. A. A. Boechtingk.

Commercial manufacture of aluminum sulfate. Luis Fstrach. *Quimica* 12, 253-7 (1935).—Descriptive.

Manufacture of sodium sulfide. Reduction of sodium sulfate to sodium sulfide at temperatures below 800°. John F. M. White and Alfred H. White. *Ind. Eng. Chem.* 28, 244-6 (1936).—While pure Na_2S does not melt below 1200°, a mixt. contg. Na_2S 30-40, Na_2SO_4 70-60, melts somewhat below 700°. Reduction of Na_2SO_4 by H_2 proceeds rapidly as long as only the solid phase is present, but is slower in liquid phase. CO is not as rapid a reducing agent as H_2 . Solid C-contg. materials act slowly until a liquid phase forms. Soft coal is the most effective C-contg. agent. Addn. of CaO increases the rate of reaction with solid C-contg. materials at temps. below 750°, because it removes CO_2 , but above 750° the CaCO_3 is dissolved. Na_2SO_4 may be completely reduced in 2 hrs. at 750° by C-contg. materials, or in 1 hr. at 750° by soft coal and CaO . Com. practice uses 900-1000°. There are no complicating side reactions at 700°. Graphite is the most satisfactory container.

Influence of mud on the flotation of phosphates. L. I. Stremovskii. *Mineral'nue Udobreniya Insektofungitsidus* 1, No. 4, 61-7 (1935).—The flotation was carried out with ground minerals and synthetic mixts. An excess of mud carries off great proportions of the phosphates, thus lowering their yields in the concentrate. The grain size is therefore of primary importance in the flotation and it should be adjusted to each type of mineral treated.

Discovery of new apatite deposits in Russia. M. P. Fiveg. *Mineral'nue Udobreniya Insektofungitsidus* 1, No. 4, 39-43 (1935).—The Khibia (Kola Peninsula) apatites are of a low grade, but they can be concd. and used commercially. Other deposits are too high in Fe and cannot be worked for the sepn. of P_2O_5 on a com. scale.

The total deposits of phosphate raw material in Russia available to January 1, 1934. I. M. Kurman and T. P. Unanyants. *Mineral'nue Udobreniya Insektofungitsidus* 1, No. 4, 44-60 (1935).—Statistical data on the available phosphorites are given and the importance of further prospecting is emphasized.

Insoluble Jules Hamand. *Ann. chim.* [2], 2, 145-63 (1936).—The properties, prepn. and utilization of insoluble as a clarifying agent are shown.

Carbon black. I. A new process for the production of carbon black by thermal decomposition of hydrocarbon gases. L. M. Pidgeon. *Can. J. Research* 13B, 351-69

(1935).—A method is described whereby C black is produced from hydrocarbon gases, such as CH_4 - C_2H_6 or C_2H_4 - C_2H_6 , by thermal decompn. of these gases in a heated tube. The essential feature of the process is the use of a porous refractory tube through which a certain amt. of inert gas is allowed to pass. By this means the reacting gas is unable to touch the walls of the system, and deposition of C thereon is prevented. Yields as high as 60% of the C in the gas, corresponding to 65 lb. per 1000 cu. ft., have been obtained from a 70-30 C_2H_4 - C_2H_6 mixt., and 19 lb. from CH_4 . The C black produced by this process is similar to the "soft" blacks in that it has a high d., low sorptive power, it accelerates the cure in a rubber stock and gives similar resistance to aging and abrasion. It imparts greater stiffness to a rubber stock, however, and in many ways occupies a position between the channel and the "soft" blacks. J. W. Shipley.

Preparation and catalytic oxidation of pure, amorphous carbon. Jesse E. Day, et al. *Ind. Eng. Chem.* 28, 234-8 (1936), cf. C. A. 30, 1291'.—In an effort to improve the production rate of amorphous C, suitable for use in oxidation rate studies, many sources of methods were tested. The ash content of C made from sucrose and lactose by H_2SO_4 and thermal decompn. was about the same as the original ash content. Phosphates and silicates cannot practically be removed from these sugars. C made in Pyrex glass and glazed porcelain contained 2-10 times more ash than when Pt vessels were used. C made from liquid hydrocarbons contained 0.02-0.13% ash and considerable tar. Unpurified natural gas and C_2H_2 gave C contg. high ash, but purified C_2H_2 gave C contg. 0.01-0.05% ash. Samples of C so prepd. were oxidized in pure O_2 under controlled temp. and the gas stream was analyzed continuously for CO_2 . C samples preheated or activated to remove tars were more resistant to oxidation. The effect of a no. of admixed oxides on rate of oxidation of unactivated C is shown. Some inhibit, others accelerate, oxidation as much as 100-200 times. E. M. Symmes.

Purified wood charcoal and its utilization in gas producers. Jean-Daniel Maublanc. *Industrie chimique* 22, 734-7 (1935).—The prepn. of purified wood charcoal is discussed and its merits for the production of lean gas for use in explosion engines are pointed out. A. P.-C.

Extractable mineral components of active carbon preparations. Jenő Mótusz. *Kísletügyi Közlemények* 38, 169-72 (1935).—Analysis of 4 types of active C (Carbontop-Frankfurt, Iponit-Ratibor, Charbon activ-Pans and Carbo-Merck) showed the following ash contents: 17.64, 11.13, 11.49 and 1.78%, of which 0.165, 0.011, 0.176 and 0.000% was MnO and 2.50, 0.77, 3.64 and 0.08% was Fe_2O_3 and Al_2O_3 , resp. Investigation proved that on exptl. clarification of wines, waters and vinegars much mineral matter was dissolved and the ash content of the clarified liquors much increased. It is proposed that active C with only 1% sol. ash, of which the amt. of Fe and Mn salts should be under 0.01-0.05%, should be used for the above purposes. S. S. de Finally.

Natural and activated decolorizing earths. C. L. Alexanian. *Ann. combustibles liquides* 10, 1097-1127 (1935).—A review, covering the origin, compn., chem. and heat activations, testing and use of decolorizing earths. Sixty references.

Wilson, A. P.: Precipitated Chalk: History, Manufacture and Standardization. 2nd ed. Birmingham: John and E. Sturge, Ltd. 62 pp. Reviewed in *Chem. Trade J.* 97, 488 (1935).

Apparatus for cooling and absorbing gaseous hydrogen chloride P. A. Persiyanov, Russ. 38,130, Aug. 31, 1934. The app. consists of a tower cooled by spraying with water and a ceramic conduit, connecting the tower with the sulfate kiln, cooled on the outside with water and on the inside with dil. HCl from the tower.

Nitric acid concentration Ingenium Hechenbleikner (to Chemical Construction Corp.), U. S. reissue 19,837, Jan. 28, 1925 (C. A. 27, 5159).

Concentrated nitric acid Ammoniaque synthétique et dérivés, Soc. anon. Belg. 408,670, April 30, 1935. A first N_2O fraction is shown in the liquid state by absorbing the nitrous gases in highly cooled, concd. HNO_3 . After the gases are washed with dil. HNO_3 , part of the resultant soln. is heated to obtain a 2nd N_2O fraction. The N_2O fractions are made to react with O and a soln. of N_2O in dil. acid.

Contact sulfuric acid process Alphons O. Jaeger (to American Cyanamid & Chemical Corp.), U. S. 2,029,530, Feb. 4. For producing SO_3 , reaction of SO_2 with O-contg. gases is effected in the presence of a catalyst comprising massive fragments of diatomite brick with which are associated at least one non-base-exchanging catalytically active compd. of V such as Na vanadate and at least one promoter such as alumina. U. S. 2,029,531 relates to the similar use of a catalyst comprising at least one non base-exchanging compd. of V, at least one compd. of an alkali-forming metal, at least one compd. of Al and an inactive siliceous carrier.

Sulfuric acid by the contact process Cyril B. Clark (to American Cyanamid Co.), U. S. 2,028,733, Jan. 21. A gas contg. SO_2 , together with sufficient O for oxidation to SO_3 and a gaseous combustible H-contg. material having a H content greater than 3 mg. per cu. ft., is subjected to oxidation in a sulfuric acid converter in the presence of a sulfuric acid contact mass at a reaction temp. so that the SO_2 is oxidized to SO_3 and the H content of the gas is oxidized to H_2O , the reacted gases are passed into a sulfuric acid absorber without permitting the temp. to fall below the dew point for acid mist and the exhaust gases from the absorber are subjected to dry pptn. of acid mist. App. is described. Cf. C. A. 30, 578.

Sulfuric acid manufacture by the contact process Cyril B. Clark (to American Cyanamid & Chemical Corp.), U. S. 2,028,739, Jan. 28. Sulfide ores contg. relatively large amounts of impurities including halogens and As are burned under such conditions that a hot SO_2 gas mixt. is obtained contg. gaseous halogen and As compds. and Fe oxide, and the hot gaseous mixt. is maintained at temps. above 315° for a sufficient length of time to permit the gaseous impurities to react with suspended solids, including the Fe oxide, dust, fume and non-volatile constituents are subsequently removed without material reduction of the gas temp., and the resulting gases are passed through a catalyst of the vanadium type at reaction temps.

Vanadium catalyst Henry Joseph (to General Chemical Co.), U. S. 2,029,576, Feb. 4. A catalyst suitable for use in oxidizing VO to SO_3 is prep'd by forming a mixt. contg. a finely divided carrier such as kieselguhr and an org. gum such as gum tragacanth and adding to this mixt. a soln. of a V compd. such as Na vanadate and then heating the mass to oxidize the org. material.

Hydrolyzing and distilling persulfate solutions Carl W. Tucker and Frank Dorrell (to L. I. Du Pont de Nemours & Co.), U. S. 2,028,481, Jan. 21. A soln. such as one of persulfuric acid or a persulfate is divid. in a 1st stage under subatm. pressure to vaporize water together with part of the available H_2O , resulting from the hydrolysis of the persulfate soln., substantially all the vapors thus formed are sep'd from the liquid residue, water is added to the residue and the dil'd residue is dist'd in a subsequent stage. App. is described.

Catalysts for ammonia synthesis S. S. Lachnov, Russ. 38,135, Aug. 31, 1934. Fe is heated in a stream of O with the addn. of activators such as Al_2O_3 or KNO_3 , and after oxidation is complete the product is maintained for some time at the m. p.

Ammonia distillation from aqueous ammoniacal brines George G. Day (to Matheson Alkali Works), U. S. 2,029,467, Feb. 4. The brine is circulated from a distn. column to a reaction vessel in which there is maintained a liquid body contg. free lime, liquor substantially inert with respect to lime is withdrawn from said body, dry lime is introduced into the withdrawn liquor and it is returned to the vessel and thence to the distn. column. App. is described.

Catalysts for the combustion of ammonia W. C. Heraeus G. m. b. H. Pr. 789,599, Oct. 31, 1935. The metal fabric is made of Pt-Rh wires, those for the warp being of greater hardness than those for the wft. The difference may be obtained by using alloys contg. different amts. of Rh or by reheating the wft wires.

Purifying caustic soda solutions Raymon L. Vander Cook and Alexander M. Lawson (to Pennsylvania Salt Mfg. Co.), U. S. 2,028,898, Jan. 29. Na_2SO_3 is added to form a substantially insol. complex salt with NaCl and NaOH, the complex salt is removed and Na_2SO_3 is recovered from it. For preventing accumulation of Na_2CO_3 in the system, recovered Na_2SO_3 is dissolved in water, H_2SO_4 is added and the complex salt is treated with the soln. to dissolve NaCl and NaOH from it, leaving at least a portion of the Na_2SO_3 undissolved, the undissolved Na_2SO_3 is sep'd from the soln., and at least a portion of the recovered Na_2SO_3 is reused in purifying further amounts of NaOH soln. Cf. C. A. 29, 3790.

Caustic alkali sticks, etc. I. G. Farbenind A-G (Frist. Heintze, inventor), Ger. 620,672, Oct. 24, 1935 (Cl. 12 15). See Brit. 417,465 (C. A. 29, 1216).

Apparatus for hydrating lime V. P. Ponomarev, Russ. 38,475, Aug. 31, 1934. Construction details.

Alkaline earth carbonates H. G. J. Lawarrée, Belg. 407,451, Feb. 28, 1935. The carbonates are ppt'd by the action of CO_2 on solns. of alk. earth phenolates or cresylates, the phenols being returned to the operating cycle. Cf. C. A. 29, 3790.

Alkali hyposulfites I. G. Farbenind A-G (Rudolf Stroh and Wolfgang Bulow, inventors), Ger. 620,760, Oct. 26, 1935 (Cl. 12: 22). Alkali sulfites are reduced in aq. soln. by means of Zn dust in the presence of sufficient CO_2 to convert all the Zn to ZnCO_3 , which is readily sep'd from the hyposulfite soln. Thus, an aq. soln. of NaHSO_3 is heated in an autoclave with Zn dust and CO_2 under pressure to give an 80% yield of Na_2SO_3 , the Zn forming ZnCO_3 which is filtered off.

Alkali metal nitrates from ammonium nitrate, Philipp Oswald and Walter Geisler (to I. G. Farbenind A-G), U. S. 2,029,738, Feb. 4. An alkali metal chloride such as NaCl is suspended in a soln., sat'd, with alkali metal nitrate, NH_4Cl and alkali metal chloride, and NH_4NO_3 dissolved in a soln. of the same compn. is added to the suspension.

Alkali metal sulfite and bisulfite solutions Gustaf Haglund (to Patentaktiebolaget Gröndal-Kämen), U. S. 2,029,610, Feb. 4. Waste liquor from a cellulose digestion process employing cooking liquor contg. alkali metal S compds. such as that from a sulfite process is treated (suitably by incineration and leaching) to eliminate org. compds. and to form a soln. contg. an alkali metal sulfite and substantially free from sulfides and thiosulfates, the soln. is subjected to the action of SO_2 and one or more Ca compds. such as CaCO_3 capable of reacting with SO_2 to form $\text{Ca(HSO}_3)_2$, until the alkali metal salts contained in the soln. have been converted to bisulfites, and the resulting soln. is subjected to the action of one or more alkali metal compds. capable of reacting with $\text{Ca(HSO}_3)_2$ to form one or more insol. Ca compds. An arrangement of app. is described. Cf. C. A. 29, 894.

Alum M. E. Liffendi and V. F. Nagrev, Russ. 38,137, Aug. 31, 1934. Alumite ore broken up into 2-3 mm. pieces is heated for 35-40 min. at $700-80^\circ$, added to water and left for 24 hrs. to cool while being agitated with air.

Aluminum compounds Erik L. Rinman, Brit. 435,870, Oct. 1, 1935. Aluminiferous materials having a high percentage of SiO_2 , e. g., kaolins, clays, certain

bauxites and not more than 12% of Fe are preferably roasted and then treated with HCl to obtain a soln. of chlorides, which after sepn. from undissolved SiO_2 , etc., is treated with Ca aluminate (I) to ppt $\text{Al}(\text{OH})_3$, and obtain a CaCl_2 soln. A part of the $\text{Al}(\text{OH})_3$ is converted into a Na aluminate (II) soln. from which pure $\text{Al}(\text{OH})_3$ may be obtained, and the remainder is mixed with the CaCl_2 soln., evapd to dryness and, after optional pulverization, heated in presence of steam to obtain HCl and I for re-use as above. In a modification, the chloride soln. is pptd with a mixt. of I and CaCO_3 , the resulting mixt. of $\text{Al}(\text{OH})_3$ and CaCl_2 soln. dried, pulverized and heated in presence of steam to obtain HCl and I, a part of I is treated with Na_2CO_3 to obtain CaCO_3 and II, the other part of I is re-used for pptg the chloride soln. and $\text{Al}(\text{OH})_3$ is recovered from the II soln., e. g., by treatment with CO_2 to obtain Na_2CO_3 for treating fresh quantities of I. The undissolved SiO_2 may be mixed with portland cement to adapt it for use in concrete structures below water.

Crystals of boron carbide V. G. Evreinov Russ. 38,134, Aug. 31, 1934. A mixt. of B and coal is covered with small pieces of an alloy contg. about 10% Ag and 90% Cu for the purpose of dissolving B_2C . The alloy is removed with HNO_3 after fusion.

Calcium aluminates Jean C. Seailles Fr. 789,323, Oct. 26, 1935. App. is described for purifying crude Ca aluminates by progressive extns. by water or dil. solns. from a previous treatment under such conditions that there is constantly in contact with the solvent an amt. of solid very much above that which corresponds to the normal soly., the contact being maintained for a detd. time preferably with agitation.

Dicalcium phosphate Franciscus Visser't Hooft (to Lucidol Corp.). U. S. 2,029,967, Feb. 4. A non-caking, free-running product of sufficient purity to be suitable for use with foods is prepd. by mixing about 5% or less of mono-Ca phosphate and a caking inhibitor such as CaO , NaHCO_3 or Na benzoate with a dry com. pptd. di-Ca phosphate.

Iron tannate M. Tz. Robert-Nik and V. M. Malushev. Russ. 37,703, July 31, 1934. Fe tannate is prepd. by passing an alk. soln. of tannin downward through a tower filled with Fe (rods, sawings, etc.) while air is passed upward through the tower.

Basic lead carbonate. A. Rouma and M. Biske. Belg. 407,862, March 30, 1935. Pb hydroxide is pptd. from a soln. of a Pb salt by means of a base, and part of the hydroxide is converted into carbonate; the hydroxide and the carbonate are mixed in suitable proportions to obtain a basic carbonate of the desired compn.

Magnesium bisulfite from dolomite rock Clyde D. W. gal (to Inland Lime and Stone Co.). U. S. 2,028,630, Jan. 21. The rock is calcined to produce a mixt. of CaO and MgO , water is added, and the mixt. is chlorinated to effect selective chlorination of the Ca without chlorinating substantial amounts of the Mg, the residual MgO is sepd., and is treated with SO_2 to produce $\text{Mg}(\text{HSO}_3)_2$.

Magnesium carbonate Soc. générale du magnésium Fr. 789,670, Nov. 4, 1935. Neutral anhyd MgCO_3 is prepd. by calcining dolomite or limestone, treating with a soln. of MgCl_2 and treating the suspension obtained at 170–200° in an autoclave with CO_2 , e. g., that obtained in the calcination.

Magnesium carbonate trihydrate V. V. Shelyagin. Russ. 34,454, Feb. 23, 1934. CO_2 is passed through a suspension of MgO or dolomite in the presence of 1–2% of a sulfonic acid of the C_6H_4 , naphthalene or quinoline series, petroleum sulfonic acid or alizarin oil as catalyst. For example, 6 g. of finely ground MgO is mixed with 200 cc. H_2O and 0.12 g. petroleum sulfonic acids and the mixt. is then treated with CO_2 for 1 hr. 45 min. at 40–50°.

Natural phosphates Soc. d'études pour la fabrication et l'emploi des engrais chimiques (Georges Chaudron, inventor). Fr. 789,497, Oct. 20, 1935. Natural phosphates are washed with slightly acidified water to eliminate

parts rich in Al, Fe and Si and org. materials and poor in P_2O_5 . The enriched phosphate is attacked by acid.

Decolorizing phosphate solutions. George E. Taylor (to General Chemical Co.). U. S. 2,028,632, Jan. 21. A phosphate soln. such as one formed in Na phosphate production and contg. oxidizable impurities is treated with chromic acid to oxidize the impurities, and the Cr is then pptd. from the soln. (suitably by an alkali). $\text{Na}_2\text{Cr}_2\text{O}_7$ also may be used.

Phosphates Kali-Forschungs-Anstalt G. m. b. H. Brit. 436,335, Oct. 9, 1935. This corresponds to Fr. 782,546 (C. A. 29, 7025').

Treating mixtures of potassium nitrate and ammonium chloride to effect separation. Carl Kireher, Fritz Mueller and Hermann Suessenguth (to I. G. Farbenind. A.-G.). U. S. 2,029,623, Feb. 4. A mixt. of KNO_3 and NH_4NO_3 (such as a reaction product from KCl and NH_4NO_3) is subjected to extraction with anhydrous liquid NH_3 contg. NH_4NO_3 and then with anhydrous liquid NH_3 and the soln. is sepd. from the residue.

Rare earth compounds I. G. Chentzov Russ. 38,139, Aug. 31, 1934. Apatite concentrates are treated with HNO_3 and soln. is cooled to –10° to –15°. The cryst. mass formed (contg. $\text{Ca}(\text{NO}_3)_2$) is filtered off and dissolved in a small amt. of water. Phosphates of the rare earths sep. in flakes.

Recovery of sodium from its mixtures with calcium and nonmetallic substances Harvey N. Gilbert (to C. I. du Pont de Nemours & Co.). U. S. 2,029,998, Feb. 4. The mixt. is introduced into a fused salt sepg. bath having a sp. gr. greater than that of Na, contg. CaCl_2 together with over 30% of NaCl , at a temp. of 600–800°, to sep. the Na from associated substances. App. is described.

Sodium bicarbonate H. G. J. Lawarrée Belg. 408,516, April 30, 1935. An amine in the form of carbonate, particularly apt to absorb and give up CO_2 , is used to catalyze the reaction.

Sodium bisulfite G. E. Shnuparkov Russ. 37,701, July 31, 1934. NaHSO_3 is prepd. by melting Na_2SO_3 with SiO_2 in the presence of C and passing the gases obtained in the process through a soln. of the previously prepd. melt so as to convert the latter into NaHSO_3 and SiO_2 .

Titanium dioxide William T. Little (to American Zirconium Corp.). U. S. 2,029,881, Feb. 4. A soln. of a Ti salt such as the sulfate is hydrolyzed by heating in the presence of a solid alkali titanate such as Na titanate which facilitates the process.

Zinc sulfide Thomas A. Mitchell and Royal L. Sessions (to Hughes-Mitchell Processes Inc.). U. S. 2,028,162, Jan. 21. In a cyclic process, a 7n compd. such as ZnO is treated with HCl to form ZnCl_2 , the latter is treated in soln. with Na sulfide to ppt. the Zn as a sulfide, the resulting NaCl soln. is removed and used for HCl production by treatment with H_2SO_4 and the Na_2SO_4 thus formed is reacted with a Ba compd. such as BaCl_2 to form BaSO_4 , and the latter is heated with a reducing agent such as carbon to form Ba sulfide which is used with Na_2SO_4 to form Na sulfide. Numerous auxiliary details of procedure are described. Cf. C. A. 30, 582.

Metallic barium. A. A. Ivanov. Russ. 37,849, July 31, 1934. $\text{Ba}(\text{OH})_2$ is fused with $\text{Al}(\text{OH})_3$ and the Ba aluminate formed is thermally reduced by known methods.

Hydrogen George F. Jaubert. Ger. 620,693, Oct. 26, 1935 (Cl. 12.1.01). App. for producing H from Si, caustic alkali and water is described. Sufficient alkali to convert the Si into NaHSiO_3 at 15 atm. and 150° is used. Cf. C. A. 29, 6376.

Iodine, sulfur and phosphates Eugène J. Burban. Fr. 789,585, Oct. 31, 1935. Ca phosphates are treated with dil. H_2SO_4 to produce $\text{Ca}(\text{H}_2\text{PO}_4)_2$ and CaSO_4 . The CaSO_4 is reduced to CaS by calcination in the presence of marine algae in the absence of air, and the kelp obtained is used for the extn. of I and pptn. of Ca phosphate with liberation of H_2S which may be decompd. *in situ*.

Oxygen of high purity. George J. Boshkoff (to The Linde Air Products Co.). Brit. 435,281, Sept. 18, 1935. This corresponds to U. S. 1,985,763 (C. A. 29, 1219').

Removing phosphorus from blast-furnace gases Friedrich P Kerschbaum, William H. Waggaman and Stapleton D Gooch (to Pembroke Chemical Corp.). U. S. 2,029,663, Feb 4 Blast furnace gases relatively dil. in P are passed relatively slowly through a series of condensers in which the gases are sprayed with water, at progressively lower temps., and the bulk of water in the first condenser is rapidly recirculated for recontact with a given quantity of the gas and is maintained at a temp. of 43-100°, the water in the second condenser being maintained at 18-43° and that in the final condenser at 0-18°.

Platinum catalyst P P Budnikov, Russ 37,698, July, 1934 An inert carrier is impregnated with a soln. of Pt salts together with reducing agents such as essential oils or turpentine pretreated S or SCl_2 . The impregnated mass is ignited.

The continuous extraction of sulfur by means of carbon disulfide Ammoniaque synthétique et dérivés, Soc anon Belg 408,374, April 30, 1935 The S-contg material is introduced continuously at one end of the app and the CS_2 at the other end.

Sulfur from pyrite and similar materials A C Makovetskii, Russ 37,699, July 31, 1934 Materials low in S are extd. with an aq soln. of SO_2 .

Sulfur dispersions Geo R Tucker (to Dewey and Almy Chemical Co.) U. S. 2,028,482, Jan 21 S is ground in an aq soln. of a sol compd comprising a condensation product of an aldehyde such as formaldehyde with a sulfonic acid of the naphthalene series, to obtain a stable fluid product substantially free from S in a form which would produce caking and showing an especially active Brownian movement.

Producing agglomerates from phosphate rock Harry A Curtis and Armand J Abrams (to Tennessee Valley

Authority). U. S. 2,020,309, Feb 4 In prepg. charging stock for a P reduction furnace, fine coking coal is added to a hot unsintered mixt. of fine phosphate rock and fine silica and the materials are mixed until the mixt. contains semicoke.

Apparatus for producing sulfur dioxide from sulfide ores, etc Harold O C. Ingraham (to General Chemical Co.). U. S. 2,030,021, Feb 4. A suspension of finely divided material such as Fe or Zn sulfide fines in an oxidizing gas such as air is introduced into an inlet at one end of a reaction chamber having a discharge opening adjacent a wall forming the opposite end of the chamber so that solid materials are sepd. from reacted gases, and a connection is provided near the outlet end for introducing supplemental oxidizing gas into the reaction chamber, reacted gases being caused to flow through a chamber surrounding the reaction chamber and in contact with the outer walls of the latter.

Expanding vermiculite Paul S Denning (to F. E. Schundler & Co.). U. S. 2,029,521, Feb 4 The material is suddenly subjected to a high temp. within an enclosed space for not over 15 sec. and is agitated and then suddenly subjected to atm temp. and submerged in water, excess moisture is removed and the mass is immediately exposed to a high temp. within a closed space for not over 15 sec. and then finally suddenly subjected to atm temp. App is described provided with an elongated passage through which the material is passed.

Regenerating used clays International Hydrogenation Patents Co Ltd 1r 789,150, Oct 21, 1935 Clays used for refining lubricating oil fractions, waxes and naphthas are regenerated by treating them with a solvent prepd by destructive hydrogenation in the vapor phase of petroleum distillates. An aliphatic alc. or ketone may be added to the solvent.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G E BARTON AND C H KERR

Specific gravity of glass Ikutaro Sawai, Morio Nishida and Ikuzo Kubo *IX Congr intern quim pura aplicada, Madrid 3*, 343-51(1934)—A balance, from one arm of which a Pt ball immersed in melted glass is suspended, can be used to det. both sp gr and viscosity. Sp gr was calcd. from the velocity of the ball by Stoke's law. The sp gr temp. curve bends sharply at 500° and slightly at 1200°. The viscosity-temp. curve also bends at 1200°. The gain in sp gr with rapid cooling increases rapidly between 450° and 600°, the range in which all transition temps. detd. from several properties, were observed. The effect of annealing on sp gr was also investigated.

Hardness of glasses M Pirani and A Fehse *Glastech Ber 14*, 21-2(1938).

Determination of the pendulum hardness of glasses W Schmidt and H F Gronow *Glastech Ber 14*, 23-6(1938)—The effect of 3% Al_2O_3 on the pendulum hardness of glasses is about the same as 10% MgO . There is little difference between 5 and 10% MgO . Glasses contg boron oxide show a max. effect at 12%. The glasses with 5, 10 and 15% CaO are harder than the corresponding BaO comps. Lead glasses increase in hardness to 20% PbO content and drop rapidly again in going to 25% PbO . The results correspond quite well to the results obtained by studying other phys. properties such as elasticity, etc.

Opal glass. I Silicon, calcium, sodium, oxygen, fluorine series Henry H Blau, Alexander Silverman and Victor Hicks *IX Congr intern quim pura aplicada, Madrid 3*, 507-34(1934)—Pure soda lime glasses were prepd by replacing Na_2O with NaF and CaO with CaF_2 , and x-ray pictures were taken of the raw materials and of the glasses before and after heat treatment. By comparing the patterns, the crystallinities responsible for opalescence were detd. For glass annealed at 820° for 30 hrs they were low temp. quartz; for 30 hrs at 650°, low-

temp. quartz with traces of low-temp. cristobalite, for 1 hr at 820°, primarily low-temp. cristobalite. Fluoride lines were very weak and approximated closely the lines for quartz and cristobalite. Much I is lost during the heating. *Cl C A 29*, 560°.

Removal of anisotropy in glass by annealing Jean Herbert *Compt rend 202*, 214-15(1936)—The anisotropy and zones structure rendered visible by polarized light, and occurring especially in window glass, is due to layers of slightly different compn., and the method of manu. It is removed by annealing for 30-40 hrs (cf. Gaubert, *C A 29*, 1221°).

A new method for the application of luminescent screens to glass surfaces W. H. Kohl *Can J Research 13A*, 126-32(1935)—An outline is given of the various methods for the application of luminescent screens, and their relative merits. Most widespread in use are methods that utilize a liquid binder that enters into a chem. reaction with the glass surface. In other cases, the powder is partially imbedded in the glass surface by a sintering process. The phys. characteristics of the luminescent screen are adversely affected by both of these methods. A process based on the activation of the glass surface by a deposit of S is described. The S coating picks up the luminescent powder in a uniform layer when it is brought into contact with the powder. After being removed by means of a moderate heat treatment, it leaves the screen firmly adhering to the glass surface. Possible mechanisms for the process are discussed.

The use of coke-oven gas in the glass industry. R. Allolio *Glastech. Ber 14*, 15-20(1938). J. F. Hyde. **Ceramic art and education** Introduction Lawrence I Barringer *Bull Am Ceram Soc 15*, 1-2(1936)—An introduction to the symposium at the Oct., 1935, meeting of the Art Division of the Am Ceram Soc. C. H. Kerr. **Ceramic art problems in the colleges** M. E. Holmes *Bull Am Ceram. Soc 15*, 2-4(1936). C. H. Kerr.

Art, industry and education in ceramics. R. Guy¹
Cowan. *Bull. Am. Ceram. Soc.* 15, 5-13(1936)

Electrical ultramicrometer for measuring the coefficient of thermal expansion of ceramic materials. Adolf Heinz and Horst Kottas. *Spektrum* 68, 49-51, 65-67(1935)

Ceramic firing I The problem and method of procedure Otto Krause and Iherhard Keetman *Spektrum* 68, 1(1935)—Important factors in firing are (1) structural changes, (2) duration of firing and (3) the furnace atm. Changes in ceramic ware during firing result from structural changes and sintering processes. The structural changes consist of decomposition, crystal transformation, fusing and sintering processes. Shrinkage, swelling, and porosity changes belong to the 2nd group. The relation of the above-mentioned factors to the changes in structure, sintering processes and properties were investigated. C. B. Jenni

Earthquakes and Montana clay manufacture Archie C. Bray. *Bull. Am. Ceram. Soc.* 15, 32(1936)

Determination of calcium sulfate, as such, in clays Charles A. Peters. *Bull. Am. Ceram. Soc.* 15, 15-16(1936)—The amt. of sample can be varied depending upon the amt. of CaSO_4 suspected, but 100 g. is usual. Put this into a liter flask and fill to the mark. Shake and allow to settle. Pour off more than 500 cc. into a 500-cc. wide-mouthed bottle and again allow to settle. Filter off 500 cc. into a beaker and evaporate. As evaporation proceeds the clay particles will coagulate and should be filtered out, the liquid being returned to a 250-cc. beaker. One filtering at the right time is usually sufficient. When the liquid is reduced to a small vol. it is examined under the microscope for CaSO_4 crystals. When these appear readily, showing that satn. has been reached, add a few drops of H_2SO_4 , cool, dil. with 4 vols. of alc., and let stand overnight. Filter on asbestos, wash with alc., gently ignite the ppt. and weigh as CaSO_4 . If a 100-g. sample was used, multiply by 2 and again by 0.6 to allow for the vol. occupied by the clay. MgO can be detd. in the alc. filtrate by the usual phosphate pptn. C. H. K.

Testing the clay from Ordzhonikidze (formerly Viadikavskas) at the "Krasnui Keramik" works at Borovitski in respect to its fitness for the production of sewer pipe T. I. Melnikova and A. K. Freberg. *Siroitel. Material* 1935, No. 7, 36-40.—The clay contains SiO_2 57.0-62.0, Al_2O_3 4.0-5.0, Fe_2O_3 5.6-7.6, CaO 1.15-3.5, MgO 0.0-1.0, SO_2 about 0.5%, ignition loss is 3.5-5.6%, refractoriness 1170°, sintering temp. 1080°. The clay proved satisfactory with 20% of refractory clay added. E. E. Stefanowsky

Waste rock from coal pits as a ceramic raw material. L. Ya. Mishulovich. *Siroitel. Material* 1935, No. 7, 40-3, cf. N. Chibunovskii, *Siroitel. Material* 1930, No. 9, 10, 123-6.—Shales from the Donetz basin coal pits are suitable for making brick. The large interval between their sintering and melting points makes possible a dense, durable product of low porosity, especially when finely ground (under 1 mm.). Plastic clay must be added. E. E. Stefanowsky

Promotion of the drying of clay by the coagulating effect of acid H. H. Macey. *Trans. Ceram. Soc. (Engl.)* 34, 396-416(1935).—The 24 fire clays and brick clays treated with increments of HCl varied widely in responding to its power of preventing cracks. A sedimentation test predetermines satisfactorily the behavior of the clays and the quantity of HCl needed to avoid cracking. The action of the acid on plastic clay bodies is due to the opening up of their water channels. The amt. of acid found necessary was less than 0.25% in all cases. Those clays benefitted by HCl treatment showed no tendency to lose this advantage in the firing process. H. F. K.

Potting clays. A. Rigby. *Trans. Ceram. Soc. (Engl.)* 34, 381-91(1935).—General discussion of the geology, prepn., characteristics and uses of potting clays. H. F. K.

Pottery printing—the engraving. J. H. Latchford. *Trans. Ceram. Soc. (Engl.)* 34, 417-20(1935).

Pottery printing paper. R. J. Bell. *Trans. Ceram. Soc. (Engl.)* 34, 421-3(1935).

Uses of coal for brickworks. W. H. Gamble and R. F. Paget. *Brit. Clayworker* 44, 311-14(1936).

Frit-kiln bricks. W. Hugill. *Foundry Trade J.* 53, 421, 420(1935).

Effect of oxides of iron and chromium and a reducing atmosphere on the rate of tridymite formation in a silica brick batch T. R. Lynam and W. J. Rees. *Trans. Ceram. Soc. (Engl.)* 34, 507-14(1935). *Bull. Brit. Refractories Research Assoc.* No. 28(Aug., 1932).—Neither of the oxides had much effect on the tridymite formation under reducing conditions. Addition of Siemens' slag and Prussian blue were most effective in open-kiln burning, showing as much as 60-75% tridymite formation. H. F. K.

Effect of the water content of silica brick batches on the porosity of the fired brick T. R. Lynam and W. J. Rees. *Trans. Ceram. Soc. (Engl.)* 34, 500-6(1935). *Bull. Brit. Refractories Research Assoc.* No. 24(Jan., 1931).—A low moisture content is favorable to low permeability, the permeability decreasing more rapidly than the porosity. Moisture below 7.5% is not commercially feasible unless mech. mold filling and heavy machine pressing are used. H. F. K.

Action of alkalis on refractory materials I. Action of potash vapor on refractory materials at 900° and 1000°. F. H. Clews, A. Green and A. T. Green. *Trans. Ceram. Soc. (Engl.)* 34, 436-55(1935). *Bull. Brit. Refractories Research Assoc.* No. 32(Oct., 1933), cf. C. A. 29, 67181.—The aluminous fireclay refractory absorbed more K_2O at 900° and disintegrated more than did the more siliceous fireclay materials which were protected by the formation of an external viscous silicate. With silica brick a liquid silicate formed, which dropped off the specimens and gave no protection. The extent to which chem. decomposition occurred was measured by treatment with dil. HCl. The fireclay test pieces showed extensive chem. decomposition after prolonged exposure to K_2O at 1000° even though they were apparently only superficially altered. Silica refractories impregnated up to 4% with K_2O showed much higher losses when heated to 1000° than did the fireclay materials. A preliminary heating for 5 hrs. at 1200° results in an almost negligible loss of K_2O from fireclay refractories at 1000°. H. F. K.

Problems for research on refractories. Anon. *Bull. Am. Ceram. Soc.* 15, 22-8(1936).—A discussion and listing of problems by the Research Com., Refractories Div., Am. Ceram. Soc. C. H. Kerr

Texture of refractories I. Nonregularity of texture of gas-works fire-clay refractories and its possible effect on durability. T. I. F. Rhead and R. E. Jefferson. *Trans. Ceram. Soc. (Engl.)* 34, 363-73(1935).—Numerous photographs of faulty structures and cross sections of faulty refractories are given to illustrate how inequalities in texture are produced and how these affect their service behavior. II. Pictorial methods of recording the texture of refractories or similar materials. T. F. E. Rhead, J. N. Shorrocks and C. L. Evans. *Trans. Ceram. Soc. (Engl.)* 34, 373-9(1935).—Black wax, forced into the pores of the material under 30 atm. pressure of N, gave the best contrast for photographic record. Ink impressions by means of a resilient gelatin-glycerol mixt. are satisfactory for recording textures of plane surfaces or sections. H. F. K.

Properties of insulating refractories I. The behavior under load at high temperatures. S. M. Phelps. *Am. Refractories Inst. Tech. Bull.* 61, 6 pp(1935).—Strength, wt. and fusion points of various brands are given. The load-test data demonstrate the type of test which should be used in evaluating these materials. The mistake of using a load test in which the brick are under a soaking heat should not be carried over from the testing of fire-clay refractories. Various tests and data are included. E. C. Petrie

Explanation of the adhesion problems in enameling iron sheets Adolf Dietzel *Sprechsaal* 68, 3-6, 20-3, 34-7, 53-6, 67-9, 84-5(1935)—The adhesion of the enamel is secured by a black inner enamel layer which adheres firmly to the Fe. Empirical results have shown that certain metallic oxides in relatively small amounts (0.5-2.0%) produce the adhering layer. The oxides of Co and Ni seem best, Cu, Mn, Cr and other oxides follow. Disadvantages of the use of adhesive oxides are (1) special methods of application, drying and burning are required and (2) the intense color may be difficult to cover. Phys and chem explanations of adhesion by earlier workers are reviewed. Two enamels were prep'd for the exptl work: I (SiO_2 55.48, B_2O_3 14.60, Al_2O_3 7.17, Fe_2O_3 0.10, TiO_2 0.13, CaO 4.59, MgO 0.02, Na_2O 11.09, K_2O 4.84, loss on ignition 125%) was mixed with various amounts of adhesive oxides. Forty-two mixts were studied. Enamel II was similar to I with 0.50% CoO added. The adhesive oxides were divided into 3 groups: poor, oxides of Fe, Cr, Ce, Ti, V, U and Pb, fair, MnO_2 , nitrate, nitrite, good, CoO and NiO . The important reactions taking place in an enamel coated adhesive oxides were investigated. Reactions in which the adhesive oxide is not concerned are: (a) $\text{Fe} + \text{O}_2$ (from the air) \rightarrow scale ($\text{FeO} + \text{Fe}_3\text{O}_4$) (b) The scale is dissolved in the soft or liquid enamel (c) Fe_2O_3 (from scale) $+ \text{Fe} \rightarrow 4\text{FeO}$ (d) $\text{FeO} + \text{O}_2$ (by diffusion) $\rightarrow \text{Fe}_2\text{O}_3$, $\text{FeO} + \text{Fe}_2\text{O}_3 \rightarrow \text{Fe}_3\text{O}_4$, supersatn of Fe_3O_4 , and pptn of magnetite (e) $\text{Fe}_3\text{O}_4 + \text{O}_2 \rightarrow \text{Fe}_2\text{O}_3$, supersatn of Fe_2O_3 , and pptn of hematite. The degree of firing in which reactions a, b and c occur was designated as A, the enamel is mostly green colored. Reaction d occurs in firing B and the enamel is black. In firing C the enamel has a red appearance as a result of the pptn of hematite according to reaction e. The poor adhesive oxides form compds with the FeO at the beginning. This oxide layer adheres to the iron like a scale. The enamel clings to these crystals and thereby to the Fe. The adhesion is imperfect and unsatisfactory. The fair adhesive oxides accelerate the formation of the "second scale layer" in firing B according to reaction d and thereby are fair as adhesives. The good and technically important adhesive oxides are reduced to the element by the $\text{Fe} + \text{CoO} \rightarrow \text{FeO} + \text{Co}$. The sepn of this metal forms a local current, which at high temp gives a strong corrosion of the Fe surface. The enamel clings in the cavities and adheres. The process was studied microscopically, analytically, electrochemically and thermodynamically. C B Jenni

Refractory bricks Österreichisch Amerikanische Magnesit A.-G. Brit. 437,448, Sept. 23, 1935 This corresponds to Fr. 779,467 (C. A. 29, 5620*)

Apparatus for molding firebricks and other articles from clay or other plastic material John A. Biddle, Leslie G. Pitt and Harold J. Haden Brit. 435,840, Sept. 30, 1935

Fired siliceous tribarium aluminated refractory John M. McKinley and Willard K. Carter (to National Aluminum Corp.) Brit. 435,348, Sept. 19, 1935 See U. S. 2,017,723 (C. A. 29, 8271*)

Coatings for furnaces The Carborundum Co. Fr. 788,801, Oct. 18, 1935 Cement or lime furnaces or other chambers subjected to abrasion, e.g., ball or drum mills, are coated with a cast refractory material having a sclerotic hardness of 8 or more Al_2O_3 content, or not a small amt. of Mg, Ca or Na, or a fused mass of Al_2O_3 and chromite may be used

Muffle kiln Frank M. Hartford. Can. 355,123, Jan. 7, 1936 Structural details

Muffle tunnel furnace V. N. Mikhovskii. Russ. 38,040, July 31, 1934 Construction details

Crystalline abrasive material Charles R. Walker (to Abrasive Products, Inc.) U. S. 2,029,253, Jan. 28, 1936 In producing uncrushed crystalline abrasive material such as garnet, SiC or Al_2O_3 , the material is subjected to sudden extremes of temp. change (as by heating to 700° or higher and quenching in water) to produce a reaction effective to cause the material to fracture along natural cleavage planes and to be capable of ready crushing without destruction of the naturally sharp cutting edges at such planes of fracture

Abrasive wheels Raymond C. Benner and William G. Soley (to Carborundum Co.) U. S. 2,028,183, Jan. 21, 1936 An abrasive wheel has a metal disk attached to each lateral face by a cement containing a phenolic condensation resin and a granulated filler in sufficient proportion to modify the character of the resin so that the cement has

a higher modulus of elasticity than the abrasive wheel This serves to reinforce the wheel for high speed use Cf. C A 29, 1600².

Abrasive wheels The British Thomson-Houston Co Ltd Brit 436,430, Oct 10, 1935 The wheels consist of a core of Mo or other metal, to which is welded or brazed an abrasive annulus consisting of diamond particles embedded in a cemented carbide compn The method of prep is described

Abrasive stones L I. Ginzburg Russ 38,009, July 31, 1934 In the prep of abrasive stones the binder is made from burned calcium dolomite together with a soln of $MgCl_2$ and $Fe_2(SO_4)_3$ soln

Measuring the hardness of abrasive disks or plates

1 Karl Geppert (to Kugelfischer Erste Automatische Gussstahlwerkfabrik vorm Friderich Fischer) U. S. 2,929,060, Jan 28 A sheet of perforatable material such as sheet metal or cardboard is applied to the surface of the disk or plate, a conical impact pin is driven through the sheet into the disk or plate by a standardized driving force, and the diam of the perforation in the sheet is measured

2 Enamel insulation for electric resistances I R Ripp and N A Artem'ev Russ 37,753, July 31, 1934 A mixt of water glass and about 5% of metal oxides, asbestos talc, lime stone or refractory clay is melted (heated to about 1000°) and placed on the resistance heated to about 1000°

20—CEMENT AND OTHER BUILDING MATERIALS

J C WITT

The fineness of the cement raw mixture I Elutriation of particles using Shōne's apparatus Yoshiaki Sanada and Gunkichi Nishi J. Soc Chem Ind, Japan 38, Suppl binding 622(1935) —Some improvements on Shōne's app were made, and exptl data on the elutriation of ground quartz are presented II. Fineness and chemical composition of the raw mixture Ibid 622-4 — Exptl data are given on the analysis of the raw materials used (limestone, clay and volcanic ash), grinding mills used, elutriation tests and chem compns, moduli and fineness compn of 4 raw mixts Conclusions The grinding machinery and grinding conditions greatly influenced the fine grinding of the raw mix, and the chem compn of the fineness fractions greatly differed with differences in raw materials III. Fineness and chemical composition of the clay Ibid 720-1 —Results on quartzite, ganister, shale and clay are presented and show that the SiO_2 content decreased as the size of the fraction decreased IV. The relation between fineness of raw mixture and alite crystals Ibid 721-2 —Ground limestone was sepd into 3 fractions below 15 μ , 15-58 μ and above 58 μ , and the ground clay into 2 fractions below and above 43 μ Six raw mixts were prepd from the variously sized materials and heated from room temp to 1200° in an elec muffle furnace in about 90 min, and sintered for 15 min at 1460-80° Microscopic clinker examn showed that the size of alite crystals decreased with decreasing grain size of the raw mixt The amt of alite crystals increased as the grain sizes of limestone and clay approached each other Exptl data are given Karl Kammermeyer

Nature of the clay fraction in the raw materials of the German cement industry K Endell, U Hofmann and E Maedgen Zement 24, 625-33(1935) —Röntgen ray analysis of the marls and clays commonly used in cement manuf in Germany showed the following clay minerals in order of their abundance (a) "mica clay," in which $Al_2O_3 + Fe_2O_3 + MgO + FeO$ are to SiO_2 as 1 2 6, (b) montmorillonite (in which Al_2O_3 to SiO_2 as 1 4) and (c) kaolinite A further distinguishing feature observed was the fineness of the accompanying quartz When the 3 clay substances are heated the water losses are gradual for the "mica clay" from 200° to 600°, gradual for the montmorillonite until 200° and the remaining crystn water (about 5%) gradual above 500°, while kaolin loses its water abruptly at 450° The relationship between the clay chemistry and the water content of the fluid cement slurry is shown, with an example of the impracticability of soda adds to a slurry contg kaolinite clay High water content is necessary for slurries with clays consisting largely of montmorillonite Certain colloidal aspects are also discussed, such as the rate of filtration and the water loss on heating the slurry H F Kriege

Importance of the determination of free lime in the manufacture of cement Fernando Pacheco. Ingenieria 9, 157-8, 163(1935) —This test is important for controlling the cement mfg process since the free lime content definitely changes the phys properties of the cement It has several advantages over the "indeformability" test:

requires less time, gives better indication of the intermediate transformations during heating and of the compds. formed, of the degree of hydration and consequently of the efficiency Various methods for detg the free lime are described; the need of a more practical, accurate method is emphasized M McMahon

4 Swelling and contracting of cements G Musgnug. Zement 24, 717-21(1935) —Addns of several siliceous powd admixts, such as slags, glass, trass and quartz did not produce great variations in the shrinkage of the cement within the range of good concrete. Transverse tests of concrete again showed the advantage of angular over rounded aggregates H I. Kriege

5 Composition of portland cement and high alumina cements. A Travers IX Congr. intern quim pura aplicada, Madrid 3, 9-75(1934); cf C A 28, 2633² —A review of optical, x ray and other phys methods of studying cement clinker with photomicrographs, phase diagrams and photographs of spectra Reactions accompanying setting and the theories of hardening are discussed E R Rushton

The temperature variation of portland-cement pastes under nonadiabatic condition Tsutomu Maeda Bull Inst Phys -Chem Research (Tokyo) 14, 714-19(1935) —The temp variations of the following cement mixt (cement, $H_2O = 1.5$) have been detd at 25° under nonadiabatic condition original cement (I), I + $CaSO_4 \cdot 2H_2O$, I + $CaCl_2$ and I + cane sugar Addn of $CaSO_4 \cdot 2H_2O$ lowers the second temp rise of the original cement; I + $CaCl_2$ soln causes the temp rise in 3 steps, the second step being obviously due to the reaction consuming $CaSO_4 \cdot 2H_2O$ K Konda

7 Supersulfate metallurgical cements E L Dupuy IX Congr intern quim pura aplicada, Madrid 3, 350-69(1934), cf C A 28, 7459² —Supersulfate cement is an intimate mixt of slag, $CaSO_4$ and CaO , with an av compn. of SiO_2 25-30, Al_2O_3 10-18, CaO 40-45, $MgO < 5$, FeO , $MnO < 4$ and $SO_3 < 10\%$ Phys properties are given, and also diagrams showing the variation of mech resistance with compn A mixt contg 13% $CaSO_4$ requires only a very small amt of CaO to give the max crushing resistance, this shows that CaO acts simply as a catalyst The cements do not crack on setting and are resistant to sea water Test cubes were immersed for more than 2 yr in $CaSO_4$, $KAl(SO_4)_3$, NH_4NO_3 , $CaCl_2$, $FeSO_4$, $MgSO_4$, $CaSO_4$, Na_2SO_4 , Na_2CO_3 , Na_3PO_4 , $NaNO_3$, K_2CO_3 and KOH solns without being attacked E R Rushton

9 Testing of cement in plastic mortars G Haegermann. Zement 24, 529-32(1935) —A comparison is made between the standard (earth moist) and the plastic condition of cement mortars for test purposes The upper limit of the tensile strength is derived from the compressive strength by the formula tensile strength = $\sqrt{2/3}$ x compressive strength H F Kriege

Testing of cement in plastic mortars II G. Haegermann. Zement 24, 607-9(1935). —Conditions imposed in

America, France, Switzerland, England, Japan, Brazil and Germany in cement tests are compared. H. I. Krieger.

The possibilities of pozzolanas in mortars and concretes. I dw. W. Scripture, Jr. *Eng. News-Record* 115, 163-7 (1935).—A general discussion of pozzolanas and their effect on the properties of mortar and concrete, including workability, vol. change, watertightness, heat evolution, strength and resistance to attack. A pozzolanic material is one that possesses constituents that will combine with lime at ordinary temps. to form insol. compds. of cementitious value. The precise nature of the reaction with lime is not clearly understood. Within limits, the degree of pozzolanic activity is governed more by structure and fineness than by compn. A reliable test of reactivity is required. Absorption of lime from a soln. under fixed conditions seems simplest and most direct. The materials must be carefully selected to secure the desired result. R. E. Thompson.

Design of concrete mixes for Mississippi River dams. Ralph P. Johnson. *Eng. News-Record* 115, 711-6 (1935).—Details are given of the design of the mixes in the construction of 5 locks and 2 dams, involving the placing of 420,000 cu yds. of concrete. The trial-mix method in which the remodeling app. of T. C. Powers (*J. Am. Concrete Inst.* 27, 419 (1932)) was used was employed throughout. R. E. Thompson.

Structural properties of vibrated concrete. Paul Anderson. *Eng. News-Record* 115, 676-7 (1935).—Tests, the results of which are given, indicated (1) that the water-cement ratio law holds for very lean mixes provided a compact concrete can be produced, and (2) that the shrinkage of lean mixes when compacted by vibration is considerably less than for richer mixes of the same water-cement ratio. R. E. Thompson.

Concrete in counterweight made heavy by magnetite. R. H. Rothschild, Jr. *Eng. News-Record* 115, 788-9 (1935).—Magnetite, prep'd from beach sand with the aid of an agitator-drum magnetic separator, was used as fine aggregate in the construction of counterweights for the Park St. bascule bridge between Oakland and Alameda, Cal. The sp. gr. of magnetite is approx. 4.75. The proportions per cu. yd., selected as a result of extensive tests, were: cement 762 lb., magnetite 2700 lb., gravel 1150 lb., water 48 gallons. The wt. of the concrete was 182 lb. per cu. ft. and strengths as high as 4800 lb. in 28 days were obtained. There was a decided tendency to lose strength and a slight excess of water did not have the usual effect on strength as the excess water rapidly rose to the surface. The surface is very uniform and smooth, very hard and highly resistant to abrasion. R. E. Thompson.

Investigating new kinds of froth formers [for concrete]. N. I. Irmolenko and N. A. Abramchuk. *Stroitel. Material* 1935, No. 9, 38-41.—Solns. of surface-active animal and vegetable albuminous materials (hides and lupine albumin, turpentine by-product soaps, etc. from fished) give a froth that is stable on the boundary surfaces of 3 phases, air, water soln., cement. The highest stability of the froth is found in a medium of pH greater than 7. The physicochemical consts. of froth concretes obtained are in accordance with standard values. The rapidity of setting of cement is higher than that of the destruction of the froths investigated. E. B. S.

Investigation of froth concrete at high temperatures. B. A. Smolyak and T. D. Morozova. *Stroitel. Material* 1935, No. 9, 42-6.—At temps. up to 400° froth concrete is a good thermal insulator and is stable. E. B. S.

Disintegration of concrete by mineral sulfates. R. W. C. Smith. *Water and Water Eng.* 38, 55-7 (1936).—In order to protect the concrete walls against sulfate disintegration they were painted with a mixt. of tar and pitch, the proportions of which were varied to give the proper consistency at the temps. at which the coats were applied. W. A. Moore.

New viscometer for bitumens has extended range. J. O. Rhodes, L. W. Volkman and C. T. Barker. *Eng. News-Record* 115, 714-18 (1935).—An instrument, termed the Koppers Products Viscometer, by means of which the consistencies of all grades of road tar can be det'd. quickly

and conveniently at a single temp. within the range of atm. temps. encountered under service conditions, is described, together with the mode of operation. This instrument, which has a precision of 1% in the lower and a much greater precision in the higher ranges, overcomes the difficulty that the tests usually employed are suitable only for a portion of the consistency range. Although the instrument has been used thus far for road tars only, it should be suitable for testing all grades of road asphalts and many other types of materials. Patents have been applied for. R. E. Thompson.

Mastering a new method of dehydration of gypsum in a suspended condition. L. L. Lipsitz. *Stroitel. Material* 1935, No. 5, 13-22.—The processes and data obtained in previous investigations abroad (cf. Schneider, C. A. 26, 1737) were verified under plant conditions. A detailed description is given of the plant, the technological process and the thermal conditions. The plastering gypsum obtained corresponded to standard requirements. I. I. Stefanovsky.

Preservation treatment of pit-timber. P. F. Dry. *Trans. Inst. Mining Engrs.* 90, 160-4 (1935).—Mine props were treated with cresote, NaCl (8 and 3 1/2% solns.), ZnCl₂ (5 and 2% solns.), NaF (4 and 2% solns.) or Wolman salts (5 and 2% solns.) (compn. NaF 80, dinitrophenol 6, Na dinitrophenate 5, and K₂Cr₂O₇ 8%) for 1 hr. at 180°F. and cooled for 16 hrs. Absorption was 7-10 lb. per cu. ft. of timber. Best results were obtained with the most expensive reagents, cresote, Wolman salts and NaF. A 2% soln. of the last 2 is adequate. NaCl gave results far superior to untreated timber. Alden H. Emery.

Investigations on the effectiveness of impregnating wood with thiocyanates. O. Routah and Voitto Virtala. *Suomen Kemistilehti* 8A, 125-6, 135-40 (1935).—The sol. murex salts are the more effective in preventing fungus growth. The amt. of HgCl₂ necessary is 0.025% and of KCNS is 2.0-2.1%. A mixt. of the 2 which gives the best results is 0.017% HgCl₂ and 1.45% KCNS. Although KCNS alone is not satisfactory as an impregnating material, it seems to produce a beneficial effect when mixed with HgCl₂ as specimens impregnated with the mixt. withstand molding to a far greater extent than corresponding specimens treated with HgCl₂ alone. E. F. Jukkola.

Studies in old timbers. III. Post neolithic. Ernest A. Rudge and Harold Lewis. *J. Soc. Chem. Ind.* 54, 433-4T (1935), cf. C. A. 29, 6389.—The results of an examn. of submerged forest timbers over 6000 yr. old are reported. The data include extns. by benzene, alc. and hot water, soly. in alkali, cellulose-lignin and ash analyses. The influence of Ie on the decompn. of lignin is again indicated. Alfred L. Kammerer.

Hydraulic cements. Chemische Fabrik Grünau Landshoff & Meyer A.-G. Tr. 788,822, Oct. 18, 1935. An alkali silicate along with one or more other salts the cations of which do not form insol. or difficultly sol. salts with the SiO₂ of the silicate, and the anions of which contain a

metalloid, preferably bi- or trivalent, is added to improve the quality of hydraulic cements. Salts used include alkali salts of acids of P, B, Si, N, HCN and HCNS, as well as bromides and bromates and salts of As, Sb and Se. The advantages of the addition of alkali silicates without the disadvantages are thereby obtained. *Cl C A 30, 8354*.

Hydraulic cement "Straba" Straßenbaubedarf A - G Ger 620,980, Oct 31, 1935 (Cl 803 1 06) The cement is obtained in powder form by mixing together the powder hydraulic constituent with powder slag as dust clouds or fine suspensions. Examples mention the blowing together of cement and trass, and cement and fine-ground active SiO_2 suspended in oil or bitumen.

Cements *Bolidens Gruvaktiebolag Brit 435,015, Sept 12, 1935* A cement or cement mixt contains Al arsenate in admixt with CaO , Ca silicate, portland cement, aluminous cement or similar products rich in CaO . The Al arsenate may be prep'd by oxidizing As_2O_3 together with an aluminiferous material, e.g., bauxite, clay, in air, e.g., by heating a sludge or moist mixt of the ingredients in a counter current of air in a rotating furnace. Catalysts for the oxidation, e.g., Fe, Mn or Cu compds, HNO_3 , nitrates or nitrous fumes, may be used. *Cl C A 30, 15391*.

Cements Soc anon des ciments de Thieu and Léon Blondiau Brit 437,855, Nov 6, 1935 See Belg 400,861 (C A 28, 6269) The calcination takes place below a temp that causes decompos., 900-1200° being preferable.

Metallurgical cement Soc anon John Cockerill Belg 406,709, Jan 31, 1935 Clinker, slag and up to 12% of alk. earth sulfate are introduced simultaneously into the pulverizer.

Hard surfaced cement Arthur L Smyly U S 2,028,956, Jan 28 A mass of iron material such as scrap iron likely to contain certain impurities capable of forming gas when present in wet portland cement is ground and treated with an alkali soln such as with a 10-30% soln of NaOH to decrease the quantity of gas-forming impurities present, the treated material is dried while wet with alkali so as to coat the particles with a protective alkali and the treated iron is used with portland cement.

Magnesium oxychloride cement Arnold Hermann U S 2,030,002, Feb 4 A dry mixt formed of MgO 40, BaSO_4 40 and chalk 20% is separately formed and then mixed with about two fifths its volume of a liquid mixt formed of a 27% Be MgCl_2 soln 60, a 21% Be HCl soln 20 and a 22% Be H_2SO_4 soln 20%.

Metal lined cementitious pipe Eric P Hailburton U S 2,029,369, Feb 4 A pipe with a cementitious body, a lining which may be formed of metal and a casing such as one of metal has ceramic balls or the like embedded in the cementitious material and extending from the liner to the casing.

Porous concrete Karl I A Ellund Brit 436,105, Oct 4, 1935 Light concrete bodies are made of portland, slag, aluminous or like cement, a gas-forming substance, e.g., powder Al, aggregate as required and finely divided siliceous material, e.g., clay, SiO_2 , the mass being heated with steam to cause the SiO_2 to react with CaO liberated in the setting of the cement and also to convert di- and tri-Ca silicates into mono-silicates. An addn of CaCl_2 gives a product of increased strength.

Road making compositions Dezzo Komlos Brit 437,808, Nov 6, 1935 A compn for making roads, pavements, tennis courts, etc., consists of fibrous or granular materials which do not disintegrate in H_2O , e.g., sand, gravel, flint, quartz and 3-5% of a drying oil, e.g., wood, nut, poppy, hemp or linseed oil, to which has been added a small proportion, e.g., 1%, of a Pb, Zn, Mn or Co compd. On applying to the road, etc., an exothermic reaction sets in and the temp rises to 120-150°. The surface is then covered by a layer of loose sand heated to said temp, which is maintained for about 48 hrs when the sand is removed.

Tar compositions for roads, etc Jean L Chambon and Georges M Hart. Fr 788,834, Oct. 18, 1935. The

compos. contain, e.g., tar 100, colloidal filler 100 and rubber oil 2 kgs. The colloidal filler contains "administrative" lime 33, colloidal SiO_2 60, and Fe_2O_3 or Al_2O_3 6%.

Bituminous compositions N. V. de Bataafsche Petroleum Maatschappij Brit 435,732, Sept 26, 1935. Light-colored road and pavement construction, e.g., road coverings, floors, traffic lines and joint and crack fillings, are made by applying a mixt of bitumen, mineral aggregate and powder Al to form a wearing course of required thickness.

Bituminous compositions Wm Gooch Brit, 436,187, Oct. 7, 1935. Bituminous road, etc., surfacing material is prep'd by mixing together 34-36% of fines, e.g., sand, passing a screen having 8 meshes to the in and retained on 15 meshes, and gravel or granite comprising 7-9% of material passing 1 in and retained by $\frac{1}{4}$ in, 7-9% passing $\frac{1}{4}$ in and retained by $\frac{1}{8}$ in, 25-27% passing $\frac{1}{8}$ in and retained by $\frac{1}{16}$ in and 13-15% passing $\frac{1}{16}$ in and retained by $\frac{1}{32}$ in mesh, heating the mixed materials until dried, adding about 6-8% of bitumen and mixing at about 380°F.

Plastic compositions, William J. Woodfine Brit 435,713, Sept 26, 1935 Slabs for surfacing pavements, etc., are molded from a compn obtained by mixing sawdust and ready-mixed oil paint, rubber latex may be added to the paint.

Apparatus for coating aggregate with a liquid-vehicle bituminous binder Wallace M Hendrick and Gustave Loeffler, Jr U S 2,028,745, Jan 28 Various mech and operative details.

Manufacture of composite building material such as sheets of wood particles and resinous material Emil C Loetscher U S 2,023,616, Jan 21. Various details of app and operation are described.

Building material from spent tanning wood R Z Taunzhammer, V I El'man and B A Sumagin Russ 35,994, April 30, 1934 The spent wood is mixed with husks or other vegetable albuminous products as binder, alkali or acid is added at ordinary temp and the mass is pressed and dried at ordinary temp. Acids used may be HCl , H_2SO_4 , HNO_3 , H_3PO_4 , HCOOH , CH_3COOH , oxalic or citric.

Asphalt-asbestos mixture suitable for flooring, heat insulation, etc Ulric B Bray, Lawton B Beckwith and Frederick S Scott (to Union Oil Co of Calif.) U S 2,029,289, Feb 4 A fibrous material such as asbestos is mixed with asphalt, water, a stabilizing agent such as Na caseinate, a demulsifying agent such as slaked lime and a finely divided material such as diatomaceous earth which adapts the mixt for trowelling.

Roofing felt Pierre Drewsen (to Barrett Co.) U S 2,029,310, Feb 4 Jute fibers and other vegetable fibers such as those of wood are separately cooked and are then mixed with each other and with cereal fibers such as those of wheat or oat straw which have been subjected to a more severe cooking, to form a felt sheet of desired strength and absorptive character.

Roofing plates Ya Yu Rottberg Russ 38,480, Aug 31, 1934 Organic fibrous material is made water-resistant by means of hot bitumen and then cemented together with lime-silica soln.

"Acoustic" partition or wall-covering material Harold D. Arnold (to Bell Telephone Laboratories, Inc.) U S 2,028,180, Jan 21 A thick, porous and easily compressible layer of material such as felt adapted readily to absorb energy from air waves of low frequencies is used with an exposed thin layer of high density non porous material such as a paint or enamel covering the porous material and serving to prevent excessive absorption of energy from air waves of the higher frequencies.

Treating wood Heinrich A Hellmers and Mersida Veneers Ltd Brit 435,334, Sept 19, 1935 Pecked wood veneers are seasoned and rendered pliable by steeping cut lengths in an aq soln of formalin, chrome alum, gelatin and glycerol. The treated veneers are adhesively secured to a paper, etc., backing for use as wall coverings, etc.

Treating wood Paul von Sonnenthal *Brit. 436,015*, 1 Oct. 7, 1935. Wooden articles of curved and angular configuration are produced by treating veneers or plywood with a soln. contg. 0.1-1% of 1 or more tanning agents, e. g., oak or quebracho bark, sumac, alum, 1e salts, chromates, phenols, aldehydes, until the wood is supple and then bending, folding or winding. Org. solvents, e. g., AcOAm, and sterilizing and fireproofing agents may be added to the soln.

Preserving wood, etc. Axel R. Lindblad *Brit. 444,084*, Sept. 12, 1935. Wood or other vegetable matter is

preserved by impregnation with a soln. contg. an alk. earth compd., e. g., a Ca, Ba, Sr or Mg compd., H_2AsO_4 , or a salt thereof and an org. acid, e. g., AcOH, HCOOH, so that on evapn. a diffusible sol. alk. earth metal arsenate is left in the wood. In modifications, the H_2AsO_4 or org. acid constituents may be chemically combined with the alk. earth metal constituent.

Preserving wood, plants and trees Serge Teliayeff. *Tr. 789,691*, Nov. 4, 1935. A soln. of 5 parts of dinitrophenol in 95 parts petroleum oil is used. The soln. may be emulsified in water contg. an emulsifying agent.

21—FUELS, GAS, TAR AND COKE

A. C. FIFLDNER AND ALDEN H. EMERY

The volume changes of mixtures of benzene and petroleum with alcohol and motor benzene. Franz Spaustra *Brennstoff-Chem.* 16, 181-4 (1935). Pyrometer d_v of motor benzene alk. mixts. are lower than calcd. values at low concns of alk. Variations between detd. and calcd. d_v are tabulated. Largest differences are with 50 vol. % alc. and become less with increasing d_v of the petroleum fraction. No relationship with boiling range was found.

I. W. Jung

Alcohol motor fuel. Tetsuro Suwa. *J. Fuel Soc. Japan* 14, 1361-79 (1935) (in English 129-32).—The use of 1:10H mixed with com. gasoline as a motor fuel was studied on a Cooperative Fuel Research engine coupled to a 4-kw. Sprague dynamometer. The tests were made with an undiluted gasoline with fuels contg. 10, 20 and 30% by vol. of abs. alc. Results: Gasoline contg. alc. up to 20% can be used in gasoline engines without readjusting the carburetor, and the equiv. calorific value of alc. is preferable to the calorific value of gasoline.

F. I. Nakamura

Compressed gas as a fuel for motor transport. R. Cook. *Gas J.* 213, 90-3 (1936).—The system of compressed gas compulsion used at present is described, and an analysis made of its economic possibilities in competition with gasoline and heavy oil. Conclusion: Heavy oil constitutes the real competitor to compressed gas. The improvement in the economic possibilities of compressed gas by enrichment with coal gas and by development of a special engine have also been examined.

P. J. Wilson, Jr.

High speed Diesel-engine fuels. Ignition characteristics of light oil for high-speed Diesel. Karoku Yamazaki and Sakae Ota. *J. Fuel Soc. Japan* 14, 1473-83 (1935) (in English 131-7).—Y. and O. measured the Diesel and ignition indexes and calcd. the cetene nos. by the methods proposed by Becker and Fischer (*C. A.* 29, 3167), Moore and Kaye (*C. A.* 29, 5257) and W. H. Butler. To verify the actual measurements of these indexes they also carried out engine tests. The distn. characteristics of the oils used, and Diesel index, ignition index and calcd. cetene nos. are given in 2 tables.

F. I. Nakamura

Applicability of physical constants for determination of ignition behavior (cetene number) of Diesel fuels. Richard Heinze and Maximilian Marder. *Brennstoff-Chem.* 16, 286-90 (1935).—The parachor, d_v and n_D are related to boiling indexes in the comparison of ignitability. Av. differences between detd. cetene no. and that calcd. with d_v of the parachor is 1.8. Refraction and surface tension appear sufficient for the calcn. of ignitability with Diesel fuels.

I. W. Jung

Relationship between the ignitability of brown-coal Diesel fuels and their physical properties. Richard Heinze and Maximilian Marder. *Oel, Kohle, Erdöl, Teer* 11, 724-8 (1935); cf. preceding abstr.—Nearly linear relationships are shown between phys. consts., particularly the parachor and d_v , of fuels of similar boiling range, and the ignitability. With creosote-contg. brown-coal oils, a correction is needed. The av. difference between the detd. cetene no. and that calcd. from phys. consts. is =1.

I. W. Jung

Coal-dust motor fuel. Hans Wahl. *Brennstoff-Chem.* 16, 201-8 (1935).—Various requirements of coal dust have

been examined. Indexes are ash content, abrasive no. and a proposed collective abrasive no.

Coal washing in Baum-type washers with selective ash control. J. W. Wilson. *Proc. III Mining Inst.* 1935, 39-42.

Alden H. Emery

Coal selection for steam plants. A. W. Gauger. *Penna. State Coll., Mineral Ind.* 5, No. 5, 1-4 (1936).—The effect of variation of moisture, ash, B. t. u., ash-handling costs, ash-softening temp. and S on the price of coal is discussed.

Alden H. Emery

Coal utilization (with special reference to sulfur content). W. D. Langtry. *Proc. III Mining Inst.* 1935, 136-43.—Occurrence of S in coal, its behavior in burning and its effect on heating equipment are discussed.

Alden H. Emery

Coal friability tests. A comparative study of methods for determining the friability of coal and suggestions for tumbler and drop shatter test methods. R. E. Gilmore, J. H. H. Nicolls and G. P. Connell. *Can. Dept. Mines, Mines Branch Rept. No. 762*, 102 pp. (1935).—The friability of 7 coals was measured by 7 methods: small jar tumbler, A. S. T. M. coke drum tumbler, box tumbler, drum (box) tumbler, Sheffield coke abrasion tumbler, A. S. T. M. coke shatter test and III shatter test.

Each method places the coals in approx. the same order of friability and hence all may be considered satisfactory. Appreciably more breakage occurs in the tumbler than in the shatter tests. The tumbler test should be used to measure comparative friability after a certain amt. of handling has taken place and during preliminary plant crushing. Shatter tests serve better to indicate resistance to breakage prior to plant crushing. The small jar tumbler and A. S. T. M. coke shatter test had sufficient advantages over the others to warrant special consideration.

In the shatter tests, the av. ratio of round to square hole screen sizes varied from 1.07 for the $\frac{1}{4}$ -in. hole to 1.17 for the $\frac{11}{16}$ -in. hole. Friability indexes varied directly with size of lumps, the larger being more friable than the smaller. Friability index and size stability index (cumulative percentage of dropped coal remaining on screen lower and next in series to the smaller screen used in prep. the sample for test) agreed closely for the $\frac{1}{4}$ - to 1-in. size of all coals tested and for all sizes of the most stable coal.

The difference between the size stability index of the least and most friable coals for 2 drops corresponds closely with the friability index for 4 drops. Rate of breakage reached

a max. at the end of the second drop for the different sizes of the least and medium friable coals. A 2-drop modification of the shatter test gave duplicable friability and size stability indices. Dropping the coal on an Fe plate or smooth concrete made little difference. Tentative procedures for shatter and tumbler tests of coal are outlined.

Alden H. Emery

Heating coal-carbonizing equipment. Stief G. u. Wasserfack 78, 905-71(1935). Coal-carbonizing equipment fired with producer gas should also be equipped to use coal gas, and vice versa, so as to increase the flexibility of gas and coke yields. Calcs. are presented as to the effect of substituting producer gas for coal gas on coal throughput and gas yield, etc. With regenerative heating of the air, the efficiency of the 2 gases is quite similar, as about the same excess of air is required in each case. Coal gas may give too short and hot flames in burners designed for producer gas—this is best avoided by adding sufficient flue gas. If mixts. of coal gas and producer gas are to be preheated before burning, sufficient steam must be added to prevent C and tar sepn. during heating. R. W. R.

Prevention of coal fires during storage. Causes. Avoidance of spontaneous ignition. M. Blanke. Arch. Vormeist. 16, 97-9(1935). Gas u. Wasserfack 79, 13-14(1936). Spontaneous ignition of coal storage piles can be avoided by (1) a storage area dry and free from fences, piers, etc. Ashes should be avoided as apt to cause O access. (2) Storage area must be cleaned up before initial use. (3) Coals of different sizes should be stored separately, and breakage avoided. (4) Coals of different origin should be stored separately. (5) The size of the storage piles should be limited, but may be slightly larger in winter than in summer. At least 1 m. should be allowed between piles. (6) In case the fire stops must be filled with coal, this coal should be removed first. (7) The following heights of storage piles are safe: (a) fine coal, over 18% volatile matter, up to 4 m.; large coal, over 18% volatile matter up to 6 m.; fine coal below 18% volatile matter, up to 6 m. and large coal below 18% volatile matter, up to 8 m. (8) Numerous pipes should be inserted for temp. measurements. (9) Coal should always be removed from the outside. (10) Storage in covered bunkers is desirable, storage in sunny corners and discharge of gutters on coal should be avoided. (11) Accumulation of gas above coal in bunkers must be avoided. (12) Storage in cones, etc., should be avoided. (13) Fine coal must not be permitted to reach temps. over 65° in bunkers. Putting out fires. (14) Bituminous coal starts to burn at about 200°. (15) Small fires are extinguished by opening up the hot "nests" and repiling the coal. (16) Larger fires are difficult to extinguish by dirt or water. Water penetrates with difficulty on account of tar formation and may cause explosions. The safest means is air exclusion, with cooling. CO₂, N or SO₂ may be introduced into the bottom of the pile and drawn off at the top of the pile by fans. If possible the coal should be removed with grab buckets and extinguished in water for 1-2 mm. and then stored at a new location. R. W. R.

The fusibility of coal ash. Y. Kosaka. J. Fuel Soc. Japan 14, 119-24 (in English)(1935). Cf. C. A. 29, 1204. K. devised a method embodying improvements on the method of Hubley and Bunte, and examd. about 60 varieties of Japanese coal ashes. The description of the app., its operation and the results of the tests are given.

F. I. Nakamura

Hydrogenations in a tetralin medium. I. Destructive hydrogenation of bitumen and pitch. E. H. Boomer and J. Edwards. Can. J. Research 13B, 323-30(1935). The importance of a suspension medium in processes of destructive hydrogenation is discussed, with particular reference to the efficiency of the medium as a H carrier. The value of tetralin as a medium, in that it is a good solvent, is stable to heat, and acts as a H carrier, has been detd. in the hydrogenation of bitumen and stable pitch. Tetralin does not cause an increase in yield of oil but does improve the quality somewhat. It increases the rate of hydrogenation of bitumen but does not affect that of stable pitch. II. Destructive hydrogenation of coal

with tetralin and with a mixture of related compounds as media. Ibid. 331-6. A complex mixt. of polynuclear hydrocarbons obtained in the pyrolysis of natural gas has been hydrogenated. The original mixt. and the product of hydrogenation have been used as suspension media in the hydrogenation of bituminous and domestic coals, and are compared with tetralin as a medium. The original mixt. is much less, and the hydrogenated mixt. only slightly less, effective than tetralin. III. Destructive hydrogenation of cellulose and wood. E. H. Boomer, G. H. Argue and J. Edwards. Ibid. 337-42. The destructive hydrogenation of cotton wood, cellulose and fir-wood sawdust in a tetralin medium was investigated. When it is present in sufficient excess, tetralin promotes the complete conversion of cellulose and wood to liquids and gases in the absence of a catalyst. The tetralin acts as a H carrier in fulfilling the function of a catalyst. IV. Destructive hydrogenation of grain screenings. E. H. Boomer and J. Edwards. Ibid. 343-50. The destructive hydrogenation of grain screenings in a tetralin medium has been investigated. With an excess of tetralin, at least 3 to 1 by weight, more than 50% of the screenings can be reduced to oils and about 15% to solid residue. Catalysts are effective by virtue of the fact that they greatly increase the rate of reaction, and also increase the production of hydrocarbon gases at the expense of CO₂. J. W. S.

Gasoline from coal at Billingham. C. H. S. Tupholme. Chem. Industries 38, 29-32(1936).—See C. A. 30, 268.

The results of low-temperature carbonization of some Lower Gondwana Indian coals. Lewis L. Fernor. Records Geol. Survey India 69, Pt. 3, 353-60(1935). Analyses of 22 coals are given tabularly with yields of coke, oil, liquor and gas and certain data on properties of each. Coals with more than 3% moisture are weakly coking or noncoking, while most of the coals below this yield good low-temp. coke. The high moisture coals yield more liquor than low-moisture coals. The most suitable coals for use in mfg. low-temp. coke are those also suitable for mfg. high-temp. metallurgical coke.

Alden H. Emery

Improvements in low-temperature analysis. W. W. Robinson, Jr., and F. N. Laird. Petroleum World 32, No. 11, 189-91(1935). Simple procedures and auxiliary equipment are described for the accurate detn. of the liquid and vapor vol. of the residues from wet gases in low temp. analysis of natural gas. Mol. wts. are readily calcd. Chas. Wirth, III.

The Coalite low temperature process. W. A. Bristow. Brennstoff-Chem. 16, 281-6(1935). The Parker Coalite process of 1906 is described in its present development.

F. W. Jung

Comparison of retort- and waste gas carbonization. E. Groh. Brennstoff-Chem. 16, 221-30(1935). The Kohlenveredlungs process and the Freiberg and Lurgi processes are compared for costs, yields and quality of products. F. W. Jung.

Press for high caking indexes. R. Kattwinkel. Brennstoff-Chem. 16, 231(1935). Addnl. app. for the method proposed previously (C. A. 26, 2847) is described.

F. W. Jung

Carbonization and combustion. David Brownlie. Steam Eng. 5, 137-9(1936). Cf. C. A. 29, 7042. By carbonization of mixts. of pulverized coal and oil up to 450° and 750-900 lb. per sq. in. a residual product is obtained composed of heavy oil and carbonized coal particles in true colloidal condition. Several of these processes are described briefly along with the Trent process.

Alden H. Emery

The flame "rating" of manufactured gases as a measure of their combustion characteristics. Horst Brückner and Hans Löhr. Gas- u. Wasserfack 79, 17-20(1936). The combustion characteristics of various manifold gases can be compared on the basis of their "specific flame rating" (C. A. 26, 829) detd. by using a Bunsen burner of 1 sq. cm. cross section (1.28 cm. diam.) with an inner cone height of 0.99 cm. This height of the inner cone corre-

sponds to a flame area of 2 sq. cm., and the "specific flame rating" is expressed in kg. cal./sq. cm./sec. This value is dependent on the rate of flame propagation, heating value, etc. A satisfactory gas should have a max. "specific flame rating" of about 1400×10^{-4} kg. cal./sq. cm./sec. $\approx 10\%$. Graphs are given for the variation of this value with various air-gas ratios for a no. of manifold gases. A higher "specific flame rating" can be secured with air-gas mixts somewhat leaner than that used in ordinary appliances of the Bunsen-burner type. Maintenance of the proper value will insure sharp flames and the slight danger of CO in the flue gas.

Combustions in gaseous phase W. A. Bone *Inst. intern. chim. Solvay, 5th Conseil 1935*, 119-204, cf C A 28, 876, 879. —A general discussion and review dealing successively with slow combustion, pre-inflammation period, the inflammation period, limits of inflammability, propagation of flame in explosive mixts., "uniform" initial movement, acceleration of initial velocity of the flame by compression waves, detonation, explosions in closed vessels, explosions under high initial pressures, influence of pressure on the spectra of stable H and CO flames in O, and the mechanism of oxidation in combustions in gaseous phase.

A. Papneau-Couture

The dry purification of manufactured gas K. Bunte *Gas- u. Wasserfach 78*, 954-9(1935). —Fouling and re-activation of dry purifying material are 2 fundamentally different processes. High capacity for absorbing H₂S is more important than high rate of absorption (activity) except where purifier capacity is limited. App. for detg. activity is illustrated but not described. The activity of Lux and Lauta purifying materials increases much more rapidly with time than do bog iron ores. A high content of reactive iron is desirable to secure optimum S contents in the oxide in the min. no. of foulings—this reactive iron content is reduced by the formation of iron disulfide, sulfate and various CN compds. While fouling and re-activation may appear to proceed at nearly the same rate with a heavily loaded purifier, this is not ordinarily true, as the H₂S can find much reactive Fe oxide, while there is much less FeS₂ available for reaction with O. The optimum moisture contents for fouling and reactivation of a given oxide are generally different. It is believed that the optimum moisture content for fouling corresponds to a thin film of water on the surface of the purifying material, and that increasing thicknesses of this film will decrease the rate of H₂S absorption due to diffusion processes. Increasing water contents up to the optimum are also believed to increase the amt. of active Fe(OH). Intensively dried purifying material has greatly decreased capacities and activities—partly dried materials can be re-humidified by adding steam to the gas. Optimum temps. for fouling and reactivation differ somewhat. Alkalis addn. to give a higher pH value increase the rate of H₂S absorption, but have no influence on the reactivation process.

R. W. Ryan

The controlled operation of a carbureted water-gas plant—II 37th Report of the Joint Research Committee of the Institution and Leeds University. F. J. Dent, W. H. Blackburn and N. H. Williams *Inst. Gas Engrs. Com. publication No. 122*, 156 pp., *Gas World* 103, 421-2, 431-8, 541-3, *Gas J.* 212, 473-5, 693-5(1935); cf C A 29, 1398. —When using carbureted water gas as a coal-gas auxiliary, the total costs of manuf. per therm are a min. when a plant is operated at a high output. To obtain high output, (a) the blast press should be such that, with the temps. in the fuel bed at the max. allowed by clinker formation and wear and tear of the generator, the heat in the blow gases is no more than is required for carbureting, and (b) the rate of steam supply should be as high as consideration for the quality of the blue water gas will permit, unless the rate of oil supply then required leads to excessive loss of oil efficiency. The relative durations of run and blow are fixed by the necessity of storing sufficient heat in the fuel bed during the blow to decompose the steam during the run. The density of the fuel must be adequate to withstand the blast pressure required to control the heat in the blow gases. When the demand for

carbureted water gas decreases, economies in raw material and maintenance can be secured by modifying operation. Clinker formation and wear and tear are reduced by using lower blast pressure. Improved decompn. of steam and oil and blue water gas of better quality result from slower rates of steam and oil admission. Heat in the blow gases can be increased with advantage until the plant is self-supporting in steam. A large proportion of the steam should be passed down through the fuel bed, for then there is less tendency for heat to leave the generator in the blow gas while there is an improvement in the quality of the gas. With coke of normal grade, nothing is gained by operating with shallow fuel beds under steady conditions. The fuel bed should be sufficiently deep to avoid excessive loss of sensible heat in the gases leaving the top of the generator, without being so deep as to restrict unduly the air supply. A temporary lowering of the fuel bed is a simple means of preventing the temps. of the carburetor from being affected by accidental variations in the moisture content or the size of the coke, or the nature of the ash. The performance of a plant using a normal grade of coke is better than with smaller grades. No mech. difficulties arise with smaller grades, they can be used when their lesser monetary value compensates for lower thermal yield and poorer quality of gas and when the full output is not required. Operation of the mech. grate at a slower speed improves the output, the quality of the gas and the yield of gas per 1000 lb. of coke, mainly because with a slower speed a greater proportion of the steam can be supplied on the back-run. If the grate speed is reduced still more a point is reached when clinker accumulation prevents further gains by disturbing conditions in the fuel bed. A self-clinkering plant has a considerably greater output per sq. ft. of cross section than a hand-clinkering plant. In spite of this, the self-clinkering generator gives a higher thermal yield of gas per 1000 lb. of coke and also of better quality.

Catalytic oxidation of benzene in gaseous phase. Y. V. Pigulevskii and E. Ya. Varzhemskaya. *J. Gen. Chem. (U. S. S. R.)* 5, 1620-8(1935). —Pure and cracking C₆H₆ was oxidized in an electrically heated Fe chamber (1.2 cm. X 17 cm.) charged to 2/3 of its capacity with the catalyst prepd. by pptg. NH₄ vanadate on grog lumps and activating at 450° in a current of air and O. The reaction was carried out with mixts. contg. 3-8% C₆H₆ and 19.7-89% O by vol. at a temp. interval of 370-450° and contact periods of 0.4-20.6 sec. The reaction gases were conducted through a system of condensers cooled to room temp., 0° and liquid air. Dry air or O was freed from the last traces of H₂O by freezing with liquid air. A max. yield of 38% maleic acid (I) was obtained at 450° and a contact period of less than 1 sec. in an O atm. The chief products of reaction are I (or maleic anhydride (II)) and H₂O; the by-products are quinone (4.23%) and some decompn. products probably contg. quinhydrone. When the first (air) condenser was heated to 40-50° to prevent any condensation of the H₂O formed in the reaction, only pure I collected in the first condenser and I in the second (ice) condenser. It follows that the primary product of the catalytic oxidation of C₆H₆ is II, which combines with the reaction H₂O in the condensers with the formation of I. The most probable mechanism of the reaction is alternate

- oxidation of $C_{12}H_{14}$ to hydroquinone, quinone and II with
'cpn of CO_2 and H_2O Chas Blanc
- Standard Oil of Indiana perfects new treating process
for motor benzene Vanderveer Voorhes *Oil and Gas J*
34, No 30, 36, 39, 41-2(1938)—Refiners are giving up
the method of treating motor benzene with strong acid and
its accompanying high cost and large losses V describes
methods now used (1) dil H_2SO_4 followed by a water and
caustic wash, (2) vapor-phase clay treatment, giving a
product that is satisfactory in everything but gum stability
This can be remedied by the use of antioxidants
Benzenes from certain sources contain excessive amts. of S
compds These can be removed by sepg the benzene into
several fractions, one of them contg most of the S This
fraction can be treated with strong acid Antioxidants
are used very satisfactorily in producing a stable benzene
made by less severe treating methods J R. Strong
- Separation of acenaphthene from coal tar, and its purification
P P Karpukhin and L I Slominskii *Ukrain Khim Zhur* 10, Wiss-tech Teil, 392-411(1935)(in
Russian)—Kamenskii coal tar contains 1.2% acenaphthene
(I), b 277-8° The first fractional distn of heavy
oil, b 260-75°, gave 2.52% I A 2nd distn of the oil and
the fraction, b 275-90°, gave addnl 0.14% I The 1st
fraction of anthracene oil after 3 fractionations gave
5.48% I, of which 1.63% was obtained in the 1st distn
Sepn of I from anthracene oil is more profitable, because
only 44% of the oil must be distd to obtain the fraction, b
279°, as compared with 79% of heavy oil Since the
difference between the vapor tensions of fluorene and I
increases at lower temps (Everest, *The Higher Coal-Tar
Hydrocarbons*, C A 22, 597), it is advantageous to distil
in *vacuo* I crystd from the fraction, b 260-75°, can be
used after sepn by centrifuging directly in many syntheses
I is purified by crystn from benzene, ligroin or alc
Plans for a com sepn of I are discussed Chas Blanc

Viscosity temperature relationship of Japanese petroleum oils III, IV Takewo Kurosawa J Soc Chem Ind, Japan 38, Suppl binding 621 2(1935), cf C A 30, 1214.—The working viscosity, i.e., the viscosity at the working temp, was obtained for various kinds of lubricating oils. The working viscosities of heavy crankcase oils were generally lower than those of light spindle oils in normal usage. The concept of transition temp and transition viscosity (at that temp) is developed, as the point of contact at which the line $V + t = k$ (angle of slope 135°) is a tangent, where V = viscosity and t = temp, on the V vs t diagram. For Japanese oils having V of 25-3000, the transition temps lie between 20° and 145° and the transition viscosities between about 50 and 60 sec. Math expressions for the V - t curves are presented. K Kammermeyer

Theoretical and technical considerations on the refining of mineral oils by physical extraction B Kwal Rechm and (Paris) 44, 282-6(1935).—After outlining the defects of the H_2SO_4 process of refining mineral oils, K presents briefly the theory of refining by solvents. Expts made by K are described that showed the feasibility (on a lab scale) of treating with $PhOH$ to s.p. the oil into a light fraction and a heavy fraction, which are further refined (after removal of $PhOH$ by vacuum distn) by extn with m -nitrobenzyl alc. An app for carrying out the combined $PhOH$ - m - $O_2NCH_2CH_2OH$ process

continuously is described. Adaptation of the process to com operation is being investigated. A. P.-C.

The bituminous shales of Lozère and Aveyron Jean Barlot Mat, grasses 27, 10683-5(1935); cf C A 30, 12164.—The shale beds of Mende, Canourgue-Campagnac, Severac, Millau, Roquefort, Tournemure, Saint-Jean and Saint Paul are described. Analysis of 12 samples gave the following results: sol in HCl at 20° 18.2-65.0, org matter 8.1-19.0, oil 4.0-9.6 and gas 1.4-3.1%. Distn of the oil gave: 30-205° (motor spirit) 3°, 205-330° (gas oil) 41, residue (pitch) 20%. The compn of the oil is approx unsatd hydrocarbons 52, aromatic hydrocarbons 12, alcs O, bases 2.0, phenols 0.8 and S 1.15%.

Diesel oil obtained in the benzene synthesis of Franz Fisher and H Tropisch Isolation and chlorination of symmetrical paraffin hydrocarbons H. Koch and G. Ihng Brennstoff-Chem 16, 185-90(1933), cf C A 28, 6291.—Diesel oil, in part dewaxed Kogasin II, was subjected to vacuum distn. Normal paraffins from decane to octane were isolated. The remaining 60-70% of the paraffins consisted of isoparaffins. The n -paraffins were chlorinated and fractionated by vacuum distn. Bibliography. F. W. Jung

The constitution of lubricants prepared from Kogasin II H. Koch and G. Ibing. *Brennstoff-Chem.* 16, 261-8 (1933); cf preceding abstr.—Alkyl chlorides previously prep'd. were condensed in the presence of active Al or condensed with aromatic hydrocarbons in the presence of $AlCl_3$. Reaction products were sep'd by distn and the compn. of the fractions was det'd. Viscosities and viscosity-temp curves are given. F W Jung

Separation and utilization of *o* and *p*-nitrotoluenes from the mononitrotoluenes prepared from the gasoline fraction of Syukkôkô crude oil II Preparation of toluidine from nitrotoluene Masakichi Mizuta *J Soc Chem Ind., Japan* 38, Suppl binding 629-30 (1935), cf C A 30, 1548—Toluidines were prep'd from *o*- and *p*-mononitrotoluene, sep'd by fractional distn and crystn from crude mononitrotoluene previously described. The yield and quality of the toluidines compared very favorably with those of toluidines obtained from pure nitrotoluene. III Preparation of safranin and magenta Total conclusions *Ibid* 723-4—The mechanisms by which the two compds were prep'd are given in detail. No differences were found between the products made from the toluidines of Syukkôkô crude oil and those made from pure nitrotoluenes. Karl Kammeyer

Thin layers of tin and other metals I Influence of thin metal layers on the deterioration of technical insulating oils P J Haringhuizen and D A Was *Proc Acad Sci Amsterdam* 38, 1002-6 (1935)—With ludge formation and increase in acidity as criteria of deterioration of insulating oils, it appears that Cu has the largest influence, Pb less and Sn least. In some cases Sn seems to act as an antioxidant. The Cu is not attacked after 100 hrs, because of formation of a protecting layer. The catalysis is thought to be due chiefly to dissolved Cu. C E P Jeffreys

Standard method of test for dilution of crankcase oils Am Soc. Testing Materials, A S T M Designation D322-35, Am. Petroleum Inst. Standard, A P I No. 524-35, Am. Standards Assoc., A S A No. Z11.29-1935, 3 pp.

The absolute viscosity of crankcase oil for automobiles Benone Anastasiu. *Ann chim anal. chim appl* 18, 5 (1935)—Values for the abs viscosity at 50°, 150° and at a temp. near the flash-point of the oil were det'd with the No 3 capillary tube of the Ubbelohde-Holde viscometer and compared with the values calcd by the formula of C. Walther (cf. C. A. 29, 7090*) The results show that the calcd. values are slightly higher than the actual exptl. values. W T H

The aromatic constituents of mineral lubricating oils. II. Carl Zerbe and Kurt Folkens *Brennstoff-Chem.* 16, 209-11 (1935), cf C. A. 29, 5643*—The Edeleanu expt. previously described has been hydrogenated under pressure with and without the catalysts I and MoS_2 . With MoS_2 under 400°, products of improved viscosity characteristics are obtained Above 450°, cracking takes place with formation of low-boiling benzene hydrocarbons. F W Jung

Apparatus and methods for investigating the chemical constitution of lubricating oil, and preliminary fractionation of the lubricating-oil fraction of a Mid Continent petroleum. Beveridge J Mair, Sylvester T Schickantz and Frank W Rose, Jr. *J Research Natl Bur Standards*

15, 557-73 (1935) (Research Paper No. 849).—This work describes the preliminary study of the hydrocarbons of lubricating oil. The lubricating fractions of a Mid-Continent petroleum were ext'd. with liquid SO_2 , crystd. from ethylene chloride and fractionally dist'd. in order to sep asphaltic and resinous matter, wax and water-white fractions, resp. The app. is described in detail. Since there was a continuous increase in the viscosity of the fractions of water-white oil with respect to their vapor pressures, blending of fractions for successive distns. was accomplished on the basis of viscosity instead of b p. Although at the end of the fourth distn. no one type of hydrocarbon had been conc'd in one boiling range. It appears likely that the oil can be sep'd. by distn. into const-boiling fractions, which can in turn be sep'd. into hydrocarbons of different types by one of the other phys. methods. P J Wilson, Jr

Petroleum-oil distillation. Alexander G. Page (to Union Oil Co. of Calif.). U. S. 2,029,601, Feb. 4. Heat is applied to a petroleum oil in proportion to distill off desired fractions present, and a cooling liquid is circulated through a closed circuit (of a described app.) in contact with the vapors for their fractional condensation (the cooling liquid being circulated under suitable control for this purpose) and the cooling liquid is then passed in heat-exchange relation with the incoming stock to be dist'd. An extensive arrangement of app. is described.

Processing hydrocarbon oils. James M. Whitley and Gustav A. Beiswenger (to Standard Oil Development Co.). Can. 354,567, Dec. 3, 1935. A hydrocarbon oil is fractionated by mixing it with 3-15 vols of a hydro-

carbon contg 1-5 C atoms and heating to within about 75° of the critical temp of the light hydrocarbon and at a pressure of 350-500 lb per sq in. An upper soln of light oil in the light hydrocarbon is sepd from a lower heavy-oil layer, and removed. The light hydrocarbon is distd from its soln and the heavy oil from its soln.

Fractionating and cracking hydrocarbons from petroleum oils. John B. Barnes (to Universal Oil Products Co.) U S 2,029,752, Feb 4. Crude petroleum oil contg natural gasoline is heated to vaporize the natural gasoline and the resulting gasoline-contg vapor is sepd from fractions of the crude heavier than gasoline, the heavier fractions are heated to a cracking temp under pressure in a pipe coil or the like and the heated material is thence passed into an enlarged reaction zone maintained under cracking conditions of temp and pressure, and the gasoline-contg vapor is introduced into this reaction zone and subjected to the cracking conditions in it, the reaction products are sepd into vapors and residue, and the vapors are dephlegmated and condensed. App is described.

Operation of oil stills with tubes and headers. Clarence H. Thayer (to Sun Oil Co.) U S 2,029,950, Feb 4. An inert gas such as flue gas is introduced into header boxes which surround return bends of a pipe still, in order to take up leakage vapors. Various details of app are described, in which gases from the header boxes are passed to the combustion zone of the still.

Bubble-tower construction suitable for fractionations. Loren P. Scoville (to Texas Co.) U S 2,029,277, Jan 28. Various structural details.

Refining oils. Hermann Suida, Hans Poll and Alfred Nowak. Fr 780,249, Oct 25, 1945. Mineral oils are sepd into paraffinic, naphthenic and aromatic fractions with simultaneous refining of the paraffinic and naphthenic fractions by treating the oil with a mixt of crude cresol and a more or less hydrophobe liquid solvent having a very selective action between the paraffinic and naphthenic fractions (PhNO₂, nitrotoluene, PhNH₂, toluidines, xyldines, PhNH₂, C₆H₅Cl). The solvent may be used to sep the paraffinic fractions, then the naphthenic fractions are sepd by satg with water, the aromatic fractions, resins and asphalt remaining in soln, or the aromatic fractions, etc., may be sepd first by using a solvent said with water.

Treatment of mineral oils. Hermann Suida, Hans Poll and Alfred Nowak. Brit 436,194, Oct 7, 1935. This corresponds to Austrian 141,514 (C A 29, 40321). The PhNO₂ may be replaced by other liquid, H₂O repellent solvents e.g., nitrotoluene, toluidines, PhNH₂, xyldines, PhNH₂, dichlorobenzenes, dichlorodethyl ether.

Treating petroleum. Frédéric Levi. Fr 783,180, Oct 24, 1935. Petroleum and products from its fractional distn are refined by treatment with certain silicates, infusional earths or animal or activated charcoal.

Refining hydrocarbon oils. Roland B. Day (to Universal Oil Products Co.) U S 2,029,250, Jan 28. An oil of approx motor fuel b.p. range is treated at temps between about 95° and 315° with added aq HCl in the presence of a natural Zn-bearing clay, which serves to remove gum forming and S compds. App is described. Cf C A 29, 4372.

Sweetening mercaptan bearing petroleum oils. Walter A. Schulze and Lovell V. Chaney (to Phillips Petroleum Co.) U S 2,028,998, Jan 28. The material is treated with a hypochlorite soln in the absence of O carriers so that part of the mercaptans present are converted to disulfides and the rest to alkyl S chlorides which remain in the oil, the material is sepd from the hypochlorite soln and is treated with a strong reducing soln of a water-sol alkali or alk earth sulfite, cyanide or stannite by which the alkyl S chlorides are reduced to disulfides, and the sweetened oil is sepd from the treating soln. Cf C A 30, 8417.

Refining sulfur containing hydrocarbon oils. Arnold V. Grosse (to Universal Oil Products Co.) U S 2,029,100, Jan 28. A S-contg oil such as a cracked oil is

treated with H₂ in the presence of a preformed thiomolybdate or thio tungstate of Co or the like under such conditions (suitably by heating under pressure) that the H₂ reacts with S compds in the oil, in the absence of H₂S other than that evolved in the reaction and from the oil.

Electric dehydration of petroleum emulsions. Lyle Dillon (to Union Oil Co of Calif.) U S 2,029,362, Feb 4. The emulsion is supplied to the surface of an electrode whence it falls freely onto a second electrode, an edge discharge being established from the first mentioned electrode in the direction of flow of the emulsion and an intense elec field being maintained between the electrodes so that the falling stream of emulsion is subjected to the high potential gradient resulting from this elec field. App is described.

Electrical dehydration of petroleum emulsions. Harmon I. Fisher (to Union Oil Co of Calif.) U S 2,029,527, Feb 4. The emulsion to be treated is flowed downwardly through an elongated vertical interrupted elec. treating field and gas is injected into the downwardly flowing material and allowed to rise through it. App is described.

Revivifying metallic salt solutions used for treating hydrocarbon oils. Paul C. Rich (to Vapor Treating Processes, Inc.) U S 2,028,473, Jan 21. Used aq solns of heavy metal salts such as ZnCl₂ contg N bases and other org. extracted constituents from the treatment of oil at temps of about 150-230° are commingled with a metallic base such as ZnO and the liberated constituents are sepd from the revived soln by stratification. An arrangement of app is described.

Recovering values from acid sludge produced in treating oils, etc., with sulfuric acid. John C. Bird (to Standard Oil Development Co.) U S 2,028,185, Jan 21. The sludge is contacted with an oxygenated org solvent not completely miscible with the sludge or with water, such as iso Pr alc., and the materials are sepd into a plurality of phases, as by setting and stratification.

Sulfur dioxide from acid sludge. James M. Rumble (to Chemical Construction Corp.) U S 2,028,725, Jan 21. See Ir 784,642 (C A 30, 2541).

Sulfur dioxide production from acid sludge. Frank J. Bartholomew (to Chemical Construction Corp.) U S 2,028,713, Jan 21. A material such as acid sludge from petroleum treatment is mixed with heated finely divided solids such as hot sand sufficient for supplying heat for decompo of the sludge, volatile products are removed from the zone of heating, carbonaceous residue is removed with the heating medium, and the latter is reheated by burning the carbonaceous residue associated with it, and at least a portion of the reheated material is further used in the process. App is described.

Coking heavy hydrocarbon oils. Lev A. Melker (to Universal Oil Products Co.) U S 2,029,783, Feb 4. The oil is discharged onto the exterior surface of a cylinder rotating within a heated zone in which a coking temp is generated exteriorly of the cylinder and the discharge of oil onto the cylinder is continued until a substantial quantity of coke has formed on it, and the coke is then removed from the surface of the cylinder by spraying onto a portion of the coke layer a cooling medium such as water. App is described.

Apparatus for coking heavy liquid residuums such as those from oil refining. Clifton J. Pratt (to J. P. Devine Mfg Co.) U S 2,028,166, Jan 21. Various structural, mech and operative details.

Selectively shutting off flow of water in oil wells. Eugene F. Ayers (to Gulf Research & Development Corp.) U S 2,029,649, Feb 4. CO₂ is forced into the well and into the water formation under high pressure to penetrate calcareous matter and dissolve it and the pressure is then released to deposit insol calcareous matter of increased bulk in the water formations and plug them. Cf C A 29, 8317.

Filter for fuel oil or crude oil. S. I. Chukhrienko. Russ 11,531, Feb 28, 1931. Construction details.

Centrifugal machines. Leo D. Jones (to Shupick Specialty Co.) Brit 436,903, Oct 21, 1935. A mixt

of oil, sludge and acid resulting from the treatment of petroleum is sepd. in a centrifugal separator having an outlet for the oil, a 2nd outlet for the sludge and a 3rd outlet consisting of inwardly directed passages which are sufficiently large to permit the discharge of all the acid, but restricted to prevent the flow of any substantial part of the sludge therethrough.

Valve suitable for controlling the flow of hot hydrocarbon oils William R. Kinnaird (to Universal Oil Products Co.) U. S. 2,029,777, Feb. 4 Structural and operative details.

Fluorescent material suitable for addition to hydrocarbon oils Hans Rabe (to I. G. Farbenindustrie A.-G.) U. S. 2,028,472, Jan. 21 A substance giving rise to fluorescence when dissolved in a hydrocarbon oil is produced by condensing a liquid olefinic material or halogenated paraffinic hydrocarbon derivs. with a polynuclear aromatic hydrocarbon in which none of the nuclei is satd with H, such as naphthalene, with a catalyst of the Friedel-Crafts type at a temp. of about 70-230° in the presence of a halide of a metal of the first or second group of the periodic system such as NaCl which does not catalyze the Friedel-Crafts reaction.

Soluble oil Standard Oil Development Co. Ir. 788,858, Oct. 18, 1935 Sol or emulsifiable oils are prep'd. by dissolving in an oil, a sulfonate sol in the oil derived from a petroleum hydrocarbon, a small amt. of a carboxylic acid (oleic acid) and an amino alc. (triethanolamine), the latter being used in at least the amt. necessary for complete combination of the acid.

Mineral oils International Hydrogenation Patents Co. Ltd. Ir. 781,626, Nov. 4, 1935 Comps. which are easily emulsifiable or sol in water for lubricating and other purposes comprise a hydrogenated mineral oil in variable proportions and an emulsifying agent, e. g., ethanalamines or ethylene glycols. The comps. may contain also naphthenic hydrocarbons, sulfonated hydrocarbons, an antioxidant, an antiseptic, water, soaps of vegetable or fat oils, or a fat oil.

Running oils Standard Oil Development Co. Brit. 436,044, Oct. 3, 1935 An oil compn. suitable for flushing the crank case of an internal-combustion engine consists of light lubricating oil and a solvent selected from aliphatic hydrocarbons, alics, ketones, ethers, halogenated hydrocarbons, or aromatic and unsatd. exts. from hydrocarbon oils. Sufficient solvent is added to increase the lauric butanol value of the compn. to above 30. Cf. C. A. 29, 7065.

Highly refined viscous mineral oil suitable for turbine or transformer oil Bertrand W. Story and Everett W. Fuller (to Socomey Vacuum Oil Co.) U. S. 2,028,257, Jan. 21 To stabilize a highly refined viscous mineral oil against acid formation, there are added to it not over 0.1% of benzyl disulfide and about 0.005-0.01% of m-cresol, thymol monosulfide, 2,2'-dihydroxy-1,1'-dinaphthyl sulfide or 4,4'-dihydroxy-diphenyl sulfide.

Fuel oil Carl L. Lauer, Robert E. Manley and Henry D. Loeb (to Texaco Development Corp.) Can. 354,572, Dec. 3, 1935 Acid-oil sludge contg. acid S compds. is treated with hot oil in a heating chamber at 350-420°. The acid S compds. are decompd. and vaporized and the vapors withdrawn. A purified oil sludge of merchantable fuel-oil grade is recovered from the residual product in the chamber.

Cracking hydrocarbon oils George D. White (to Texas Co.) U. S. 2,029,601, Feb. 4 In a process wherein cracked residual products are withdrawn from the system without recirculation through a heating coil, a combined stream of oil (as hereinafter specified) is passed through a heating coil maintained at a cracking temp. and is maintained in the coil for a time sufficient to effect substantial conversion to lower-b-p. products, the converted products are discharged from the coil into an enlarged sepg. chamber also maintained at a cracking temp. and whence residual products are withdrawn and discharged from the system, vapors are sepd. by fractionation into a vapor fraction, a higher b-p. condensate and a lower b-p. condensate and the vapor fraction is

separately condensed to give the desired final product, such as a motor fuel, the lower b-p. condensate fraction is heated in a sep. heating coil to a cracking temp. materially higher than that of the first-mentioned coil, to effect a substantial conversion, and a portion of the highly heated lower-b-p. condensate is then immediately combined with the higher-b-p. fraction and the combined stream is passed to the first-mentioned heating coil, and the remainder of the highly heated lower b-p. fraction is passed directly to the enlarged chamber to aid in maintaining a cracking temp. in it. App is described.

Hydrocarbon-oil cracking Albert G. Peterkin, Jr. (to Atlantic Refining Co.) U. S. 2,028,728, Jan. 21 Oil such as a gas oil is heated to a cracking temp. while being passed through a pipe system or the like in zones of a furnace which are, resp., convectively and radiantly heated, the cracked oil is introduced directly into a vaporizing zone whence vapors are passed to a fractionating zone where a series of liquid fractions of progressively increasing volatility are sepd., and from an intermediate point in the fractionating zone there is removed a liquid fraction having lower volatility than gasoline but which will substantially completely vaporize under vapor-phase cracking conditions, this fraction is vaporized and heated to cracking temp. while passing through a heating zone in a furnace where it is heated only by radiant heat, and the cracked products are directly introduced into the vaporizing zone. App is described.

Refining cracked hydrocarbon distillates Roland R. Day (to Universal Oil Products Co.) U. S. 2,029,758, Feb. 4 A distillate such as one of low b-p. is treated with aq. HCl in the presence of brass, Cu or Zn under conditions suitable for removing gum-forming olefins which are readily reactive with H₂SO₄, and desulfurization of the distillate is subsequently effected by treatment with H₂SO₄. App is described.

Inhibiting gum formation in cracked petroleum distillates Elliott B. McConnell (to Standard Oil Co. of Ohio) U. S. 2,030,033, Feb. 4 The distillate has added to it a small proportion (suitably about 0.5% or less) of 2-, 6-, 7- or 8-hydroxy quinoline or of 2-, 6-, 7- or 8-hydroxy tetrahydroquinoline.

Petroleum-oil conversion Ralph H. McKee (to U. S. Hydrogenation Corp.) U. S. 2,028,705, Jan. 21 In treating an oil such as a crude oil, fuel oil or gas oil for production of motor fuel, by hydrogenation below the satn. point, a mixt. of the oil with water is passed through a primary conversion zone subjected to a temp. sufficient to vaporize and crack a substantial portion of the oil, the water being in proportion to retard polymerization of the oil during its heat treatment, resulting vapor and entrained liquid products are passed into a sepg. zone where liquids and vapors are sepd. and whence liquid is passed directly to a secondary conversion zone subjected to a higher temp. than that in the primary conversion zone but below that required for conversion of a substantial portion of the residue into a fixed gas (the treatment being under pressure below 20 atm.), resulting products from both conversion zones are mixed in the sepg. zone, lighter vapors from both conversion zones are together removed from the sepg. zone, and residues from the two conversion zones are recycled with hydrogenous material such as water through the more highly heated secondary conversion zone. App is described.

Conversion of hydrocarbon oils Joseph G. Alther (to Universal Oil Products Co.) Can. 354,315, Nov. 19, 1935 The oil is heated under pressure to cracking temp. and discharged downward through a reaction zone, and the vapors are sepd. and removed from the unvaporized oil. The unvaporized oil is removed and passed to a second zone for further sepn. of vapors. The vapors from both zones are dephlegmated and the resultant condensate is returned to the heating zone. The dephlegmated vapors are then condensed. Cf. C. A. 29, 7064.

Converting petroleum acid sludge M. I. Khizerovich Russ. 38,453, Aug. 31, 1934 Petroleum acid sludge is added to clay, whereby the emulsion is broken up. The clay-bitumen mixt. can be utilized as a building material,

while the sepd. dil. acid can be worked in the usual manner. Linings for vessels used in hydrocarbon-oil conversion John Carlstrom (to Texas Co.) U. S. 2,028,967-8, Jan. 28 Various structural details are described of vessels with an outer metal shell and linings which may be formed of corrosion resisting materials.

Pyrolysis of hydrocarbon gases Michael Halpern, William B. Logan, Robert E. Manley and Walter Ulrich (to Texas Co.) U. S. 2,030,030, Feb. 4 In the conversion of normally gaseous hydrocarbons such as natural or refinery gases into hydrocarbons of higher mol. wt. such as motor fuel and lubricating oils by a pyrolysis operation to cause substantial cracking of paraffins into olefins and then polymerizing the olefins with use of an adsorptive catalyst, the catalyst used consists essentially of a "high power clay" of the acid treated montmorillonite type 50% or more of which is finer than 200 mesh and a filter aid material such as diatomaceous earth in sufficient amount substantially to reduce the resistance of the clay to the flow of vapors and gases through it. App. is described.

Processing hydrocarbons Boris Malishev (to Shell Development Co.) Can. 355,081, Dec. 31, 1935 Synthetic hydrocarbon mixts. are obtained by reaction of anhyd. unsatd. liquid hydrocarbons in the presence of finely divided anhyd. P_2O_5 . E. g., 5 g. of P_2O_5 , 2 g. lampblack and 0.5 cc. of cresol are added to 1000 cc. of isobutylene and the mixt. is stirred and heated for 2 hrs. at 250°. The product freed of refining agents boils up to 300°. The distd. gasoline has a good color, sweet odor, low gum content and high antiknock value.

Recovering hydrocarbons Carbo Norit-Union Verwaltungen G. m. b. H. Brit. 436,399, Oct. 10, 1935. In the recovery of hydrocarbons by adsorption, they are expelled from the adsorbent by steaming from above downward and the portion thereof obtained in liquid form during the steaming is revalorized by heat-exchange with the gaseous portion, the hydrocarbons being recovered by condensation. During or before the distn., the products may be washed with a reagent adapted to prevent revalorization of injurious constituents, e. g., S compds.

Gasoline Joseph W. Trotter Can. 354,506, Dec. 3, 1935 A mixt. of heavy and light hydrocarbon oils is heated in a high pressure converter to 750-1000°F., the vapors are passed to a second converter and sprayed over a catalytic, electrically heated surface through perforated plates. The vapors are treated with superheated steam at 800-1100°F. and at a pressure of 175 lb. per sq. in. and passed to a third converter and sprayed over a heated catalytic surface at 900-1000°F. and a pressure of 75 lb. per sq. in. The oil is treated with superheated steam and the vapors are condensed.

Refining gasoline Roland B. Day (to Universal Oil Products Co.) U. S. 2,029,757, Feb. 4 For removing S and gum and color forming constituents, gasoline is treated in the vapor phase with $AlCl_3$ in the presence of Zn at a temp. sufficiently high to decompose the $AlCl_3$. App. is described.

Refining gasoline N. V. Nieuwe Oetrouw Maatschappij Fr. 788,742, Oct. 15, 1935 Crude gasoline obtained by cracking oil in the vapor phase above 500-10° and using a gas as heat carrier is purified by isolating the fraction between 70-7° and 118-2°, purifying this fraction and the remaining fractions separately, the treatment of the isolated fraction being more intense, and afterward mixing the treated fractions.

Refining cracked hydrocarbon-oil products of motor-fuel boiling point range Jacques C. Morrell (to Universal Oil Products Co.) U. S. 2,023,785, Feb. 4 The material is subjected, while in the vapor phase, to the action of a soln. contg. H_2SO_4 and H_3PO_4 in order to remove color- and gum-forming constituents and to reduce the S content (the process being suitable for treating a material contg. mono-, di- and tri-olefins).

Refining petroleum distillates such as gasoline Jacques C. Morrell (to Universal Oil Products Co.) U. S. 2,029,115, Jan. 28 The distillate is treated in the vapor

phase with a soln. contg. sufficient H_2SO_4 to effect substantial refining of the vapors and to which has been added a sulfonated hydrocarbon such as benzene sulfonic acid in an amount substantially to dilute the H_2SO_4 .

Rectification of normally gaseous hydrocarbons from refinery operations Paul D. Barton (to Alco Products Inc.) U. S. 2,028,432, Jan. 21 Compressed gases such as those contg. C_2H_4 and C_2H_6 are expanded in a reflux condensing zone (of a described app.) and material from the expansion step is passed into a rectification zone, a selected fraction such as rectified C_2H_4 is withdrawn from the rectification zone and is heated from a material being refrigerated such as a hydrocarbon oil and a portion of the heated fraction is reintroduced into the rectification zone.

Treatment of benzene, gasoline and other hydrocarbons Soc. anon. d'Ougree-Manhay. Brit. 435,953, Oct. 2, 1935 This corresponds to Belg. 406,192 (C. A. 29, 4555*) but an oxidation inhibitor, e. g., cresol, is added to the purified hydrocarbon.

Gasoline like hydrocarbons from ethylene series hydrocarbons Cary R. Wagner (to Pure Oil Co.) U. S. 2,028,686, Jan. 28 Ethylene gases such as those from oil cracking having an ethylene content sufficiently high to produce an exothermic reaction when subjected to the temp. and pressure conditions used are passed through a reaction zone in which temps. of about 350-540° and pressures of 500-1500 lb. per sq. in. are maintained, and the time the gases are in this zone is regulated so as to effect a substantial conversion into gasoline-like aromatic hydrocarbons.

Desulfurizing gasoline Francis M. Rogers (to Standard Oil Co. of Ind.) U. S. 2,028,995, Jan. 28 Difficultly removable S compds. are converted into easily removable S compds. by contacting the gasoline in the vapor phase with solid adsorbent catalytic material of the clay type at temps. of about 340-400° at a flow rate of 12-20 bbl. of oil per hr. per ton of catalyst, the vapors are then condensed and the condensate is further treated to remove the easily removable S compds. (suitably by use of NaOH soln.) App. is described.

Storage of gasoline containing gum- and color forming constituents Harold C. Weber (to Universal Oil Products Co.) U. S. 2,029,743, Feb. 4 For preventing deterioration when the gasoline is stored for a prolonged time, nascent H is generated beneath the surface of the gasoline in storage (suitably by chemical or electrolytic action) and is permitted freely to contact with the gasoline, and an atm. of H is maintained above the surface of the gasoline to exclude oxidizing gases.

Cup grease William P. Hillier (to Standard Oil Co.) Can. 354,964, Dec. 24, 1935 Oil is processed with a small amt. of H_2O and 2-35% of a Ca soap of a hydrogenated fat acid by heating to 260-300°F., maintaining the temp. for 1.5 hrs., cooling to about 240°F., adding 1% of H_2O , and gradually lowering the temp. until a content of 33% soap and 220°F. is reached, and the rest of the oil is worked in. The finished product contains 1% H_2O and 65-97% oil.

Lubricating oils and motor fuels Siemens & Halske A.-G. Fr. 789,567, Oct. 31, 1935 Deposition of solids or semiholids from lubricants or org. fuels on the walls of motor cylinders is prevented by modifying the surface of the metal of the cylinder by bringing it into contact with S, P or Se or compds. or mixts. of these substances. The modification may be carried out by adding one of the above substances to the lubricant or fuel.

Lubricant Standard Oil Development Co. Fr. 789,595, Oct. 31, 1935 A lubricant is composed of a heavy hydrocarbon oil and a small amt. of an organometallic compd. of the type contg. 2 metal atoms in the mol., e. g., $Me_2SnSnPh_4$, and like compds. of Pb, Bi, Hg and As.

Lubricant Albert Jean-Baptiste Sellier. Fr. 789,588, Oct. 31, 1935 A lubricant having a basis of a vegetable or animal fatty substance contains a substance which automatically neutralizes acids formed during usage. Thus, olive or arachid oil having 5% acidity reckoned as oleic acid is heated in the presence of the proportion of

glycerol which corresponds to this acidity. A lubricant is thus obtained which has no tendency to acidify on using. Lubricating composition. Standard Oil Development Co. Fr. 788,557, Oct. 18, 1935. Deterioration of lubricants composed of or containing polymerized oils is prevented by adding a small amt. (0.01-0.05%) of S, Se or Te.

Lubricants from partial oxidation products of hydrocarbon oils. Joseph H. James (to Clarence P. Byrnes, as trustee). U. S. 2,029,619, Feb. 4. Mixed products of vapor-phase catalytic partial oxidation of a light lubricating oil or the like are separated into fractions of different average mol wt. containing similar compounds in the range of alcohols to oxygenated acids, a heavier fraction is reacted with a relatively small percentage of H_2SO_4 at a temperature materially above 45° , excess free H_2SO_4 is removed and oil-soluble sulfonates are also removed, leaving a lubricant substantially free from gum-forming compounds and oil-soluble sulfonates but containing oxygenated acids and which may be used alone as a lubricant or mixed with other lubricants such as automobile engine oil or with gasoline to serve as an overhead engine valve lubricant.

Lubricant suitable for use on wire rope. Walter D. Hodson. U. S. 2,028,155, Jan. 21. A plastic, jelly-like adhesive lubricant includes a top drier such as Co oxide and linseed oil in proportions to produce a tough, leathery surface on exposure of the lubricant to air without affecting the body of the lubricant such as Al oleate and mineral and blown oils. U. S. 2,028,156 relates to details of a wire rope having a core containing asbestos fibers ground to different degrees of fineness, with a lubricant, and U. S. 2,028,157 relates to a generally similar lubricated wire rope and core. U. S. 2,028,158 relates to details of lubricated wire rope manufacture.

Lubricating strips for use between spring leaves. Harvey D. Geyer (to General Motors Corp.). U. S. 2,029,366, Feb. 4. A fabric strip is provided on one side with a cushion layer of resilient non-metallic material such as rubber and carries a layer of dry lubricant such as a mix of graphite and cellulose nitrate on the other surface.

Refining south Texas lubricating-oil stocks. Wilson H. Beardsley (to Sinclair Refining Co.). U. S. 2,029,605, Feb. 4. A South Texas lubricating-oil stock having an acid number substantially exceeding 0.2 is subjected to a preliminary neutralization treatment (suitably with NaOH) insufficient to reduce the acid number of the oil to 0.2 and is thereafter treated with H_2SO_4 and with an amount of water about 1.5-3.0% the volume of the oil to assist the separation of the sludge formed.

Solvent fractionation of lubricating-oil stocks. George L. Parkhurst (to Standard Oil Co. of Ind.). U. S. 2,029,680, Feb. 4. A lubricating-oil stock is treated with substantial amounts both of liquid SO_2 and of a vapor-phase cracked naphtha containing at least 25% of olefins, and extract and raffinate fractions are separately recovered. App. is described. Cf. C. A. 29, 6751.

Hydrocarbons of high molecular weight from petroleum oil. David R. Merrill (to Union Oil Co. of Calif.).

U. S. 2,029,382, Feb. 4. A cracked residuum pitch is commingled with a solvent such as lubricating oil capable of dissolving high-mol.-wt. hydrocarbons from the pitch, the solution formed is separated from insoluble residue and the high-mol.-wt. hydrocarbon material is treated with an aromatic solvent such as CaH_2 and the solution thus formed is treated with an acid such as 93% H_2SO_4 and the high-mol.-wt. hydrocarbons are separated from the solvent and acid.

Viscosity-responsive devices suitable for controlling engine lubricating systems. Harry T. Booth (to Lubrication Control Corp.). U. S. 2,029,146-7, Jan. 21. Various structural, mechanical and operative details.

Asphalt from residual oil. Ullrich B. Dray and Lawton B. Beckwith (to Union Oil Co. of Calif.). U. S. 2,029,200, Feb. 4. An asphaltic residual oil is oxidized with air to produce an oxidized asphalt, which is then separated into its oil and bitumen constituents by means of a solvent such as liquid SO_2 . The oil constituent is commingled with liquid SO_2 to form a raffinate and an extract, and the extract is commingled with the bitumen and the mixt is further oxidized with air to produce an asphalt having a lower penetration for the same m. p. and a relatively higher susceptibility to temperature change than the first-mentioned oxidized asphalt. Cf. C. A. 29, 6420.

Asphalt produced from petroleum distillation residuum. Bernard L. Rowe (to Standard Oil Co. of Ohio). U. S. 2,029,922, Jan. 28. A distillate residuum substantially freed from lubricating hydrocarbons is mixed with an oil distillate cylinder stock having a viscosity of at least 190 at 99° Saybolt, and the mixt is oxidized.

Synthetic asphalt. A. Liser and B. Fisel. Belg. 408,393, April 30, 1935. Mud is mixed with tar waste, crude oil waste or natural or artificial bitumens, finely ground products, such as slag, are added.

Oxidizing oils to produce asphalts. Edward G. Ragatz (to Union Oil Co. of Calif.). U. S. 2,029,504, Feb. 4. Oil such as an asphaltic residuum is commingled with an O-containing gas at an elevated temperature (suitably about 175°) to oxidize the greater part of the oil to asphalt, and the oxidized asphalt is subsequently maintained at a higher elevated temperature (suitably about 350°) to polymerize oil fractions in the oxidized asphalt and under sufficient pressure (suitably about 25 lb. per sq. in.) to prevent material distillation of vaporizable oil fractions. App. is described.

Bituminous emulsions. Francis V. Lister. Brit. 436,494, Oct. 11, 1935. These are treated with an alkali clay paste and Na or K silicate, added in succession or simultaneously after pre-mixing. Thus, an emulsion is made from bitumen 55 and soap comprising 40% resin or resinous oil and 60% of a 7% NaOH solution 10 parts; 30 parts of paste comprising bentonite 15, H_2O 78 and 7% of a 7% NaOH solution are added and then 5 parts of a 35% B_6 Na silicate solution.

Apparatus for the manufacture of acetic acid. G. V. Safonov. Russ. 34,457, Feb. 28, 1934. Construction details are given of an app. for the continuous decomposition of $Ca(OAc)_2$ with H_2SO_4 .

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Methods of testing cellulose. R. Gabillon. *Rev. chim. ind. (Paris)* 44, 310-15, 330-1 (1935).—A brief description and discussion of the principal tests applied to cellulose, particularly that used in chemical industries. H_2O , ash, fat, Cl and chlorides, H_2SO_4 -insoluble matter, color, hydrophilic properties, α -cellulose, Cu no., furfural no., I no., Ag no., KOH soly., methylene blue no., and cuprammonium viscosity. A. Papineau-Couture.

The ripening of cellulose solutions. II. Giulio Tocco and Emilio Cerbaro. *Boll. reparto fibre tessili vegetali, sez. sper. ind. carta e fibre tessili vegetali* 30, 640-2 (1935); cf. C. A. 29, 1623.—The ripening of cellulose acetate dissolved in $Ca(CNS)_2$ or $CaBr_2$ is very slow and probably is only complete in a period of several years. The ripening

in $ZnCl_2$ solutions takes place more readily. The ripening speed of cellulose formate depends on the thiocyanate used: the max. speed is obtained with NH_4CNS and $Ca(CNS)_2$. H_2O is next, there is a min. of speed with $KCNS$ and with $NaCNS$. $2H_2O$. With coned solns of cellulose esters the ripening is accelerated, while with coned solns of thiocyanates or of $ZnCl_2$ it is retarded. G. A. B.

Processes of solution of cellulose compounds. The structure of colloidal solutions. V. Ya. Kurbatov. *Narodnii Komissariat Tsychelet. Prom. S. S. R. Leningrad, Plastmassy* 1, 3-75 (1935).—Micelles contain polar and nonpolar parts. The ionic or nonionic nature of solvents for them, and hence the chemical structure of the solvents, must be considered. Such rules as those

of Trouton or Ramsay and Young are inexact because they do not consider chain structure. Corrections in these rules are suggested for various org. groups.

H M Leicester

The properties of films of cellulose and its esters I. The properties of cellulose acetate films. D A Fedorov, N Ya Solechnik and A M Kuptzova. *Narodnii Komissariat Tyazhelei Prom. S. S. S. R., Leningrad, Plastmassy 1, 76-92(1935)*—Films of cellulose acetate 0.04-0.07 mm thick have a tearing strength of 7 kg per sq mm and a 10% elasticity. Two days' soaking in H₂O lowers the strength slightly and raises the elasticity 50%, while 12% H₂O is absorbed. After 2 months' soaking, however, the film becomes brittle. When plasticizers are added, the hygroscopicity is greatly lowered, and the strength and the elasticity after wetting also fall somewhat. A similar result is attained by increasing the no of acetyl groups on the cellulose. A sharp fall in hygroscopicity is noted when the content of acetyl group is increased from 57 to 58%. The more polar a plasticizer, the more easily it takes up H₂O, and the less it protects the film from moisture. Nonpolar materials do not plasticize well. Hence those plasticizers which are neither too polar nor too nonpolar give the best results. Such are Ph₃PO₄, (MeC₂H₄)₂PO₄, and di-Et phthalate. When 5-20% of a plasticizer is added to a film, the hygroscopicity drops sharply, and further increase of the amt of plasticizer does not greatly change this property. The amt of H₂O absorbed by a film is the resultant of the hygroscopicity and the amt of material extd by H₂O. The application of modern theories to the above facts is discussed. II The technological properties of films made from cellulose. *Ibid* 92-100—The hygroscopicity and H₂O absorption of films are characteristic of their components, and are almost proportional to the polarity of these. Thus, H₂O absorption decreases steadily from Cellophane (pure cellulose) through cellulose acetates and nitrates, ethyl- and benzyl-cellulose to polystyrene, which is nonpolar and nonhygroscopic. Hydrophobic plasticizers reduce the hygroscopicity of films, especially of those from cellulose nitrates and benzylcellulose. The latter gives the best of the films studied. The amt. of material extd by H₂O is practically 0 for benzyl- and ethyl-cellulose, and is 0.5-1% for cellulose acetates and nitrates. The film strength is a max for polar Cellophane and a min for nonpolar polystyrene. For the esters and ethers it is about 6-7 kg per sq mm. Wetting has little effect on the strength of films from Cellophane or polystyrene. It raises the strength slightly for films from hydrophobic compds like cellulose nitrates and lowers it slightly for those from hydrophilic ones like cellulose acetates.

H M Leicester

The viscosity of solutions of cellulose ethers (ethyl-cellulose). S N Danilov and R S Aleksandrova. *Narodnii Komissariat Tyazhelei Prom. S. S. S. R., Leningrad, Plastmassy 1, 100-166(1935)*—The viscosity of ethylcellulose solns depends on the method of prepn and degree of ethylation of the ether, as well as on the solvents used. Curves for the viscosity of solns of the ether in mixts of acetates and alcs show a point of inflection at 10% alc, except for AmOAc and EtOH, in which a rise begins at 50% AmOAc. In mixts of aromatic hydrocarbons and alcs there is a min viscosity whose position is not affected by the use of homologous alcs. Mixts of ketones and alcs show no min viscosity. The viscosity of ethylcellulose solns does not rise with diln, as does that of cellulose acetate. When concd ethylcellulose solns in C₂H₄ are diltd with small amts of alcs, their viscosity falls sharply. The viscosity min is lower than in more dil solns. Ternary mixts of 1 good and 2 poor ethylcellulose solvents give stable solns. The best films are obtained from mixts of C₂H₄ or PhMe with alcs. C₂H₄ and acetates are not so satisfactory, and mixts of acetates and alcs are much worse. Ethylcellulose solns are not affected by the dipole moments and similar properties of the solvents as are cellulose acetate solns.

H M Leicester

The acid hydrolysis of cellulose acetates D A

Fedorov and M. M Ratovskaya. *Narodnii Komissariat Tyazhelei Prom. S. S. S. R., Leningrad, Plastmassy 1, 110-82(1935)*—The ordinary methods for detg acidity in cellulose acetates are not satisfactory. It is best to det the loss in wt. on heating to 160°, and, by absorption, the amt of AcOH given off. The acidity in most forms of cellulose acetates is entirely accounted for by AcOH, though H₂SO₄ may sometimes be present. About 1/2 of the AcOH is absorbed inside the micelle. The rest is either adsorbed on the micelle surface or held mechanically in the ester capillaries. The hydrolysis of cellulose acetates is catalyzed by the adsorbed acid, which is the only form that can be in contact with both H₂O and the micelle H₂SO₄, when present, causes especially strong hydrolysis. The ester can be stabilized by removing the H₂O from the surface either by drying at 100° or extg with abs EtOH, which also removes 80-90% of the AcOH. Hydrophobic plasticizers are also good stabilizers.

H M Leicester

The synthesis of benzylcellulose S N Ushakov and V. I Gribkova. *Narodnii Komissariat Tyazhelei Prom. S. S. S. R., Leningrad, Plastmassy 1, 158 80(1935)*—A high-quality benzylcellulose contg 2PhCH₃ groups is best prepd from cellulose mercerized with 50% NaOH soln for 24 hrs. This is heated for 8 hrs with 5-6 moles of PhCH₂Cl at 130°. It is best purified by grinding with abs EtOH to remove the PhCH₂OH, (PhCH₂)₂O and (PhCH₂)₃, which are formed as by-products, and then with H₂O to wash out the NaCl and NaOH. Ag and Ni app show least action on the process. Strong mineral acids attack the ester. The viscosity of C₂H₄ solns of the compd falls greatly when small amts of EtOH are added. Preliminary attempts to prep xylcellulose by this method give products whose films are of very poor quality.

H M Leicester

Ways of improving the quality of viscose cellulose. V. N Dolivo Dobrovolskii. *Bumazhnaya Prom 14, No. 8, 44-7(1935)*—Improved methods of production of viscose cellulose in U. S. S. R. equal to that of the American and Canadian products are discussed. C. B.

The sorption of lime by cellulose and wood G L Laroque and O Maass. *Can J Research 13B, 380-9(1935)*—The adsorption of CaO on cellulose and wood has been measured. On the basis of mol proportions, the magnitude of the adsorption is shown to be much greater than that of NaOH. It is found that considerable time is required for satn adsorption to take place. The adsorption on similar wood species is shown to be the same and much greater than on cotton cellulose. J W S.

The hemucelluloses II The association of hemucelluloses with lignin Arthur G Norman and Jagdishwar Gopal Shrikhande. *Biochem J 29, 2250-66(1935), of C. A. 29, 5651*—The removal of polyuronic hemucelluloses from plant materials and woods was not easily effected by dil sulfite solns unless the material was given a previous chlorination. Probably the lignin and hemucellulose exist in some type of combination since the extn of the latter depended on a treatment effecting a soln of the lignin. E W Scott.

Qualitative and quantitative analyses of sulfite waste liquor F. Roll. *Giesserei 22, 628-30(1935)*—Bundlers for molding sands are briefly discussed. The sulfite waste liquor from paper mills contains inorg constituents such as CaSO₃, CaO, H₂SO₄, H₂O, thio acids, other acids, chiefly lignosulfonic acids or their Ca salts, a little fermentable sugar, dextrose, mannose, as well as gums, albumins, resins, vanillin and sometimes AcOH. The properties are therefore quite variable. The waste liquor is purchased at 32-35°Bé and in some cases as a powder. The latter is much more suitable for mixing with sand. Qual and quant analyses are briefly discussed. The av compn of the dry substance from waste liquor is: lignin 50, sugars 10, SO₃ 10, CaO 8, H₂O 7, remainder 15%. C. B. Jenni.

The adsorption of carbon dioxide and of water vapor by paper pulp Donovan D J Salley. *Textile Research 5, 493-508(1935)*—Adsorption isotherms for CO₂ and for H₂O vapor on slightly beaten and well-beaten paper

pulp were measured over a range of temp. A correlation of the results with the known structure of cellulose and with present ideas concerning the effects of the heating process is presented.

H. P. Ieupold

Projecting and building of machines for paperboard making. B. S. Darovskii *Bumazhnyia Prom* 14, No. 9, 60 (1935)—Structural details are discussed.

Chas. J. Lane

Asphalt paper, its manufacture, properties and applications. *Rutz Hoyer Bitumen* 5, 191-3, 216-20 (1935). Asphalt papers are made by (1) impregnating the finished paper with bitumen by the hot process, and (2) adding an emulsion of bitumen and H_2O in the hollanders or to the wet paper in the mill. Details of these methods are discussed at length. Uses for asphalt paper are roofing, packing or wrapping, paper sacks, insulating material, etc. Twenty-two references.

Cellulose. British Celanese Ltd., Walter H. Groombridge and Eric V. Mellers. Brit. 436,090, Oct. 4, 1935. Cellulose is obtained from wood or other lignocellulosic material by dissolving the lignin in org. solvents contg. SO_2 or contg. inorg. basic substances in amt. at least about 0.5% of the wt. of the org. solvent, which may contain considerable H_2O . SO_2 may be used with the basic substances, which may be present in the form of alkali metal sulfite. In an example, spruce chips are extrd. in stages with an $FeOH$ and H_2O mixt. contg. SO_2 , then washed with alc. and H_2O and bleached with Cl_2 . The residue obtained on distn. of the solvent contains lignin and H_2O -sol. sugars. In another example, the extr. soln. is $FeOH$ and H_2O contg. $NaOH$. Cl. C. A. 30, 8014.

Cellulose. Kalle & Co. A.-G. (Julius Voss, inventor). Ger. 620,627, Oct. 21, 1935 (Cl. 39b 14). The swelling capacity of articles of regenerated cellulose such as films, fibers, tubes, etc., is reduced by heating to temps. above 100° with an indifferent org. solvent with a water content of 10-35%. Thus, regenerated cellulose foil contg. 16% glycerol and 10% water is heated for 1 hr. to 106° in an autoclave with 85% $FeOH$. On cooling, the foil is dried. On steeping in water, the foil shows a water content of 41% as against 62% before treatment with $FeOH$. Other examples are given.

Estherifying fibrous cellulose. Russel H. Van Dyke, Cyril J. Staud and Harry Leff. Gray (to Eastman Kodak Co.). U. S. 2,023,900, Feb. 4. Fibrous material such

as cotton linters is pretreated with an acid such as glacial H_2OAc contg. H_2SO_4 and H_3PO_4 and is subsequently acetylated in a bath contg. a predtd. amount of the acid and of a fatty acid anhydride such as Ac_2O and an inert diluent such as CCl_4 (the acid content of the pretreated cellulose being reduced to the predtd. amount by washing with the diluent used so that the latter is simultaneously supplied to the cellulose). Cl. C. A. 29, 6269; 30, 6124.

Saccharifying cellulose. Henry Dreyfus. Brit. 436,877, Oct. 21, 1935. In saccharifying cellulose material with H_2SO_4 , the acid is recovered as $Fe_2(SO_4)_3$ or other sulfate that evolves SO_2 when heated, by adding Fe_2O_3 or other suitable oxide to the liquor.

Transparent cellulosic sheets. La Cellophane. Fr. 784,027, Oct. 22, 1935. The sheets are impermeabilized by a varnish contg. a cellulose deriv., a plastifier, a wax and "hydroresinates" which are the products obtained by hydrogenating vegetable resins of the colophony type or their derivs. such as esters.

Watermarked pellicles. James E. Snyder (to du Pont Cellophane Co. Inc.). Can. 354,932, Dec. 24, 1935. A pellicle of regenerated cellulose is cast, coagulated, regenerated, softened and partially dried, and die-pressed against one of the drier rolls while there is still H_2O left in the pellicle.

Waterproofing films of cellulosic materials. A. Maurer, Soc. Anon. Brit. 140,300, Oct. 9, 1935. This corresponds to Fr. 770,346 (C. A. 29, 6009).

Cigaret wrappers. Societe "La Cellophane," Soc. Anon. (to British Cellophane Ltd.). Brit. 435,844, Sept. 30, 1935. A wrapper for a cigaret or a tobacco cartridge is composed of a thin film of regenerated cellulose to which has been added during manuf. a liquid and inodorous hydrocarbon in the form of a fine emulsion. The film may be about 0.02 mm. thick and contain 25 g. paraffin oil per 100 g. dry cellulose, with or without small quantities of glycerol, stearic acid and gums, resins or perfumes, e. g., gum mastic or gum elemi.

Cellulose esters. Joseph F. Haskins and Wm. F. Underwood (to du Pont Cellophane Co.). U. S. 2,029,481, Feb. 4. Cellulose, regenerated cellulose or a lowly esterified or etherified cellulose at a temp. of about 35° is treated with a bath contg. an aliphatic monocarboxylic acid anhydride such as Ac_2O and an addition product of pyridine and HCl together with some uncombined HCl or pyridine. Numerous examples are given. Cl. C. A. 29, 6758.

Cellulose esters such as cellulose acetate. Camille Dreyfus and George Schneider (to Celanese Corp. of America). U. S. 2,028,781, Jan. 28. For prepg. an ester contg. little or no S compds. and of good soly. in acetone, an ester such as a cellulose acetate formed by a suspension method in the presence of a S-contg. catalyst such as H_2SO_4 is treated with an aq. liquid such as fresh water under super-atm. pressure at temps. above 100° , repeatedly, until substantially all of the S compds. are removed and the soly. in acetone is improved. Cl. C. A. 29, 7074. U. S. 2,028,762 relates to the reduction of the viscosity of an ester such as a cellulose acetate which is free from combined S, by treating with an aq. liquid under super-atm. pressure and at temps. above 100° . Cl. C. A. 30, 8027. U. S. 2,028,763 relates to purifying cellulose acetate prepd. in the presence of H_2SO_4 as a catalyst, by heating the cellulose acetate in solid form with water contg. 0.01-0.1% of an inorg. acid such as H_2SO_4 at a temp. of $103-115^\circ$ and under a super-atm. pressure of 5-10 lbs. per sq. in.

Cellulose derivatives containing alkoxy-aliphatic acid groups. Carl J. Malm and James D. Coleman (to Eastman Kodak Co.). U. S. 2,025,792, Jan. 23. For producing a cellulose deriv. such as a cellulose acetate ethoxyacetate, a cellulose material having free and available hydroxyl groups, such as a cellulose acetate, is treated with an esterifying bath comprising an alkoxy-aliphatic acid anhydride such as ethoxyacetic anhydride and a tertiary org. base such as pyridine as a catalyst.

Nitrocellulose. Milton O. Schur (to Brown Co.).

U S 2,029,547, Feb 4 Sheets of interfelted cellulose fibers are hydrolyzed with a dil. inorg. acid soln so as to reduce the soln viscosity of the cellulose and the size of fiber units in the sheets but without substantial loss of such reduced fiber units, and the pretreated material is then nitrated to produce nitrocellulose of low soln viscosity Cf C A 29, 341¹

Nitrocellulose composition. Amerigo F. Caprio and Harry E. Smith (to Celluloid Corp.). Can 355,177, Jan 7, 1936 A plasticized compn of nitrocellulose having improved stability and clearness is made by treating with an alc. that has been used to dehydrate nitrocellulose and has been pretreated in the presence of H_2SO_4 or of a permanganate until the alc. passes the concd H_2SO_4 test or the $KMnO_4$ test and then treating a fresh batch of nitrocellulose with the rectified alc.

Glossy articles of celluloid S A Voevodskii. Russ 38,316, Aug 31, 1934 The articles are etched with $AcOEt$

Coloring cellulose esters and ethers Franz Ackermann (to Soc pour l'ind. chim. à Bâle). U S 2,028,141, Jan 21 Coloring is effected by use of a product which can be obtained by condensing an aromatic p -dialkylamino aldehyde such as p -dimethylaminobenzaldehyde with aliphatic compds contg a reactive methylene group such as benzyl cyanide or a pyrazolone (the double linkage thus formed playing the part of the main chromophore) Such products dye various colors Numerous examples are given

Saponifying cellulose esters Aceta G m b H. Fr 788,985, Oct 21, 1935 The sapon. of articles, e. g., rayon, made of cellulose esters is accelerated by adding org. bases contg N, P, Sb, As or S to the alk. treating baths Examples are given using dodecyltrimethylammonium bromide, chloride and thiocyanate, diethylbenzyl-dodecylammonium chloride, (β -phenylethylcarbamylmethyl)trimethylammonium bromide and methylethylthiethylsulfonium methosulfate

Seasoning extruded cellulose ester plastic sheeting. Paul W. Crane and Reuben T. Fields (to du Pont Viscoid Co.) U S 2,028,602, Jan 21 Sheetting such as that of a cellulose nitrate or acetate compn is run through NaCl brine, the temp. of the brine at the point where the sheeting is introduced into it being relatively low and progressively increasing along the path of travel of the sheeting at a rate correlated with the rate of decrease of solvent content so as to avoid distortion of the sheeting, and the sheeting is then further seasoned in air Cf C A 30, 189¹

Viscose B M Lotarev Russ 37,802, July 31, 1934 The xanthation is carried out with alc. emulsions of CS_2

Rayon from viscose B M Lotarev Russ 37,809, July 31, 1934 To the viscose before spinning is added an alc. soln of starch

Precipitation bath for viscose rayon D I Kornecv Russ 37,810, July 31, 1934 To the bath is added SO_2 instead of H_2SO_4 or pyrosulfuric acid to take up excess water that accumulates in the course of the process

Rayon I G. Farberind A-G. Fr 789,553, Oct 31, 1935 Rayon is spun at a speed of more than 90 m per min., the threads being disposed in crossed layers without the aid of a thread guide or spinning funnel, on a support which has a rotary and a to-and-fro movement The coagulating bath is a rapid one contg H_2SO_4 and Na_2SO_4 , and also salts of metals of higher valency such as Zn, Mg and Al.

Rayon The Calico Printers' Association Ltd. Fr 789,363, Oct 29, 1935 Threads or cloth made from regenerated cellulose are weighted in a manner which preserves a soft and pliable touch by using as weighting agents sol. org. compds of high b. p. and sp. gr. (ethylene glycol, glycerol, or their polymers or derivs., mono-, di- and tri-acetin) along with the constituents of a synthetic resin of the CH_2O urea type, preferably in the form of the primary condensation product and an appropriate catalyst. The impregnated fiber is dried and heated to a relatively high temp. and then washed in slightly alk. water

Rayon yarn or filament. George Schneider (to Camille Dreyfus) Can 354,330, Nov. 19, 1935 Yarns from org. derivs. of cellulose are lubricated with teased oil, oleic acid and H_2O E. g., during the winding operation a furnishing roller treats the yarn with 2% of teased oil

Rayon William Whitehead (to Camille Dreyfus). Can 354,973, Dec. 24, 1935 Textile filaments, yarns, and fabrics are lubricated for textile processing purposes with mineral oil, such as petroleum jellies, and stabilized by a phospholipide, such as lecithin E. g., a spinning charge of 26% cellulose acetate dissolved in 74% of acetone (contg. 5% H_2O) is prep'd To this soln is added 10% (on wt of cellulose acetate) of 90/100 mixt. of mineral oil and lecithin The charge is then spun by dry or evapn. method.

Artificial threads Heinrich Ziegner. Fr 789,410, Oct 29, 1935 Threads are made from materials which are solidified by the action of solid, liquid or gaseous agents, by passing the material through a tube having porous or gas-permeable walls, the tube being surrounded by the coagulating agent which may be forced through the walls of the tube under pressure After passing out of the tube the material may be passed through a coagulating agent.

Rayon-spinning apparatus Julius Brenzinger (to Max Ams Chemical Engineering Corp.) U S 2,028,821, Jan 28 Various mech. and operative details

Spinning bucket for use in rayon manufacture Vincent Panoff (to General Elec. Co.). U S 2,029,185, Jan 29. Structural and mech. features.

Multiple spinning nozzles for spinning rayon. Fittore Viviani. Brit 436,435, Oct. 10, 1935

Mat surfaces on rayon Böhme Fettechemie-Ges. m b H. Fr 789,538, Oct. 30, 1935 Mat surfaces are obtained by on the fibers substances yielding cations having surface activity by means of tanning substances or wood exts. and salts of multivalent metals, particularly of the 3rd, 4th, 6th and 8th group Thus, viscose silk is treated in a bath contg. dodecylpyridinium sulfate and $FeCl_3$ and then in a bath contg. ext. of chestnut wood The fiber with mat aspect is subjected to a soaping operation at a relatively high temp.

Paper pulp Sidney D. Wells (one-half to Gerald D. Muggleton) U S 2,029,973, Feb 4 A continuous stream of material such as corn stalks, straw or bagasse is fed into a rod mill, immersed in partially spent, hot cooking lyes from a subsequent digestion step, and fibrous and cellular elements are sep'd by the action of the mill, the pulp material is discharged from the mill continuously, the substantially completely spent lyes are removed, and the material is digested at an elevated temp. with cooking lyes contg. an excess of cooking chemical and the partially spent lyes from this treatment are used in the preliminary treatment mentioned An arrangement of app. is described.

Charging cellulose digesters with chip wood or the like. Sjune Svensson U S 2,029,086, Jan 28 In an operation in which the speed of charging is accelerated only by means of steam, excess steam is introduced into the downwardly flowing charging material before it is affected by the steam used for speed acceleration, in such a direction that it has no entraining effect upon the charging material and in such quantity that the excess steam prevents air accompanying the charging material from entering the digester App. is described

Fitting knives and separators of Jordan engine haling sections Harold D. Stuck (to John W. Bolton & Sons, Inc.) U S 2,029,123, Jan 28 Mech. details.

Pulp wood grader. Andrew N. Russell and John D. Robb (to Dominion Engineering Works Ltd.) U S 2,029,125, Jan 28 Various mech. and operative details

Means for spitting pulp in cylinder paper making machines William H. Millsap Brit. 435,472, Sept 23, 1935

Apparatus for treating paper stock Charles P. Tolman (to Noble and Wood Machine Co.). Can 355,072, Dec 31, 1935 A stream of paper making stock is subjected to shearing action under pressure while it is passed in a liquid film through a film shearing gap Pressure is applied in

advance of the shearing gap, and the freeness of the sheared stock tested. The value of freeness of the stock is adjusted by increasing or decreasing the feed pressure.

Apparatus for treating paper stock. Charles P. Tolman and James T. Coghill (to Noble & Wood Machine Co.) Can. 355,073, Dec. 31, 1935.

Apparatus for determining the concentration of paper pulp. T. M. Titov. Russ. 34,197, Jan. 31, 1934. The concn. of the paper pulp is measured by means of a helical stirring device rotating in a cylindrical container with the pulp and recording the load of an elec. motor rotating at const. speed.

Bleaching wood pulp. Alois Danninger. Fr. 788,916, Oct. 19, 1935. Wood pulp is bleached by treatment with hyposulfite which is produced *in situ*, e. g., by the action of SO_2 on Zn powder.

Cellulose pulp suitable for esterifications. George A. Richter (to Brown Co.) U. S. 2,028,840, Jan. 28, 1935. A preblended hardwood pulp is suspended in a mercerizing liquor for about 2-8 hrs. or longer, washed free from mercerizing liquor, treated with NaOH to form soda cellulose, and the latter, without aging, may be treated with CS_2 to form visc. e. Various cellulose esters also may be formed from the treated pulp.

Apparatus for refining fiber. Daniel M. Sutherland, Jr. Can. 354,206, Nov. 19, 1935. The working surfaces of the refining members are kept in such close clearance that the major part of the stock goes through the radially extending grooves of the surfaces.

Pressed fiberboard. Robert T. Pollock (to Respats, Inc.). U. S. 2,029,034, Jan. 28, 1935. For producing hard pressed fiberboard, uncooked wood and vegetable matter such as saw grass or palmetto fibers are reduced to fiber and a mixt. of the fibers contg. an excess of wood fibers is mixed, sheeted, dried and pressed.

Drying vulcanized fiber. G. M. Frolov. Russ. 30,620, May 31, 1933. The fiber sheets to be vulcanized are sprayed with a porous material and are dried while being compressed in closed steam-heated containers.

Sheet vulcanized fiber. Herbert R. Stratford (to Horace B. Fay). U. S. 2,028,932, Jan. 28, 1935. For inhibiting distortive change in sheet vulcanized fiber, moisture is expelled from the fiber, and the surface is sealed with a settable liquid compn. contg. a urea-rosin condensation product together with another synthetic resin such as one formed from a phenol and formaldehyde and a wax such as Japan wax. Cf. C. A. 29, 69571.

Paper manufacture. Philip J. Reimer. U. S. 2,028,952, Jan. 28, 1935. App. is described, suitable for carrying out a method in which an aq. suspension of stock is flowed onto the forming wire of a Fourdrinier type paper machine and liquid is flowed upwardly through the forming wire to maintain the stock on it in suspension, the drainage of water through the wire being gradually regulated so that the formation of two-sided sheets is prevented.

Paper. Elmer C. Schacht (to Behr-Manning Corp.). Can. 354,518, Dec. 3, 1935. A mixt. of comminuted cork and fibers with sufficient H_2O to form a stock has a flexible rubber-like binder incorporated in the web. The rubber-like binder may be rubber latex, gutta-percha latex or balata latex. The amt. used is sufficient to increase the strength and resilience of the web and render it resistant to creasing and flexing.

Paper. Elmer C. Schacht (to Behr-Manning Corp.). Can. 354,517, Dec. 3, 1935. A mixt. of comminuted cork and fibers with H_2O is formed into a web with a flexible resinous binder, such as Glyptal resins, incorporated uniformly. This makes it resistant to creasing and flexing. E. g., 60 parts of alkyl resin together with 20 parts of cork and 30 parts by wt. of fiber satd. with H_2O is placed in a steam-jacketed mixer for 35 min. at 85° and more H_2O added. This is then beaten for 1 hr. and run on a cylinder machine. The paper is then passed through a chamber at 130° to set the resin. This is suitable for manuf. of artificial leather, floor coverings and the like.

Paper. Wilma D. Schumacher. Ger. 620,953, Oct. 30, 1935 (Cl. 55d. 17). App. for watermarking paper is described.

Asbestos paper or cardboard. A. A. Bryushkov and A. D. Bakhtin. Russ. 37,953, July 31, 1934. Low-grade asbestos is disintegrated in a mill, moistened with water, worked in a macerated state in a stamp mill for 2-3 hrs., sepd. in a stream of water from traces of magnetite with the help of a magnetic separator and finally passed through paper or cardboard machines.

Chemically modified paper. George A. Richter (to Brown Co.). Can. 355,155, Jan. 7, 1936. Paper is mercerized with NaOH of less than 18% strength, washed free from chemical soln., and dried.

Paper. George A. Richter (to Brown Co.). Can. 355,156, Jan. 7, 1936. An 8% soln. of cellulose ether is mixed with a 7-8% NaOH soln. and added to 0.5-2% cellulose content with NaOH of sufficient causticity to avoid pptn. of the ether from the soln. An absorptive paper base is impregnated with the dil. soln. to a cellulose ether content of 0.5-2% and treated with an acid reagent to ppt. the ether from soln. *in situ* in the base. Cf. C. A. 30, 2481.

Coating paper. William J. Montgomery and Donald B. Bradner (to Champion Paper and Fibre Co.) U. S. 2,029,273, Jan. 28, 1935. In the manuf. of paper which is at least partially covered with a coating such as a clay mixt. having a cast surface, a fluid aq. coating mixt. is deposited upon a hard non-adhering finishing surface such as one of metal, paper is cemented to the coating and then sepd. with the coating from the finishing surface after hardening of the coating to a non-plastic condition. App. is described.

Conditioning paper. Sturtevant Engineering Co. Ltd. and W. Ardill. Brit. 434,837, Sept. 10, 1935. Paper is cooled and moisture is deposited as "dew" thereon as it passes from the calender rolls to the reel of a paper-making machine, the moisture being compressed into and absorbed by the paper during reeling. App. is described.

Decorating paper. Joseph J. Pohlman (to Beveridge-Marvellum Co.). U. S. 2,028,948, Jan. 28, 1935. Differently colored material is successively applied in irregular and non-conforming areas on paper, so that the areas have no defined boundaries and are formed of dots of color, light in shade and variously spaced, and an overlying unbroken translucent cryst. coating is then applied.

Continuous drying of paper with superheated steam. S. I. Chuvikovskii and A. A. Dubinin. Russ. 29,701, March 31, 1933. The steam used for heating calenders is passed through superheaters together with the steam formed from the moisture present in the paper. The excess of steam may be used for various purposes.

Laminated paper. Lloyd L. Dodge (Rhinelander Paper Co.). Can. 354,301, Nov. 19, 1935. A layer of thermoplastic material is interposed between plies of dried, uncalendered, well-hydrated paper. Water (10-40% by wt.) is incorporated in the paper, and then the paper is calendered under high pressure at elevated temp. The paper is relatively transparent. Cf. C. A. 29, 16391.

Safety paper. Hugo A. Schoeller G. m. b. H. Brit. 434,807, Sept. 10, 1935. Compd. safety paper for checks, deeds, etc., includes 2 or more chemicals that react to give a visible effect when a protective layer sepg. them is tampered with, e. g., by washing with H_2O or alc. or by mech. erasure. The compds may be (a) salts of Ag or Pb and S, sulfides or chromates, or (b) Fe salts and tannin, tannic or gallotannic acid.

Transparent wrapping paper. Carleton Ellis (to Ellis-Foster Co.). U. S. 2,029,525, Feb. 4, 1935. Glassine paper carries a urea-aldehyde resin and may also carry a plasticizing synthetic resin such as an acetone-HCHO rean.

Transparent paper. Solomon G. Lipsett (to Appleford Paper Products, Ltd.). Can. 354,226, Nov. 19, 1935. A thin sheet of paper is impregnated with about 5% of mineral oil heated to at least 100°, and a coating of 5-30% polymerized vinyl acetate is applied to the surface to seal the liquid.

Transparent paper. Solomon G. Lipsett (to Appleford Paper Products, Ltd.). Can. 354,225, Nov. 19, 1935. Polymerized vinyl acetate is applied to the surface of a

230°, 24% from XIII and XVII; 2,2',3-*tri*-Et, greenish

bronze reflex, m. 217°, 29% from 2-methyl- β -naphthothiazole etho-*p*-toluenesulfonate (XXII) and XVII, 2,2'-dimethyl-*S*-phenyl, greenish brown, m. 242-4°, 3% from XIII and VII, 2,2'-diethyl-*S*-phenyl, green, m. 232°, 4.5% from XXII and VII. *Selenocarbocyanine sodides*—2,2',8-tri-Me, bluish purple, m. 270-1°, 36% from 1-methylbenzoxazole metho-*p*-toluenesulfonate (XXIII) and XV, 8-ethyl-2,2'-dimethyl, green, m. 271-2°, 32% from XXIII and XVII, 2,2',8-tri-Et, double blue and brassy-green reflex, m. 146-8°, 16% from 1-methylbenzoxazole etho-*p*-toluenesulfonate (XXIV) and XVII, 2,2'-dimethyl-*S*-phenyl, greenish bronze, m. 271-2°, 18% from XXIII and XIII, 2,2'-diethyl-*S*-phenyl, metallic greenish prisms, m. 280-1°, 13% from XXIV and VII. *Oxocarbocyanine sodide*—2,2',8-tri-Me, garnet-red, m. 230-2°, 6% from 1-methylbenzoxazole metho-*p*-toluenesulfonate (XXV) and XV, 8-ethyl-2,2'-dimethyl, orange-red, m. 280-2°, 11% from XXV and XVII, 2,2',8-tri-Et, orange-red, m. 269-70°, 8% from 1-methylbenzoxazole ethiodide and XVII. Substitution of H in the mol of a thiocarbocyanine dye derived from 1-methylbenzothiazole by an 8-Me group causes the absorption max. in MeOH to shift about 150 Å toward the blue but replacement of 8-Me by 8-Et shifts the max. about 50 Å back toward the red. Replacement of 8 Et by higher aliphatic groupings up to Am and iso-Am causes no further shift. Replacement of H by 8 benzyl causes a shift (75 Å) toward the blue but replacement by 8 Ph causes a slight shift (25 Å) toward the red. Somewhat similar relationships to those summarized above can be traced in the 3,4,3',4'- and 5,6,5',6'-dibenzothiacarbocyanine series and in the selenocarbocyanines. The oxocarbocyanines are exceptional. III. Improvements in the 2'-cyanine condensation. L. G. S. Brooker and G. H. Keyes. *Ibid* 2488-92.—Et₃N is superior to KOH as a condensing agent for the prep. of 2'-cyanines. Thus, 1',2-diethyl-oxa-2'-cyanine sodide, orange-yellow, m. 230-2°, results in 43% yield with Et₃N and in only 3% yield with KOH, the corresponding seleno compd., red with blue reflex, m. 280-2°, results in 72% yield from I and V; I and IX give 35% of 1,1'-diethyl-2'-pyrido-2'-cyanine sodide, reddish brown with green reflex, m. 237-9°, III and VI give 41% of the same dye, VII and III give the corresponding 4'-cyanine der., reddish brown, m. 194-6° (22%), 1,1'-Diethyl-4'-pyrido-2'-cyanine perchlorate, dark red with double blue and green reflex, m. 211-14°, 12% from I and XI, 1,1'-Dimethyl-2,2'-pyridocyanine sodide, light orange-brown with pale green reflex, m. 315-17°, 14% from II and VIII, the di-Et homolog, m. 237-9°, 12% from III and IX, 1,1'-Dimethyl-2,4'-pyridocyanine sodide, reddish brown with blue luster, m. 214-17°, 10% from II and X, di-Et homolog, dull red, m. 163-6°, 13% from III and XI. The absorption characteristics of the new dyes are given. The nos. used above refer to the following: I, 2-iodoquinoline EtI, II, 2-iodopyridine-MeI, III, 2-iodopyridine EtI, IV, 1-methylbenzoxazole-EtI, V, 1-methylbenzoxazole-EtI, VI, quinaldine-EtI, VII, lepidine-EtI, VIII, γ -picoline-MeI, IX, γ -picoline EtI, X, γ -picoline metho-*p*-toluenesulfonate, XI, γ -picoline etho-*p*-toluenesulfonate. IV L. G. S. Brooker, G. H. Keyes and F. L. White. *Ibid* 2492-6.—Et₃N is an excellent condensing agent for the prep. of thiazolo-2'-cyanines. Use was made of the following quaternary salts: I, 2-iodoquinoline EtI, m. 195-7°, II, 2-iodopyridine EtI, III, 2-iodo- β -naphthoquinoline EtI, IV, 2-methylthiazole EtI, V, 2,4-dimethylthiazole EtI, VI, 2-methyl-4-phenylthiazole EtI, m. 175-5-6.5°. VII, 2,4-dimethylthiazole etho-*p*-toluenesulfonate, VIII, 2-methyl-4-phenylthiazole etho-*p*-toluenesulfonate, IX, 2,4-dimethylselenazole EtI, m. 157-8°. I and IV give 61% of 1',3'-diethylthiazolo 2'-cyanine sodide, m. 267-9°, 4-Me der., from I and V (66%), m. 255-7°, 4-Ph der., m. 256-8° (76%), 1',3'-diethyl-4-methylselenazole-2'-cyanine sodide, from I and VII, m. 255-8°, 49%, 4-Ph der., from I and VIII, m. 262-4°, 19%, 1',3'-diethyl-4-methylselenazole-2'-cyanine sodide, from I and IX, m. 259-60°, 62%. 2'-Pyridocyanine sodides—1',3'-diethylthiazolo, from II and I, m. 260-2°, 31%, 4-Me der., from II

and V, m. 255-7°, 35%, 4-Ph der., from II and VI, m. 247-9°, 30%; 1',3'-diethyl-4-methylselenazole, from II and IX, m. 242-3°, 24%. 2'-Cyanine sodides—1',3'-diethyl-5',6'-benzothiazolo, from III and IV, m. 268-70°, 24%; 4-Me der., from III and V, m. 278-80°, 33%; 4-Ph der., from III and VI, m. 274-6°, 42%; 1',3'-diethyl-4-phenyl-5',6'-benzoxazole, from III and VIII, m. 279-82°, 1.5%, 1',3'-diethyl-4-methyl-5',6'-benzoxazole, from III and IX, m. 275-7°, 41%. All these dyes are photographic sensitizers and details of their action are given. C. J. West.

The vat dyes of the benzanthrone series. XV. Synthesis of 5-methoxybenzanthrone and 5,5'-dimethoxyviolanthrone. Toshio Maki. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 630-6(1935); cf. C. A. 30, 867. 5-Chlorobenzanthrone (I) was prep. from 1-chloroanthraquinone. The constitution of I was detd. by oxidation with CrO₃. When I was heated with KOH and MeOH in an autoclave, the corresponding 5-methoxybenzanthrone (II) was obtained, i. m. 191°. In the K melt II gave about 65% of 5,5'-dimethoxyviolanthrone which dyed cotton a greenish blue in an alc.-contg., violet red vat. The by-product of the K condensation was a gray-blue vat dye, which was difficultly sol. in alk. hyposulfite. When I was condensed with K, the Cl atom was split off giving 5,5'-dihydroxyviolanthrone, which was practically insol. in alc. contg. alk. hyposulfite. The 5,5'-substituents of violanthrone (III) in general exerted a rather strong bathochromic action. Exptl. results, procedures and structural formulas are given. XVI. The constitution of dichlorinated violanthrone and the preparation of some new Bz-3,Bz'-3'-violanthrone derivatives. Toshio Maki and Toshisada Aoyama. *Ibid*. 630-42.—Exptl. proofs are presented for the constitution of the Bz-3,Bz'-3'-dichloro compd., which is given by IV. All vat dyes

prep. from II dye a deep blue, independently of the color of the vat dye. All known derivs. of III which are substituted in the anthraquinone ring only, as well as III itself, give violet-red to red violet vat dyes (e. g., light colored dyes), while the derivs. substituted in the Bz rings, as far as known, all give dark colored hyposulfite vat dyes. The prep. and properties of the following dyes are described: Bz-3,Bz'-3'-dimethoxyviolanthrone, Bz-2,Bz'-2'-dihydroxyviolanthrone; Bz-3,Bz'-3'-dichloro-Bz-2,Bz'-2'-dihydroxyviolanthrone, Bz-3,Bz'-3'-diaminoviolanthrone and Bz-3,Bz'-3'-di-*p*-toluinoviolanthrone. XVII. Preparation and purification of dinitroviolanthrone (V), which is a blue substance, gives the best, clear green cotton dye, and a black dye with hypochlorite oxidation, while mononitroviolanthrone (VI) (a blue-violet substance) dyes cotton a dark blue and upon hypochlorite treatment it gives a drab gray-violet. Violanthrone which possess more than 2-NO₂ groups give dark green to gray-green dyes. The nitration of III was carried out in glacial AcOH. The nitration curve was established and from it the optimum conditions for the

prepn. of V were found to be: 3 parts of III is stirred up in 50 parts glacial AcOH, and a mixt. of 30 parts HNO_3 (d. 1.43) and 30 parts glacial AcOH is added, and the whole stirred at 60° for 12 hrs. The total ratio of glacial AcOH to HNO_3 is therefore 8:3. The crude nitration product always contains more or less of a gray by-product dye, which can be removed almost completely with an 80% H_2SO_4 , as V is insol in it. Pure V can be obtained by recrystn. from tetrachloroethane. It 10 pts of HNO_3 only is used in the above directions, VI is obtained. The expts. are described and the nitration curve is presented. Purification of V by means of org. solvents and with 80% H_2SO_4 , as well as nitration of III at room temp. (20°) and nitration in concd H_2SO_4 , are described. XVIII Constitution of dinitroviolanthrone. *Ibid* 715 20—Expt results which are presented show that V is B: 2, 2'-Bz: 2'-dinitroviolanthrone. Karl Kammermeyer

Aniline black Francis A Newton *Textile World* 85, 2256 (1935)—"Practical hints on preventing streaking, tendering and other defects in printing with aniline black." Ruby K. Wornor

The action of substantive dyes Erik Schurr *J. prakt. Chem* 144, 63-62 (1935)—A new theory of the action of dyes is proposed, which suggests that in all substantive dyes and intermediate products a many-membered ring system of conjugated double bonds is present, whose residual valence, together with that of the auxochrome group present, is the cause of the substantive action. C. J. West

Preparation and tunctional properties of certain benzoxazole dyes Vladimir J. Mikeska and Marston Taylor Bogert *J. Am. Chem. Soc.* 57, 2713-17 (1935), cf. C. A. 30, 1019—Azo dyes of 2-p-aminophenyl-5-phenylbenzoxazole and $\alpha\text{-C}_6\text{H}_5$ give bluish red shades on cotton, the sulfonic acid (I) with PhOH , $\beta\text{-C}_6\text{H}_5\text{OH}$, $m\text{-C}_6\text{H}_5\text{OH}$, (OH), and $\alpha\text{-C}_6\text{H}_5\text{NH}_2$ (II) gives dyes which show yellow, orange-red, orange and purple shades on cotton, the bis-azo dye from II and $\alpha\text{-C}_6\text{H}_5\text{NH}_2$ gives black shades. 2,7-Diphenyl-5-aminobenzoxazole and $\alpha\text{-C}_6\text{H}_5\text{OH}$ give a dye yielding a saffron shade on cotton, its sulfonic acid with PhOH , $\beta\text{-C}_6\text{H}_5\text{OH}$, $m\text{-C}_6\text{H}_5\text{OH}$, (OH), and $\alpha\text{-C}_6\text{H}_5\text{NH}_2$ (III) yields dyes and III gives a dye with $\alpha\text{-C}_6\text{H}_5\text{NH}_2$, which shows the same color on cotton as those from I. p,p'-(5-Phenylbenzoxazole-2)-o-azobenzene, amorphous brownish red, decompose above 300°, fuming H_2SO_4 gives a chloramine yellow, $\text{C}_{12}\text{H}_5\text{ONa}_2\text{S}_2\text{Na}_2$ deep orange powder, concd. H_2SO_4 gives a deep blood-red color, it dyes cotton, wool or silk a direct yellow. Chloramine yellows were also prepd from 2-p-aminophenyl-5-phenylbenzoxazole-sulfonic acid, its 5-Me analog and 2,7-diphenyl-5-aminobenzoxazole-sulfonic acid. Those dyes in which the azo grouping is in the p-position on the 2-Ph nucleus are far better substantive cotton dyes than those having this grouping in position 5 on the benzoxazole portion of the mol. Azo dyes of Ingrain Red type, in the thiazole and oxazole series, on spectroscopic examn. give curves which paralleled each other closely. In general these benzoxazole dyes resemble the analogously constituted benzothiazoles but, as expected, give lighter shades. C. J. West

The dyeing of particularly wide pieces of cotton Siegfried Kosche *Z. ges. Textil-Ind.* 39, 60-1 (1936)—The width of the goods to be dyed should be between 1 and 2 m. Mech. details of the app. employed are briefly described. Conditions and procedures are discussed for dyeing with Sirius and Sirius light dyes, diazo dyes, S dyes and indanthrene or vat dyes, and also for dyeing mercerized goods. Leopold Schellau

Two-tone dyeing as related to the shape and size of silk filaments. Ired A. Mennerich and O. A. Houghton *Textile Research* 5, 475-82 (1935), cf. C. A. 29, 4948—Differences in shape (diam. ratio) exceeding 0.03 and in size (mean diam.) exceeding 0.7 micron cause noticeable two-tone dyeing which cannot be corrected by chem. treatment. H. P. Leopold

The fiber-damaging action of vat dyes on cellulose. Hans Frothingham *Monatsh. Seide Kunststoffe* 41, 17-20, 22-4 (1936)—A review. Leopold Schellau

Comparison of the light-fastness types for dyed textiles which are in use at present. P. Kraus. *Angew. Chem.* 49, 57-7 (1936)—The German, English and American standards were compared under identical conditions by exposure to sunlight at Dresden, Germany. Expts. were also carried out with the light-fastness tester of J. F. H. Custer. The German and English standards are directly comparable in 7 out of the 8 types, while all of the 6 American standards possess much greater light fastness. Nine references. Karl Kammermeyer

Textile-testing laboratories Robert H. Brown. *Cotton* 100, 48-9, 51 (Jan., 1936)—A discussion covering some of the more recent advanced applications of more accurate control of conditions and recently established and approved principles and methods. W. H. Boynton

Conditioning water for the textile industry. H. H. Morrison *Am. Dyestuff Repts* 25, P43-7 (1936).

Conditioning of water may require one or a combination of several processes such as sedimentation, coagulation, settling, clarification, color removal, Fe removal, Mn removal, water softening, etc. W. H. Boynton

The cause of the von Allwörden reaction C. Sturm and H. Collé *Melliand Textilber* 16, 583-6 (1935)—A review. *Ibid* 667-8—A repetition of the work of von Allwörden (C. A. 10, 1476) gave a compd. in 1915, [α] 57.5°, which is claimed to be glucosazone, [α] 56.5°, instead of galactazone. *Ibid* 795 8—On treating wool with Br water, 26% of the total cystine and 39% of the total tyrosine goes into soln. Similar treatment with Cl water caused only 1.91% of the total cystine to go into soln. The amino acids, cystine and tyrosine, split off, swell up and dissolve, causing the von Allwörden reaction. F. H. Moser

Influence of various kinds of wool on some of the physical properties of flannel Florence Barr S. Dak. Agr. Expt. Sta., *Ann. Rept.* 1934, 35-8 (1934)—The wool in order of fineness is Rambouillet, Tailless, Southdown, Shropshire and Hampshire. Wool from the Tailless, Hampshire and Shropshire gave high breaking strength, bursting strength and high resistance to abrasion. The wool from Southdown was lowest in these respects. Detailed data are given. C. R. Fellers

The optimum conditions of wool scouring. S. S. Rakhilina and M. I. Piekhan *Sherstyanoe Jelo* 1935, No. 3, 19-23, Nos. 4-5, 17-23—The fats remaining on the wool after treatment in the successive scouring tanks have lower acetyl values and higher I values, the unsaponifiable matter, the acid value and the sapon value are unchanged. The supposition that the high-melting fats remain in the wool at the end of the scouring is disproved. Removal of fat from wool is best accomplished with soap-soda solns. producing stable emulsions. The soap forms absorption films on the surface of the fat drops and creates in the soln. a concn. corresponding at least to the satn. limit of the surface layer. Soda forms soaps with the free acids of the wool, maintaining the soap introduced into the tank at optimum dispersion at a definite pH value of the medium. The optimum concns. of the scouring liquor are soap equiv. to 0.5-0.9 g. fat acids and soda 3-5 g. per l. B. V. Shvartzberg

Alkalies and wool. Frederick R. Harrison. *Textile World* 85, 2247 (1935)—Up to a pH of 12 at 120°F. for 15 min., the amt. or kind of alkali has no harmful effect on wool, so far as that effect can be measured by tensile strength. Above pH 12, damage is shown by decrease in strength and by yellowing. Ruby K. Wornor

Wool yarn bleaches Walter Bruckhaus. *Deut. Wollen-Graeber* 68, 3-4 (1936)—The compn. of the water used is important, particularly in the case of O bleaches employing Na_2O_2 and H_2O_2 . In place of wooden tanks it is better to use tank manifolds from V4A steel, stoneware, Havag material, etc. Directions are given for pretreatments and for bleaching with Na_2O_2 and bisulfite, KMnO_4 and SO_2 , Na_2O_2 , H_2O_2 , S bleaches and combination bleaches utilizing oxidation and reduction methods. L. S.

Deterioration of weighted silk under the conditions of acidity, alkalinity and salinity to which fabrics are subjected in service and maintenance. Rachel Edgar. *Ja.*

Agr. Expt. Sta., *Rept. Agr. Research* 1934, 151(1934); cf. C. A. 29, 7083⁴—Abstract. A decided similarity in behavior was observed among 1-e-weighted black silk crepe fabric, Pb-weighted white silk crepe fabric, Sn-weighted white silk crepe fabric, Zn-weighted white silk crepe fabric and degummed silk crepe fabric when treated with alkali for 10 hrs at 40°. The effect of the alkali at 0.4 N was greater than that of 1.7 N acid. The fabrics were carefully examined chemically and physically, after 33 dry cleanings and launderings. A great decrease in dry elongation of the dry-cleaned silks, low breaking strengths of the dry-cleaned Sn- and Sn-Pb weighted silks, low wet breaking strengths of the Pb-weighted silks and the low breaking strength of the laundered Sn-Pb-weighted silk were noted.

C. R. Fellers
Too much sheen should be avoided in finishing pure-dye and par-weighted flat crepes. Philip Lebrun *Textile World* 85, 2048(1935).—Finishing operations are described. Formulas for rubbing oil to hide chafe marks and for sizing are given.

Ruby K. Worner
Spun silk—its manufacture and uses. Noel D. White *Am. Dyestuff Repr.* 25, 27-30, 63-4(1936).—An illustrated description.

W. H. Boynton
The elimination of the soap from degummed silk. G. Baroni and G. Cola *Boll. ufficiale sta. sper. seta* 5, 53-6(1935).—Acid soaps can be completely eliminated from degummed silk by treatment with alkali, it can be more easily removed by extn. with 10% HCl, or with boiling water followed by CaCl₂.

G. A. Bravo
Better boil-off. Philip Lebrun *Textile World* 85, 2257(1935).—A pre-soaking treatment and the "skein" method of boiling-off silk flat crepes are described. The prevention of chafing is discussed.

Ruby K. Worner
Serviceability of rayons and silks. I. thelwyn Dodson *Am. Silk Rayon J.* 55, 37-8, 56-7, 58-9, 60(1936).—Data on tensile strength, yarn slippage, shrinkage in cleaning, dry, color fastness for many of the 82 dress goods fabrics are studied.

W. H. Boynton
Staudinger viscosity law in rayon manufacture. A. Zart *Kunststoffe* 17, 38-42(1935).—This article is a reply to Prof. Staudinger who complained that the detn. of mol. wt. according to his viscosity law (C. A. 28, 6129⁴) has not been given sufficient attention in the rayon industry. Z. reviews Staudinger's investigations of the relation between viscosity and mol. wt., and discusses the possibility of applying this method in the investigation of celluloses used in making rayon and of the intermediate products and the final rayon. Z. concludes that the viscosity law can have only limited application in such studies.

R. K. W.
Rayons and linseed-oil sizes. W. Weltzien *Monatsh. Seide Kunststoffe* 41, 32-7(1936).—Although the use of linseed oil for sizing purposes has been deplored, linseed oil is still being used nearly exclusively for strand sizing. Linseed-oil sizes are used particularly for high grade textiles. Advantages of strand sizing with this oil are enumerated, and a review is given of several characteristic properties and relationships dealing with the high smoothness of a good linseed-oil size, the stability of the sizing, the stability test (dry heat at 105° for 3 hrs.), the tropical test (heating for 4 hrs. to 80°, at a relative air humidity of 90%, in an oil bath), ease of desizing, damages to the fibers and strength measurements. Some data are given showing the strength of 2 viscose silks which had been treated with 5 different linseed oil sizes. A schematic drawing shows the various methods of testing unsized, sized and desized rayon. The complete set of tests involves 8 strength detns. of 30 measurements each in addition to various other exams.

Leopold Scheffan
Warp sizing. III. Paul Seydel *Cotton* 100, 55-7 (Jan., 1936), cf. C. A. 30, 1750⁴.—The gums and glues used in warp sizing and finishing are covered. The gums include gum arabic, tragacanth, cherry tree, sugarbeet, carageen, sea moss, Irish moss, Iceland moss, etc. and some converted starch gums.

W. H. Boynton
Cotton fiber investigations. Effect of soil types and

seasonal conditions on length and strength of cotton fiber. O. A. Pope *Ark. Agr. Expt. Sta., Bull.* 312, 27(1934), cf. C. A. 29, 8207⁷.—Fiber quality is the composite result of many phys. and chem. properties. A photoelectric method for detg. the fiber length distribution in cotton is suggested.

C. R. Fellers
Studies of nitrogenous compounds from cotton and linen. Franz Barlet *Monatsh. Seide Kunststoffe* 41, 25-31(1936).—A critical review. In spite of the work of Chilikin (cf. C. A. 24, 3375⁴) the characters of the "black acid" and the "amino acid L" have not yet been explained.

Leopold Scheffan
A critical study of cotton manufacturing processes. R. L. Lee, Jr. *Textile Research* 5, 167-83(1935), cf. C. A. 28, 7024⁴.—Data are given on the variation which occurs in the uniformity of the strands used in each of the processes of manu. of carded cotton warp yarns.

Ibid 326-36.—Methods of measuring the irregularity of cotton sliver are studied.

H. I. Leopold
An electrical method for measuring the moisture contents of fabrics. J. L. Spencer-Smith *J. Textile Inst.* 26, T336-40(1935).—See C. A. 30, 1236⁴.

R. K. W.
Comparative tests for value of sulfur trioxide in different amounts in sulfonated compounds. Albert H. Grimshaw *Am. Dyestuff Repr.* 25, T37-42(1936).—The properties required of textile softening and finishing compds are outlined. Comparative tests on 8 samples of sulfonated compds with varying percentages of fat and SO₂ are outlined and results tabulated for several. The tests include stability with HCl, stability by Babcock method, stability by Babcock with H₂SO₄, stability by Babcock with AcOH, stability of common salt, stability with hard water using CaCl₂. Some finished tests on dyed skeins, wetting-out tests and emulsion tests are included. While results are somewhat incomplete it appears that in using oils of equal fat value those with higher SO₂ content generally give better results.

W. H. Boynton
Sources of defects during the washing operation (in the textile industry). A. Foulon *Deut. Wollen-Gewerbe* 68, 49-50(1936).—A survey dealing with the action of soap, mech. and chem. factors causing defects, and the detection of chem. damages by means of the quartz analysis lamp and the microscope. Chem. deterioration is also indicated by the presence of oxycellulose. Tests with the strength tester show whether the washed goods had been weakened only locally or all over.

Leopold Scheffan
Calgon in textile improvement. Anton Volz *Melliand Textilber* 16, 780-1(1935).—The detergent qualities of Calgon are described.

Dyes. See pour l'ind chim A Bile. Swiss 174,082, May 1, 1915 (Cl. 37a). Dyes are formed by coupling diazo compds of the general formula $\text{ROCH}_2\text{CONH}_2$ $\text{C}(\text{CH}_3)(\text{OH})$ $\text{C}(\text{N}(\text{OH})\text{CH}_2\text{CO}_2\text{H})$, in which R is

an aromatic nucleus of the benzene series, with arylides contg a coupling α hydroxy carboxylic acid group in the α position to a OH group, in a medium of pH value 5 to 7. Thus, an aq soln of diazotized 4 (methylphenoxyl) acetyl amino 2,5 diethoxyaniline is given an addn of Na_2PO_4 to obtain the correct pH value and is treated with the anilide of hydroxynaphthone acid and NaOH to give a dye.

Dye compositions for printing animal and vegetable fibers. Intz Grieshaber (to Soc pour l'ind chim A Bile). U. S. 2,029,991, Feb 1. Printing with dyes of different classes such as indigoid, anthraquinoid and sulfur dyes, also dyes contg methyl in complex combination: azo dyes, di- and tri-arylmethane dyes, pyrazoline dyes, acridine dyes, quinoline dyes, quinonimine dyes, azine, oxazine and thiazine dyes, is affected with use of auxiliary substances such as alkyl sulfonamides, benzene-sulfonamide, benzenedialkylsulfonamides, toluene-sulfonamide, toluenemonomethylsulfonamide, toluenedimethylsulfonamide, tolueneethylsulfonamide, mixts of α and β toluene-sulfonamide, dibenzene-sulfonamide, m -aminobenzene-sulfonamide, halo benzene-sulfonamides, naphthalene-sulfonamides, e. g., naphthalenedimethylsulfonamide, naphthaleneethylsulfonamide, naphthalenedisulfonamides, naphthalenetrifluoromethylsulfonamides, 1-hydroxynaphthalene-8-sulfonamide, tetrahydro-naphthalene-sulfonamides, benzene-sulfonamides, as well as the salts, such as Na and K salts of such compds. Further, salts of sulfonamides of the benzene and naphthalene series having in the nucleus sulfo groups or carboxyl groups, such as phthalic acid-sulfonamide or hydroxybenzenecarboxylic acid-sulfonamides. The process may be applied to all kinds of textile printing on webs, yarn or loose materials, for instance in discharge printing or in direct printing, for instance in padding printing or any other kind of printing in which steaming follows the printing. Several examples with details are given.

Anthraquinone derivatives. Georg Krametz, Hans Schlichenmayer and Ludwig Schöring (to General Aniline Works). U. S. 2,029,249, Jan 28. See Ger 610,580 (C. A. 29, 6074f).

Acid dyes of the anthraquinone series. Ernst Dieffenbach and Fritz Fischer (to General Aniline Works). U. S. 2,029,258, Jan 28. Dyes generally drying wool and silk blue shades are produced by heating to about 60–100° a 1-amino-2-sulfo-4-haloanthraquinone compd with an aminocarbonylsulfonamide compd of the general formula $\text{NH}_2\text{—R—SO}_2\text{NX}(\text{alkyl})$, wherein X means H or a lower alkyl group, R means an aryl radical of the benzene and naphthalene series and alkyl means a lower alkyl group, at least one of the alkyl groups contg a hydroxy group, in the presence of water, a Cu salt and an acid-binding agent. Several examples with details of procedure are given. Cl. C. A. 29, 3514.

Thioindigo dye preparations. Alfred Hagelbäcker and Rudolf Brune (to General Aniline Works). U. S. 2,021,711, Feb 4. In a suitable phase of a process of pyrythionindigo dyes (e. g., during the oxidation of the hydroxy-thionaphthyls in an alk. medium), a salt, oxide or hydroxide of a heavy metal, such as FeSO_4 , NiSO_4 , CuSO_4 , or $\text{Al}_2(\text{SO}_4)_3$, is added, in less than an equimol proportion to the dye being formed. Dye preps thus obtained are readily reduced to the leuco compds which have a

reduced tendency to sep from the dye baths at low temps. Several examples with details are given.

Thioindigo dyes. I. G. Farbenind. A.-G. Ir. 789,463, Nov 1, 1915. Dyes are prepd by transforming a β -hydroxythionaphthene deriv. of the C₁₀ series, contg an I group in the 1- and halogen in the 6-position, and, if desired, a COOH group in the 2 position, either by treatment with oxidizing agents or by condensing the deriv. or the corresponding 3-anils, 2-oximes or 2-ketones with 4-methyl-6-halo-3-hydroxythionaphthene or their derivs., provided these are suitable for the synthesis of mixed dyes of the thioindigo series. Thus, 1,1'-diethyl-6,6'-dichlorothioindigo (by oxidizing 4-ethyl-6-chloro hydroxythionaphthene-2-carboxylic acid) dyes cotton bright rose shades from the vat.

Dyes of the triphenylmethane series. Avery A. Morton and Joseph R. Stevens. U. S. 2,029,830, Feb 4. In the prepn of dyes such as crystal violet and malachite green, a halide of a tertiary aryl amine which is N -disubstituted by alkyl or aryl radicals, such as p -bromodimethylamine, is condensed in the presence of an alkali metal such as Na, with di- t -carbonate, t -t benzoate or other suitable carbonyl compd, ester, acid chloride, anhydride, quinone or ketone. Among the starting materials which may be used to produce dyes and related compds are the halides of diethylamine, dimethylammonaphthalene, dimethylammonodiphenyl, methylbenzylamine, methylphenylamine and the like. Other compds contg the carbonyl group, all of which are suitable in place of the di- t -carbonate, are di- t -oxalate, t -t benzoate, di- t -phthalate, phthalic anhydride, phosgene, BzCl , chloroethyl formate, quinone, anthraquinone, xanthone and like compds. Xanthone and anthraquinone react with p -bromodimethylamine to form strongly fluorescent substances.

Azo dyes. I. G. Farbenindustrie A.-G. Brit. 436,390, Oct 10, 1935. Unsulfonated azo dyes suitable for dyeing cellulose esters are made by coupling the diazo compd of an amine of formula $2\text{X—C}_6\text{H}_4\text{—Y—C}_6\text{H}_4\text{—NH}_2$ in which X is H, NO_2 or halogen and Y is H or halogen, with an amine of formula PhNRR' in which the benzene ring may be further substituted and in which R is alkyl or a hydroxyethyl group, R' is a β , γ -dihydroxypropyl or a γ -methoxy- β -hydroxypropyl group, in which latter case R may be H. Among examples, (1) 1-nitro-1-aniline \rightarrow 3-chloro-1-(β -hydroxyethyl)- β , γ -dihydroxypropylammonobenzene (fiery yellowish red), and (2) 6-bromo-2,4-dinitroaniline \rightarrow 1-methyl-1-(β -butyl)-(γ -methoxy- β -hydroxypropyl)ammonobenzene (reddish blue).

Azo dyes. I. G. Farbenind. A.-G. Ir. 788,920, Oct 10, 1915. Dyes are prepd by condensing an aminobenzaldehyde or a nuclear substitution product thereof with a compd, contg an active CH_2 or CH_3 group, diazotization and coupling with a coupling component. Diazotization and coupling may precede the condensation. Thus, 1-aminobenzaldehyde \rightarrow 1-(2'-sulfophenyl)-3-methyl-5-pyrazolone is refluxed with 1 mol. proportion of $\text{NCCl}_3\text{CO}_2\text{H}$, giving a dye which dyes animal fiber bright orange-yellow shades fast to light. $\text{NCCl}_3\text{CO}_2\text{H}$ may be replaced by anilide of acetoacetic acid, β -hydroxythionaphthene, 1,3,3-trimethylindole-2-one or α -methylindole.

Azo dyes. I. G. Farbenind. A.-G. Ir. 789,006, Nov. 4, 1915. Dyes are prepd by coupling diazotized aromatic amines with pyrazolones of the formula $\text{RCH—CH(R)—CH(R)—CH(R)—N—CO—CH}_3$, R is H or

an alkyl group and R' is alkyl, aryl, COOH, COO-alkyl, CONH₂, CONH-alkyl or CONH-aryl. Thus, $\text{PhNH}_2 \rightarrow$ 1-(3-cloxyethyl-5-methyl-5-pyrazolone, m. 145°, dyes cellulose lacquers in fast yellow shades, sulfanilic acid \rightarrow 1-(4'-methyl-5-cloxyethyl-5-methyl-5-pyrazolone dyes wool in fast yellow shades. Other examples are given.

Azo dyes. Soc. pour l'ind chim A Bile. Ger. 620,619, Oct 21, 1935(Cl. 22a). Fast unsulfonated dyes are prepd by using coupling or diazo or azo components contg at least one (etherified or esterified) hydroxy-alkylamino group, the coupling being carried out at an

amino or substituted amino group. Thus, diazotized 4-nitroaniline is coupled with the Me ether of *N*-ethyl-*N*-(hydroxyethyl)aniline to give a product coloring acetate silk in light red shades. Many other examples are given.

Azo dyes Wilhelm Neelmeier and Heinrich Morschel (to General Aniline Works) U S 2,028,409, Jan 21. Dyes which may be represented by the probable general formula

wherein R stands for a tetramethine chain linked to two vicinal C atoms of the benzene nucleus R', R'' stands for a nonsulfonated and noncarboxylated aromatic radical, such as a radical of the benzene, naphthalene and carbazole series, and R''' stands for the radical of a nonsulfonated and noncarboxylated diazotized component suitable for producing azo dyes, in which substituents may occur in the nuclei R' and R''' such as alkyl, alkoxy, halogen and the nitro group, are obtainable by coupling in substance or on a substratum a diazotized nonsulfonated and noncarboxylated amine suitable for producing azo dyes with a 5,6-, 6,7- or 7,8-benzo 2-hydroxycarbazole-3-carboxylic acid arylamide. The shades when produced on the fiber, according to the usual method of producing ice colors, have good fastness. Numerous examples are given, the dyes formed being various shades of brown.

Azo dyes Richard Stusser (to General Aniline Works) U S 2,028,450, Jan 21. Dyes of various colors and good fastness are produced in substance or on the fiber by diazotizing 2-nitroaniline or other component free from solubilizing groups and coupling with a pyrazolone such as that of dehydrothiolutidine or the like. Examples and details of procedure are given.

Azo dyes Hans Schindhelm and Carl T. Schultz (to General Aniline Works) U S 2,029,591, Feb 4. Various examples are given of the production of dyes of the general formula 4 (RX) 2-HO₂SC₆H₄CH ClCH₂H₂(SO₃-H) 2'-(N N R₁ N)-4' wherein X stands for an azo or azoxy group, R means a radical of the benzene or naphthalene series which may be connected with a benzothiazole or arylazo radical or the whole radical attached on the other side to X and R₁ means a radical of the naphthalene series which may contain a sulfonic or carboxylic acid group or may be connected with a further arylazo group, obtained by oxidizing a stilbene compd. of the general formula 4 Y 2-HO₂SC₆H₄CH ClCH₂H₂(SO₃H)-2'-(N N R₁NH)-4', wherein Y stands for a nitro or arylazo or arylazoxy group and R₁ has the aforesaid significance, in an alk. soln., for instance by means of cupric sulfate. In the case of Y standing for a nitro group it is to be converted subsequently into an arylazo or arylazoxy group. These dyes, which may be purified by an aftertreatment usual for stilbene azo dyes, dye vegetable fibers yellow to red to brownish shades of a good fastness particularly to light. Cf. C A 30, 1575¹.

Azo dyes Jose S. Petrus Blumberg (to General Aniline Works) U S 2,029,555, Feb 4. Diazo dyes which in the form of their alkali metal salts are generally dark water-sol. powders, dyeing cellulosic fiber generally bluish shades which by diazotizing and developing with a yellow component, such as methylketol, acetoacetic acid arylamides, pyrazolones and the like, yield green shades of excellent clearness and good fastness, are obtainable by diazotizing a primary amine of the benzene or naphthalene series contg. a sulfonic or a carboxylic acid group and coupling with a 1-amino 2-naphthol alkyl ether or a 6- or 7-sulfonic acid thereof, further diazotizing and coupling with a 1-(aminobenzoylamino)-8 naphthol mono- or disulfonic acid which may be substituted in the benzene nucleus of the benzoylamino group by alkyl, alkoxy or halogen, effecting the final coupling with the addition of a

basis of the pyridine or quinoline series, such as picoline, quinaldine and preferably pyridine itself. As initial components there may be used, e. g., aminobenzonic acid, antimesulfonic acid, 1-naphthylamine-4-sulfonic acid, 2-naphthylamine-8-sulfonic acid, *p*-toluidine-*m*-sulfonic acid, chlorotoluidinesulfonic acids, 2-aminidine-4-sulfonic acid (OCN₂=1), *m*-xylydine-*m*-sulfonic acid and as final coupling components there may be used, e. g., 1-*p*-aminobenzoylamino-8 naphthol-3,6- or -4,6-disulfonic acid, 1-(4'-methoxy-3'-aminobenzoylamino)-8 naphthol-3,6- or -4,6-disulfonic or -4 monosulfonic acid, 1-(4'-methyl-3'-aminobenzoylamino)-3,6-disulfonic acid and 4'-chloro-3'-aminobenzoylamino-4,6-disulfonic acid. Several examples with details of procedure are given.

Metal compounds of azo dyes Hans Krzikalla and Walther Kuehne (to General Aniline Works) U S 2,028,981, Jan 28. See Ger. 621,473 (C A 30, 1249¹).

Azo dyes James D. Todd, Laurence F. May and William L. Newbury (to Sherwin-Williams Co.) U S 2,028,958, Jan 28. A dye which is suitable for pigment manuf. is made by coupling diazotized Tobias acid with β -naphthol in the presence of a quantity of phenylmethylpyrazolone up to 25% the quantity of the β -naphthol. U S 2,028,959 relates to forming a dye by coupling diazotized Tobias acid with β -naphthol in the presence of a lesser quantity of a diazotized naphthylaminesulfonic acid. Several examples are given.

Disazo dyes Heinrich Klingenstein, Hans Roos and Carl Heusner (to General Aniline Works) U S 2,028,479, Jan 21. Several examples are given of the production of diazo dyes of the general formula PyN.NaRCO.NiR(SO₃H)₂NiCOA.NR'', wherein Py stands for the radical of a coupling component of the pyrazolone series, such as a 1-aryl-3-methyl-5 pyrazolone which may bear substituents in the aryl nucleus, or a 1-aryl-5-pyrazolone-3-carboxylic acid or a deriv. thereof, such as a carboxylic acid ester, carboxylic acid amide or a carboxylic acid arylamide, which 1-aryl-5-pyrazolone-3-carboxylic acid or deriv. thereof may bear substituents in the aryl nucleus or nuclei respectively, Ar stands for radicals of the benzene series, R stands for a naphthylene radical to which the NH groups have been attached neither in *o*-position nor in *peri* position, *n* stands for the numbers one or two, and R' stands for the radical of a yellow component suitable for preparing azo dyes, such as a pyrazolone coupling component, phenol, phenol ether, salicylic acid, methylketol and acylacetic acid arylamides. These dyes give fast yellow to orange dyeings on cellulosic fiber. Cf. C A 30, 872¹.

Metal complex compounds of azo dyes I. G. Farbenindustrie A.-G. Brit. 430,588, Oct. 7, 1935. See Fr. 787,428 (C A 30, 1237¹).

Ethylene azo dyes Robert Wizinger (to General Aniline Works) U S 2,029,647, Feb. 4. See Brit. 435,449 (C A 30, 1577¹).

Indigoid vat dyes I. G. Farbenindustrie A.-G. Brit. 436,322, Oct. 9, 1935. These are prep'd by condensing 4,7-dichloro-5-methyl-3-hydroxythionaphthene with an isatin α -deriv., e. g., 5-bromoisatin chloride or 4-methyl-5-chloro-7-methoxysatin α -chloride in PhCl. Cf. C A 30, 877¹.

Vat dyes I. G. Farbenind. A.-G. Fr. 789,003, Oct. 22, 1935. Dyes of the formula $\overline{\text{SR}^{\text{N}}\text{CR}^{\text{N}}\text{CZS}}$ (in which Z is a univalent radical, and R and R' are aryl groups at least one of which belongs to the anthraquinone series) are prep'd by condensing α -aminoaryl mercaptans with aryl thiazole compds. of the

general formula $\overline{\text{SR}^{\text{N}}\text{N}^{\text{N}}\text{CC}(\text{Y})\text{X}}$, in which X is H or a halogen, Y is O or 2 atoms of halogen and the group C(Y)X may be in the thiazole or R' ring. Thus, the dye obtained by heating the Na salt of 1-mercapto-2-aminoanthraquinone (I) and 6-chlorobenzothiazole-2-carbonyl chloride (II) in PhNO₂ dyes cotton in fast greenish yellow shades. Dyes are also prep'd from I and 2-methylbenzo-

thiazole-6-carbonyl chloride and anthraquinone-2-benzothiazolecarbonyl chloride, 3-bromo-I and II, anthraquinonyl-1,2-thiazole-2'-carbonyl chloride and 1-amino-2-mercapto-4-chlorobenzene, β -aminoanthraquinone and II and 1-chloro-2-aminoanthraquinone and II.

Vat dyes. I. G. Farbenind. A-G. Ir 789,551, Oct. 31, 1935. Dyes of the anthraquinone series are prep'd by treating with acid-condensing agents, if necessary in the presence of an org. diluent inert to the condensing agent, anthraquinonylaminanthraquinoneacridones of the general formula

in which the anthraquinone radical represented by A has the 4 position free, and that by A' has the 2' position free and B is an aromatic radical. Thus the product obtained by condensing 3 bromoanthraquinoneacridone with α -aminoanthraquinone is agitated with $AlCl_3$ in $PhNO_2$ and heated to 140–50°, the product giving brown shades on cotton. Dyes are also obtained from the condensation products of 3-chloroanthraquinoneacridone (I) with 1-amino-4-benzylaminoanthraquinone (II), and 3,4',6'-trichloroanthraquinone-2,1(N)-1',2'(N)-benzaziridone (cf. Ir. 748,790, C. A. 27, 5549) with II.

Vat dyes. I. G. Farbenind. A-G. Fr. 789,561, Oct. 31, 1935. Dyes of the anthraquinone series are prep'd by causing Al or Fe halides to act on anthraquinone-2,1-(N)-benzeneacridones having a 1-aminoanthraquinonyl group in the 6-position of the $C_{10}H_6$ ring, in the presence of org. solvents nonbasic for the said halides, and, if necessary, causing oxidizing agents to act on the hydrogenated compds., thus formed. The products have the probable formula

the position of the H atoms in excess not being known. The compds. have a low content of $AlCl_3$, and give fast brown shades from the vat. The prep'n of the starting materials, anthraquinone-2,1(N)-1',2'(N)-3'-methyl-6'-chlorobenzeneacridone (by causing 4-chloro-2-amino-toluene to react with 1-chloroanthraquinone-2-carboxylic acid (I) and heating with $BzCl$ for 1 hr. at 150°), anthraquinone-2,1(N)-1',2'(N)-3'-methoxy-6'-chlorobenzeneacridone (by causing 2-methoxy-5-chlorobenzene to react with I and heating with $BzCl$ at 130–60°), and anthraquinone-2,1(N)-1',2'(N)-3'-phenoxy-6'-chlorobenzeneacridone (by the action of I on 2-amino-4-chlorodiphenyl ether and treating the 1-(α -phenoxy- m -chloro-aniline)anthraquinone-2-carboxylic acid with agents favoring cyclization). Cf. C. A. 30, 875.

Vat dyes. Imperial Chemical Industries Ltd. Ir. 789,570, Oct. 31, 1935. New anthraquinone dyes are prep'd by treating 1,4,5-tris(α -anthraquinonyl amino)-anthraquinone with $AlCl_3$ as a condensing agent contg. $AlCl_3$.

Vat dyes of the dibenzanthrone series. Karl Koeberle, Hugo Wolf and Emil Krauch (to General Aniline Works). U. S. 2,029,237, Jan. 28. Nitrodibenzanthrones contg.

about 4–5–6–5% N, violet powders dyeing vegetable fibers from a blue vat green shades which by aftertreatment with hypochlorite become gray to black are obtained by treating dibenzanthrone or its substitution products such as monobromodibenzanthrone, etc., with aq. HNO_3 solns which also may contain H_2SO_4 (suitably by heating to 80–90°). Several examples with details of procedure are given. Cf. C. A. 30, 1069.

Coloring matters. Imperial Chemical Industries Ltd. Ir. 789,594, Oct. 30, 1935. These are made by causing an aromatic acid nitrile or amide having a Cl or Br atom in the position ortho to the nitrile or amide group to react with $CuCN$. Examples are given of compds. prep'd from α -chlorobenzonitrile and α -chlorobenzamide which are the same as the Cu compds. of Brit. 322,169 (C. A. 24, 2890).

Anthrapyridonesulfonic acids. Klaus Weinand (to General Aniline Works). U. S. 2,029,007, Jan. 28. Products dyeing wool from an acid bath red to violet shades of good fastness are produced by heating a 1,4-diaminoanthraquinone-2-sulphonic acid, the 4-amino group of which has one hydrogen atom replaced by an alkyl, phenyl, chlorophenyl, acetamidophenyl, benzyl, hydronaphthyl or hydrophenyl group, with a compd. having the configuration $-CO-CH_2-CO-$ selected from the group consisting of malonic acid esters and acetoacetic acid esters of aliphatic alcs. Several examples are given.

Arylamides of 2,3-hydroxynaphthoic acids. Wilfred A. Sexton (to Imperial Chemical Industries Ltd.). U. S. 2,029,500, Feb. 4. Compds. suitable for use as ice color coupling components are produced by reacting 2,7-dihydroxynaphthalene-3-carboxylic acid with a primary aromatic amine to produce a 2-hydroxy-7-arylamino-naphthalene-3-carboxylic acid. Aniline, α -toluidine, p -anisidine and the like may be used as initial materials and several examples with details of procedure are given.

Color lakes. Compagnie nationale de matières colorantes et manufactures de produits chimiques du Nord réunies établissements Kuhlmann. Ger. 620,837, Nov. 9, 1935 (Cl. 22/12). Condensation products of the anthraquinone series having the constitution 1-HO-2- RCH_2 -4-A- $CaH(CO)_2$, in which R is a salt-forming group or a radical contg. a salt-forming group and A a OH group or a substituted or unsubstituted amino group, are used for forming lakes. The anthraquinone nucleus may contain other substituents. In an example, sulfonated 2-benzylquinizarin is dissolved in distd. water. A suspension of pptd. washed Al_2O_3 is added to form a bluish red lake. Other examples are given.

Symmetrical bis(arylamino)phenols. Leopold Lacka and Oskar Haller (to German Aniline Works). U. S. 2,029,727, Feb. 4. See German pat. 586,806 (C. A. 28, 1546).

Trifluoromethylphenylazodiaminopyridines. Max Engelmann (to E. I. du Pont de Nemours & Co.). U. S. 2,029,315, Feb. 4. By diazotizing m -aminotrifluoromethylbenzene and coupling with an α,α' -diaminopyridine, products are obtained which are suitable for dyeing cellulose acetate, etc.

Ketones of the anthracene series. I. G. Farbenind. A-G. Fr. 789,547, Oct. 23, 1935. Ketones which are intermediates for dyes are prep'd by heating with spongy agents compds. of the formula $YCOC(R)(R')X$ (Y is a univalent radical of the anthracene series, X is H or an alkali or alk. earth metal, R is a COOH group which may be esterified, R is H or an acyl radical or a COOH group which may be esterified). Examples are given of the prep'n of 2-acetyl-1- (from the product obtained by condensing anthraquinone-2-carboxylic chloride (I) and acetoacetic ester with $EtONa$), 2-chloro-3-acetyl-1- (m. 154–6°, from the product obtained by condensing 2-chloroanthraquinone-3-carboxylic chloride and malonic ester (II) with $EtONa$), 1,4-dichloro-2-acetyl-1- (from the product obtained by condensing 1,4-dichloro-I with II), 1-nitro-2-acetyl-1- (m. 255–7°, from the product obtained from 1-nitro-I and II), and 1,4-dichloro-6-acetyl-anthraquinone, m. 235° (from the product obtained from 1,4-

dichloroanthraquinone 6-carboxylic acid and II), Bz-1-acetylbenzanthrone, m 174-5°, 2-acetylthiazoleanthrone (from the product obtained from thiazoleanthrone 2-carboxylic chloride and II) and 2-acetylthiazoleanthrone.

Organic tellurium compounds Melvin A Perkins (to F I du Pont de Nemours & Co.) U S 2,030,035, Feb 4. Dye intermediates are prep'd by causing a Bz-1-halo-benzanthrone to react with an alkali metal telluride, the halogen in the Bz-1-position being replaced by Te. Various examples are given and among the products obtained is Bz-1, Bz-1-dibenzanthronyl ditelluride, which when fused with alc.-KOH yields isodibenzanthrone.

Aminodinitrophenylamine I G Farbenind A-G (Leopold Lanka and Rudolf Heil, inventors) Ger 629,907, Oct 30, 1935 (Cl 12g 1 02). The comp'd 4-amino-3,4'-dinitrophenylamine is obtained by condensing 4-nitro-1-chlorobenzene-2-sulfonic acid with nitro-*p*-phenylenediamine and splitting the HSO₃ group from the resulting 4-amino-3,4'-dinitrophenylamine-2-sulfonic acid by usual methods. The condensation is effected by heating mol amts of the constituents to 130-5° in a pressure vessel in the presence of water and CaCO₃. The substance m 226-7° and is used for making dyes.

Condensation products Durand & Huguenin S A Fr 789,589, Oct 31, 1935. One mol of a naphthol-, naphthylamine- or aminonaphthol sulfonic acid is condensed with at least 2 mols of an ammosalicylic acid in the presence of bisulfite. Thus, 2 mols of *p*-aminosalicylic acid are condensed with 1 mol of 2-naphthol-7-sulfonic acid or 1 naphthylamine-6-sulfonic acid. The products are intermediates for dyes.

Dyeing I G Farbenindustrie A G Brit 436,371, Oct 3, 1935. H₂O insol azo dyes are made on the fiber by applying diazoamino compds and coupling components and developing the dye at a neutral to weakly alk reaction under the influence of an elevated temp. in the presence of moisture, the coupling components, if applied as salts, being transformed by treatment with an alkali binding agent, at least partially, into the free OH form prior to the coupling. The process may be applied simultaneously with the development of vat or aniline black dyes. Among examples, (1) cotton is impregnated with 2,3-hydroxy naphthol aniline in dioxane and pyridine soln, padded with a soln of the diazoamino comp'd from diazotized 4-chloro-2-toluidine and methylaminoethanesulfonic acid and the Na salt of the *o*-amide of 2,3-hydroxynaphthoic acid, padded on the reverse side with aq (NH₄)₂SO₄ with or without NaCl and steamed, and (2) cotton is printed with a paste contg the diazoamino comp'd from diazotized 2,5-dichloroaniline and 4-sulfo-2-aminobenzoic acid and diacetoacetyl-*o*-toluidine, padded with aniline black liquor contg NH₄NO₃, steamed, chromed and finished. Cf C A 30, 878.

Dyeing, printing H Th Bolme A-G Brit 436,410, Oct 10, 1935. In coloring fibrous materials with oxidation dyes, substances that give rise to cations that reduce the surface tension are added to the dyes or printing pastes contg the aromatic bases or their salts to be oxidized. Among examples, (1) unboiled, non-prewetted cotton piece goods are dyed a deep level black by impregnation at room temp with an aq liquor contg PhNH₂·HCl, PhNH₂, Na₂SO₄, K₂Fe(CN)₆, NaClO₂ and decylpyridinium sulfate, dried at 80-90°, steamed 1 min at 108°, treated 5 min in an aq soln of Na₂Cr₂O₄ at 40°, rinsed, washed and dried, the goods may be printed with a reserve before the impregnation or steaming, and (2) an unbleached cotton fabric is dyed a level brown by sloppadding in an aq liquor at room temp contg *p*-phenylenediamine, Na sulfoxylate, NaClO₂, NH₄Cl, tartar emetic, hexadecylpyridinium chloride and NH₄ vanadate, drying at 80-90°, steaming 1 min at 108° and finishing as usual, a printed reserve may be used.

Continuous dyeing of undressed fabrics P P Sazanov Russ 8,111, Aug 31, 1934. The dyeing is effected in a vat by introducing the fabric predried and warmed to the temp of the dyeing vat soln.

Dyeing textiles with sulfonic ester salts of leuco vat dyes Alex Wormald (to Imperial Chemical Industries

Ltd) U. S. 2,029,351, Feb. 4. Compds such as dibenzylsulfanilic acid or its Na, K or NH₄ salts (suitably in soln with a polyhydric alc. such as diethylene glycol) are used to facilitate printing, dyeing, padding or stenciling with coloring matters such as Indigosol brown IRD, Indigosol pink IR extra, Indigosol brilliant pink 13B and the like. Several printing paste formulas are given.

Printing pile fabrics Duncan Ferguson and Herbert H Schell (to Sidney Blumenthal & Co.) U S 2,029,768, Feb. 4. A design is applied to the flat side of the fabric by printing (suitably with an engraved Cr-plated Cu roller) and the printing compn is caused to show through on the pile face of the backing fabric without affecting the projecting portions of the pile, the flat side is coated with a binder such as a rubber soln and the material is dried.

Method of treating spoils of textile material with a dyeing or washing liquor Joseph Annecq Brit 436,511, Oct 11, 1935.

Dyeing animal fibers Soc pour l'ind chim à Bâle Brit 436,790, Oct 14, 1935. Addn to 433,230 (C A 30, 624). The fibers are dyed with complex metal compds of mordant-dyeing azo dyes contg sulfo groups with the addn to the dye bath of a small proportion, not exceeding 0.5% of the wt of the goods to be dyed, of a sol salt of an org nitrogenous H₂O insol base or of an org quaternary NH₄ comp'd, which base or comp'd contains at least 1 aliphatic or cycloaliphatic residue comprising at least 8 C atoms but contains no polyethenovy group and is other than a quaternary NH₄ comp'd obtainable by treating with an alkylating or aralkylating agent a *N*-alkyl or *N*-aralkyl benzimidazole substituted at the α C atom by an aliphatic residue contg at least 8 C atoms. Among ex. amples, wool, 100, is entered into an aq soln at 60-70° contg H₂SO₄, the Cr compds of the dye 4-chloro-2-aminophenol-6-sulfonic acid \rightarrow 2,4-dihydroxyquinoline, and the condensation product, *o*-1-*o*-2 part, from stearyl chloride and unsym *N*-diethylethylenediamine, the bath is heated to boiling during 30 min and so maintained 60-75 min and the goods are rinsed and dried. Cf C A 29, 940.

Dyeing cellulosic material Imperial Chemical Industries Ltd, Leslie P. Rendell and Harry A Thomas Brit 436,592, Oct 14, 1935. Natural or regenerated cellulosic textile material is dyed with a chrome dye after treatment with an aq soln of a quaternary NH₄ quaternary phosphonium or ternary sulfonium salt of which the mol contains a sat'd, nonhydroxylated aliphatic chain of at least 10 C atoms and contains no acylamino group. The pretreated material may be further treated with a reduced bichromate prior to the dyeing or the dyed material may be aftertreated with a sol bichromate. Among examples, viscose stockinette is immersed 30 min in a 3% soln at 90° of cetyltrimethylammonium bromide, rinsed and placed in a warm dye bath contg Solochrome brown RH, AcOH and Glauber's salt and the temp is raised gradually to 90-95° with an addn of HCOOH after 1 hr and of K₂Cr₂O₇ after a further 15 min.

Dyeing organic derivatives of cellulose such as cellulose acetate George H Ellis and Frank Brown (to Celanese Corp of America) U S 2,029,312, Feb. 4. The material is treated with an unsulfonated anthraquinone comp'd having as a substituent in the anthraquinone nucleus a phenylamino radical having an alkyl group as a meta substituent, e. g., with 1-amino-4-m-tolylaminoanthraquinone. Numerous examples are given. U S 2,029,313 relates to the similar use of an unsulfonated anthraquinone comp'd having as a substituent in the anthraquinone nucleus an ether substituted arylamino group of the benzene series, such as 1-amino-4-(*o*-methoxyphenylamino)anthraquinone. Numerous other examples are given.

Dyeing acetate silk I G. Farbenind A-G Ir 789,364, Oct 28, 1935. Acetate silks of various degrees of acetylation or other acylated cellulosics are printed or dyed by 1,4-diaminoanthraquinones slightly sol in water and which contain alkyl radicals in the amino groups, the alkyl radical in the 1-amino group being different from the

alkyl radical in the 4-amino group, or 1 amino group contains 1 or 2 alkyl groups and the other a hydroxyalkyl group or an alkyl group having more than 1 OH group. Examples are 1-methylamino-4- β -hydroxyethylamino- (m. 190°), by reaction of 1-methylamino-4-aminoanthraquinone and ethylene oxide, 1-methylamino-4-bis(β -hydroxyethylamino)-, 1-methylamino-4-butylamino-, 1-hydroxyethylamino-4-hydroxypropylamino-, 1-methylamino-4-phenylethylamino- and 1-methylamino-4-cyclohexylamino-anthraquinone.

Printing acetate artificial silk Wolfgang Jaack and Arthur Schurch (to Soc pour l'ind. chim. à Bâle) U. S. 2,029,505, Feb. 4. See Fr. 779,884 (C. A. 29, 5674).

Dyeing cellulose esters and ethers Imperial Chemical Industries Ltd. Fr. 789,041, Oct. 22, 1935. The esters or ethers are treated with an aq. soln. of a quaternary ammonium, phosphonium or sulfonium salt, the mol. of this salt contg. an aliphatic chain, satd. or not, of at least 10 C atoms, and afterward dyed with a direct acid or chrome dye. The chrome dyeing is carried out by the chromate or metachrome process of dyeing and subsequently treating with Cr. Salts include octadecylpyridinium bromide, ester of oleic acid and *N*- β -hydroxyethylpyridinium chloride, cetyl ester of *N*-hydroxymethylpyridinium chloride, etc.

Dyeing wool Imperial Chemical Industries Ltd. Fr. 788,991, Oct. 21, 1935. In dyeing wool with acid or chrome dyes, the dye liquor is kept at 60–90° and is maintained in a state of turbulence by introducing bubbles of air, steam or other inert gases which impinge on the material.

Fabrics containing natural silk Leo Wallerstein, Rowland A. Gale and Thomas G. Hawley, Jr. (to Wallerstein Co. Inc.) U. S. 2,029,968, Feb. 4. In making a fabric contg. natural silk fibers provided with their body-giving gum coatings, some of which coatings in the fabric are in relatively inaccessible condition, while others are in accessible condition to the action of a subsequent decatizing bath, the fibers the coatings of which are relatively inaccessible are treated with a proteolytic enzyme prep. without removing the coating, the impregnated fibers are dried, then combined with unimpregnated fibers, the coatings of which are relatively accessible, to form a fabric. U. S. 2,029,969 relates to highly twisted silk yarn for weaving and knitting, comprising natural silk in girth, the yarn being rendered more flexible and given lessened tendency toward kinkiness and unevenness by impregnation with a proteolytic enzyme prep. without removal of the gum and being dried while contg. such prep. U. S. 2,029,970 relates to a generally similar treatment to prepare a yarn for knitting, weaving or other textile operations. U. S. 2,029,971 relates to fabric formed in part of a similarly treated natural silk and in part of cellulose acetate, capable of being degummed at a temp. below 55° and at relatively low alkalinities such as avoid injury to the cellulose acetate. U. S. 2,029,972 relates to knitted fabric capable of being simultaneously dyed and degummed in acid, neutral and alk. media, comprising yarn formed of natural silk treated as described with a proteolytic enzyme prep.

Preparng silk for degumming Leo Wallerstein, Thomas Hawley and Rowland A. Gale (to Wallerstein Co.). U. S. 2,029,350, Feb. 4. Degumming of raw silk is facilitated by a preliminary treatment with a protease prep. such as a papain or pancreatin prep. and drying of the impregnated material.

Apparatus for respooling rayon. Rudolf Etzkorn (to North American Rayon Corp.). U. S. 2,029,226, Jan. 28. Structural details.

Apparatus for treating thread with fluids such as in applying conditioning oil to artificial silk Henry R. Childs (to Eastman Kodak Co.). U. S. 2,029,910, Feb. 4. The thread is guided into contact with a portion of a wire mesh screen the interstices of which are filled with a thread-treating fluid.

Treating textiles British Celanese Ltd. Brit. 430,703, Oct. 16, 1935. Textile materials, films or foil, of org.

1 derivs. of cellulose are treated with a compn. comprising a H₂O-insol. lubricant and a phenol, e. g., olive oil and cresylic acid. Such material may be readily delustered by treatment with a hot aq. delustering medium. Cf. C. A. 30, 620^b.

2 Treating fabrics British Celanese Ltd., Albert Mellor, Ralph J. Mann and Ernest L. Greenwood. Brit. 436,463, Oct. 11, 1935. An antierose treatment comprises treating the fabric in open width while substantially tensionless with an aq. liquor, e. g., H₂O, dil. soap, above 90° for less than 10 min. The treatment may also be used to develop crepe effects in fabrics contg. crepe threads.

3 Improving textile fibers and cellulosic materials R. Botson. Belg. 407,146, Feb. 28, 1935. Tanning materials are incorporated with the fibrous material and are fixed by means of CH₃CO, (CH₃)₂CO, gelatin or the like, to render the fibers resistant to water and to decay, unshrinkable and undeformable. The process is applicable also to paper.

Retting fibrous plants Cie. Belge des fertilisants. Belg. 408,286, April 30, 1935. The plants are steeped in H₂O contg. K₂CO₃, heated to 75° and cooled to 37°. The vol. is completed with liquid manure or sewer water and air is blown into the tank for several 12 hr. periods. The liquid from this treatment can be used as fertilizer.

5 Animalization of vegetable or artificial fibers I. G. Farbenindustrie A.-G. Fr. 789,331, Oct. 26, 1935. The incorporation of primary, secondary and tertiary amines and quaternary ammonium bases of the general formula (R₁R₂R₃N)OH (at least 1 of the radical R₁, R₂, or R₃ contain a chain of 8 or more C atoms, while the others may be replaced by H, aryl or aliphatic chains with less than 8 C atoms) or their salts in vegetable or artificial fibers gives the fibers a strong affinity for wool dyes. Examples of compds. are stearylamine acetate, isopropyldecylamine lactate, *N*-decyl-1- β -propylenediamine formate, dimethylstearylamine, methylidibutyldecylammonium bromide and stearylpyridinium chloride.

Bleaching textiles, etc. Adolf Danzinger. Brit. 436,268, Oct. 8, 1935. See Austrian 143,295 (C. A. 30, 881^b).

6 Bleaching cotton goods James A. Clark and Harry G. Smolens (to Buffalo Electro-Chemical Co.) U. S. 2,029,985, Feb. 4. The goods are moistened with an aq. H₂O₂ soln. and then subjected to a temp. above the b. p. of the soln. in an atm. contg. steam for a sufficient time to produce the desired bleaching effect. App. is described.

7 Fireproof textile material William Whitehead (to Camille Dreyfus) Can. 355,242, Jan. 7, 1936. Yarns and filaments of org. derivs. of cellulose are treated with an alkylamine salt of an inorg. acid, such as H₂BO₃, H₃PO₄, HI and HBr. The coating should be 20–50% on the wt. of the yarn.

Increasing the heat resistance of materials such as cellulose acetate fabrics George H. Ellis and Ralph C. Storey (to Celanese Corp. of America). U. S. 2,028,769, Jan. 28. There is incorporated in the material a small proportion of an insol. metal compd. such as Sn phosphate so that the material on incineration yields a voluminous ash of 0.5–2.0% and so that it has a safe ironing point of at least 300°.

8 Mercerizing baths Deutsche Hydrierwerke A.-G. Fr. 789,582, Oct. 31, 1935. The wetting power of the baths is increased by adding to the lye mixts. of phenols and aliphatic and aromatic alcs., e. g., a mixt. contg. crude cresol 93, benzyl alc. 4 and normal primary octyl alc. 3%.

9 Mercerizing I. G. Farbenindustrie A.-G. Brit. 436,660, Oct. 16, 1935. See Fr. 771,856 (C. A. 29, 1664^b).

Preserving textile materials Industriegewerke E. Isakiewicz. Fr. 789,314, Oct. 26, 1935. Clothing, etc., are preserved in an atm. of N.

Dry-cleaning apparatus. The American Laundry Machinery Co. Brit. 436,118, Oct. 4, 1935.

Dry-cleaning apparatus of the drum type. I. G. Farbenindustrie A.-G. Brit. 436,061, Oct. 3, 1935.

Dry-cleaning apparatus with a vacuum or suction operated filter for the used solvent John R. Courtney and Harry Ward. Brit. 436,585, Oct. 14, 1935.

26—PAINTS, VARNISHES AND NATURAL RESINS

A. H. SABIN AND CARLTON H. ROSE

Some advances in the field of paints and their future possibilities. Johannes Scheiber. *Beihft Z. Ver dent Chem* No 19, *Angew Chem* 49, 21-22 (1936). K. K.

An objective for the American paint industry. Richard L. Cawood. *Official Digest Fed. Paint Varnish Production Clubs* No 151, 432-6 (1935).—Lecture, stressing the advantages of the pebble mill. Modernizing for profit. *Ibid* 437-9. G. G. Sward.

Trends in the paint and varnish industry. Wayne R. Fuller and M. S. Armstrong. *Chem & Met Eng* 43, 4-9 (1936). E. H.

Flashlights on new European practices. Wilhelm Krumbhaar. *Official Digest Fed. Paint Varnish Production Clubs* No 150, 400-14 (1935). cf. C. A. 29, 632.—A lecture on current practices of the European paint and varnish industry. G. G. Sward.

Bituminous paints for submerged objects. E. Kind-scher. *Farbe u. Lack* 1935, 485-6, 497.—A discussion of a no. of practical points, e. g., testing and selection of suitable bitumens, the advantages of priming with red lead and the superior results obtained with bitumen paints contg. chlorinated rubber. J. W. Perry.

The status of the theory of colors. Ernst Mayer. *Farben Ztg* 41, 31-2 (1936).—The possibility of applying the Ostwald color classification system to the standardization of paints and pigments is discussed briefly. J. W. Perry.

Effect of mill scale on the using of paint. K. G. Lewis and U. R. Evans. *Verfahrenstechnik* 8, 154-5 (1935). cf. C. A. 29, 4716. J. W. Perry.

The evaluation of anticorrosive paints by the swelling test. Hans Wagner and Edgar Pabst. *Farben Ztg* 40, 789-90, 811-13 (1935).—The swelling behavior of linseed-oil paints prep'd with various kinds of chromate pigments and applied to sheet iron was studied. The effect of the pigment on the swelling, which is observed after 100 days' immersion in water, is made clearer by calcg. the swelling factor, i. e., the ratio of the observed swelling to the swelling which the oil in the paint would have experienced if present alone. In all cases superior anticorrosive action was asocd with firmer adhesion. The swelling factor is an aid in predicting the anticorrosive power of pigments, provided they exert no sp. electrochem. anticorrosive action. The swelling ratio of paint films contg. neutral or basic Pb chromates free from sol. or soap-forming components varied from 0.2 to 0.4. This was reduced to 0.15 and the adhesion and anticorrosive power were improved by the presence of soap-forming components in the pigment. Sol. chromates may improve adhesion and the anticorrosive action even though the swelling factor is thereby increased. H. Wolff and G. Zendler. *Ibid* 1199.—The swelling factor is not entirely det'd by the type of pigment used in linseed-oil paint. The pigment-oil ratio is also an important factor. Changes in the mech. properties, e. g., adhesion, of the paint film brought about by swelling are more important than the magnitude of the latter. J. W. Perry.

Corrosion symposium, 1935. The selection and application of bituminous materials for paints. Walther. *Farben Ztg* 40, 1196-7 (1935).—The properties of various bitumens are briefly discussed with emphasis on products prep'd from Mexican petroleum and anthracite coal. Lab. expts. show that moist O. together with ultraviolet light causes the rapid deterioration of films of blown bitumen. J. W. Perry.

Cold cracking and peeling failures attributable to four causes. E. A. Fluevog. *Paint, Oil & Chem Rev* 97, No 26, 7 (1935).—In order to avoid cold cracking and peeling the finish must (1) have good initial adhesion to the substratum, (2) avoid loss of adhesion due to either reaction with the substratum or penetration of moisture and (3) remain sufficiently flexible so that its coeff. of expansion at low temps. is at least equal to that of the

substratum over which it is applied. An accelerated cold-cracking test is described. J. W. Perry.

Tint retention. C. D. Holley. *Paint, Oil & Chem Rev* 97, No 25, 9-10 (1935).—Exposure tests extending over 2 yrs. and involving over 300 panels are summarized. The desirability of retaining substantial percentages of ZnO (preferably introduced as a high leaded Zn pigment) was again demonstrated. Hydrated Fe oxide pigments and Fe₂O₃ were superior to chrome yellows and orange chrome, resp., as tinting pigments. Tint retention was not markedly affected by wide variations in type, kind and combinations of drier metal used. Formulation changes involving vehicle compn. indicated that replacing part of the linseed oil with synthetic materials, notably of the alkyl type, improved color retention without loss of durability. Also the substitution of new pigments such as PbTiO₃ gave improved color retention. J. W. Perry.

Developments of titanium pigments. L. Firing. *Official Digest Fed. Paint Varnish Production Clubs* No 151, 440-2 (1935).—A historical lecture. G. G. S.

Zinc yellow and mixed pigments made therefrom. Martin Seidel. *Farbe u. Lack* 1935, 603-4, 615-16.—The properties of Zn yellow and Zn green are discussed and methods of manuf. described. J. W. Perry.

Lead titanate. D. W. Robertson. *Ind Eng Chem* 28, 216-18 (1936).—This new pigment, made from PbO and TiO₂, is essentially PbTiO₃. Properties: pale yellow color, sp. gr. 7.3, n_D 2.7, particle size 0.3-0.2 μ , ultraviolet absorption almost 100%, chemically inert toward paint vehicles. Paint films contg. it retained a dt. tenacity of 55% for 2 years, chalked very slightly, inhibited rusting, and protected incorporated tinting pigments from fading. Study of PbTiO₃ paints suggests that, contrary to the accepted ideas, chem. inertness and high ultraviolet absorption are necessary for good paint properties, but that variation in particle size and ability to form soaps with the vehicle are not. Arnold M. Collins.

The thickening of red lead ground [in oil] and the production of nonlivering red lead. H. Grohn. *Farben Ztg* 40, 1063-5 (1935).—As shown by G. (cf. C. A. 24, 3396) and others (cf. C. A. 23, 3358, 26, 5436-7) the thickening of red lead-linseed oil paints is due to the pigment's contg. PbO. Oxidation of the latter is most advantageously accomplished by grinding the pigment to an av. particle size of 5 μ and then heating to 360-380° for 8-10 hrs. This increases the Pb₂O₃ content of the pigment to 97-108.5% and practically eliminates any tendency toward livering. J. W. Perry.

Lithopone. H. Mills. *Oil Colour Trades J.* 89, 217, 215, 217-18 (1936).—Characteristics of lithopone and other ZnS pigments are discussed. The hiding and reducing powers of several white pigments are tabulated. Lithopone has valuable properties for an inside paint, while for outside use it is well to blend with other pigments. Lithopone or ZnS pigments are remarkably adaptable to formulation. W. H. Boynton.

Color and constitution. L. Dittmar. *Farbe u. Lack* 1935, 555, 568-9, cf. C. A. 30, 629.—The relation between chem. structure and color of synthetic org. pigments is discussed. J. W. Perry.

Systematizing and evaluating emulsified paint vehicles. Hans Wagner and E. Pabst. *Farben Ztg* 40, 1245-6, 1267-8 (1935).—By following, under the microscope, the process of film formation it is possible to classify the film according to type and make general predictions about its properties, e. g., stability. Such a test should be supplemented by reversibility tests by immersion in water and permeability tests, e. g., to CdSO₄ soln. The authors believe that important savings in drying oils can be achieved by application of the emulsion technic. The use of Mittel 100 J with emulsions contg. tung oil is recommended. J. W. Perry.

Reactions in monolayers of drying oils. I. The oxidation of the maleic anhydride compound of β -eleostearic

G. Gee and Eric K. Rideal. *Proc. Roy. Soc. (London)* A153, 116-28(1935).—The film spread on 0.01 N H_2SO_4 increased in area at const. pressure owing to oxidation. Fairly consistent force-area and phase-boundary potential curves could be obtained by rapid examn. The limiting area A of the unsaturated monolayer was observed to be 385 Å² (calcd 380 Å²), the elec moment, $\mu \times 10^{18}$, 25.4 e. s. u. (calcd 24.8). Four stages of compression were noted to each of which structural configurations were assigned. At the end A was equal to 120 Å² and $\mu \times 10^{18}$ to 8.2. This state corresponded to submergence of the glyceride mol. and emergence of the outer double bond, both of which were originally in the same horizontal plane. The oxidation velocity varied considerably with pressure. The total increase in area was greater at the higher pressures. Conclusion. The film is oxidized to an unstable primary peroxide, which in turn undergoes polymerization or isomerization. The energy of activation of oxidation was 6500 cal/mol and of isomerization 19,000 cal/mol. II. Polymerization of the oxidized forms of the maleic anhydride compound of β -eleostearin. G. Gee. *Ibid* 129-41, *Trans. Faraday Soc.* 32, 187-95 (1936), cf. C. A. 29, 7162².—Analysis showed that the polymerization is a chain reaction which can be broken by inhibitors like hydroquinone in the substrate or like Ft myristate in the film itself. By compressing a film that had been oxidized at high pressure, polymerization of the stable isomer was studied. k varied directly with the 3rd power of the pressure as in Semonoff's equation for γ -rays chain reactions, and the energy of activation was 20,000 cal/mol. Polymerization of the unstable peroxide was studied at temps at which reaction of the isomer was negligible. Pressure and temp had a marked effect on this polymerization, and the stable isomer acted as inhibitor. The energy of activation was 5000 cal/mol.

F. S. Roller. The synthesis of drying oils. A. Ya. Drnberg. *Sovetskii Rekonstruktivnyi i Nauka* 1935, No. 6, 16-25, cf. C. A. 29, 6443³.—The esters of unsatd. linseed oil acids and monohydric alcs. cannot form a film; the esters of diat. alcs. form with difficulty a rather unstable film, the films of synthetic glycerol esters are different from the films of the natural linseed oil. The esters of alcs. of high mol wt. form very hard films; possibly these esters can be used to improve vegetable oils. Attempts to obtain unsatd. from satd. acids were practically unsuccessful. The Al salts of hydroxy carboxylic acids are better than the Ca, Zn, Pb and Ba salts and give films stable for 2 yrs. indoors but unfit for outside work. The drying oil from a mixt. of Ca and Al salts of the natural naphthenic acids is somewhat worse. Introduction of asbestos into salt-contg. drying oils lengthens the term of their service and promises to make them fit for outside work. Treatment of chlorinated mineral oil polymers with salts of synthetic hydroxy carboxylic acids to produce a drying oil meets with difficulties due to the great impurity of technical polymers. Unsatd. hydrocarbons obtained by Weitz from the wastes of synthetic rubber, in the presence of naphthenic acids, proved very resilient. By oxidizing the same unsatd. hydrocarbons with oil Ruben obtained inner esters.

B. V. Shvartzberg. Drying properties of mixed oils. Kh. Dorn and R. Frastova. *Masloboino Zhirovo Delo* 11, 487-8(1935).—In the preliminary study of the function of linoleic acid (I) in the drying of oils and the properties of paint films, tests were made with various mixts. of linseed oil (II) with (1) lallelantia and perilla oils contg. more I than in II, (2) makhorka and nut oils with low contents of I, and (3) corn oil with no I. The drying rate of lallelantia and perilla oils is retarded on the addn. of II. With the addn. of makhorka and nut oils up to 70% the drying rate of the mixt. gradually decreases, and then beginning with 70% the curve rises sharply above that for II. The corn-oil mixt. also fails to show an additive function of the II contents, viz., the curve is characterized by the absence of a max and min. The results thus show that the drying power of oil is not directly dependent on the relative proportions of I in an oil. This observation is supported

by the exptl results of Long (C. A. 27, 5557) showing that in the mixts. of triglycerides with increasing percentage of triolein the O nos increase.

Chas. Blanc. A note on the composition of Egyptian linseed oil. M. A. Hummat. *J. Oil & Colour Chem. Assoc.* 18, 312-14 (1935).—An Egyptian linseed oil having the following consts., acid no 5.6, I no (Wijs) 190-2, d₄ 0.933, n_D²⁰ 1.481, was analyzed by the methods of Kaufmann (C. A. 23, 2031) and Twitchell (C. A. 15, 5017) and found to contain unaponifiable matter + glycerol 5.30, satd. acids 6.34, oleic acid 7.57, linoleic acid 38.44 and linolenic acid 42.35%. Of the total unsatd. acids, 18.3% yielded insol hexabromide by Coccinaras' method (C. A. 26, 3127). Egyptian and Calcutta linseed oils are closely similar.

J. W. Perry. The oxidation of linseed oil in solution. A. F. H. Ward and G. D. France. *J. Soc. Chem. Ind.* 54, 435-8T (1935).—The oxidation at 70° by O of linseed oil in dil. soln in CCl_4 was studied. The unsatd. was deid by a modification of the Wijs method (C. A. 23, 1518). The I value decreased with time, an induction period being followed by a more rapid reaction. A brown polymerization product, not completely satd., was pptd. This substance could reduce the induction period catalytically. Darkness or an antioxidant increased it. The satn. of double linkings had to continue a long way before polymerization proceeded sufficiently for the product to become insol in CCl_4 . During the time of rapid fall in I value of about 60-70 hrs the oxidation was approx. unimol.

P. S. Roller. The behavior of linolenic acid, linseed oil and wood oil on heating. Karl Meinel. *Naturwissenschaften* 23, 721 (1935).—When linolenic acid (I) or linseed oil is heated in N₂, the isolated double bonds of I change over into conjugated bonds as shown by decrease in Br no. The Br no. of wood oil increases on heating, the eleostearic acid conjugated bonds move apart. Cf. Kappelmeier, C. A. 27, 4425.

B. J. C. van der Hoeven. The molecular weight of stand oil (Evaluation of viscosity measurements). Hans Wolff. *Fettechem. Umschau* 42, 169-71(1935).—Application of the Staudinger equation, $\eta_{sp}/c = k \cdot M$ (C. A. 28, 6120⁴), to dil. solns. of linseed-oil stand-oil or the acids therefrom in CCl_4 and in toluene and the interpretation of the viscosity relations of more concd. solns. of the same solutes in linseed oil by means of the Arrhenius equation, $\log \eta = m \times \log \eta_1 + (1 - m) \times \log \eta_2$ (η is viscosity of mixt., η_1 and η_2 are the viscosities of the components, and m is the quantity of the component with η_1 viscosity), showed that the degree of polymerization was the same for both the stand oils and their free acids. This indicates that, for every two fatty acid radicals united during heat treatment by extramol. polymerization, four radicals unite to form dimers by intramol. polymerization. A tendency toward the development of structure viscosity made it necessary to work at low concns. (3 g./100 cc.) when toluene and CCl_4 were used as solvents. This tendency to aggregate formation was more noticeable with the stand oil gth cides than with their free acids.

J. W. Perry. The trend of polishing varnishes during the past one hundred years. W. M. Jauch. *Official Digest Fed. Paint Varnish Production Clubs* No 150, 398-400(1935).—The uses of natural resins in short oil rubbing varnishes during the past 100 years are reviewed. G. G. Sward.

The weathering of unpigmented varnishes. E. Fonrobert and F. Wilborn. *Farben-Ztg.* 41, 10-12, 32-3(1936).—The selection of synthetic resin for use in oil varnishes by means of outdoor weathering tests is a problem complicated by a no. of factors, e. g., seasonal and other variations in the weather, the proportion of resin in the varnish and the prepn. of the surface to which it is applied. The weathering stand used by the authors was so situated that, depending on the direction of the wind, the samples under test were exposed to an acidic atm. or to the alk. dust of a cement plant. This caused a no. of peculiar effects which are described in detail.

J. W. Perry. The relative values of some weathering tests. A. M. Mees. *Verfkronek* 8, 205-8(1935); cf. C. A. 29,

5287¹—Eight different unpigmented lacquers and varnishes were tested in several different labs by a variety of methods including accelerated artificial weathering, Florida tide range test, Florida land test, roof exposure and variations of the same. The wide discrepancies between some of the results were probably due to the unusually destructive action of excessive amts of moisture on some of the products under test. Discussion C A Lobry de Bruyn and A M Mees. *Ibid* 209-9.

New work on natural resins H J Loyck. *Forstarchiv* 11, 310-56 (1935).—Improvements in methods of harvesting and purification of resins are reviewed. The yields of oil of turpentine and colophony distd from crude balsamic resin have been increased to about 95%. Small quantities of irritants are present in the harvested balsam which usually are not harmful but which may disturb the esterification of colophony. A trace of mineral acid favors the conversion of resin acid to abietic acid which may be avoided by a 15-min heating to 210°. I. C Feustel.

Congo copal resins. I. Separation of normal nonacosane from the resin. Ferdinando Trost. *Ann chim applicata* 25, 470-2 (1935).— $C_{29}H_{58}$ has been isolated from copal resin by fractional distn, by steam distn and by sepn from paraffin by sapon with alc KOH.

Resins XIX. A copal from the Fiji Islands. Erich Stock. *Farben-Ztg* 40, 1112 (1935), cf C A 28, 3252¹, 5690¹.—The copal had the following const: acid no 103.5, sapon no 113.6, sinter point 110°, m. p 135°, ash 0.135%. It leaves a glossy film from alc or turpentine soln and appears to belong to the Mandia copal group. It has, however, a typical microscopical structure, which is described in detail. J W Perry.

Gardner, Henry A. Physical and Chemical Examination of Paints, Varnishes, Lacquers and Colors. 7th ed. Washington, D C. Inst of Paint and Varnish Research. 1448 pp. \$11. Reviewed in *Ind Eng Chem., News Ed* 13, 483 (1935).

Paints. Beckacite Kunstharzfabrik G. m. b H. Fr 789,645, Nov 4, 1935. Metallic siccatives used for paints and varnishes are obtained by pptg the hydroxides of the metals generally used, e. g., Ca, Zn, Mn, Co, Pb, from aq solns of their resp metal salts, e. g., their sulfates, chlorides, acetates at ordinary or reduced temp. The water used is previously freed from dissolved air by boiling. The paste is mixed with a dispersing agent and caused to react with an org. acid or glyceride at low temp.

Mills for grinding paints, printing inks, etc. Boudewyn C. J. Selier. Fr 788,920, Oct 19, 1935. Cf C A 29, 6445¹.

Enamel paint. George C Finn (to Sherwin Williams Co.) Can 354,311, Nov. 19, 1935. The pigment material and resin components are suspended in suitable solvent and plasticizing materials and ground and mixed by falling bodies in a rotating mill. The mix is then combined with volatile solvents.

Pigments. A Esser and B Fisel. Belg 408,318, April 30, 1935. Colored mud is emulsified with oil, dried *in vacuo*, heated and ground.

Pigments. Henry A Gardner. Fr 789,594, Oct 31,

1935. Metal salts of phthalic acid when they are relatively insol in water and ordinary org. solvents are incorporated in oil paints, varnishes or cellulose lacquers. The prep and use of phthalates of Pb, Cu and Ti are given. A pigment may comprise particles of TiO_2 treated on the surface with a relatively small amt of Ti phthalate.

Pigments. Frich Korinth and Georg Meder (to I G Farbenind A -G.) U S 2,028,980, Jan 28. Practically pure ZnO is combined with an oxide of Cd, Mg, Fe or Mn to form mixed crystals or a solid soln by heating the materials together at temps of about 800-1100°.

Red pigments. Ekbert Lederle. U S 2,030,009, Feb 4. Mixed crystals comprising normal Pb chromate, normal Pb sulfate and normal Pb molybdate are pptd by adding to an aq soln contg a sol Pb salt such as the chloride or nitrate a strongly acid soln, contg sulfate, chromate and enough molybdate ions to produce mixed crystals contg at least 4% of Pb molybdate. The Pb salt soln used may also contain a Ba or Sr sol salt. Cf C A 29, 6445¹.

Calcium sulfate-zinc sulfide pigment. Harold F. Saunders (to Sherwin-Williams Co.). Can 354,310, Nov. 19, 1935. To obtain a pigment contg approx 50% ZnS , 1000 lb of gypsum assaying 80% $CaSO_4$ is suspended in H_2O . An aqueous suspension (2400 lb) contg 33 1/3% by wt. of ZnS is added. The mixt is agitated, filtered, dried and calcined at above 600° in an O free atm, quenched, dried and disintegrated.

Zinc-dust paints. Lester D Grady, Jr. (to The New Jersey Zinc Co.). Brit 436,164, Oct 7, 1935. The evolution of H during the storage of Zn-dust paints is limited by the addn of CaO , BaO or activated bauxite in small amt, e. g., 0.25-1%.

Bunder for paints, etc. N. V. tot voortzetting der zaken van Pieter Schoen & Zoon. Fr 789,597, Oct. 31, 1935. A mixt contg one or more crude or polymerized drying oils, a phthalic resin and a chlorinated rubber is used.

Removing dried coatings such as those of paint and varnish from surfaces. Carleton Ellis (to Chadeloud Chemical Co.) U S 2,029,992, Feb 4. A liquid finish remover is applied to the surface and allowed to soften the coating, a pulverulent solid absorbent such as sawdust or kieselguhr is then applied and mixed with the material on the surface substantially to dry up the slush formed, and the mixt. is removed from the surface. Cf C A 29, 5058¹.

Transfer ink. Frank Solomon (to Beatrice Brier) U S 2,029,204, Jan 28. A transfer ink solid at normal atm temps and flowable into a thin film by low heat from a hot iron is formed of shellac 5, TiO_2 1, tritolyol phosphate 0.5, rosin 5 and varnish 0.5 part, together with coloring matter.

Lacquer for leather. R Collet and J. Coulon. Belg 406,447, Jan 31, 1935. Shellac is dissolved in 90% alc by heating on the water bath and aniline is added to produce the desired shade.

Varnish. Joseph B Dietz and Edmund F. Oeffinger (to E I du Pont de Nemours & Co.). U S 2,028,758, Jan 28. See Can 346,340-1 (C A 29, 2376¹).

Esters of 2-butyltolanol. Carbide & Carbon Chemicals Corp. Fr 789,407, Oct 29, 1935. See U S 2,014,310 (C A 29, 7343¹).

Apparatus for fusing and treating organic materials used in making varnishes, etc. Beckacite Kunstharzfabrik G m b H. Fr 789,642, Nov. 4, 1935.

Coating compositions. James A Arvin (to E I du Pont de Nemours & Co.). U S 2,029,851, Feb 4. A compn suitable for coating various surfaces comprises a varnish solvent such as "mineral spirits" and the pentaerythritol ester of an unsatd aliphatic monocarboxylic acid having at least 16 C atoms and an I no. of at least 120, such as the pentaerythritol esters of the acids of linseed, China-wood or soybean oils, with pigments, driers, etc.

Greenland oils, 9 samples of Labrador oils and 3 samples of Iceland oils are given. In the second paper, the values obtained from 41 samples of Iceland, Faroes and West Greenland oils and of 5 samples of Norwegian oils are tabulated. The "blue values" of West Greenland oils, indicating the vitamin A content, varied from 623 to 12,930. The lowest blue value in any sample of pure oil was 405. The sp. gr. of all the oils was 0.928 or a little less. The I values ranged from 114.0 to 161.0. Apparently there is some relation between a high I value and a high content of vitamin A but it is not quite clear what this is. The refractive indices varied from 1.47 to 1.49, the unsaponifiable matter from 6.34 to 17.6%. W. T. H.

Extracting lipoids, etc. I. G. Farbenindustrie A.-G. Brit. 435,798, Sept. 27, 1935. Lipoids and other substances having the character of fats are sepd. from animal or vegetable tissues or the crude fluids therefrom by treatment with an alc. having 6-10 C atoms, or a mixt. thereof. The process is also applicable for the elimination of the extractive substances, as when therapeutically active soaps of albumin or carbohydrates are being purified. In examples, (1) juice expressed from liver and of pH 6.8-7.2 is mixed with octyl alc., N being passed through the mixt. for 3 hrs. while it is cooled with ice, the mixt. of lipoids and alc., which seps. in a solid or semi liquid condition, is caught on a filter and the solvent removed by evapn. under reduced pressure, and (2) blood serum is agitated at room temp. with octyl alc. and the mixt. of lipoids and alc. that seps. is removed by centrifuging or filtering, a serum nearly free from lipoids being obtained.

Consistent greases. Produits chimiques Becoline (Gustave Beckmann, inventor). Fr. 789,633, Nov. 4, 1935. Greases are obtained by mixing deglycerolated oils or fats with sulfonated oils or fats, incorporating other animal or vegetable or mineral oil in the cold and saponifying with caustic lye. Thus, a fatty acid of high mol. wt., a sulfonated animal fat and deglycerolated coals oil are intimately mixed at 70°, then mixed with a mineral oil in the cold and saponified by NaOH.

Apparatus for refining oils and fats. Felipe Inda Jimenez. Fr. 788,840, Oct. 18, 1935.

Oils. N. V. Maschinenreien-en Apparaten Fabriek. Ger. 620,703, Oct. 25, 1935 (Cl. 23a 3). Animal, vegetable and mineral oils and fats are rendered odorless, after the usual refining, by allowing them to trickle in a fine stream over a series of inclined surfaces in a high vacuum

at 100-150°. The gases or aromatic vapors evolved are sucked off above the inclined surfaces.

Extracting fatty oils. Francis M. Hamilton. Brit. 436,482, Oct. 11, 1935. Oil is extd. from fish livers or carcasses by disintegrating the material with revolving or rotating knives without addn. oil, steam or solvents and then expressing the oil from the resulting mass in a filter press. App. is described.

Nickel catalyst suitable for use in hydrogenating oils. William W. Myddleton (to Robinson-Bindley Processes Ltd.). U. S. 2,029,789, Feb. 4. Ni oxide is mixed with ethyl orthosilicate, coagulation is effected by the addition of NH_3 , the material is broken up into granules and the dried granules are heated in H or other suitable reducing gas.

Polymerized oils. Beckacite Kunstharzfabrik G. m. b. H. Fr. 789,644, Nov. 4, 1935. Body is given to a drying, semi- or non-drying oil capable of being polymerized, by electrically dispersing a heavy metal such as Co, Mn or Fe in an org. liquid miscible with the oil, e. g., BuOH in turpentine oil, and heating the oil with the colloidal dispersion until a viscous oil is produced.

Refining oils such as carrot oil or palm oil. Vernon Jersey (to S. M. A. Corp.). U. S. 2,029,722, Feb. 4. Oils contg. appreciable amts. of carotene and a substantial amt., but not over about 10%, of free fatty acids, are treated with an aq. soln. of an alk. material such as NaOH or Na_2CO_3 in the presence of air at substantially normal atm. pressure, in an amount approx. just sufficient to combine with the free fatty acids present, with slow stirring to avoid inclusion of air, and after neutralization is effected the mixt. is warmed to about 50-60°, allowed to stratify, and the refined product is sepd.

Purifying fish oil. Weaver L. Marston (to Sharples Specialty Co.). Can. 354,307, Nov. 19, 1935. The impure oil obtained by expression from fish is heated directly by steam and part of the steam is condensed. Nearly all the remainder of the steam is evapd. The oil is then continuously sepd. from impurities by centrifuging. Apparatus for separating albumin and mucilage from oil. A. L. Tepeev. Russ. 34,267, Jan. 31, 1934. Albumins and mucilage are sepd. from oil by passing it through a heating coil in the upper part of a vessel and a cooling coil in the lower part of the same vessel.

Apparatus for steaming oil seeds. S. S. Il'in. Russ. 34,672, Feb. 28, 1934. Addn. to Russ. 33,243 (C. A. 28, 3009). Construction details.

Sunflower seed fat of definite melting point and consistency. D. A. Nechaev, A. D. Lebedev and I. A. Oberhard. Russ. 37,787, July 31, 1931. Hydrogenated sunflower-seed oil is melted at 60-75° and then crystallized. The nonsolid part is pressed out at 75 atm., the solid part melted again at 60-75°, recrystd. and pressed. The fraction obtained by pressing at 300 atm. and 37° is finally left at 15° until solidified.

Synthetic wax for the manufacture of wood, metal or leather polishes. S. Kamarovsky. Belg. 410,633, Aug. 31, 1935. Fatty oils are cooked or saponified with $\text{Ca}(\text{OH})_2$ and mixed with candleilla wax.

Thermostatic wax-melting pot. Harry E. Dow (to United Shoe Machinery Corp.). U. S. 2,023,533, Jan. 21. Structural details.

Stabilizing soap products against discoloration or rancidity. Robert M. Reed (to Procter & Gamble Co.). U. S. 2,029,506, Feb. 4. About 0.01-1.0% of *p*-tert-amylphenol is added to soaps as a stabilizer.

28—SUGAR, STARCH AND GUMS

J. K. DALE

Efficiency of sucrose extraction in cane grinding mills. M. Ch. Varona. *Proc. Asoc. Tec. Azucareros Cuba* 8, 141-4 (1934). O. W. Wilcox.

The caramelization of sucrose. A. Joszt and S. Mohácsi. *Biochem. Z.* 282, 269-70 (1935).—On heating sucrose *in vacuo* there is no gas formation but about 10% is lost

in the form of a liquid distillate which has about 20% solid residue. The latter consists almost entirely of furfural compds., but probably no furfural. S. M.

Oliver filter performance in Hawaii. S. A. Wickey. *Facts About Sugar* 31, 53-4, 59 (1933).—Sugar losses in filter cake have been reduced 60% on the av. by replacing plate

and frame presses with Oliver filters; the purity drop between clarified and filtered juice has also been very much smaller. There has been a considerable reduction in cost of labor, filtering medium and fuel. Less floor space and less supervision are required, while the filter station is easier to keep clean. The av. mud eliminated by the Olivers was 0.585 ton per 100 sq ft per hr. If the filters must be operated at high speed, the clarity of the juice suffers. As little as possible of the filtrate should be recirculated, especially when thin muds are being handled.

F. W. Zerban

High-speed centrifugals. Ralph B. Johnson *Facts About Sugar* 31, 55-9 (1936).—The results of factory tests with centrifugals running at 1600-1700, instead of 1100-1200 r. p. m., are shown in tables and graphs, and discussed. The high speed machines purge more sucrose to the same purity in the same time, and handle massecuites at considerably greater viscosity. Best results are obtained if the temp. of the massecuite and of the sugar is kept at a max.

F. W. Zerban

Hydrolysis of oat hulls with hydrochloric acid. Loren C. Bryner, L. M. Christensen and Ellis I. Fulmer *Ind. Eng. Chem.* 28, 206-8 (1936).—In the HCl hydrolysis of oat hulls a practically constant yield (about 40%) of xyllose is obtained at each pressure (varying from atm. to 7 kg./sq. cm.) with an appropriate concn. of acid (varying inversely with the pressure, 1.49 to 0.42 N HCl). Under these optimum conditions there is little charring. About 2.2% of volatile products and about 5.5% of lignins are lost during the hydrolysis.

O. W. Wilcox

Net density of starch. Bunsuke Takei *Mem. Coll. Sci., Kyoto Imp. Univ.* A18, 169-72 (1935), cf. Yoshida and Takei, *C. A.* 26, 3916.—Purified starch reaches a constant concn. and d. after 5 hrs. pumping with an oil pump at 70-90°. The net ds. of rice and potato starches after this treatment are 1.646 and 1.650, resp., considerably higher than previous values.

C. D. West

Starch nitrate. E. Berl and W. C. Kutzke *Ann.* 520, 270-89 (1935).—Starch (I) is nitrated with HNO_3 , H_2PO_4 , mixts. giving a starch nitrate (II) with a max. N content of 13.0% as against 14.14% for trimitate. The viscosity of II shows a flat max. after 12 hrs. of nitration. Decreasing the H_2O content of the mixed acids decreases the stability of II without increasing its percentage of N. With 6% or more H_2O in the acid, the product does not delaminate below 180°. H_2O , MeOH and particularly AcOH act as stabilizers. The potato starch used shows by x-rays about 9 interference rings. This no. is reduced to 3 by nitration, and raised again but not quite up to the original no., when II is converted into sol I by sapon. Under the microscope, II shows a transparent shell, surrounding an opaque center. By freezing the moistened II, suspending in water and fractionating by settling, 2 products are obtained contg. 11.6 and 12.1% N, resp. Treated with Me_2CO , the outer shell swells, while the inner material gives a clear soln. This proves the presence of 2 different materials, amylose nitrate and amylopectin nitrate. As with cellulose nitrate, the use of H_2PO_4 gives a product which is less broken down, and thus shows a higher viscosity (about 10 fold) than when H_2SO_4 is used. The viscosity is also a function of the origin of I, of the strength of acid used in nitration and of the time and temp. of nitration. Sep. nitration of amylose and amylo-

pectin show higher N content and much lower viscosity in the case of the latter. Preheating of I in autoclave up to 180° progressively decreases the viscosity of II.

ALLEN ROGERS

Characteristics of vegetable tanning materials. VII. The amount, velocity and intensity of combination of vegetable tanning materials with animal hide substance. Fritz Stather and Reinhold Lauffmann. *Collegium* 1935, 420-33, 470-1; cf. *C. A.* 29, 2774.—Strips of fresh beef hide, from which the outer layers had been split, were tanned with 10 com. vegetable tanning exts. The velocity of tanning was det'd. by removing part of the hide from the tanning ext. after 1, 2, 4, 8, 16, 32 and 64 days, washing it

10 times with water and analyzing it. The amt. of tanning was measured by the max. degree of tannage (parts combined tannin per 100 parts hide substance). The tanning curve followed the equation $B = K \log t$ (erroneously given as $B = K \sqrt{t}$ in the first paper), in which B is the amt. of combined tannin, K a const. characteristic of the tannin and t is time. Values for K and amt. of tanning, resp., were: chestnut 36.3, 46.2, quebracho 32.5, 53.3, sulfited quebracho 31.7, 52.2, myrobolans

31.6, 51.3, mimosa 30.2, 51.9, sumac 27.2, 40.9, valonia 26.0, 45.0, oak bark 22.5, 41.8, gambier 22.4, 42.1, pine bark 10.8, 30.5. The intensity of tanning was detd by washing the leather for 28 days, rotating constantly, with one change of water per day. Afterward the residue was washed 16 days with 70% alc but the alcohol soln bore no relation to the water soln. and was of no value in detg intensity. The first 8 aq. exts. were considered to give the "free H₂O sol. matter," and the sum of extns. 9-13 the "fixed H₂O-sol. matter," and matter going into soln in extns 14-28 was considered to result from hydrolysis of the leather "free H₂O-sol. matter" was fairly const at 13-14%, but was a little higher for gambier, myrobolans and valonia. "Fixed H₂O sol. matter" varied from 1.5 to 2.6. The percentage decrease in degree of tanning from the 13th to the 28th washing was taken as a measure of intensity. The values ranged from 19 for oak and sumac to 25 for pine and gambier.

I D C

Bating and dyeing XXIX Theory of mineral tanning I Elöd, Th Schachowsky and M Weber-Schäfer *Collegium* 1935, 400-20, cf *C A* 29, 83921.—On untanning Cr leather a small part of the Cr compd. (about 0.3% Cr) is found to be more "intensely" combined than the major portion, this is probably the amt of Cr necessary to render gelatin films stable to boiling. During tanning a change in chem. compn., state of aggregation, etc., of the Cr compds is probable, there is no proof that this is not true. Expts in which Cr solns and proteins were allowed to react under such conditions that changes in the Cr compds would be minimized showed that these conditions were not realized if the pH of the pickled protein was equal to or lower than the pH of the Cr soln. The optimum tanning action of Cr(NO₃)₃ and CrCl₃ was at pH 4.5-5.0, of Cr sulfate (28% basic) at 3.5-4.0, therefore, at the optimum, the sulfate has a more intense tanning action than the chloride or nitrate. In general, the condition of the Cr compd and not the isoelectric point of the protein is the dominant factor in tanning. As the basicity of CrCl₃ solns was increased (by dialysis) their tanning action decreased, probably because when the particle size increases in the absence of protein, active centers are closed.

A further study of the fat liquoring process for chrome-tanned leather. Shoo Tze Leo and Tao-Yu Cheng *J Chem Eng (China)* 2, 106-11(1935), cf *C A* 29, 42041.—Fat liquors with sulfonated oils have less penetration power than other types of fat liquors, while fat liquors with egg yolk have greater penetration power than others. In the extn by solvent before fat liquoring, the bound fats and acetone ext. will be low if the petroleum ext. is high, and vice versa.

C L Tseng

The prevention of acid damage to vegetable tanned leather Gerhard Otto *Collegium* 1935, 449-55.—Sets of leathers, tanned with a quebracho-chestnut-valonia mixt with or without addn of sulfite cellulose, Tanigan F C or Tanigan O was electrometrically titrated before and after aging 2 years. During aging one set was exposed to air and another had air excluded. Leathers contg Tanigan F C or O retained the original buffering capacity of the vegetable tanning material for 2 years, while pure vegetable leather had entirely lost its buffering power. The hide substance of the latter was noticeably attacked, as was shown by sol. N data, while the Tanigan leather was not attacked. Treatment of hide with tanning sulfonic acids of high mol wt decreases or prevents absorption of acid gases. Sulfite cellulose has a similar but lesser protective action. The quinhydrone and glass electrodes gave the same pH values up to pH 5.7, so the former can be used for detg free acid and buffer capacity of leather by titration.

I D C

The liming process in the manufacture of leather Shoo-Tze Leo and Cheng-Tan Chang *J Chem Eng (China)* 2, 89-101(1935).—The liming effects of calcsols with CaO alone and with CaO + As₂S₃ or Na₂S are studied. As₂S₃ usually produces a tighter grain than Na₂S, while pure CaO produces a loose grain. The greater the loss of hide substances during this process, the higher are the ash

and lime contents and the looser the grain of the finished leather. A leather of good quality should contain 63-72% of hide substance. The leather is too soft if the hide substance content is below 63%, and too stiff if above 72%.

C. C. DAVIS

The laws and the mechanism of the electrophoresis of rubber latex. Industrial applications and the manufacture of articles by electrophoresis. Georges Génin *Revue caennaise* 12, No. 117, 11-15 (1935).—An illustrated review and description. C. C. Davis

Acetone extraction of raw rubbers. V. Effect of heating of acetone extract at 100° and storing the acetone extract on the saponification value. Hidemaro Endô *J. Soc. Rubber Ind. Japan* 8, 964-8 (1935).—See C. A. 30, 323.

Methods of extraction of rubber from tau-saguz. V. Zhuravlev and V. Provorov *Sovetskii Kauchuk* 1935, No. 12, 42-7.—The roots of tau-saguz (I) contained water 5.5, ash 6.06, tars 2.4, rubber 23.5 (av. 20%). They were treated by 2 methods. (1) The *Gintzelmetla* method involved consecutive disintegration of the raw material to insure flotation in app. The roots of I were cleaned, cut into small pieces, disintegrated in a Gelfry machine, and milled to crush bark and wood pulp, the mass was treated with hot water to swell the wood pulp. The wood pulp was removed from the rubber in a Rozenfeld and Lebedev app., and the material was fed into a Rettinger classifier. The floated rubber was fed into the receiving screens, the rubber concentrate was washed and the "skins" of I were dried and packed. The yield of "skins" was 67-69%, and they contained H_2O 1.5, ash 0.98, tars 4.5, rubber 70-83 (acetone plus $CHCl_3$ ext. 80-88%). (2) The *microbiol. method* (in the exptl. stage) consisted in fermenting the roots of I. The roots were cut into pieces, treated with hot water and left for 7 days in a fermentation soln. contg. urine, $(NH_4)_2CO_3$ or $(NH_4)_2HPO_4$ (no difference in results was observed), the amts. of salts being detd. daily by the acidity. After washing, "skins" of the following compn. were obtained: H_2O 1.16, ash 0.93, tars 5.11, rubber 88.87, insol. matter 5.09%. The yields from the dry distn. of tau-saguz rubber were: fraction up to 150°, 10.19; 150-200°, 6.77; 200-300°, 46.35; 300-310°, 7.59; residue, 24.33; losses, 4.98%. The reaction of the tar water was alk. By treatment of I rubber with Cl_2 and Br_2 , the products corresponded to those obtained with Para rubber. The dipentene fraction gave with Br_2 a violet coloration. I rubber contains isoprene units. A. P.

Simplified method of estimation of the proportion of rubber in kok-saguz for purposes of selection. P. Stolbin. *Sovetskii Kauchuk* 1935, No. 2, 19-21.—Boil kok-saguz root (1.2 g.) and 50 cc. of 3% NaOH soln. 30 min., decant, roll down the root on glass to a flat piece, wash the flat piece with water acidified with HCl , treat with cold H_2SO_4 (d. 1.84) for 4 hrs. to destroy the cellulose, wash, leave overnight in 50 cc. of 3% NaOH, wash out NaOH, dry at 70-80° and weigh. Multiply the wt. by 0.38 (The flat piece which was treated in this manner contd. 38% of substances extd. with $CHCl_3$). This factor must be checked for each large series of analysis. A. Pestoff

The newest principles of formulating rubber mixtures. B. Fabritzev. *J. Rubber Ind. (U. S. S. R.)* 12, 757-62 (1935).—The free S in rubber is oxidized by the air to H_2SO_4 or H_2SO_3 . These deteriorate the rubber, therefore formulas should contain a min. of free S. Vulcanization in the future will be with polysulfide accelerators like tetramethylthiuram disulfide (I), e. g., 3% in the presence of a very small proportion of S, or combinations of S 0.1-0.5% and Se 3.0%. The effects of various ingredients,

including ZnO , magnesia alba, ground asbestos, etc., in a formula with 3% tetramethylthiuram disulfide and no S, on the mech. properties of rubber are shown. A. Pestoff

The plasticization of rubber and rubber mixtures with tau-saguz and with light crepe, and the mechanical properties of the vulcanized rubber. N. Chesnokov. *Sovetskii Kauchuk* 1935, No. 2, 34-41.—The mixts. tested contained rubber (tau-saguz (I) or light crepe (II)) 100, mercaptobenzothiazole 0.8, stearic acid 2.0, ZnO 5.0, $CaCO_3$ 50 or lamp black 35, S 3.5. The rubber mixts. were milled for different times and cured 10, 20, 30, 40 and 50 min. at a temp. corresponding to 2.5 kg. per sq. cm. The plasticity of I was higher than that of II, and it did not change with the time of plasticization, whereas that of II increased. I can be used in rubber mixts. without plasticization. The plasticities of rubber mixts. with $CaCO_3$ and lamp black were higher than the plasticity of pure rubber, lamp black mixts. increased the plasticity to a smaller degree than did $CaCO_3$. I and II in mixts. with $CaCO_3$ gave the same plasticities after calendaring. The tensile strengths of rubber mixts. with II were higher than with I (189 kg. per sq. cm. and 151 in mixts. with lamp black). The residual elongations of rubber mixts. with I were higher than with II (28 and 22%). The reverse relationship between the plasticity of rubber mixts. and tensile strength was observed, a decrease in the plasticity of lamp-black mixts. compared with $CaCO_3$, corresponded to the same percentage increase in tensile strength.

A. Pestoff
The plasticization of rubber on the Gordon plastometer. N. Krulov. *J. Rubber Ind. (U. S. S. R.)* 12, 739-46 (1935); cf. C. A. 29, 6466.—Descriptive. A. P.

Thermal plasticization of rubber. Technological characteristics of the product of thermal plasticization. M. Farberov and A. Suslyakov. *J. Rubber Ind. (U. S. S. R.)* 12, 715-22 (1935); cf. C. A. 29, 7696.—Gunsev, Gruzevich, Khovrina and Zelikov, C. A. 29, 6797.—Rubber was plasticized in an autoclave at 150°, cooled to 50° and passed 3 times through a mill (65-70°). The plasticity increased directly with the time of thermal treatment. The energy used was 15-50%; less than that with mech. treatment. With a high proportion of rubber and a high plasticity, the economy is greater with thermal plasticization. The mech. properties of vulcanizates prepd. from mech. and thermally plasticized rubber aged the same. The thermally treated vulcanizates adsorbed less water and showed less calender effect; at plasticities of 2.5-2.75, their solns. gave lower viscosities and a plasticity of 1.85 a higher viscosity than solns. of mechanically plasticized rubber. Thermally plasticized rubber was used to prep. sponges, rubberized fabrics and frictions. Thermally plasticized rubber required a higher concn. of alkali for its water dispersion.

A. Pestoff
Aging of rubbers by exposure on top of Mount Fuji and on level land. Shohai Saito. *J. Soc. Rubber Ind. Japan* 8, 631-93 (1935).—Rubber sheet was exposed for 319 days at the top of Mt. Fuji and below on level land. Contrary to the expected there was greater aging effect on top of the mountain because of more ultraviolet light; the deterioration was less than below. This may have been due to more cloudy days and the low temps. K. Kitsuta

Determination of free sulfur in rubber. E. W. Oldham, L. M. Baker and M. W. Craytor. *Ind. Eng.*

ethylenediamine turned pale brown, and those containing phenylenediamine pale yellow-green. Among compounds of the phenylnaphthylamine type, phenyl- α -naphthylamine did not show consistent colors, but varied from dark green to green, depending on the particular kind of antioxidant used. However, the substances belonging to this type can easily be identified by their outward appearance. Phenyl β -naphthylamine turned yellow or yellow-green. β -Naphthols turned sepia or dark gray. Color reactions which are believed to be characteristic are those of Parazon, aldol- α -naphthylamine resin, Agerite white, Neozone A and C, Akroflex C and Fictol white.

Treating latex International Latex Processes Ltd and Mario Faldini Brit 435,636, Sept 25, 1935 Vulcanized aq. dispersions of rubber are clarified by centrifuging in a clarifier. The vulcanization before the centrifuging is preferably effected in the presence of excess vulcanizing agents, the excess being removed by the clarifying, which may be in 1 or more stages.

Concentrating rubber latexes Alfred E Petersen and Wilhelm Gensecke (to Metallgesellschaft A-G) U S 2,029,531, Feb 4. Latex to be concentrated is heated while avoiding the formation of steam (suitably in a tube and header app.) and is introduced in a state presenting a large surface, such as a spray into a vacuum evaporator at a temperature which is higher than the b. p. of the latex under the pressure prevailing in the evaporator. App. is described. Cf. C A 30, 900.

Concentrating latex Rubber Producers Research Association, Geo Martin, Wilfred S Davey and Herbert C Baker Brit 437,788, Nov 5, 1935 Rubber latex is creamed by adding a H_2O sol. alkylated deriv. of starch or of other food reserve polysaccharide. The rate of creaming may be accelerated by restricting the amt. of NH_3 in the latex and by warming. A sol. methylated starch may be obtained by heating an aq. dispersion of potato starch with NaOH and Me_2SO , and treating the cooled reaction mixt. with dil. H_2SO_4 until it is only slightly alk. The product may be used directly or the alkylated starch may be 1st isolated by pptn. with alc. or by evapng to dryness under reduced pressure, extg. with $CHCl_3$, dehydrating with anhyd. $MgSO_4$ and evapng the $CHCl_3$. Cf. C A 29, 7122.

Synthetic rubber I G Farbenindustrie A-G Fr 788,973, Oct 21, 1935 Vulcanizable products of good quality are prep'd by polymerizing butadiene and its homologs in an emulsified form, as emulsifying agents nonvolatile org. compounds are used and these are allowed to remain in the products after their coagulation. Agents used include transformation products of oil fms. of high mol. wt., drying or semidrying oils, such as linseed oil, wood oil, olive oil, fish oils, and alkali metal or NH_3 , salts of carboxylic acids of high mol. wt.

Rubber substitutes Herbert Vohrer, Fr 789,172, Oct. 24, 1935 Elastic objects are made by forming a paste in the cold with water and polyvinyl alc. insol. in water and emollients, the paste being pressed to any desired shape and heated to 80–100°. The ratio between the polyvinyl alc. and fillers on the one hand and water and emollients on the other is between 1 and 1.5, the fillers being glue, dextrin, gelatin, starch, etc., which are insolubilized by adding tanning substances.

Halogenating rubber, etc Metallgesellschaft A-G Brit. 435,729, Sept 26, 1935 See Fr 785,257 (C A 30, 647)

Chlorinated rubber Deutsche Gold- und Silber-Scheideanstalt vorm Roeder Brit 435,726, Sept 26, 1935 Addn to 425,769 (C A 29, 61004) The process of 425,769, in which chlorinated rubber is sep'd from its soln. by spraying in the presence of a condensable vapor, e. g., steam, at or above the b. p. of the solvent, is carried out in the presence of an alkali for stabilizing purposes. The alkali, as vapor or finely divided solid, e. g., NaOH, may be blown in by the atomizing medium for the chlorinated soln. or may be added to liquid into which the soln. is sprayed.

Rubber compositions Siemens & Halske A-G Brit 435,027, Sept 9, 1935 An elec. conductor has an insulation consisting of a mixt. of unvulcanized rubber and waxes falling in the classes montan waxes freed from resin and bleached and hardened by oxidation, chlorinated $C_{18}H_{34}$ and wax obtained from the higher alcs. of the fat series, wax acid and vegetable oils hardened by hydrogenation. The proportions are preferably rubber 60 and wax 40. Balata and gutta percha may be added, as may other waxes, e. g., carnauba, ceresin, "Superta". Cf. C A 29, 7692.

Rubber compositions Franklin H Lushington Brit 436,509, Oct 14, 1935 A self-vulcanizing compo. for use on roads, walls and floors comprises corr. dust, peat dust, wood flour or sawdust and rubber latex in the proportions of 1–5 of dry rubber to 1 of corr. dust, together with the following vulcanizing agents: pptd. S 3–15, an accelerator, e. g., diphenylguanidine, quinodine, piperidine, 0.5–1, an activator, e. g., ZnO , 2–3 and, if necessary, an anti-coagulant, e. g., NH_3 , NaOH, 0.5–1%, all calcd. on the solid content of the latex. The compn. is left to stand to effect partial vulcanization and then applied to the surface to be covered.

Rubber compositions Henry P Stevens, W. H. Stevens and Clayton and Stevens Ltd Brit 435,401, Sept 23, 1935 The rubber compns. of Brit 390,820 (C A 27, 6020), comprising rubber mixed with a high proportion of an oily softener, are used for the production of textile machinery parts, e. g., rollers, belts, bands and pickers, liable to be contaminated with the oil naturally occurring in the fibers or used in the treatment thereof.

Rubber derivatives I G Farbenindustrie A-G Fr 788,840, Oct 19, 1935 Rubber, products obtained by polymerizing isoprenes, butadienes and rubber substitutes such as factice are treated with dil. F to give products contg. up to 30% of F. The products are particularly suitable for the production of insulators in electrolytic cells serving for the production of F.

Chlorinated rubber compositions I G Farbenindustrie A-G Brit 436,393, Oct. 10, 1935 Alkylated naphthalenes, in which the alkyl groups preferably contain 3–4 C atoms, are incorporated with chlorinated rubber fillers, color, resins, softeners and, to produce a lacquer, org. solvents may be added.

Rubber threads or strips Carl L Beal (to American Anode, Inc.) Brit 436,259, Oct 8, 1935 These are made by shearing along a plurality of parallel lines a sheet of H_2O -contg. latex coagulum, whereby a rounded edge is produced with a longitudinal "seam" along the shear line. App. is described.

Rubber threads Thomas L Shepherd Fr 788,944, Oct 21, 1935 A very fine stream of coagulant (e. g., 5–25% soln. of $AcOH$) is introduced into a bath contg. latex of suitable concn. and a divided material, e. g., cotton

rayon or wool flock. The thread formed is drawn out and subjected to further necessary treatments. Cf C A 30, 1608⁴.

Rubber shoe soles resembling leather. Walter R Hiebler (to Hood Rubber Co.). U S 2,029,371, Feb 4 Articles such as rubber shoe soles contg a high proportion of fiber carry a surface layer of wax through which the fibers extend and this surface is burnished so that it resembles sole leather

Surfacing rubber articles such as portions of rubber shoes with comminuted material such as flock Alvin L Diller and Leslie H L'Hollier (to Hood Rubber Co.) U S 2,029,361, Feb 4 A layer of adhesive liquid comprising a coagulant for rubber such as a soln. contg ZnCl_2 , glycerol, etc., is deposited upon a support and a layer of comminuted material is deposited upon this layer; coagulable rubber material is applied over these layers, and the resulting layered product is removed from the support

Ornamented rubber articles Leslie H L'Hollier and Alvin L. Diller (to Hood Rubber Co.). U S 2,029,379, Feb 4 In forming bathing caps or other ornamented articles, a liquid rubber dispersion is ejected from a nozzle onto a supporting surface to form a gossamer design, and upon this there is deposited a layer of rubber of a contrasting appearance and this layer is then removed with the rubber of the design adhered to its surface Cf C A 29, 4633⁴

Apparatus for producing shirred margins on rubber articles Arthur E. Collins (to B F. Goodrich Co.). U S 2,029,359, Feb 4 Various mech details

Rubber to metal bonding method George Livings and Bernard W. D. Lacey (to Dunlop Tire and Rubber Goods Co. Ltd.) Can. 354,930, Dec. 24, 1935 The surfaces of a metal sheet and a sheet of uncured rubber compn are bonded together by exposing the rubber sheet compn to Hg vapor lamps for 15 min at 18 in distance, and then vulcanizing the sheet rubber *in situ* upon the metal surface

Apparatus for coating wires with rubber Charles J

Moody and Earle A. Mitchell (to Phelps Dodge Copper Products Corp.). U. S. 2,029,435, Feb. 4. Various structural, mech and operative details.

Apparatus and method for coating the wires of vehicle wheel tires with rubber latex. Hubert H. Burton and John Bull Rubber Co. Ltd Brit 436,844, Oct. 16, 1935

Treating raw rubber passed through calendars 1. T. Kataev Russ 36,002, Apr 30, 1931 The shrinkage of rubber obtained from the calendars is eliminated or lowered to 0.1 to 0.2% by passing it through a vat of boiling water (time of exposure 1 min)

Preserving rubber, etc Wingfoot Corp Brit 436,153, Oct 7, 1935 Rubber or other deteriorable compn is vulcanized in the presence of an antioxidant consisting of a tertiary dialkyl naphthylamine, the naphthyl radical being unsubstituted and the alkyl radicals, which may be the same or unlike, connected only through the tertiary N atom. The tertiary amines may be prep'd by causing an alkyl halide to react with a naphthylamine in the presence of Na_2CO_3 , or a dialkyl sulfate, an alkyl ester of toluene-sulfonic acid or a secondary dialkylamine with a naphthylamine Cf C A 30, 619⁴

Rubber Imperial Chemical Industries Ltd and William Baird Brit 435,024, Sept 6, 1935 Divided on and addn to 431,951 (C A 30, 900⁴) To prevent oxidation and flex-cracking of rubber there is incorporated in the mix an alkoxy- or polyalkoxy-diaryllamine in which the alkoxy group or groups are in the *m*- or *p*-position to the imino group and the aryl radical is Ph, tolyl or xyllyl, 4,4'-dimethoxydiphenylamine is excluded Examples are given of the use of *p*-methoxydiphenylamine, 3-methoxy-4'-methylphenylamine and 3,4'-dimethoxydiphenylamine

Rubber William Patter ter Horst (to Dominion Rubber Co Ltd.) Can 354,278, Nov 19, 1935 To improve the resistance and retard the deterioration, there is incorporated in rubber a S deriv of the reaction product of a ketone with a secondary amine

Plasticizer for rubber Julius Hyman (to Velocoid Corp.) Can 354,960, Dec 21, 1935 Rubber is mixed with 0.1-25% of a viscous, sticky, liquid polymer of reddish yellow color derived from the high pressure liquid-phase polymerization at 450-750° F of cracked gasolines and having an iodine no of 100-200

Rubber Irma Louis Blumer Ger 620,751, Oct. 25, 1935 (Cl 39b 3) A softening agent for rubber transformation products consists of ethers of PhOH and polyhydric alcs. Thus, PhOH, cresol, guaiacol, α -resorcinol, naphthol, etc., are etherified with glycerol, etc. The products are used for making lacquers, paints, etc.

Process and apparatus for softening raw rubber and compositions thereof Società italiana Pirelli Brit. 435,974, Oct 2, 1935 A rolling mill is used which comprises 2 oppositely revolving rollers, the rubber being worked as an endless loop by feeding the forward end of the issuing sheet again to the rolls, the loop accumulating in superimposed folds upon a support at the feed side of the mill as its length increases with continued working to the desired thickness and the rollers drawing continuously from the accumulation

Rubber solutions J. R. Geigy A-G. Brit 436,512, Oct 11, 1935 The viscosity of solns. of rubber, gutta-percha, balata, etc., is reduced by treating the rubber, etc., with a sulfonic acid, before, during or after the dissoln or swelling, at a moderate temp., e. g., 50°. The acid may be *p*-toluene-, ethane-, benzene-, xylene-, cymol-, nitrobenzene- or nitrochlorobenzene-sulfonic acid Cf C A 29, 7698⁴

Utilizing waste rubber. Ernest Bemelmans Brit. 435,890, Oct. 1, 1935 Waste rubber contg. fibers is heated in a closed container to carbonize the fibers and render the rubber capable of being plasticized by passage between rollers. Thus, a motor tire cover is heated at 220° for an hr. in a closed container and allowed to cool thereon. On milling, the carbonized fiber is converted into a powdery filler

Vulcanizing press for tires, inner tubes, etc Giuseppe

Cozzo (to Società italiana Pirelli). U. S. 2,029,060, Jan 28, 1935. Mech features.
Vulcanizing press suitable for vulcanization of tire casings, etc. Colin Macbeth U. S. 2,023,618, Jan 21, 1935. Mech features.

Vulcanization apparatus. Lewis J. Clayton (to Viceroy Manufacturing Co. Ltd.) Can. 354,318, Nov. 19, 1935. A strip of rubber is passed through and supported centrally in a tunnel having reflective walls. Radiant heat elements are disposed at intervals, and wire mesh screens are placed between the heater and rubber. Cf. C. A. 29, 4212¹.

Pneumatic tire casings. Ralph M. Reel (to Pharis Tire and Rubber Co.) U. S. 2,027,248, Jan. 7, 1935. A tire is formed comprising a fabric carcass and a compd. outer covering of rubber composed of an outer tread and side wall layer of relatively hard high abrasive resisting properties, an intermediate cap layer of a more resilient compn. than the tread layer, and an inner layer adjacent the cap layer and of softer and more resilient compn. than the cap layer, the inner layer contg. Sb sulfide, rubber and ZnO, the intermediate cap layer contg. about 44% as much ZnO as rubber and being relatively thin as compared to the outer tread.

Rubber substitute. I. G. Farbenind. A-G. Fr. 787,467, Sept. 23, 1935. Products obtained by polymerizing butadiene, its homologs or their derivs. or mixts thereof among themselves or with other polymerizable compds., in the form of emulsion, are purified by extr. or pptn. and to these are added org. compds. not or only slightly volatile or their mixts in amt. of 10-50, preferably 20-30%. Org. compds. include vegetable, animal or mineral oils, fats or waxes, resins, resinic acids, bitumens, olefins of high b. p., drying or semidrying oils and asphalt. The vulcanized products have good resistance to rupture and elasticity.

Rubber-like compositions. I. G. Farbenind. A-G. Fr. 788,670, Oct. 14, 1935. Isobutyl vinyl ether having a high degree of purity is polymerized either alone or in admixt. with other polymerizable compds. at temps. below 10°, e. g., -40° to -80°, by means of BF₃ used as such or as a product of addn. with an org. compd. contg. O.

Vulcanization accelerators. Wilhelm Lommel and Rudolf Schroter (to I. G. Farbenind. A-G.) U. S. 2,027,184, Jan. 7, 1935. See German 578,673 (C. A. 28, 932²).

Vulcanization accelerator. Arthur W. Sloan and Robert C. Goodwin (to B. F. Goodrich Co.) Can. 354,142, Nov. 12, 1935. As accelerator is specified the salt of a bivalent metal and a diaryldithiocarbamic acid, e. g., Zn diphenyldithiocarbamate.

Vulcanization accelerators. Wm. C. Calvert and Howard I. Cramer (to Wingfoot Corp.) U. S. 2,028,086, Jan. 14, 1935. As vulcanization accelerators there are used compds. of the general formula R₂NHCH₂CH₂NH₂, in which R is a hydrocarbon radical, such as *o*-tolylethylene diamine or various other specified similar compds. (details for making some of which are given).

Vulcanization accelerators. Wingfoot Corp. Fr. 788,621, Oct. 14, 1935. A salt of a secondary furyldithiocarbamic acid (I) is caused to react with a haloaryl thiazole, preferably in the presence of a solvent. Thus, 5-nitro-1-benzothiazyl di- α -furfuryl-dithiocarbamate, m. 93-5°, is made by refluxing 1-chloro-5-nitrobenzothiazole (II), di- α -furfurylamine, CS₂ and NaOH in a solvent such as EtOH. Results are given of the use of this accelerator. Fr. 788,622. A secondary hydrogenated furyldithiocarbamic acid is substituted for I in the process of Fr. 788,621. Thus, 5-nitro-1-benzothiazyl bis(tetrahydro- α -furfuryl)dithiocarbamate, m. 116-8°, is made by refluxing II, bis(tetrahydro- α -furfuryl)amine, CS₂ and NaOH in EtOH.

Sulfenamides. I. G. Farbenind. A-G. Fr. 785,990, Aug. 23, 1935. See Ger. 615,580 (C. A. 29, 8405⁹).

Thiazyl monosulfides. Jan Teppema (to Wingfoot Corp.) U. S. 2,023,082, Jan. 14, 1935. A μ -halothiazole is caused to react with a mercaptobenzothiazole (as by heating the materials together with solvents) to form a dithiazyl

monosulfide, which may be used as a vulcanization accelerator with rubber compns. Starting materials which are mentioned include 1-chlorobenzothiazole, 1-chloronaphthothiazole, the 1-chlorotolylthiazoles, the 1-chloroxylythiazoles, 1-chloro-5-nitrobenzothiazole, 1-chloro-4-chloro-5-nitrobenzothiazole, 1,4-dichlorobenzothiazole, 1,5-dichlorobenzothiazole, 1-chloro-4-nitrobenzothiazole, 1-chloro-5-nitrobenzothiazole, 1-chloro-3-phenylbenzothiazole, 1-chloro-3-phenylthiazole, 1-chlorothiazole, 1-chloro-5-ethoxybenzothiazole and other ring-substituted nitro, alkoxy, halo, alkyl and aryl 1-chloroarylenethiazoles, 1-bromo and other halo thiazoles. If the sulfide starting material is a mercaptobenzothiazole, either the hyposulfite or corresponding metal sulfhydrate thereof may be employed. There may be used 1-mercaptopthiazole, 3-butylmercaptobenzothiazole, 1-mercaptop-3-phenylthiazole, 1-mercaptop-3,5-dimethylbenzothiazole, 5-nitromercaptobenzothiazole, 5-aminomercaptobenzothiazole, 4-chloromercaptobenzothiazole, 5-chloromercaptobenzothiazole, 1-mercaptaphthothiazole, 1-mercaptop-5-methoxybenzothiazole, 5-methylmercaptobenzothiazole, 1-mercaptop-3-phenylbenzothiazole, the mercaptotolylthiazoles, and other ring-substituted nitro, amino, halogen, alkyl, alkoxy and aryl mercaptoarylene thiazoles. Various details of procedure are given.

Carbamyl disulfides. Jan Teppema (to Wingfoot Corp.) U. S. 2,024,613, Dec. 17, 1935. By reaction of a dithiocarbamate with a nitro-substituted haloarylenethiocarbonyl mercaptan rubber-vulcanization accelerators are produced such as 2-benzoyl-4-nitrophenyl dimethylthiocarbamyl disulfide, the corresponding di-Et, di-Bu, dicyclohexyl and Γ -cyclohexyl derivs., 2-benzoyl-4-nitrophenyl pentamethylene-thiocarbamyl disulfide, *o*-nitrophenyl ethylcyclohexylthiocarbamyl disulfide, and the corresponding dicyclohexyl, di-Me and di-Am derivs., *o*-nitrophenyl morpholythiocarbamyl disulfide, 2-nitro-4-chlorophenyl morpholythiocarbamyl disulfide, 2-nitro-4-chlorophenyl pentamethylene-thiocarbamyl disulfide, 2-nitro-4-chlorophenyl difurfurylthiocarbamyl disulfide, *o*-tolyl ethylphenylthiocarbamyl disulfide, *o*-tolyl dibenzylthiocarbamyl disulfide, 4-nitrophenyl dibenzylthiocarbamyl disulfide, 2,4-dinitrophenyl dibenzylthiocarbamyl disulfide, 2,4-dinitrophenyl dimethylthiocarbamyl disulfide and 2-nitro-3-methylphenyl dimethylthiocarbamyl disulfide.

Mercaptobenzothiazyl aryl disulfides. Max Bögemann (to I. G. Farbenind. A-G.) U. S. 2,026,873, Jan. 7, 1935. Rubber vulcanization accelerators are formed by condensing together (suitably by heating in C₆H₆) 1-mercaptopbenzothiazole or its 3,5-di-Cl or 5-chloro-3-methoxy derivs. or other compds. such as are described by Sebrill and Boord (C. A. 17, 3376), or by Teppema and Sebrill (C. A. 21, 2688-9), with compds. of the formula aryl-S-X, such as PhSCl, *p*-MeC₆H₄SCl, *o*-O₂NC₆H₄SCl, 1-ClC₆H₄SCl, 2-*o*-O₂NC₆H₄SCl and the like. Details are given of the production of benzothiazyl *p*-nitrophenyl disulfide, in 137-8°, 4-methoxy-6-chlorobenzothiazyl *p*-nitrophenyl disulfide, m. 172-3°, and 4,6-dichlorobenzothiazyl *p*-nitrophenyl disulfide, m. 181-2°.

Vulcanizing rubber. Imperial Chemical Industries Ltd. Fr. 787,621, Sept. 26, 1935. Accelerators are made by causing a quaternary ammonium halide (other than tetramethylammonium halide) to react with a metal deriv. of a mercaptobenzothiazole. The reaction is carried out in a medium in which at least one of the reagents is sol and at least one of the reaction products is insol. Examples are given of the prepn. of hexadecylpyridinium (m. 102-5°), hexadecyltrimethylammonium (m. 120-30°), (β , γ -dihydroxypropyl)pyridinium (m. 101-7°) and β -hydroxyethylpyridinium-1-benzothiazyl sulfide and a product, m. 85-6°, from benzyltrimethylammonium chloride and Na salt of 1-mercaptopbenzothiazole.

Vulcanized rubber sponge. Fabbriche Riunite Industri Gonina Torino. Ger. 622,238, Nov. 22, 1935 (Cl. 3¹/₂ 11 01). See Fr. 768,905 (C. A. 29, 640¹).

10% discount for combinations of 1, 2 and (or) 3 (complete).
 Postage to foreign countries outside the Pan American Postal
 Union extra as follows: 1, \$1.50; 2 and 3 (complete), \$2.10
 each. Canadian postage one-third these rates.

BACK NUMBERS AND VOLUMES

Single Numbers when available, each major publication . . . \$ 0.75

Back Volumes	J Am Chem Soc, Vols 23, 29-57, each	9.00
	Chemical Abstracts	
	Vols 1-29, incl both Dec Indexes	600.00
	Vols. 6, 8, 10, 12, 13, 14, 15, each	20.00
	Vols 16-29, each	15.00
	Ind and Eng Chem, Vols 9-27; each Vol	9.00
	Ind and Eng Chem Sets, Vols 1-27*	243.00
	Index to Vols 1-20, J Am Chem Soc.	1.00
	Index to Chem Abst., ordered separately, each Vol	2.50
	2nd Decennial Index to Chemical Abstracts—5 Vols	50.00

*Members, for personal use (sets excepted), are allowed a discount of 20%.

*The News Edition and Analytical Edition are not included in back volume price for INDUSTRIAL and ENGINEERING CHEMISTRY. Price \$2.00 and \$3.00 each, respectively, when available. Single numbers 10 cents and 75 cents each, respectively.

Advance payment is required in all cases and must be made by check or postal order payable in American exchange (dollars).

1. Journal American Chemical Society
 Proceedings, Vol. 2 and Vols 23, 29-57, only available. Some single numbers of other volumes can still be supplied.
2. Chemical Abstracts
 Volumes 1-5, 7, 9, 11 will be sold as complete volumes only in sets of Vols 1-29 including the 1st and 2nd Decennial Indexes.
3. Industrial and Engineering Chemistry
 Volumes 1 to 8 sold only as part of complete sets of Vols. 1-27, inclusive.

DOMESTIC SHIPMENTS. Single copies are sent by mail. Full volumes and sets are sent in the United States and Canada express collect.

FOREIGN SHIPMENTS. Foreign shipments will be sent by mail either at purchaser's risk or by registered mail at postage cost, plus 5% of invoice, additional for registry; minimum charge, 75 cents. Large shipments will be delivered, if desired, to responsible forwarding agents in New York free, further charges to be paid by the purchaser on receipt.

The Society will not be responsible for loss due to change of address unless notification is received ten days in advance of issue. Claims for non-receipt must be made within 60 days of date of issue. "Missing from files" cannot be accepted as evidence of non-receipt. If change of address means a change of position, please indicate its nature.

Members or subscribers desiring their Journals or Abstracts forwarded from an old address should always notify their Postmaster and leave necessary postage.

The names of members and subscribers, whose Journals cannot be delivered by the Post-Office Department, will be cut off the mailing list at once, and will not be restored until correct addresses have been furnished.

In the absence of other information, the notices of change of address received from the Post Office Department will be considered as correct, and the mailing list changed accordingly.

All communications relating to subscriptions or back issues should be addressed to
